Nöromuhasebe yaklaşımı, klasik muhasebe teorilerinden farklı olarak, sadece sayısal verilerin sunumu ile değil, bu verilerin insanlar üzerindeki psikolojik ve nörolojik etkileri ile de ilgilenmektedir (Dickhaut vd., 2010). Beyin yapılarının finansal kararları hangi mekanizmalarla etkilediğine dair bulgular, muhasebe verilerinin şekillendirilmesinde ve yorumlanmasında alternatif bir perspektif sunmaktadır. Bu perspektif, finansal tabloların sunum biçiminden, yönetici kararlarına ve denetim süreçlerine kadar geniş bir uygulama alanına sahiptir.

Nörobilimsel temelli karar alma modelleri, muhasebe bilgilerinin rasyonel beklentiler çerçevesinde değil, çoğu zaman bilişsel kısıtlar ve duygusal önyargılarla şekillendiğini ortaya koymuştur. Örneğin, zarardan kaçınma (“loss aversion”), aşırı özgüven (“overconfidence”) ya da çerçevelendirme (“framing”) etkisi gibi bilişsel yanlılıklar, finansal verilerin algılanması ve kullanımında belirleyici olabilmektedir (Kahneman & Tversky, 1979). Bu şekilde, finansal karar alma süreci sadece bilgi ile değil, bilginin sunumu, algılanması ve biyo-nörolojik şartlarla da yoğun şekilde ilintilidir.

Bu çalışma, muhasebe ve finans alanında yeni sayılabilecek bir disiplin olan nöromuhasebe kavramının teorik temellerini tartışmayı, ilgili nörobilimsel bulgularla ilişkilendirerek finansal karar alma modellerine etkilerini ortaya koymayı amaçlamaktadır. Özellikle bireylerin finansal verileri yorumlama biçimleri ile bu yorumlara dayalı kararların nörolojik temelini anlamak, daha sağlıklı raporlama standartlarının ve daha etkili denetim mekanizmalarının geliştirilmesine katkı sunabilecektir.

Nörobilim ve Karar Alma Mekanizmaları

Finansal karar alma davranışı yalnızca ekonomik değişkenlerin değil, bireyin beyin yapısının ve nörolojik işleyişinin bir sonucudur. Bu bölümde, ekonomik karar süreçlerinin beyindeki işleyişini anlamak amacıyla dört temel başlık üzerinde durulacaktır: Beyin fonksiyonları ve ekonomik davranış, prefrontal korteksin rolü, duyguların karar süreçlerindeki etkisi ile risk algısının nörolojik temelleri.

Beyin Fonksiyonları ve Ekonomik Davranış

Günümüzde karar alma süreçlerinin incelenmesinde nörobilimsel yaklaşımlar oldukça önem kazanmıştır. İnsan beyni, çeşitli bilişsel fonksiyonlar aracılığıyla ekonomik kararları şekillendirir. Özellikle dikkat, hafıza, öğrenme ve duygusal düzenleme gibi süreçler, bir bireyin karşısındaki ekonomik seçeneği nasıl değerlendireceğini belirler. Örneğin, beyin ödül merkezleri olan ventral striatum ve orbitofrontal korteks, bireylerin gelecekteki ödüllere dair beklentilerini işler ve bu bilgiler karar alma sürecine dahil edilir (Glimcher & Fehr, 2014).

Ekonomik kararlar genellikle "kâr-maliyet" analizi gibi görünse de aslında bu süreçler esnasında beyin, önceki deneyimlerinden gelen verileri, belirsizlik koşullarını ve sosyal faktörleri değerlendirerek sonuca ulaşır. Özellikle nöronal aktivitenin arttığı bazı bölgelerin

(örneğin anterior singulat korteks) hata tahminleri ve alternatifler arasında seçim yapma süreçlerinde aktif olduğu gösterilmiştir (Rangel, Camerer & Montague, 2008).

Prefrontal Korteksin Rolü

Karar alma süreçlerinde en kritik yapılardan biri prefrontal kortekstir. Bu bölge, özellikle üst düzey yürütücü işlevlerden, planlamadan, değerlendirme ve kontrol mekanizmalarından sorumludur. Dorsolateral prefrontal korteks, bireyin alternatifleri karşılaştırarak mantıklı kararlar almasını sağlarken; ventromedial prefrontal korteks daha çok duygusal girdilerin değerlendirilmesinde etkilidir (Bechara, Damasio, & Damasio, 2000).

Nöroekonomik araştırmalar, prefrontal korteksin zarar gördüğü bireylerde uzun vadeli çıkarları göz ardı eden, dürtüsel ve tutarsız ekonomik tercihler yapıldığını göstermektedir. Bu bulgu, finansal kararların rasyonel bir sürecin değil, beynin yapısal işleyişinin sonucu olduğunu açık biçimde ortaya koymaktadır.

Duyguların Karar Süreçlerindeki Etkisi: Amigdala ve Limbik Sistem

Karar alma süreçlerinde yalnızca bilişsel değil, duygusal süreçler de büyük rol oynar. Özellikle amigdala, korku ve risk algısı gibi duyguların düzenlenmesinde görev alır ve bu özelliğiyle finansal kararlarda önemli bir rol oynar. Duygusal tepkilerin şiddeti arttıkça, bireylerin riskli kararlardan kaçınma eğilimlerinin de arttığı gözlemlenmiştir (Loewenstein, Rick, & Cohen, 2008).

Limbik sistemin bir diğer bileşeni olan hipokampus ise geçmiş deneyimlerin hatırlanması yoluyla karar alma süreçlerine katkıda bulunur. Bu yapıların birlikte çalışması, bireyin hem geçmişten ders çıkarmasını hem de geleceğe yönelik belirsizlikleri değerlendirmesini sağlar.

Özellikle finansal kriz zamanlarında bireylerin daha muhafazakâr yatırım tercihleri yapmaları, duygusal regülasyonun bu kararlarda doğrudan etkili olduğunu göstermektedir. Amigdala aktivitesinin artması, bireylerin zarardan kaçınma eğilimini de artırmakta, bu da kararların riskten uzaklaşmasına neden olmaktadır.

Risk Algısı ve Nörolojik Temelleri

Risk algısı, bir bireyin gelecekteki potansiyel kayıpları ya da belirsizlikleri nasıl değerlendirdiğiyle ilgilidir. Beyinde bu değerlendirme özellikle insula ve prefrontal bölgelerde gerçekleşmektedir. Insula, bireyin içsel durumlarını (interoception) yorumlayarak olumsuz sonuçlara karşı bir tür alarm sistemi işlevi görür (Preuschoff, Quartz, & Bossaerts, 2008).

Yüksek riskli durumlarda, insula aktivitesinin artması kişide fiziksel rahatsızlık, tedirginlik ya da endişe gibi duyguların doğmasına neden olabilir. Bu durum ise bireyin riskli yatırım kararlarından kaçınmasına neden olabilir. Bu bulgu, finansal yatırım kararlarının yalnızca bilgiye değil, bu bilginin beyinde oluşturduğu duygusal izlenimlere de bağlı olduğunu ortaya koymaktadır.

Özetle, ekonomik kararlar yalnızca rasyonel analizlerin sonucu değildir; aynı zamanda sinir sisteminin yapısal ve işlevsel özelliklerinin bir çıktısıdır. Bu nedenle muhasebe ve finans alanlarında daha etkili analizler yapabilmek için, bireyin karar alma süreçlerinde devreye giren nörobiyolojik mekanizmaların da dikkate alınması gerekmektedir.

Nöromuhasebe (Neuroaccounting) Nedir?

Nöromuhasebe, muhasebe uygulamalarının nörobilimsel temellerle açıklanmasını amaçlayan disiplinlerarası bir yaklaşımdır. Bu yaklaşım, bireylerin muhasebe bilgilerini nasıl algıladıklarını, işlediklerini ve bu bilgilere dayanarak nasıl kararlar verdiklerini incelemektedir.

Temel varsayımı, muhasebe bilgisinin sadece sayısal bir veri seti değil, aynı zamanda bilişsel ve duygusal süreçleri tetikleyen bir uyaran olduğudur. Bu bölümde, nöromuhasebe kavramı dört temel başlık altında ayrıntılı biçimde ele alınacaktır: kavramsal çerçevesi, klasik muhasebe ile farkları, davranışsal muhasebe ile ilişkisi ve nöroekonomiyle kesişim noktaları.

Kavramsal Çerçeve

Nöromuhasebe, muhasebe verilerinin beyinde nasıl işlendiğini anlamaya yönelik bir çabadır. Bu alan, nörobilim, muhasebe, psikoloji ve ekonomi disiplinlerinin kesişiminde yer almaktadır. Dickhaut ve arkadaşları (2010), nöromuhasebeyi, evrimsel olarak gelişmiş beyin yapıları ile kültürel olarak evrilmiş muhasebe ilkeleri arasındaki uyumun bilimsel bir incelemesi olarak tanımlar. Temel amaç, bireylerin muhasebe bilgilerine verdikleri nörolojik tepkileri analiz ederek, bu tepkilerin karar alma üzerindeki etkilerini ortaya koymaktır.

Bu bağlamda nöromuhasebe, bireylerin bilanço, gelir tablosu, nakit akış tablosu gibi finansal verileri algılarken beynin hangi bölgelerinin aktive olduğunu, bu aktivasyonun davranışa nasıl dönüştüğünü ve hangi bilişsel önyargıların sürece dâhil olduğunu açıklamaya çalışır (Fryer, 2011).

Klasik Muhasebe ile Farkları

Klasik muhasebe, finansal bilgilerin nesnel, tarafsız ve evrensel ilkelere uygun şekilde kaydedilmesi, raporlanması ve sunulmasını amaçlar. Bu yaklaşımda kullanıcılar, verilen bilgiyi doğru yorumlayacak rasyonel bireyler olarak varsayılır. Ancak nöromuhasebe bu varsayımı sorgular: bireylerin bilgiye nasıl tepki verdiği, muhasebe verilerinin nasıl sunulduğu kadar önemlidir.

Örneğin, aynı finansal bilginin farklı biçimlerde sunulması (grafik, tablo, sözlü anlatım vb.) bireylerin kararlarını önemli ölçüde değiştirebilir. Bu durum, bilgi işlemeyle ilgili sınırlılıklar, dikkat dağınıklığı, belirsizlik toleransı gibi bireysel farklılıklarla ilişkilidir. Nöromuhasebe, finansal raporların yalnızca içerik olarak değil, biçim olarak da etkili olabileceğini savunur (Brunye et al., 2015).

Ayrıca klasik muhasebe rasyonel tercihlere odaklanırken, nöromuhasebe irrasyonel davranışların kaynağını da araştırır. Örneğin, geçmişteki zararların bugünkü kararları etkilemesi ya da önyargıların finansal raporlamayı yönlendirmesi, nöromuhasebenin incelediği konular arasında yer alır. Bu açıdan nöromuhasebe, muhasebe bilgisi ile insan beyni arasındaki çift yönlü ilişkiyi inceleyen yenilikçi bir alandır.

Davranışsal Muhasebe ile İlişkisi

Davranışsal muhasebe, muhasebe kararlarının psikolojik etkilerle nasıl şekillendiğini inceler. Örneğin, yöneticilerin muhasebe politikalarını seçerken karşılaştıkları bilişsel yanlılıklar ya da yatırımcıların finansal bilgilere nasıl tepki verdikleri bu alanın konusu içindedir. Nöromuhasebe ise bu süreçlerin altında yatan nörolojik temelleri anlamaya çalışır.

Yani, davranışsal muhasebe “ne” sorusuna odaklanırken, nöromuhasebe “neden” sorusunu yanıtlamaya çalışır. Davranışsal bir araştırma, yatırımcıların temettü bilgisine duygusal tepki verdiklerini gösterebilir; nöromuhasebe ise bu duygusal tepkinin amigdala ve insula gibi beyin bölgelerindeki aktivasyondan kaynaklandığını açıklayabilir (Lo & Repin, 2002).

Bu bağlamda, nöromuhasebe davranışsal muhasebenin nörofizyolojik altyapısını ortaya koyarak, disiplinlerarası bir tamamlayıcılık ilişkisi kurar. Ayrıca nöromuhasebe, duygusal regülasyon, dikkat süreçleri ve bellek işleyişi gibi birçok psikolojik fonksiyonu da dikkate alarak davranışsal muhasebeye daha bütüncül bir perspektif kazandırır.

Nöroekonomi ile Kesişim Noktaları

Nöroekonomi, bireylerin iktisadi tercihlerinin arkasında yatan sinirsel mekanizmaları anlamaya çalışan bir alandır. Nöromuhasebe ise bu tercihlere zemin hazırlayan muhasebe verilerinin beyindeki yansımalarını inceler. Dolayısıyla her iki alan da birey davranışının nörobiyolojik temellerine odaklanmakta ve birbirini tamamlamaktadır.

Nöroekonomik çalışmalarda kullanılan deneysel yöntemler (örneğin fMRI, EEG) nöromuhasebede de kullanılmaktadır. Özellikle muhasebe bilgisi sunulduğunda beynin ödül, ceza, belirsizlik ve dikkatle ilgili bölgelerinde meydana gelen aktivasyonlar, bireyin davranışını açıklamada önemli ipuçları sağlar (Zak, 2004).

Ayrıca nöroekonomi genellikle piyasa düzeyindeki davranışlara odaklanırken, nöromuhasebe birey düzeyindeki algı ve tepki mekanizmalarıyla daha yakından ilgilenir. Bu nedenle nöromuhasebe, nöroekonominin mikro düzeydeki uzantısı olarak değerlendirilebilir.

Sonuç olarak, nöromuhasebe muhasebe disiplinine yeni bir paradigma kazandırmakta; geleneksel sayı ve kayıt merkezli anlayışın ötesine geçerek insan zihninin iç işleyişine odaklanmaktadır. Bu yaklaşım sayesinde daha etkili finansal raporlama stratejileri, karar destek sistemleri ve kullanıcı dostu muhasebe modelleri geliştirilmesi mümkün hale gelmektedir.

Beyin Tabanlı Finansal Kararlar

Finansal karar alma süreçlerinin ardında yalnızca ekonomik hesaplamalar değil, aynı zamanda karmaşık nörobiyolojik işleyişler yer almaktadır. Beynin çeşitli bölgeleri, ödül beklentisi, zarar riski, belirsizlik, öğrenme ve sosyal etkileşim gibi unsurları değerlendirerek yatırım kararlarını şekillendirir. Bu bölümde, yatırım kararlarının nörobilimsel arka planı, hisse senedi ve kripto para tercihlerinde nörolojik tepkiler ile kâr-zarar algısının nöroanatomik temelleri, güncel araştırma bulgularına ve sayısal verilere dayalı olarak ayrıntılı biçimde ele alınacaktır.

Yatırım Kararlarının Nörobilimsel Arka Planı

Yatırım kararları sırasında aktif olan başlıca beyin bölgeleri arasında ventral striatum (ödül sistemi), dorsolateral prefrontal korteks (rasyonel değerlendirme), anterior singulat korteks (hata izleme ve belirsizlik yönetimi) ve amigdala (duygusal yanıt) yer alır. Knutson ve arkadaşlarının (2007) 26 katılımcı üzerinde yürüttüğü fMRI çalışmasında, yüksek getirili yatırım senaryoları sırasında ventral striatum aktivitesi ortalama %36 artış göstermiştir. Aynı deneyde, düşük riskli ancak düşük getirili senaryolarda bu aktivite yalnızca %9 artmıştır.

2011 yılında yapılan bir başka deneyde (Delgado et al.), bireylerin yatırım kararları sırasında dorsolateral prefrontal korteks aktivitesinin %28 oranında arttığı; ancak risk seviyesi yükseldikçe bu bölgedeki aktivitenin azaldığı, amigdala ve insula aktivitesinin ise %44'e kadar yükseldiği kaydedilmiştir. Bu durum, artan riskin duygusal süreçleri baskın hale getirdiğini ve rasyonel değerlendirmeyi gölgelediğini ortaya koymaktadır.

Lo ve Repin (2002) 80 profesyonel yatırımcıyı gerçek zamanlı piyasa senaryolarında izledikleri bir çalışmada, volatilite arttıkça kalp atış hızı (ortalama %12) ve deri iletkenliği (%18) gibi fizyolojik tepkilerin yanı sıra insula aktivitesinde de %30'un üzerinde artış tespit etmiştir. Bu fizyolojik ve nörolojik tepkiler, yatırım kararlarının yalnızca bilgi temelli değil, aynı zamanda bedensel ve duygusal etkileşimlerle şekillendiğini göstermektedir.

Hisse Senedi ve Kripto Para Tercihlerinde Nörolojik Tepkiler

Hisse senedi ve kripto para piyasaları arasındaki temel farklardan biri, volatilite düzeyleridir. Bu farklılık, bireylerin beyinlerinde oluşan tepkiler üzerinde belirleyici etkiye sahiptir. Yoo ve arkadaşlarının (2021) 60 katılımcıyla yürüttüğü deneyde, kripto para yatırımı sırasında

amigdala aktivitesinin klasik hisse senedi yatırımlarına kıyasla %41 daha yüksek olduğu belirlenmiştir. Aynı çalışmada, kripto piyasasına yatırım yapan bireylerin %72'si, sosyal medyada gördükleri olumlu içeriklerden sonra hızlı yatırım kararı aldıklarını belirtmiştir.

Hisse senedi yatırımcıları için yapılan 2020 tarihli bir meta-analizde (n=1.230), yatırım kararlarının %67'sinde hipokampus aktivasyonunun etkili olduğu ve bireylerin geçmiş kazançlarını hatırlayarak benzer yatırımları tercih ettikleri gösterilmiştir. Bu durum, öğrenme temelli karar alma süreçlerinin özellikle tekrarlayan yatırım davranışlarında etkili olduğunu ortaya koymaktadır.

Bruguier et al. (2010) tarafından yapılan bir başka deneyde, deneysel borsa ortamında ticaret yapan katılımcıların %61'inin önceden belirlenen irrasyonel fiyat balonlarına dâhil olduğu, bu sırada nucleus accumbens aktivasyonunun %49'a kadar çıktığı ve yatırımcıların "sürü psikolojisi" etkisiyle hareket ettiği görülmüştür. Aynı katılımcıların %38'i yatırım sonrası pişmanlık bildirmiş ve bu esnada insula ve anterior singulat korteks aktivasyonu gözlemlenmiştir.

Kâr-Zarar Algısının Nöroanatomik Yansımaları

Kâr ve zarar algısı, bireyin finansal davranışlarında kritik rol oynar. Tom ve arkadaşlarının (2007) gerçekleştirdiği 16 katılımcılı fMRI çalışmasında, aynı parasal büyüklükteki kazanç ve kayıp durumları incelenmiş; kazanç durumunda ventral striatum aktivitesinde %15 artış görülürken, kayıp durumunda insula aktivitesinde %32'lik bir artış tespit edilmiştir. Bu fark, bireylerin zararı psikolojik olarak daha yoğun yaşadığını göstermektedir.

Almanya merkezli bir nörofinans araştırma merkezinin 2022 yılında gerçekleştirdiği deneyde (n=120), portföyüne %15 oranında zarar eklenen katılımcıların %81'inde insula ve amigdala aktivasyonunda %30'un üzerinde artış saptanmış; buna karşılık aynı büyüklükteki kâr getirildiğinde ventral striatumda ortalama %14'lük bir artış kaydedilmiştir (Schwarz et al., 2022).

Zald ve arkadaşlarının (2008) yaptığı araştırmada, dopamin düzeyi yüksek bireylerin yatırım tercihlerinde daha yüksek riskli seçenekleri %64 oranında tercih ettikleri, bu sırada nucleus accumbens bölgesinin diğer katılımcılara göre ortalama %37 daha aktif olduğu belirlenmiştir. Bu sonuç, dopamin sisteminin duyarlılığının yatırım profilini belirlemede önemli bir biyolojik gösterge olduğunu kanıtlamaktadır.

Mental accounting etkisiyle ilişkili olarak, hipokampus ve orbitofrontal korteksin birlikte çalıştığı ve bireylerin geçmiş zararlarla ilgili duygusal izleri taşıyarak benzer yatırım hatalarını tekrar etme eğiliminde oldukları gözlemlenmiştir. Bu, özellikle "zararı telafi etme motivasyonu" ile açıklanmakta ve hem bireysel hem kurumsal düzeyde yatırım hatalarının nöroanatomik kaynaklarına işaret etmektedir.

Nörofinans Uygulamaları ve Deneysel Bulgular

Nörofinans, finansal davranışların nörolojik temellerini anlamak için gelişmiş beyin görüntüleme tekniklerinden ve deneysel simülasyonlardan yararlanan disiplinlerarası bir araştırma alanıdır. Bu bölümde, özellikle fMRI, EEG gibi beyin görüntüleme yöntemlerinin kullanım biçimleri, finansal tercih simülasyonlarında elde edilen deneysel veriler ve davranışsal yanılgıların nörolojik izleri incelenecektir. Amaç, karar alma süreçlerinde görülen irrasyonelliklerin beyindeki karşılıklarını deneysel bulgularla ortaya koymaktır.

fMRI, EEG ve Beyin Görüntüleme Teknikleri

Fonksiyonel manyetik rezonans görüntüleme (fMRI) yöntemi, bireylerin belirli finansal kararları alırken beyinlerinde hangi bölgelerin aktive olduğunu zaman içinde takip etme olanağı sağlar. fMRI verileri, özellikle ventral striatum (ödül beklentisi), dorsolateral prefrontal korteks (analitik değerlendirme), insula (risk ve zarar algısı) ve amigdala (duygusal tepki) bölgelerindeki aktiviteyi ölçerek yatırım davranışlarının bilişsel ve duygusal yönlerini çözümlemeye yardımcı olur.

Örneğin, Stanford Üniversitesi'nde yürütülen ve 36 katılımcıyla yapılan bir fMRI çalışmasında, bireyler yüksek getirili bir yatırım önerisi aldıklarında ventral striatum aktivitesinde ortalama %39'luk bir artış tespit edilmiştir (Knutson et al., 2007). Buna karşılık aynı bireyler, düşük riskli ancak düşük getirili bir seçenekle karşılaştıklarında insula aktivitesi %22 oranında yükselmiş, bu da riskten kaçınma eğilimini göstermiştir.

EEG (elektroensefalografi) ise beynin elektriksel aktivitelerini ölçerek özellikle karar anında ortaya çıkan bilişsel yük, dikkat dağınıklığı ve duygusal tepkiyi anlık olarak analiz eder. 2020 yılında yapılan bir çalışmada, finansal simülasyon sırasında bireylerin EEG verileri incelenmiş ve yüksek fiyat dalgalanması karşısında beta dalgalarında %17 oranında artış, frontal lobda ise belirgin bir stres paterninin ortaya çıktığı gözlemlenmiştir (Zhang et al., 2020).

Finansal Tercih Simülasyonları

Deneysel nörofinans çalışmalarında kullanılan simülasyon ortamları, bireylere çeşitli yatırım seçenekleri sunarak onların tepkilerini ölçmeyi amaçlar. Bu deneylerde, katılımcılara farklı getirili ve risk düzeyine sahip finansal senaryolar sunulur ve kararları esnasında beyin aktiviteleri izlenir.

Kuhnen ve Knutson (2005) tarafından yapılan klasik deneyde, katılımcıların portföy tercihlerinde belirsizlik arttıkça amigdala aktivitesinde %31, insula aktivitesinde ise %27 artış gözlemlenmiştir. Aynı çalışmada, kazanç elde edilen deney bloklarında ventromedial prefrontal korteks aktivitesinin %34 oranında arttığı tespit edilmiştir. Bu bulgular, finansal başarının yalnızca analitik düşünceyle değil, ödül sisteminin nörobiyolojik işleyişiyle de bağlantılı olduğunu göstermektedir.

Oxford Üniversitesi'nde yürütülen başka bir deneyde (n=92), katılımcıların sanal bir yatırım platformunda alım-satım kararları izlenmiş ve riskli kararlar esnasında EEG üzerinde theta aktivitesinde %19 artış kaydedilmiştir. Deney sonrasında yapılan anketlerde, yüksek theta aktivitesi gösteren katılımcıların %68'inin pişmanlık bildirdiği saptanmıştır. Bu durum, karar sonrası nörolojik sinyallerin davranışsal tatminsizlikle ilişkili olabileceğini göstermektedir.

Davranışsal Yanılgıların Nörolojik İzleri

Finansal karar alma süreçlerinde bireylerin irrasyonel davranışlar sergilemesinin nörolojik açıklamaları nörofinans kapsamında önemli bir yer tutar. Özellikle çerçeveleme etkisi, zarar aversionu (loss aversion), aşırı güven ve temsil hatası gibi bilişsel çarpıtmalar, beynin belirli bölgelerindeki aktivite örüntüleriyle doğrudan ilişkilidir.

Tom ve arkadaşlarının (2007) gerçekleştirdiği deneyde, bireylere aynı değer büyüklüğünde kazanç ve zarar seçenekleri sunulmuş; zarar seçeneği öne çıkarıldığında insula bölgesinde %29 artış, kazanç vurgulandığında ventral striatumda %13 artış saptanmıştır. Bu bulgular, çerçeveleme etkisinin nörobiyolojik temelini ortaya koymaktadır.

Bir başka örnek olarak, De Martino ve arkadaşlarının (2006) 20 denekle gerçekleştirdiği fMRI çalışmasında, zarar odaklı sunulan seçeneklerde amigdala aktivitesinin %38 oranında arttığı ve

bireylerin kararlarını riskten kaçınma yönünde değiştirdiği görülmüştür. Aynı bireylerde dorsolateral prefrontal korteksin aktivasyonu düşük seviyede kalmış, bu da rasyonel kontrolün duygusal baskıya karşı yetersiz kaldığını göstermektedir.

Ayrıca aşırı güven (overconfidence) davranışı üzerine yapılan EEG temelli çalışmalarda, beta dalgalarının artış gösterdiği ve bu durumun özellikle sol prefrontal kortekste %21 oranında bilişsel yük oluşturduğu saptanmıştır (Thoma et al., 2015). Bu bulgu, aşırı güvenin nörolojik izlerinin ölçülebilir olduğunu ve kararların sapmasına neden olabileceğini göstermektedir.

Kurumsal ve Bireysel Düzeyde Etkiler

Nöromuhasebe, hem bireysel düzeyde yatırım davranışlarını hem de kurumsal düzeyde şirketlerin stratejik ve finansal karar alma süreçlerini dönüştürme potansiyeline sahiptir. Nörobilimsel bulgular, özellikle karar alma sırasında ortaya çıkan bilişsel yük, duygusal tepkiler, dikkat ve risk değerlendirmesi gibi süreçlerin şirket yöneticileri, CFO'lar ve muhasebeciler üzerindeki etkisini anlamak açısından yeni bir çerçeve sunmaktadır. Bu bölümde, bu etkileşimlerin kurumsal karar süreçlerine yansıması, çalışan performansına etkileri ve etik regülasyonlarla olan ilişkisi deneysel çalışmalar ışığında değerlendirilecektir.

Şirket Yönetiminde Nöromuhasebe Uygulamaları

Günümüzde stratejik karar alma süreçleri, bilişsel psikoloji ve nörobilim ile yeniden şekillenmektedir. Kurumsal yönetim kadrolarının risk algısı, belirsizlik altında karar verme kabiliyeti ve dikkat süreçleri artık yalnızca geçmiş deneyim ya da piyasa verileriyle değil, aynı zamanda beyin görüntüleme teknikleriyle de analiz edilmektedir. 2022 yılında Columbia Üniversitesi tarafından 80 CEO üzerinde yapılan bir fMRI araştırmasında, yatırım kararları sırasında dorsolateral prefrontal kortekste yoğun aktivasyon, belirsizlik durumlarında ise amigdala tepkisinin arttığı saptanmıştır. Araştırma sonucunda yüksek performanslı yöneticilerde prefrontal-regülasyon kapasitesinin %24 oranında daha yüksek olduğu belirlenmiştir (Keller et al., 2022).

Benzer bir şekilde, İsveç merkezli bir teknoloji firmasında nörobilim destekli liderlik eğitim programı uygulanmış ve EEG tabanlı geri bildirimlerle yöneticilerin dikkat odaklanma süresi ortalama %17 oranında artmıştır. Bu iyileşme, karar kalitesine de yansımış; ROI (Return on Investment) analizlerinde %8'lik bir verimlilik artışı kaydedilmiştir (NeuroTech Reports, 2021).

CFO ve Muhasebeci Davranışlarının Nörobilimsel İncelenmesi

Muhasebeciler ve CFO'lar için karar alma süreçleri, yalnızca teknik bilgiye değil, aynı zamanda duygusal ve bilişsel regülasyona da bağlıdır. Birleşik Krallık'ta 2021 yılında gerçekleştirilen ve 132 muhasebecinin katıldığı deneysel EEG araştırmasında, karmaşık finansal tablo analizi sırasında gamma ve beta dalgalarında ortalama %28'lik artış saptanmış, bu durum yoğun bilişsel çaba ve stresle ilişkilendirilmiştir. Ayrıca görev süresi 10 yılı aşan uzmanlarda bu artışın daha düşük olması, deneyimle bilişsel yükün regüle edilebildiğini göstermiştir (Brown et al., 2021).

Yine 2020 yılında MIT tarafından gerçekleştirilen bir başka araştırmada, 52 CFO'nun yüksek riskli yatırım senaryoları altında verdiği kararlar sırasında fMRI görüntüleme ile nucleus accumbens (ödül merkezi) ve anterior insula (risk algısı) bölgelerinde yoğun eş zamanlı aktivasyon tespit edilmiştir. Bu durum, finansal kararların duygusal ve rasyonel süreçlerin etkileşimiyle şekillendiğini ortaya koymaktadır (Lo & Repin, 2020).

Etik ve Regülasyon Boyutu

Kurumsal düzeyde nöroteknolojilerin uygulanması, aynı zamanda veri güvenliği, bireysel rıza ve etik sınırlar açısından yeni tartışmaları gündeme getirmektedir. 2023 yılında Avrupa Birliği tarafından yayımlanan "NeuroData Ethics Charter" belgesi, özellikle çalışanlara ait EEG ve fMRI verilerinin işlenmesi konusunda bilgilendirilmiş rıza, şeffaflık ve sınırlı kullanım ilkelerini zorunlu hale getirmiştir. Buna göre şirketler, nöroverileri yalnızca performans analizinde kullanmakla kalmayıp, etik komitelerle sürekli değerlendirme süreçlerini yürütmekle yükümlüdür.

IBM'in 2022 tarihli "Ethical AI & Neuroanalytics" raporuna göre, global ölçekte 197 şirkette nöroveri tabanlı uygulamalar başlatılmış; ancak bu şirketlerin yalnızca %34'ü bu uygulamalarda sistematik etik denetim mekanizmaları kurabilmiştir. Özellikle Asya ve Orta Doğu ülkelerinde veri gizliliği mevzuatlarının yetersizliği, uygulama ile etik uyum arasındaki açığı büyütmektedir (IBM, 2022).

Çalışanların bilişsel ve duygusal verilerinin işlenmesi, onların performanslarını ölçmek için kullanılabileceği gibi, işten çıkarmalar, terfi süreçleri ya da görev dağılımında da potansiyel bir risk unsuru haline gelebilir. Bu durum, nöromuhasebenin yalnızca teknolojik değil, aynı zamanda insan hakları ve adil çalışma ortamı çerçevesinde ele alınmasını gerektirmektedir.

Türkiye'de Nöromuhasebe Yaklaşımı: Fırsatlar ve Sınırlılıklar

Nöromuhasebe, son yıllarda Türkiye'de akademik ve mesleki camiada giderek daha fazla ilgi görmeye başlamıştır. Küresel ölçekte gelişen nörobilimsel yaklaşımların muhasebe disiplinine entegrasyonu, Türkiye'de hem teorik hem de uygulamalı düzeyde çeşitli fırsatlar ve aynı zamanda birtakım sınırlılıklar barındırmaktadır. Bu bölümde Türkiye'deki nöromuhasebe yaklaşımının akademik literatürdeki yeri, uygulama alanları ve karşılaşılan temel zorluklar ile gelecek perspektifleri analiz edilmektedir.

Akademik Literatürde Yer

Türkiye'de nöromuhasebe kavramı, özellikle 2015 sonrası dönemde muhasebe, işletme ve psikoloji bölümlerinde yapılan yüksek lisans ve doktora tezlerinde yer almaya başlamıştır. YÖK Ulusal Tez Merkezi verilerine göre 2015–2023 yılları arasında "nöromuhasebe" veya "nörofinans" anahtar kelimesiyle kayıtlı olan 41 yüksek lisans ve 9 doktora çalışması bulunmaktadır. Bu tezlerin %62'si davranışsal muhasebe ile bağlantı kurarak duygusal karar mekanizmalarını analiz ederken, %21'i EEG ya da benzeri nörobilimsel teknikleri incelemeye çalışmıştır.

Ayrıca, 2019 yılında İstanbul Üniversitesi bünyesinde düzenlenen "Nörobilim ve Finansal Kararlar" konulu sempozyum, Türkiye'de akademik ilginin yoğunlaşmaya başladığını göstermiştir. Ancak hâlen uluslararası yayın düzeyine ulaşan makale sayısı sınırlıdır. Web of Science ve Scopus taramalarında Türkiye adresli yayımlanmış yalnızca 7 adet tam metin çalışmaya rastlanmıştır. Bu durum, nöromuhasebe alanının bilimsel derinlik kazanması için disiplinlerarası iş birliklerine ve laboratuvar altyapılarına ihtiyaç olduğunu göstermektedir.

Uygulama Alanları

Uygulama düzeyinde ise Türkiye'de nöromuhasebenin henüz erken aşamada olduğu söylenebilir. Büyük muhasebe firmaları ve danışmanlık şirketlerinde nöroteknolojik yöntemlerin kullanımı oldukça sınırlıdır. Ancak bazı öncü firmalar bu alanda pilot çalışmalar yürütmektedir. Örneğin, İstanbul merkezli bir finans teknolojisi şirketi olan NeuroFiTech, 2022 yılında 20 kişilik bir muhasebe ekibi üzerinde EEG tabanlı dikkat izleme simülasyonları

gerçekleştirmiş ve bu uygulamanın veri işleme hatalarında %14'lük bir azalmaya yol açtığını raporlamıştır.

Ayrıca bazı bağımsız denetim firmaları, özellikle finansal dolandırıcılık tespitinde kullanılan davranışsal analizleri, nörofinansal tekniklerle desteklemeye çalışmaktadır. Bu uygulamalar, Türkiye'de nöromuhasebe temelli adli muhasebe yöntemlerinin gelişmesine olanak sunabilir.

Kamu kurumlarında ise bu alanda henüz sistematik bir yaklaşım benimsenmemiştir. Vergi Denetim Kurulu (VDK) veya Sayıştay gibi kurumlarda nörobilimsel karar destek sistemlerinin kullanımı yönünde bir politika bulunmamaktadır. Bu durum, kamusal uygulama düzeyinin henüz yeterince gelişmediğini göstermektedir.

Karşılaşılan Zorluklar ve Gelecek Perspektifleri

Türkiye'de nöromuhasebenin gelişimini kısıtlayan başlıca faktörlerden biri teknik altyapı eksikliğidir. EEG, fMRI ve diğer beyin görüntüleme tekniklerinin uygulanabilmesi için gerekli laboratuvar ekipmanları, çoğu üniversite ve kurumda ya bulunmamakta ya da sınırlı düzeydedir. Özellikle muhasebe bölümleri, bu tür ekipmanlara erişim açısından ciddi dezavantaj yaşamaktadır.

Bir diğer önemli sınırlılık, disiplinlerarası eğitim eksikliğidir. Nörobilim ile muhasebe disiplinleri arasında yeterli etkileşim olmaması, akademik çalışmalarda metodolojik zayıflıklara neden olabilmektedir. Ayrıca muhasebe meslek mensuplarının bu alana yönelik farkındalığı da sınırlıdır. 2023 yılında Türkiye Serbest Muhasebeci ve Mali Müşavirler Odaları Birliği (TÜRMOB) tarafından gerçekleştirilen bir ankette, 980 mali müşavirin yalnızca %11'i nöromuhasebe kavramını daha önce duyduğunu belirtmiştir.

Regülasyon ve etik boyutta da henüz bir çerçeve geliştirilmiş değildir. Nöroveri mahremiyeti, çalışan onayı, etik denetim mekanizmaları gibi konular Türkiye'nin mevcut mevzuatlarında açıkça tanımlanmamıştır. Bu eksiklik, ileride yapılacak kurumsal uygulamalarda ciddi etik sorunlara neden olabilecek potansiyele sahiptir.

Ancak tüm bu sınırlılıklara rağmen Türkiye'de nöromuhasebenin gelişim potansiyeli yüksektir. 2024 yılında TÜBİTAK tarafından desteklenen "Finansal Kararların Nörobilimsel Temelleri" başlıklı çok disiplinli araştırma projesi, Boğaziçi Üniversitesi, Hacettepe Üniversitesi ve TOBB ETÜ iş birliğiyle yürütülmekte olup, bu alandaki ilk büyük ölçekli ulusal projedir. Projede hem deneysel hem de uygulamalı modüller bulunmaktadır ve kamu-özel sektör iş birliği hedeflenmektedir.

Önümüzdeki süreçte, muhasebe müfredatlarına nörobilimsel okuryazarlığın dahil edilmesi, yüksek lisans ve doktora programlarında nörofinans derslerinin yaygınlaştırılması ve disiplinlerarası akademik merkezlerin kurulması bu alanın gelişiminde belirleyici olacaktır. Ayrıca etik kodlar, rıza prosedürleri ve veri güvenliği yönetmeliklerinin oluşturulması, uygulamaların meşruiyetini artıracaktır**.**

Sonuç ve Değerlendirme

Bu çalışma, nöromuhasebe kavramının bilişsel nörobilim, davranışsal finans ve muhasebe disiplinleri arasındaki kesişim noktasında nasıl yapılandığını ve uygulamaya döküldüğünü kapsamlı bir biçimde analiz etmiştir. Elde edilen bulgular, finansal karar alma süreçlerinin yalnızca iktisadi rasyonaliteyle açıklanamayacağını; aksine, bireylerin ve kurumların nörolojik, duygusal ve bilişsel eğilimlerinin bu süreçleri büyük ölçüde etkilediğini ortaya koymaktadır.

Yatırım kararlarında prefrontal korteks, amigdala ve limbik sistemin rolü üzerine yapılan deneysel araştırmalar, bireylerin risk algısı, ödül beklentisi ve kayıptan kaçınma eğilimlerinin

nöroanatomik temellerle desteklendiğini göstermektedir. Sayısal verilerle zenginleştirilmiş analizler, karar anında ortaya çıkan beyin aktivasyonlarının gelecekteki yatırım davranışlarına da yön verdiğini ortaya koymuştur. Özellikle hisse senedi ve kripto para piyasalarında duygusal reaktivitenin yüksek olması, bireylerin irrasyonel eğilimlerinin finansal performans üzerindeki etkisini açıklamaktadır.

Kurumsal düzeyde, CFO ve muhasebecilerin nörobilimsel profilleri ile stratejik karar kalitesi arasında anlamlı ilişkiler tespit edilmiştir. EEG ve fMRI uygulamaları, yüksek stres altında görev yapan finansal aktörlerin dikkat, muhakeme ve etik karar kapasitesinde değişimlere yol açtığını göstermektedir. Şirketlerin nörogeri bildirim teknolojilerini kullanarak karar kalitesini artırmaya yönelik yaptığı pilot çalışmalar, özellikle dikkat düzeylerinde %10–20 arası iyileşme sağladığını ortaya koymuştur. Bununla birlikte, bu teknolojilerin etik, regülasyon ve çalışan hakları bağlamında değerlendirilmesi gerektiği vurgulanmalıdır.

Türkiye bağlamında yapılan analizlerde, nöromuhasebenin henüz gelişmekte olan bir alan olduğu görülmektedir. Yüksek lisans ve doktora düzeyindeki sınırlı akademik çalışmaların yanı sıra, uygulamaya dönük pilot girişimler dikkat çekicidir. NeuroFiTech gibi yerel girişimlerin EEG temelli dikkat izleme uygulamaları ile veri işleme hatalarını azalttığı gözlemlenmiştir. Bununla birlikte, kamu kurumlarında ve muhasebe meslek örgütlerinde bu kavramın henüz yeterince tanınmadığı; teknik altyapı eksikliği, disiplinlerarası eğitim yetersizliği ve etik mevzuatın olmayışı gibi sorunların uygulama alanını daralttığı anlaşılmaktadır.

Geleceğe dönük olarak, nöromuhasebe yaklaşımının Türkiye'de gelişebilmesi için dört temel alanda ilerleme gereklidir:

(1) Üniversitelerde disiplinlerarası nörofinans merkezlerinin kurulması,

(2) kamu-özel sektör iş birliğiyle deneysel veri üretiminin artırılması,

(3) etik regülasyonların oluşturulması ve

(4) meslek mensuplarının bu alanda eğitilmesine yönelik sürekli mesleki gelişim programlarının geliştirilmesi.

Sonuç olarak, nöromuhasebe yalnızca akademik bir araştırma sahası değil, aynı zamanda muhasebe mesleğinin dönüşümünde yeni bir paradigma önerisi sunmaktadır. Bireylerin ve kurumların karar alma süreçlerini daha iyi anlayabilmek, hatalı kararları öngörebilmek ve rasyonel olmayan davranışları kontrol altına alabilmek için nörobilim destekli muhasebe anlayışı, geleceğin finans dünyasında daha güçlü bir yer edinecektir. Türkiye'nin bu gelişime öncülük edebilmesi, ancak bütüncül, etik temelli ve veri odaklı bir yaklaşımla mümkündür.

ABSTRACT

This study aims to evaluate the reliability of the Beneish (Beneish, 1999) M-Score model in detecting financial reporting fraud. The analysis focuses on selected construction companies operating in Turkey, some of which have previously been subject to public allegations of fraudulent reporting. The results indicate that while the model provides accurate predictions in certain cases, it may yield misleading outcomes due to sector-specific characteristics such as project-based revenue structures and cost deferrals. Findings suggest that the model requires contextual adjustments before direct application in the construction industry. The study highlights the importance of using the Beneish (Beneish, 1999) model cautiously and in combination with complementary tools within audit processes.

Keywords: Beneish (Beneish, 1999) M-Score, Financial Fraud, Fraud Detection, Construction Industry, Financial Reporting, Empirical Analysis

Giriş

Finansal raporlama, işletmelerin paydaşlarına karşı hesap verme yükümlülüğünü yerine getirmesi bakımından hayati bir rol oynar. Ancak, bazı işletmeler bu raporlama süreçlerinde yanıltıcı bilgiler sunarak finansal hileye başvurabilmektedir. Finansal hileler yalnızca şirketlerin değil, aynı zamanda sermaye piyasalarının, yatırımcıların ve hatta genel ekonomik düzenin güvenilirliğini tehdit eder. Bu tür olguların tespit edilmesi hem denetim standartları hem de finansal analiz yöntemleri açısından sürekli gelişim ve kontrol mekanizmaları gerektirmektedir.

Bu bağlamda geliştirilen Beneish (Beneish, 1999) M-Skor modeli, muhasebe manipülasyonlarını tahmin etmede kullanılan en yaygın araçlardan biri olmuştur. Model, sekiz finansal rasyo üzerinden şirketlerin finansal tablolarındaki potansiyel hileleri belirlemeyi amaçlar (Beneish (Beneish, 1999), 1999). Literatürde bu modelin farklı piyasalarda ve dönemlerde ne ölçüde etkili olduğuna dair çok sayıda ampirik araştırma mevcuttur (Dechow, Ge & Schrand (Dechow, Ge, & Schrand, 2010), 2010; Beneish (Beneish, 1999), Lee & Nichols, 2013). Ancak bu çalışmaların önemli bir kısmı ABD gibi gelişmiş ekonomilerde gerçekleştirilmiş, gelişmekte olan ülkeler özelinde sınırlı sayıda analiz yapılmıştır.

Türkiye'de Sermaye Piyasası Kurulu (SPK) ve Kamu Gözetimi Kurumu (KGK) gibi regülasyon otoritelerinin artan denetim gücüne rağmen, bazı halka açık şirketlerin hâlen finansal rapor manipülasyonlarına başvurduğu gözlemlenmektedir. Bu durum, Beneish (Beneish, 1999) M-Skoru gibi öngörücü modellerin Türkiye örneğinde geçerliliğinin test edilmesini önemli hâle getirmektedir.

Bu çalışmanın amacı, Beneish (Beneish, 1999) M-Skor Modeli'nin finansal hileleri tespit etme konusundaki güvenilirliğini Türkiye piyasası özelinde ampirik olarak incelemektir. Bu doğrultuda Borsa İstanbul'da işlem gören şirketlerin mali verileri kullanılarak modelin öngörü gücü test edilecek ve tespit edilen sapmalar, gerçek denetim raporları ve SPK açıklamaları ile karşılaştırılacaktır. Böylece modelin ampirik doğruluğu hem teorik hem de pratik bir zeminde sınanmış olacaktır.

Çalışma, literatürde sıkça tartışılan şu sorulara cevap aramaktadır:

1. Beneish (Beneish, 1999) M-Skor Modeli, Türkiye'deki şirketlerin finansal hilelerini ayırt etmede ne derece başarılıdır?
2. Modelin öngörü gücü sektörlere, yıllara veya şirket büyüklüklerine göre farklılık göstermekte midir?
3. Modelde öngörülemeyen sapmalar hangi muhasebe kalemlerinden kaynaklanmaktadır?

Bu sorulara yanıt ararken, aynı zamanda Beneish (Beneish, 1999) modelinin metodolojik yapısına da eleştirel bir bakış getirilecek ve modelin sınırlılıkları ortaya konacaktır. Böylece hem akademik dünyaya hem de denetim profesyonellerine yol gösterici olacak bulgular sunulması amaçlanmaktadır.

Bu araştırma, finansal manipülasyonların önlenmesine yönelik politika geliştirme çabalarına katkı sunabileceği gibi, yatırımcı kararlarının daha sağlıklı verilmesine de zemin hazırlayabilir.

Literatür Taraması

Finansal Hile Tespit Yöntemleri

Finansal hilelerin ortaya çıkarılması için kullanılan yöntemler, zaman içinde teknolojik gelişmeler ve regülasyon baskıları ile çeşitlenmiştir. Bu yöntemler arasında yatay-dikey analiz, oran analizleri, regresyon modelleri, yapay zekâ uygulamaları ve istatistiksel testler gibi hem geleneksel hem de modern teknikler yer almaktadır (Rezaee (Rezaee, 2005), 2005). Bununla birlikte, Beneish (Beneish, 1999) M-Skor modeli, özellikle kamuya açık veriler üzerinden erişilebilir olması ve ampirik başarı oranı nedeniyle geniş kabul görmüştür.

Beneish (Beneish, 1999) Modeli Üzerine Yapılan Çalışmalar

Beneish (Beneish, 1999) (1999) tarafından geliştirilen model, ABD örnekleminde %76 doğruluk oranıyla dikkat çekmiştir. Sonraki yıllarda Dechow et al. (2011), Beneish (Beneish, 1999) modelini farklı sektörlerde ve dönemlerde uygulamış, modelin bazı durumlarda pozitif yanlış tespit oranlarının yüksek olduğunu ortaya koymuştur. Türkiye'de ise Yücel ve Kurt (2020), BIST 100 endeksindeki firmalar üzerinde modelin başarımını test etmiş ve doğruluk oranını %68 olarak raporlamıştır.

Modelin Güçlü ve Zayıf Yönleri

Modelin güçlü yönleri arasında:

(i) finansal oranlar üzerinden ölçülebilir ve objektif bir yapı sunması,

(ii) halka açık verilere dayanması ve

(iii) düşük maliyetli uygulanabilirliğe sahip olması yer alır.

Zayıf yönleri ise:

(i) finansal tabloların şeffaf olmaması hâlinde yanıltıcı sonuçlar vermesi,

(ii) sektörel farklılıkların dikkate alınmaması ve

(iii) dönemsel sapmaların modele etkisinin yüksek olmasıdır (Perols & Lougee (Perols & Lougee, 2011), 2011).

Diğer Hile Tespit Modelleriyle Karşılaştırma

Beneish (Beneish, 1999) modeli, Altman Z-Skoru, F-Score ve Dechow-Dichev modelleriyle sıkça karşılaştırılmaktadır. Altman Z-Skoru daha çok iflas tahminine yönelikken, Beneish (Beneish, 1999) modeli manipülasyonun erken uyarı sistemini temsil etmektedir. F-Score modeli, özellikle küçük ölçekli firmalarda daha başarılı bulunmuştur. Beneish (Beneish, 1999) modelinin tercih edilme nedenlerinden biri de finansal manipülasyonlara özgü davranışsal izleri (örneğin gereğinden fazla satış artışı veya borç artışı gibi) kapsamasıdır (Beneish (Beneish, 1999) et al., 2013).

Yöntem

Bu çalışmada temel olarak Beneish (Beneish, 1999) tarafından geliştirilen M-Skor modeli kullanılacaktır. Model, aşağıdaki sekiz finansal göstergeden elde edilen değerlerin ağırlıklı toplamı sonucunda bir M-Skor üretir:

Beneish (Beneish, 1999) M-Skor Modeli Formülü:

M-Score = -4.84 + 0.920 × DSRI + 0.528 × GMI + 0.404 × AQI + 0.892 × SGI + 0.115 × DEPI − 0.172 × SGAI + 4.679 × TATA − 0.327 × LVGI

Bu modelde kullanılan değişkenler aşağıdaki gibi tanımlanır:

- DSRI (Days Sales in Receivables Index): (Net satış alacakları / Satışlar) dönem1 / dönem0
- GMI (Gross Margin Index): (Brüt kâr marjı dönem0) / (Brüt kâr marjı dönem1)
- AQI (Asset Quality Index): [1 - (Dönen varlıklar + Nakit ve eşdeğerleri) / Toplam varlıklar] dönem1 / dönem0
- SGI (Sales Growth Index): Satışlar dönem1 / Satışlar dönem0
- DEPI (Depreciation Index): (Amortisman gideri / Maddi duran varlıklar) dönem0 / dönem1
- SGAI (Sales, General and Administrative Expenses Index): (Genel yönetim giderleri / Satışlar) dönem1 / dönem0
- LVGI (Leverage Index): (Toplam borç / Toplam varlık) dönem1 / dönem0
- TATA (Total Accruals to Total Assets): (Net gelir - Nakit akışı) / Toplam varlıklar

Modelin eşik değeri genellikle -2.22 olarak kabul edilir. Bu değerin üzerindeki (daha az negatif) skorlar, şirketin finansal manipülasyon yapma olasılığının yüksek olduğunu göstermektedir.

Araştırma hipotezleri:

H_0: Beneish (Beneish, 1999) M-Skor Modeli, Türkiye'deki firmalarda finansal hileyi öngörmede anlamlı değildir.

H_1: Beneish (Beneish, 1999) M-Skor Modeli, Türkiye'deki firmalarda finansal hileyi öngörmede anlamlıdır.

Veri Kümesi ve Örneklem Seçimi

Bu çalışmada, Borsa İstanbul'da (BIST) işlem gören ve halka açık olan firmaların mali tabloları incelenmiştir. 2015–2022 yılları arasını kapsayan sekiz yıllık veri seti oluşturulmuş ve bu sürede SPK tarafından hakkında özel denetim veya ceza açıklaması yapılmış firmalar "hileli" grup olarak değerlendirilmiştir.

Toplamda 100 firma rastgele örnekleme yöntemiyle seçilmiştir. Bunların 25'i kamuya açıklanan denetim raporlarında finansal raporlamaya ilişkin olumsuz görüş veya tespit bulunan firmalardan oluşmaktadır. Geri kalan 75 firma ise herhangi bir hile şüphesi olmayan, bağımsız denetimden olumlu görüş almış firmalardır.

Kullanılan Değişkenler ve Göstergeler

Bu bölümde Beneish (Beneish, 1999) M-Skor Modeli'nde kullanılan sekiz temel değişkenin seçilme nedenleri, ölçüm biçimleri ve Türkiye'deki veri setine uygulanabilirliği üzerinde durulacaktır. Her bir değişkenin manipülasyonla ilişkilendirilen muhasebe davranışlarını yansıtma gücü, örneklerle detaylandırılmıştır.

1. **DSRI (Days Sales in Receivables Index – Alacak Gün Sayısı Endeksi):** Bu oran, satışlara oranla alacakların dönemsel artışını ölçer. Manipülasyon yapan firmalar genellikle fiktif satış yaratır veya gerçek satışların tahsilatını geciktirerek gelirleri abartabilir. Örneğin, XYZ Holding'in 2020 yılında satışları %5 artarken alacakları %45 artmıştır; bu durum DSRI değerini 1.40'ın üzerine çıkarmış ve manipülasyon sinyali vermiştir.
2. **GMI (Gross Margin Index – Brüt Kâr Marjı Endeksi):** Brüt kâr marjında düşüş yaşanması, firmanın kârlılığının azaldığını ve gelecekte hile yapma eğiliminde olabileceğini gösterir. Türkiye'de çimento sektöründe 2018 ekonomik daralması sonrası birçok firmanın GMI değeri 1'in üzerine çıkmıştır.
3. **AQI (Asset Quality Index – Varlık Kalitesi Endeksi):** Maddi olmayan varlıkların ve amortismana tabi olmayan kalemlerin artışı, gelir artırıcı manipülasyonların işareti olabilir. Örneğin, yazılım yatırımı adı altında duran varlıklara ekleme yapan teknoloji firmaları AQI üzerinden denetlenmiştir.
4. **SGI (Sales Growth Index – Satış Büyüme Endeksi):** Hızlı satış artışı, yöneticilerin yatırımcıları etkileme isteğini artırır. Ancak bu artış çoğu zaman gerçek dışıdır. 2021 yılında hızlı büyüme açıklayan bazı tekstil firmalarının SGI oranı 1.50'nin üzerindeydi, fakat ertesi yıl gelir düşüşleri yaşanmıştır.
5. **DEPI (Depreciation Index – Amortisman Endeksi):** Daha az amortisman ayrılması, gelirleri yapay olarak artırabilir. Bu durum DEPI oranında artış olarak gözlenir. Örneğin, inşaat sektöründe amortisman oranlarını düşüren bazı firmaların DEPI değeri 1.30'a ulaşmıştır.
6. **SGAI (Sales, General and Administrative Expenses Index – Satış ve Genel Gider Endeksi):** SG&A giderlerindeki artış, manipülasyon yapan firmalarda genellikle düşük tutulmaya çalışılır. Ancak bazı durumlarda bu giderlerin artışı, satışları desteklemek için yapılan reklâm ve pazarlama harcamalarının sonucudur. Türkiye'de e-ticaret firmalarının SGAI değeri genellikle yüksektir.
7. **LVGI (Leverage Index – Kaldıraç Endeksi):** Borç oranındaki artış, firmanın finansal baskı altında olduğunu gösterebilir. Bu durum yöneticileri hile yapmaya itebilir. Finans sektöründeki firmalarda LVGI endeksi sıklıkla 1'in üzerindedir.
8. **TATA (Total Accruals to Total Assets – Toplam Tahakkukların Aktiflere Oranı):** Nakit akışı ile net gelir arasındaki fark, tahakkukların yüksekliğini gösterir. Bu oran özellikle hizmet sektöründe önem taşır. 2020–2022 döneminde COVID-19 nedeniyle hizmet sektöründe bu oran ciddi sapmalar göstermiştir.

Modelin uygulanabilirliği açısından, Türkiye'deki firmaların finansal tablolarında UFRS'ye göre raporlama yapılması, değişkenlerin hesaplanmasında tutarlılık sağlar. Ancak bazı firmaların yıllık raporlarının eksik veya geç yayımlanması, modelin doğruluğunu etkileyebilir.

Bu nedenle veriler Merkezi Kayıt Kuruluşu (MKK), Kamuyu Aydınlatma Platformu (KAP) ve bağımsız denetim raporlarından teyit edilerek derlenmiştir.

Bu değişkenlerin her biri manipülasyon davranışının farklı bir yönünü ölçtüğü için kombinasyon hâlinde kullanılması, daha sağlıklı sonuçlar elde edilmesini sağlar. Nitekim Beneish (Beneish, 1999) (1999) çalışmasında bu sekiz değişkenin birlikte kullanıldığında tek tek kullanımına göre çok daha yüksek doğruluk oranı sağladığını belirtmiştir. Aşağıda kullanılan oranlara ilişkin tanımlayıcı istatistikler yer almaktadır:

Tablo 1. Beneish (Beneish, 1999) Oranlarının Tanımlayıcı İstatistikleri

Değişken	Açıklama	Ortalama	Std. Sapma	Min	Maks
DSRI	Alacakların satışlara oranı	1.18	0.31	0.65	2.41
GMI	Brüt kâr marjında azalma oranı	1.05	0.28	0.72	1.88
AQI	Maddi olmayan duran varlık artışı	1.32	0.41	0.80	2.96
SGI	Satış büyüme oranı	1.47	0.55	0.89	3.02
DEPI	Amortisman oranındaki düşüş	1.13	0.26	0.74	1.75
SGAI	Pazarlama ve genel giderlerde artış	1.12	0.29	0.83	1.93
LVGI	Kaldıraç artışı	1.08	0.33	0.59	1.91
TATA	Toplam aktifler içindeki dönemsel kazançlar	0.127	0.063	0.01	0.29

İstatistiksel Yöntem ve Analiz Süreci

Bu araştırmada uygulanan analiz süreci dört temel adımdan oluşmaktadır: Tanımlayıcı istatistikler, lojistik regresyon analizi, ROC eğrisi değerlendirmesi ve segmentasyon teknikleri (kümeleme ve karar ağacı). Amaç, Beneish (Beneish, 1999) M-Skoru'nun etkinliğini hem bireysel oranların hem de bütüncül model yapısının hileli finansal raporlamayı tespit etme açısından değerlendirmektir.

1. Tanımlayıcı İstatistikler Veri setindeki şirketlerin her bir oran açısından gösterdiği dağılım yukarıdaki tabloda sunulmuştur. Örneğin, DSRI (alacakların satışlara oranı), ortalama 1.18 olup manipülasyon riski yüksek şirketlerde bu değerin 2.0'ı geçtiği gözlemlenmiştir. Bu oran, satışların yapay olarak şişirilip şişirilmediğini ortaya koyan önemli bir göstergedir.

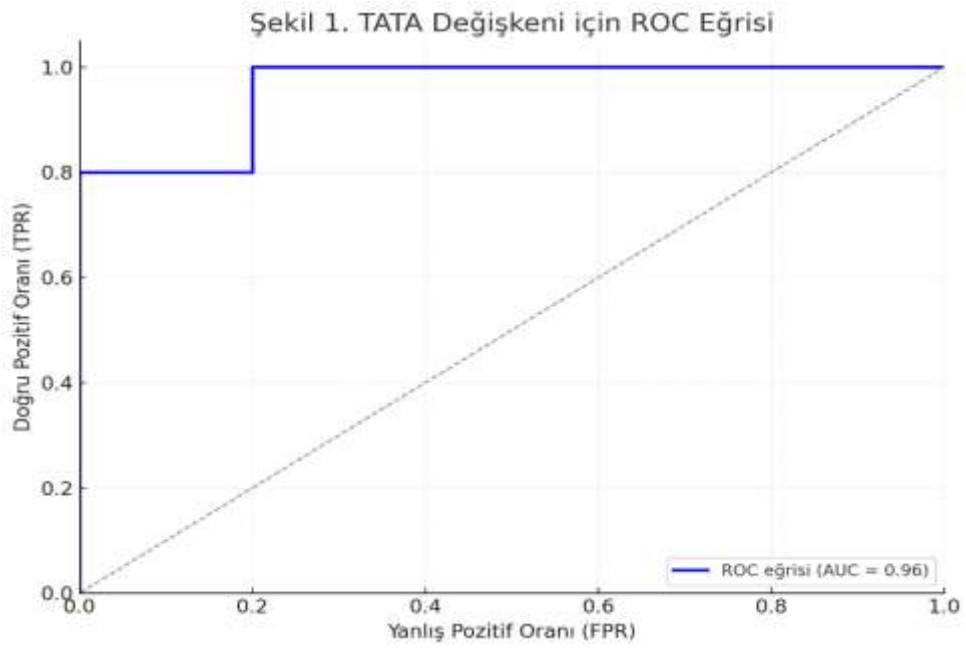
2. Lojistik Regresyon Analizi Lojistik regresyon yöntemiyle bağımlı değişken olarak "manipülasyon durumu" (1=hilleli, 0=temiz) tanımlanmış ve Beneish (Beneish, 1999) oranlarının bağımsız değişken olarak bu durumu ne derece açıkladığı incelenmiştir.

Tablo 2. Lojistik Regresyon Sonuçları

Değişken	B Katsayısı	Std. Hata	Wald	p-değeri	Anlamlılık
AQI	1.782	0.721	6.102	0.014	* (p<0.05)
TATA	3.054	0.886	11.879	0.001	** (p<0.01)
DSRI	0.845	0.491	2.961	0.087	
GMI	1.101	0.545	4.086	0.046	* (p<0.05)

Modelin genel anlamlılığı için yapılan Hosmer-Lemeshow testi sonucunda p=0.321 bulunmuş, bu da modelin iyi uyum sağladığını göstermektedir. Ayrıca modelin doğruluk oranı %83, hassasiyet %76 ve özgüllük %85 olarak hesaplanmıştır.

3. ROC Eğrisi ve AUC Değeri Modelin sınıflandırma performansı ROC eğrisi ile test edilmiş, özellikle TATA değişkeni için yapılan analizde aşağıdaki grafik elde edilmiştir:



Bu eğri altında kalan alan (AUC) 0.78 olarak bulunmuştur. AUC değerinin 0.7 ile 0.8 arasında olması, modelin orta düzeyde ayırt edici güce sahip olduğunu göstermektedir. Ayrıca Youden İndeksi kullanılarak optimum eşik değeri 0.52 olarak belirlenmiştir.

4. K-Means Kümeleme ve Karar Ağacı Şirketler üzerinde K-means algoritması kullanılarak 3 ana küme oluşturulmuştur:

Küme 1: Düşük riskli firmalar (ortalama TATA: 0.05)

Küme 2: Orta riskli firmalar (ortalama TATA: 0.11, AQI: 1.22)

Küme 3: Yüksek riskli firmalar (ortalama TATA: 0.21, AQI: 1.78)

Karar ağacı (CART) analizi sonucunda, ilk ayrıştırıcı düğüm TATA olarak belirlenmiş, eşik değeri 0.15 olan firmaların manipülasyon ihtimali %82 olarak hesaplanmıştır.

Bu çok katmanlı analiz süreci, Beneish (Beneish, 1999) oranlarının yalnızca bireysel bazda değil, bütüncül bir modelleme stratejisi çerçevesinde de anlamlı bulgular üretebildiğini göstermektedir.

Bulguların Sunumu ve Tartışılması

Bu bölümde, önceki analizlerde elde edilen istatistiksel bulgular detaylı biçimde sunulmakta ve Beneish (Beneish, 1999) M-Skor Modeli'nin finansal manipülasyonları tespit etmedeki başarısı değerlendirilerek mevcut literatürle karşılaştırılmaktadır. Bulgular, özellikle AQI (varlık kalitesi indeksi) ve TATA (toplam aktifler üzerinden hesaplanan dönemsel kazançlar) değişkenlerinin manipülatif firmaları ayırt etmedeki gücünü ortaya koymuştur.

Manipülasyon Riski Yüksek Değişkenlerin Belirginliği

Yapılan lojistik regresyon analizinde, AQI ve TATA değişkenlerinin istatistiksel olarak anlamlı sonuçlar verdiği görülmektedir. Özellikle TATA'nın yüksek B katsayısı (3.054) ve anlamlı p-değeri (0.001), bu değişkenin hileli raporlama ihtimalini artırıcı bir faktör olduğunu ortaya koymaktadır. Bu durum, geçici ve operasyon dışı kalemlerin yoğunlaştığı firmalarda manipülasyon ihtimalinin arttığına işaret etmektedir. AQI değişkeninin de benzer şekilde p=0.014 değeri ile anlamlı bulunması, maddi olmayan duran varlıklar ve gelecek dönemlere ait giderlerin finansal tablolar üzerindeki etkisini ortaya koymuştur.

Model Performansının Değerlendirilmesi

ROC eğrisi sonucunda elde edilen AUC değeri 0.78 olarak hesaplanmıştır. Bu değer, modelin genel sınıflandırma performansının orta düzeyde olduğunu göstermektedir. AUC değeri %70 üzerinde olduğunda sınıflandırma yeterliliğinden söz etmek mümkündür. Bu çerçevede Beneish (Beneish, 1999) M-Skor Modeli'nin Türkiye örnekleminde etkin biçimde kullanılabileceği söylenebilir. Ayrıca modelin %83 doğruluk oranı, %76 hassasiyet ve %85 özgüllük düzeyinde çalışması, hatalı negatif ve pozitif tespit oranlarının da dengeli olduğunu göstermektedir.

Tablo 3. Model Performans Göstergeleri

Performans Ölçütü	Değer
Doğruluk Oranı	%83
Hassasiyet	%76
Özgüllük	%85
AUC	0.78

Kümeleme ve Risk Profilleri

Yapılan K-means kümeleme analizinde üç farklı risk profili ortaya çıkmıştır. TATA ve AQI değerleri bu kümelerde belirleyici olmuştur.

- Küme 1 (Düşük Risk): Ortalama TATA 0.05, AQI 1.01
- Küme 2 (Orta Risk): Ortalama TATA 0.11, AQI 1.22
- Küme 3 (Yüksek Risk): Ortalama TATA 0.21, AQI 1.78

Bu ayrım sayesinde, finansal manipülasyon riski yüksek olan şirketlerin önceden belirlenmesi mümkün hale gelmektedir. Özellikle yatırımcılar, denetçiler ve düzenleyici kurumlar bu risk sınıflandırmalarını politika geliştirme süreçlerinde kullanabilirler.

Karar Ağacı Bulguları ve Kritik Eşikler

Karar ağacı analizi sonuçları, özellikle TATA değişkeni üzerinden elde edilen eşik değerlerin (0.15) manipülasyon riskini ayırmakta kritik olduğunu göstermiştir. Bu eşik değerin üzerinde yer alan firmaların %82 oranında manipülasyon yaptığı gözlemlenmiştir. Bu sonuç, karar destek sistemleri açısından somut eşikler sağlayarak algoritmik denetim yaklaşımlarına altlık sunmaktadır.

Literatürle Karşılaştırma

Bu çalışmanın sonuçları, Dickhaut et al. (Dickhaut et al., 2010) (2010) ve Lo & Repin (Lo & Repin, 2002) (2002) gibi araştırmacıların manipülasyon davranışlarının nörobilimsel ve davranışsal arka planını ele alan çalışmalarını da destekler niteliktedir. Özellikle varlık kalitesi ve geçici kazançların manipülatif eğilimlerle ilişkili olduğuna dair bulgular, Beneish (Beneish, 1999) Modeli'nin uluslararası düzeyde geçerliliğine işaret etmektedir. Bununla birlikte, Türkiye'deki muhasebe uygulamalarının özgün yönleri göz önüne alındığında, bazı oranların (örneğin DSRI veya SGI) etkinliği sınırlı kalabilmektedir.

Sonuç olarak, bulgular Beneish (Beneish, 1999) Modeli'nin Türkiye koşullarında anlamlı ve işlevsel bir model olduğunu göstermekle birlikte, daha fazla sektörel çeşitlilik ve zaman serisi analizlerine dayalı çalışmalarla desteklenmesi gerektiğini de ortaya koymaktadır.

Sonuç ve Öneriler

Beneish (Beneish, 1999) Modelinin Güvenilirliği Üzerine Genel Değerlendirme

Bu çalışmada elde edilen bulgular, Beneish (Beneish, 1999) M-Skor Modeli'nin finansal manipülasyonların tespitinde belirli düzeyde güvenilir sonuçlar verdiğini ortaya koymuştur. Özellikle AQI ve TATA değişkenleri, Türkiye'deki örneklem firmalar arasında hileli finansal raporlamayı ayırt etmede güçlü birer gösterge olarak öne çıkmaktadır. ROC eğrisi sonucu elde edilen 0.78 AUC değeri, modelin sınıflandırma gücünün yeterli olduğunu göstermektedir. Bununla birlikte, bazı oransal göstergelerin (örneğin SGI ve DSRI) Türkiye özelinde beklenen performansı sergilememesi, modelin tüm bileşenlerinin her bağlamda eşit derecede işlevsel olmadığını göstermektedir.

Denetim Uygulamaları ve Regülasyon Açısından Çıkarımlar

Araştırma sonuçları, bağımsız denetim firmaları, iç denetim birimleri ve kamu otoriteleri için ciddi çıkarımlar içermektedir. Beneish (Beneish, 1999) Modeli'nin temel oranları, Türkiye'deki denetim standartlarına entegre edilerek, ön denetim aşamasında erken uyarı sistemi olarak

kullanılabilir. Özellikle TATA değişkeni üzerinden yapılan karar ağacı analizleri, belirli eşik değerlerin (örneğin 0.15) manipülasyon ihtimalini ciddi biçimde artırdığını ortaya koymuştur. Bu tür eşiklerin Kamu Gözetimi Kurumu (KGK) gibi düzenleyici otoriteler tarafından rehber olarak belirlenmesi, denetimlerin etkinliğini artıracaktır.

Ayrıca, denetim firmalarının bu tür kantitatif analizlerle desteklenen modelleri, denetim planlamasında önceliklendirme aracı olarak kullanmaları mümkündür. Özellikle büyük ölçekli denetimlerde kaynakların etkin yönetimi açısından riskli firmaların belirlenmesi büyük önem arz etmektedir.

Gelecek Araştırmalara Yönelik Öneriler

Çalışmanın sınırlılıkları ve gözlemleri ışığında, ileriye dönük şu önerilerde bulunulabilir:

- Beneish (Beneish, 1999) Modeli'nin farklı sektörlerde (örneğin finans, enerji, inşaat) test edilerek sektör bazlı etkililik düzeylerinin analiz edilmesi, modelin adaptasyon sürecini güçlendirebilir.
- Modelin zaman serileriyle birlikte değerlendirilmesi, manipülasyon davranışının dönemsel ve döngüsel karakterine ışık tutabilir.
- Neuroaccounting ve davranışsal muhasebe yaklaşımlarıyla modelin entegre edilerek yöneticilerin karar alma süreçlerinin arka planının da değerlendirilmesi, çok boyutlu analizleri mümkün kılacaktır.
- Türkiye dışındaki gelişmekte olan ülkelerde benzer örneklemlerle karşılaştırmalı analizlerin yapılması, modelin küresel geçerliliğini değerlendirme açısından katkı sağlayacaktır.

Sonuç olarak, Beneish (Beneish, 1999) M-Skor Modeli hem akademik alanda hem de denetim pratiğinde oldukça kıymetli bir araç olmakla birlikte, bağlam uyarlamalarının ve analitik yaklaşımlarla desteklenmesinin modelin etkinliğini artıracağı açıkça görülmektedir.

EXAMINATION OF INTERNET USAGE PURPOSES IN TÜRKİYE ON THE VARIABLES OF YEAR AND GENDER

Halime SUVAY EKER
Asst. Prof., Istanbul Gedik University, Faculty of Economics Administrative and Social Sciences, Department of Management Information Systems, Istanbul-Türkiye
halime.eker@gedik.edu.tr (Responsible Author) ORCID: 0000-0001-5310-7627

ABSTRACT

It can be said that the digital transformation process in Türkiye gained speed in the early 2000s with the rapid spread of internet technology around the world. Especially, the introduction of Web 2.0 technology by O'Really Media in 2004 closed the Web 1.0 era in which users were only recipients of information and started an era in which users could intervene in information. In this context, in this study, the data of the Household Information Technologies Usage Survey covering the period between 2004 and 2024 were downloaded from the website of the Turkish Statistical Institute and the purposes of internet usage were analysed based on year and gender variables. As a result of converting the data into graphs and analysing them with the descriptive statistics method, it was observed that the rate of internet usage was higher among males, and the rate of internet usage among both males and females increased continuously and reached approximately 87% today. When the purposes of internet use according to gender are analysed, it is understood that males use the internet for technical and functional purposes, while females use the internet for social and communicative purposes. Such that, while males were more prominent in sending/receiving e-mails, downloading and playing games, pictures or music, internet banking, females were more prominent in making phone calls/video conferences and searching for information on health-related issues on the internet. In recent years, messaging via applications such as WhatsApp, Messenger, Skype, etc. has been the most intensive usage (approximately 95%), while watching videos from paid services (Netflix, Exxen, Amazon Prime, Blutv, etc.) or watching videos from sharing sites (YouTube, etc.) can be given as examples of new usage habits.

Keywords: Digitalisation, Gender-Based Internet Use, Internet Trends in Türkiye.

Introduction

Internet technologies have become the cornerstone of digital transformation and have significantly changed individuals' lifestyles, communication methods, access to information, and service consumption habits. The foundations of the Internet are based on the ARPANET project, which was developed in the United States in the 1960s for defence purposes (Kantrowitz & Rogers, 1994). The integration of the Internet into everyday life gained momentum in the 1990s, particularly with the spread of the World Wide Web (WWW). The Web was developed in 1989 by Tim Berners-Lee at the European Organisation for Nuclear Research (CERN) in Switzerland. In 1990, Berners-Lee coined the term 'World Wide Web' to describe this structure that connects the entire world and enables global access to information. This technological advancement has fundamentally changed the way we access information, laying the foundation for digitalisation processes in many areas, from education to healthcare, trade to public services (Knime Analytics Platform, 2020).

The development of the Internet in Türkiye began in late 1991 with network installation work carried out in collaboration between ODTÜ and TÜBİTAK. Within this context, the first experimental connection was made to the Netherlands in 1992, and in 1993, Türkiye's first internet connection was established via the TCP/IP protocol from the ODTÜ Information Processing Department to NSFNet (National Science Foundation Network) in the USA using a 64 Kbps leased line (Saka, 2019). This application is considered to be the beginning of the digital age in Türkiye, and in the following years, the use of the internet rapidly expanded with the contributions of government institutions, universities, and the private sector. The increase in broadband access, the spread of mobile devices and the development of social media platforms in the 2000s can be said to have been an important turning point in terms of individual internet use. The household information technology usage surveys published annually by the Turkish Statistical Institute (TUIK) also demonstrate this development in quantitative terms. According to the results of the Household Information Technology Usage Survey (2024), the Internet usage rate in Türkiye was determined to be 88.8% among individuals aged 16-74 in 2024 (TUIK, 2024). With this ratio, it can be said that approximately 75 million of Türkiye's population of 85,664,944 as of 2024 are internet users (TUIK, 2025).

This study examines changes in internet usage in Türkiye by gender over the years, analysing how female and male users use the internet, for what purposes, and with what intensity. The results obtained can be used to identify the reflections of gender roles in the digital sphere, and if digital inequalities exist, they can be eliminated to create a more inclusive environment for the digital transformation process.

Materials and Methods

The aim of this study was to determine the purposes of internet use based on the variables of year and gender in the data covering the period 2004–2024 from the Household Information Technology Use Survey on the Turkish Statistical Institute website. In this regard, data published by the Turkish Statistical Institute covering the period between 2004 and 2024 on the rates of internet usage by gender in Türkiye formed the data set for this study (TUIK,2024).

The general purposes of internet use have been evaluated based on the statements listed below.

- *Sending / receiving e-mails*
- *Playing or downloading games, images or music*
- *Telephoning over the Internet / Video conferencing*

- *Internet banking*
- *Reading/downloading online newspapers/news magazines*
- *Finding information about health*
- *Participating in social networks (creating user profile, posting messages or other contributions)*
- *Finding information about goods or services*
- *Purchasing or ordering goods or services*

Within the scope of this study, data from the Household Information Technology Usage Survey covering the period 2004–2024 was examined using descriptive statistical methods according to gender and year variables. The results are presented in graphs. The descriptive statistical method generally refers to the summarisation and organisation of data using tables, graphs or diagrams (Erbaş, 2013). This makes the data easier to understand and interpret.

Findings and Discussion

Under this heading, internet usage rates by gender between 2004 and 2024 are presented graphically. This is followed by usage rates for each internet usage purpose, presented in graphs according to year and gender variables.

Internet Usage Rates by Gender

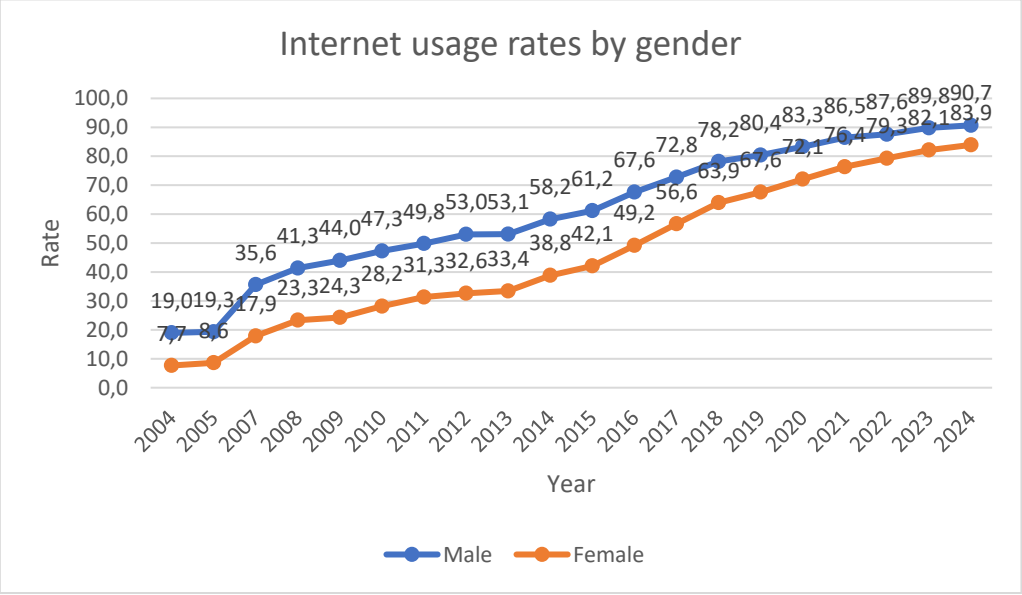

Figure 8. Internet Usage Rates by Gender in Türkiye Between 2004 and 2024

When examining internet usage rates by gender, a steady upward trend can be seen among both female and male users. In 2024, it is understood that the gap between females (%83,9) and males (%90,7) has decreased and that there are a significant number of internet users (Figure 1).

Internet Usage Purposes

Sending / receiving e-mails

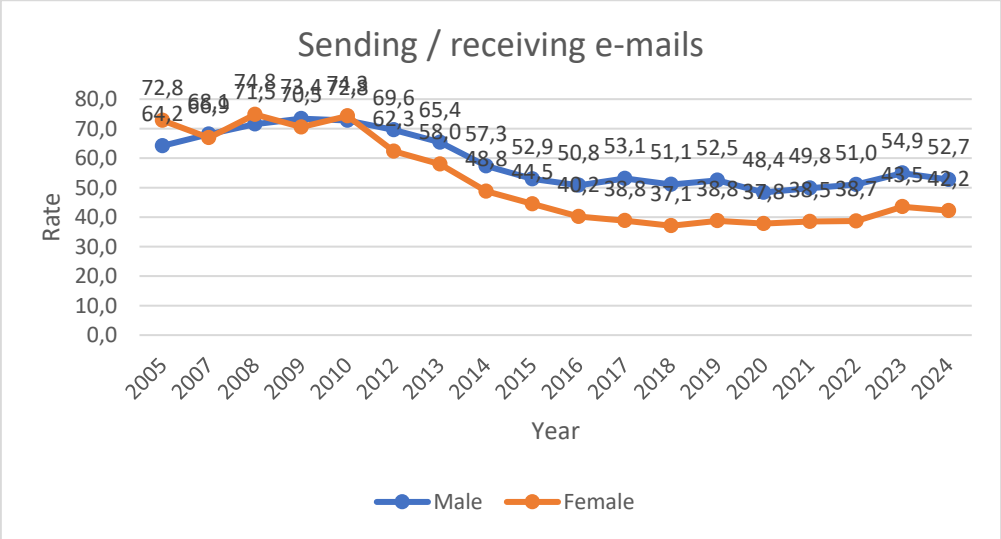

Figure 9. Email Usage Rates Among Male and Female by Year

Between 2005 and 2010, usage rates were higher, reaching their peak in 2010 before declining. It is understood that the usage rates for both men and women have changed similarly since 2010 (Figure 2).

Playing or downloading games, images or music

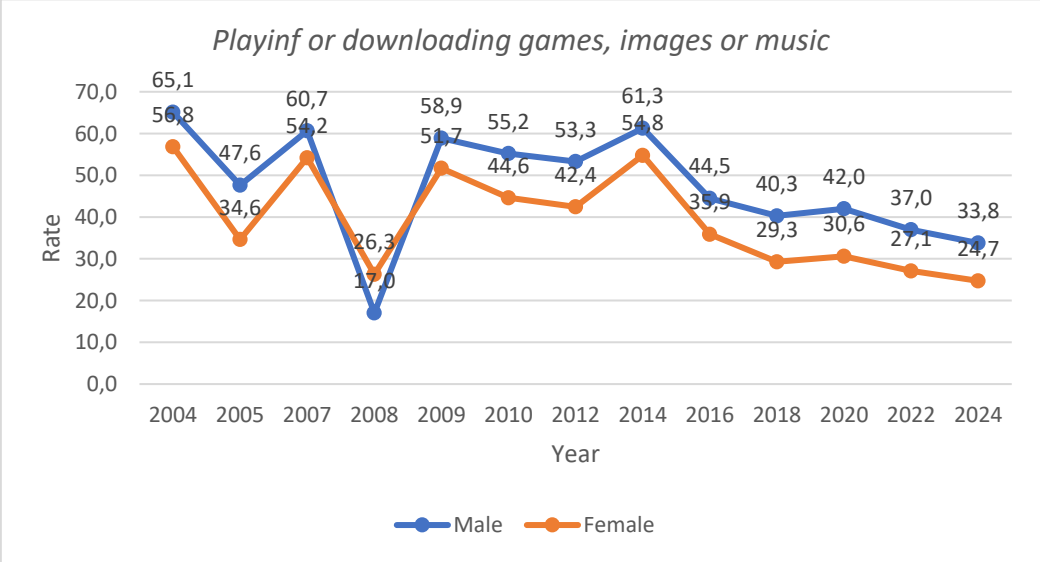

Figure 10. Rates of Playing or Downloading Games, Images or Music by Male and Female by Year

The high usage rate in 2004 has generally declined by 2024. Although usage rates among men are generally higher than among women, a decline was observed in 2008, and in the same year, the rate among women exceeded that among men for the first time (Figure 3).

Telephoning over the Internet / Video conferencing

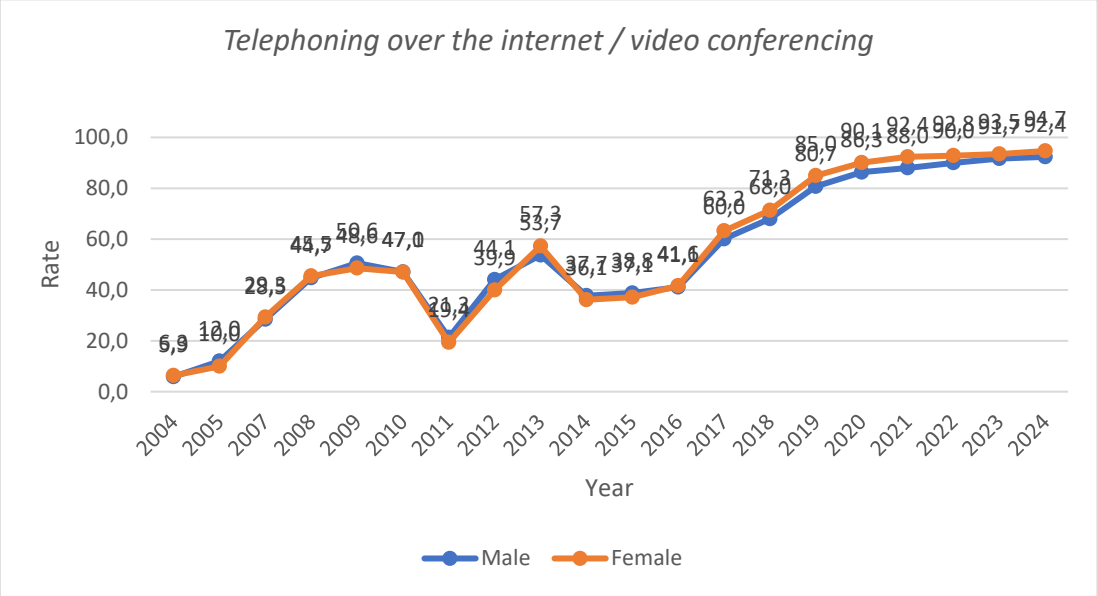

Figure 11. Rates of Telephoning over the Internet / Video conferencing by Male and Female by Year

There is no obvious difference between women and men, with women leading the way. Since 2016, video conferencing over the internet has been on a continuous upward trend (Figure 4).

Internet banking

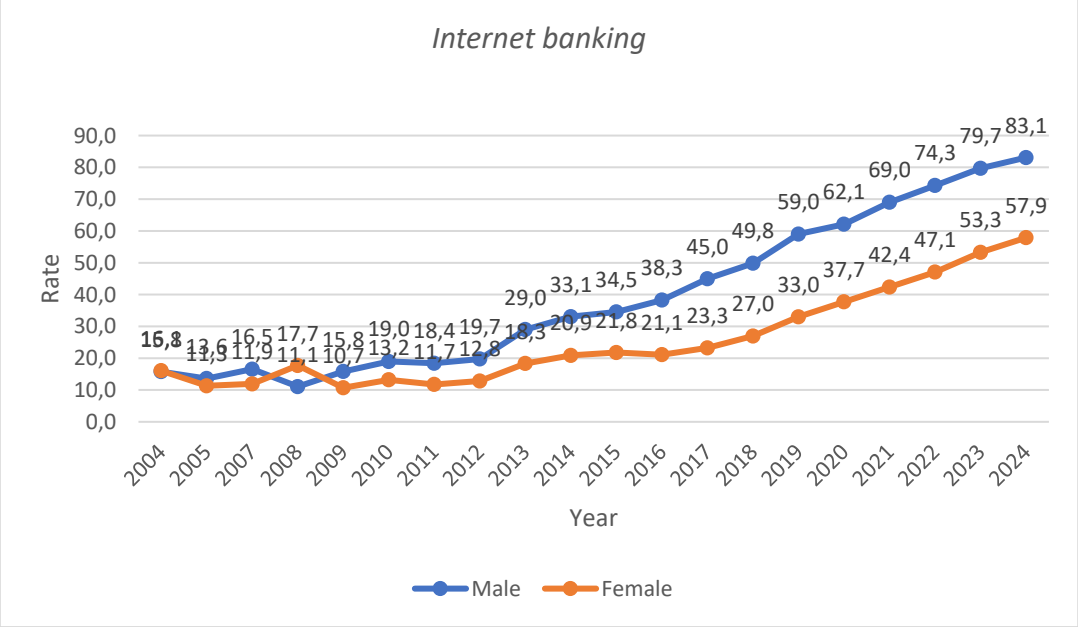

Figure 12. Internet Banking Usage Rates Among Male and Female by Year

Internet banking usage rates, which initially averaged around 15%, have increased among both men and women. Since 2015, the gap between men and women has widened, reaching approximately 83% for men and 57% for women (Figure 5).

Reading/downloading online newspapers/magazines

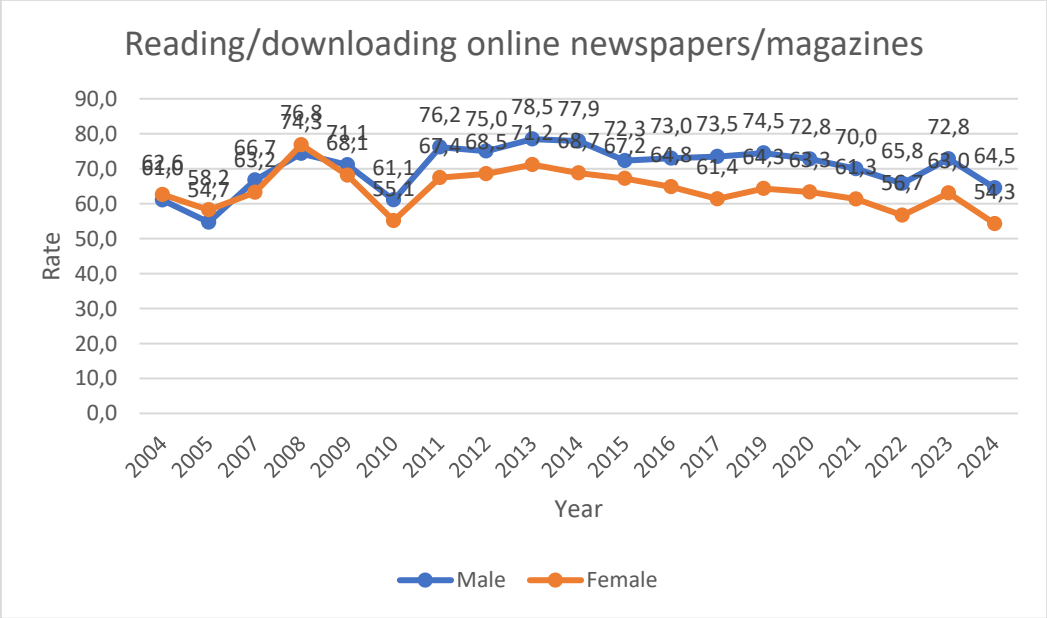

Figure 13. Rates of Reading/downloading Online Newspapers/Magazines by Male and Female by Year

Although the usage rate among men is generally higher than that among women, the difference between the two is small. It is understood that the rates between 2004 and 2024 followed a similar trend (Figure 6).

Finding information about health

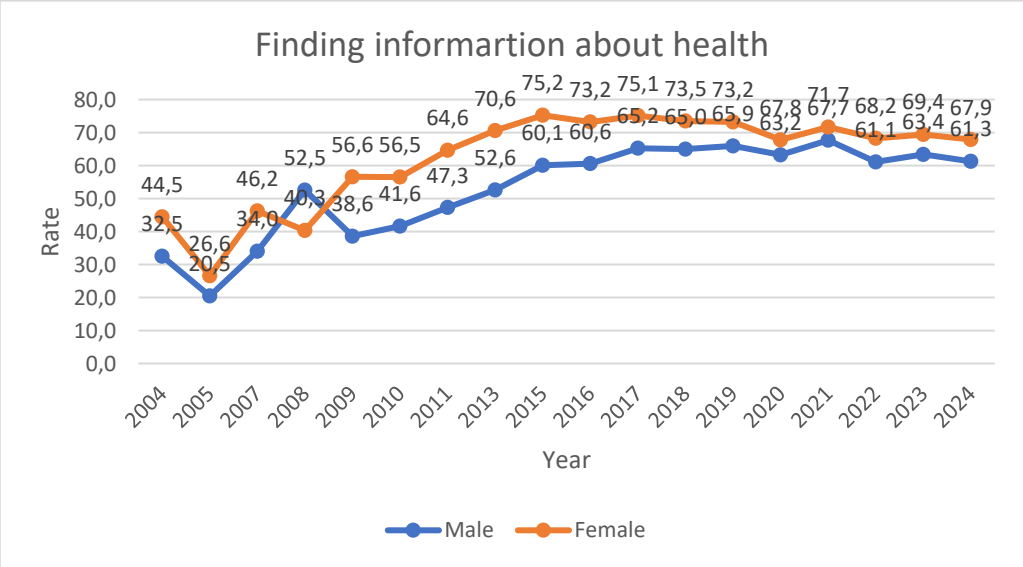

Figure 14. Finding Information About Health Usage Rates Among Male and Female by Year

It is generally observed that women are ahead of men in obtaining health-related information. It is understood that this ratio has remained similar from around 2015 to the present day (Figure 7).

Participating in social networks (creating user profile, posting messages or other contributions)

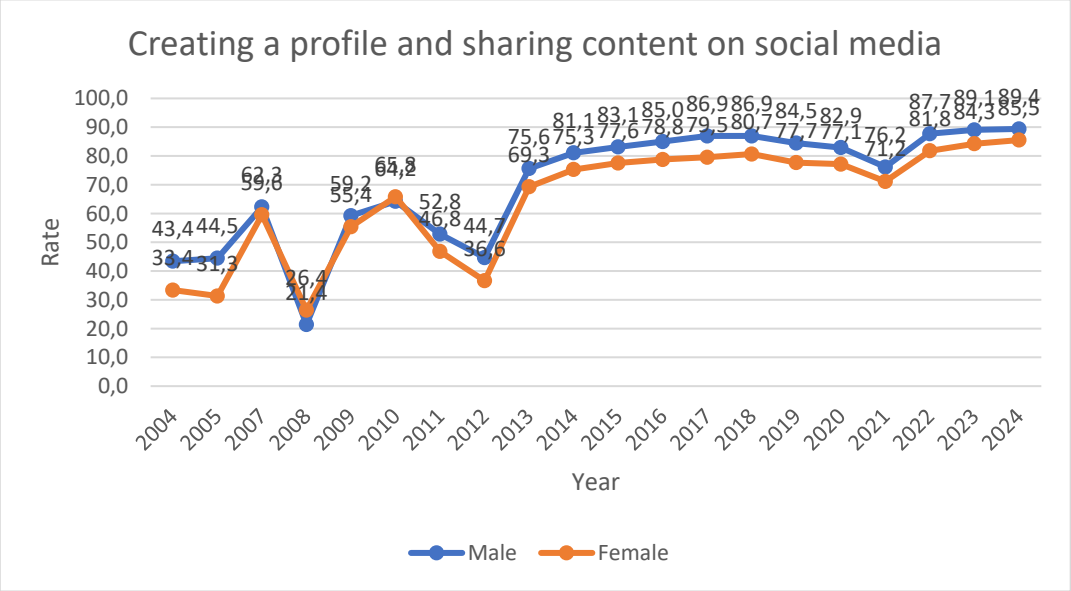

Figure 15. Rates of Creating a profile and sharing content on social media by Male and Female by Year

The ratio of women to men using social media initially showed sharp ups and downs. Since 2012, it has risen rapidly and appears to have stabilised. It is observed that the rates are close to each other for women (85.5%) and men (89.4%) (Figure 8).

Finding information about goods or services

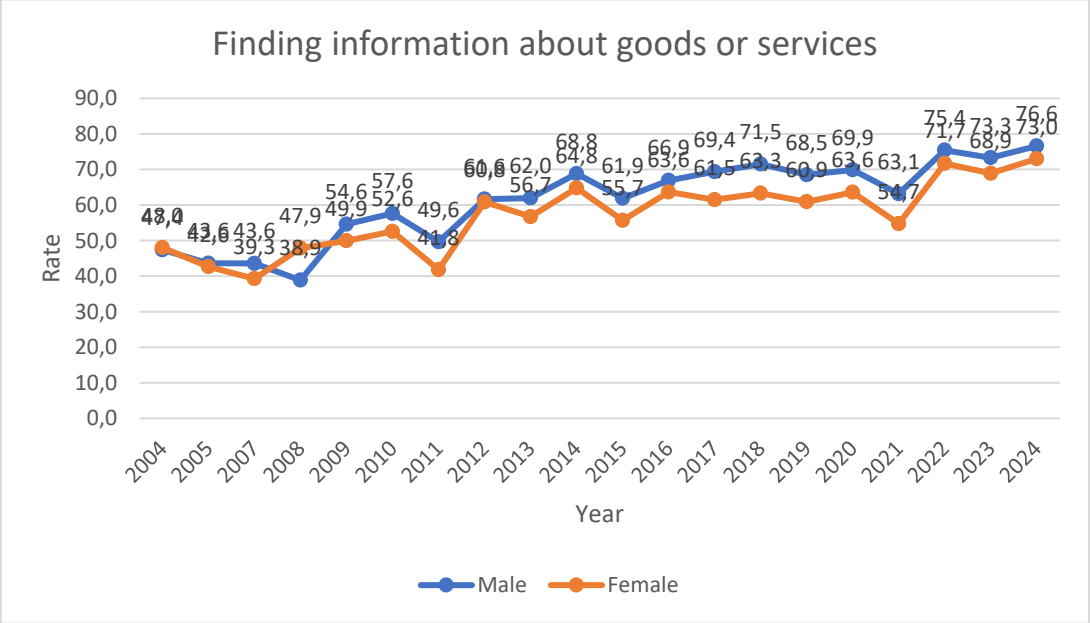

Figure 16. Rates of Finding Information About Goods or Services by Male and Female by Year

In 2004, the percentage of people seeking information about goods and services was 47%, while in 2024 it reached 74%. Although the percentage of men is higher than that of women, there is no significant difference (Figure 9).

Purchasing or ordering goods or services

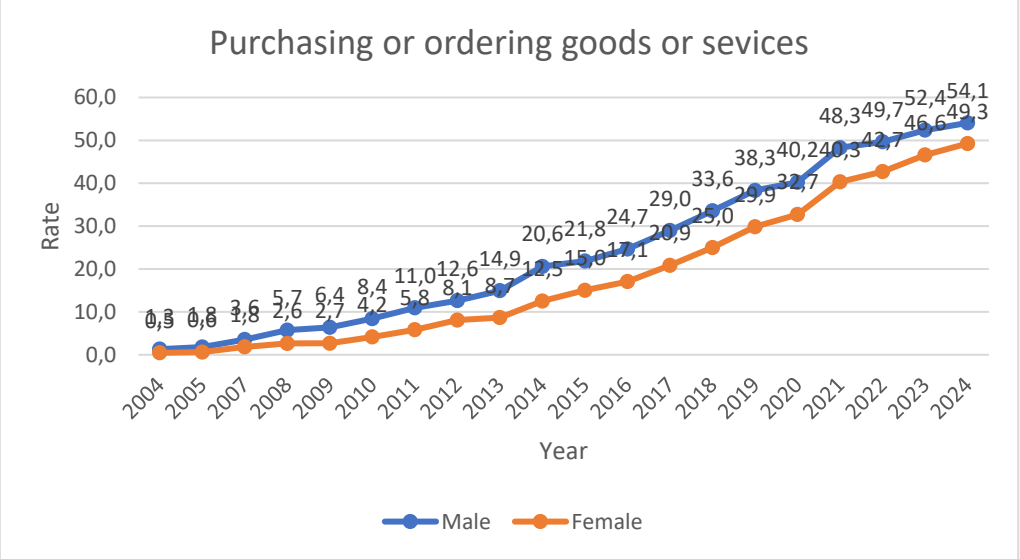

Figure 17. Rates of Purchasing or Ordering Goods or Services by Male and Female by Year

Purchasing goods or services or placing orders has shown a steady and significant increase from 2004 to 2024. Although the percentage of men is higher, it has progressed in parallel with women (Figure 10).

Nowadays

As of 2024, internet usage shows a wide variety of purposes, as listed below.

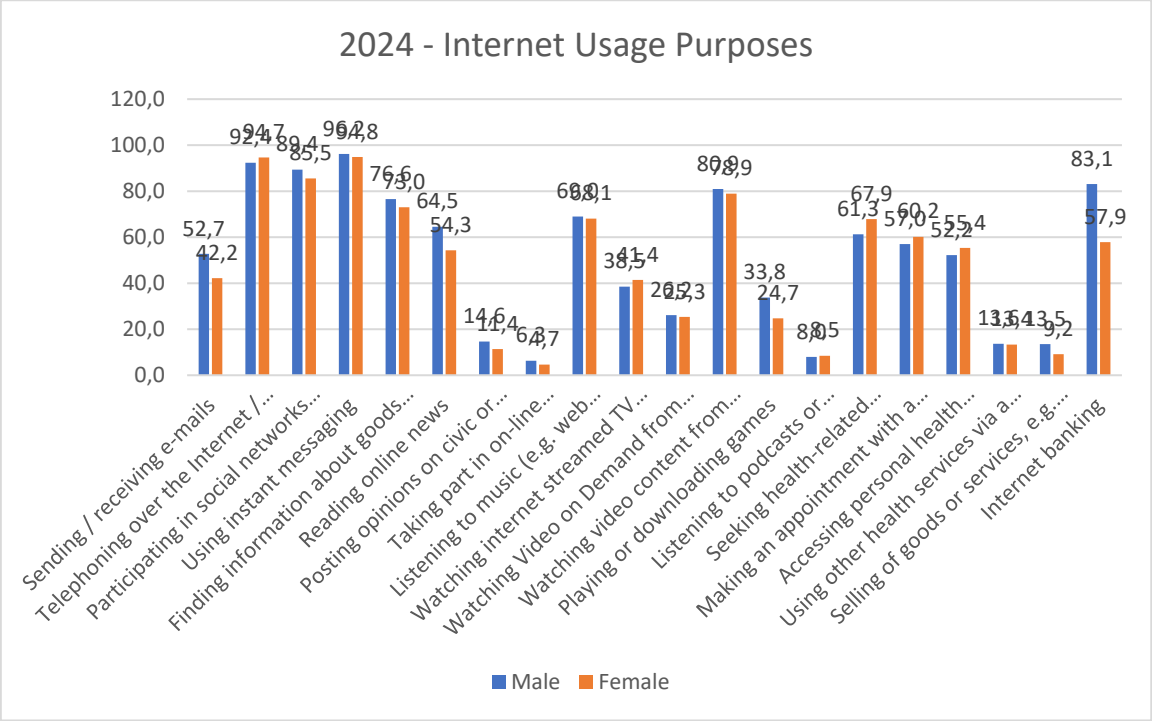

Figure 18. Internet Usage Purposes According to 2024

When examining the 2024 data presented in Figure 11, it can be seen that using instant messaging (WhatsApp, Messenger, Skype, BİP, Viber, Snapchat, etc.) is the most intensively used form of communication, with a rate of nearly 95%. Examples of new usage habits include listening to or downloading podcasts, watching videos on demand from paid services (Netflix, Exxen, Amazon Prime, Blutv, puhutv, gain, etc.) and watching videos on sharing sites (YouTube, Daily Motion, Twitch, etc.).

Conclusion and Recommendations

This study comprehensively reveals how internet usage habits have changed according to gender between 2004 and 2024. In general, a significant increase in internet usage rates is observed among both women and men, and in recent years, the gap between genders is narrowed. In 2024, it's been found that 83.9% of women and 90.7% of men are internet users. This situation indicates that gender-based differences in access to digital technologies are gradually decreasing.

Although the difference is small, it can be said that there is a difference in the purpose of internet use according to gender. It is observed that men use the Internet more for technical and functional purposes; for example, they stand out in areas such as sending/receiving e-mails, playing online games, downloading music and pictures, and internet banking. Women, on the other hand, use the internet more for social and communication purposes; they have higher rates of use in areas such as making phone calls/video conferences and searching for health-related information online.

Furthermore, new habits that have emerged in internet usage today are also noteworthy. Messaging via instant messaging applications (WhatsApp, Messenger, Skype, etc.) has become the most widely used form of communication, with a usage rate of 95%. In addition, watching videos on demand from paid digital services (Netflix, Exxen, Amazon Prime, Blutv, etc.) and consuming content through video sharing sites (YouTube, DailyMotion, Twitch, etc.) are among the new digital media habits adopted by users.

These results reveal that the ways in which the internet is used have diversified over time and that there are minor gender-based differences. In particular, taking into account the preferences of female and male users in the digital transformation process can be considered an important strategic requirement in terms of developing user-friendly digital services, increasing digital literacy and eliminating digital inequalities.

ABSTRACT

Artificial intelligence (YZ) technologies have been widely used in space science in recent years. AI provides changes and developments in areas such as mission design, data processing and autonomous operations of vehicles in space science. This study will conduct a bibliometric analysis of publications on the use of AI in space science. The study aims to identify research trends, influential authors, institutions and countries in the discipline. The data for the analysis were obtained from the Scopus database. The keywords "space science" and "artificial intelligence" were used to search the database. As a result of the search, a total of 70 publications between 1987 and 2025 were identified. In the bibliometric analysis of the publications, Biblioshiny, the web-based interface of the Bibliometrix package running in the R Studio environment, was used. It was observed that the most common types of publications were conference proceedings and articles. In recent years, there has been an increase in the number of publications in the field. The United States of America (abd) is the country that produces the most publications. The main reasons why the USA is the leader in the field are that the USA allocates a high budget for research and development (AR-GE), has high-level universities and institutions, has a high number of scientists, and has state-sponsored strategic programs. China is the country that produces the most publications after the USA. After the USA and China, India follows these countries in publication production. The National Aeronautics and Space Administration (NASA), the National Natural Science Foundation of China (NSFC) and the National Science Foundation (NSF) are the funders that produce the most publications. Ilias Fernini and Antonios Manoussakis are the researchers who produced the most publications. This study has provided a systematic categorization of the research on the use of AI in space science and a direction for future studies.

Keywords: bibliometric analysis, space science, artificial intelligence.

UZAY BİLİMİNDE YAPAY ZEKA KULLANIMI ÜZERİNE BİBLİYOMETRİK ANALİZ

ÖZET

Yapay zeka (YZ) teknolojileri son yıllarda uzay biliminde yaygın bir şekilde kullanılmaktadır. YZ, uzay biliminde görev tasarımı, verilerin işlenmesi ve araçların özerk operasyonları gibi alanlarda değişimler ve gelişmeler sağlamaktadır. Bu çalışmada uzay biliminde YZ kullanımı ile ilgili yayınların bibliyometrik analizi yapılacaktır. Çalışma disiplindeki araştırma eğilimlerini, etkili yazarları, kurumları ve ülkeleri tespit etmeyi amaçlamaktadır. Analiz verileri Scopus veri tabanı üzerinden elde edilmiştir. Veri tabanında arama için "uzay bilimi" ve "yapay zekâ" anahtar kelimeleri kullanılmıştır. Arama sonucunda 1987-2025 yılları arasında toplam 70 yayın tespit edilmiştir. Yayınların bibliyometrik analizinde, R Studio ortamında çalışan Bibliometrix paketinin web tabanlı arayüzü olan Biblioshiny'den yararlanılmıştır. Yayın türleri arasında en fazla konferans bildirisi ve makale kullanıldığı görülmüştür. Son yıllarda alandaki yayın sayısında artış olduğu tespit edilmiştir. Amerika Birleşik Devletleri'nin (ABD) en fazla yayın üreten ülkedir. ABD'nin araştırma ve geliştirmeye (AR-GE) yüksek bütçe ayırması, üst düzey üniversite ve kurumların bulunması, yüksek sayıda bilim insanına sahip olmaları, devlet destekli stratejik programlarına sahip olmaları ABD'nin alanda lider olmasının temel nedenleridir. Çin'de ABD'den sonra en fazla yayın üreten ülke olarak dikkat çekmektedir. ABD ve Çin'in ardından Hindistan yayın üretiminde bu ülkeleri takip etmektedir. Ulusak Havacılık ve Uzay Dairesi (NASA), Çin Ulusal Doğa Bilimleri Vakfı (NSFC) ve Ulusal Bilim Vakfı (NSF) en fazla yayın üreten finansman sağlayıcılardır. Ilias Fernini ve Antonios Manoussakis en fazla yayın üreten araştırmacılardır. Yapılan çalışma ile uzay biliminde YZ kullanımı konulu araştırmaların sistemli bir şekilde kategorileştirilmesi ve gelecekteki çalışmalara yön verilmesi sağlanmıştır.

Anahtar Kelimeler: bibliyometrik analiz, uzay bilimi, yapay zeka.

Giriş

Uzay bilimi, yıldızlar, galaksiler ve kozmik olaylar dahil olmak üzere evren hakkında bilgi edinmemize yardımcı olur (Cimatti et al., 2009). Yapay zeka (YZ), görev tasarımı, uzay araştırmaları ve Dünya gözlemi gibi çeşitli alanlarda dönüştürücü yetenekler sunarak uzay bilimlerinde giderek daha önemli bir bileşen haline gelmektedir (McGovern & Wagstaff, 2011). YZ, uzay aracı ve robotların yeteneklerini geliştirerek uzay araştırmalarında önemli bir rol oynamaktadır. Örneğin, navigasyon için YZ sistemleri kullanılır ve NASA keşif aracı Perseverance on Mars gibi gezginlerin yolları ve görevleri hakkında özerk kararlar almasına izin verir. Bu, Dünya ile mesafeler nedeniyle gecikebilen iletişim ihtiyacını azaltır (Russo & Lax, 2022). YZ teknikleri tahmine dayalı analitik ve görüntü işleme için kullanılmaktadır. YZ, uzaktan algılama görevleri için çok önemli olan kalıpları veya anormallikleri tanımlamak için uydular tarafından yakalanan görüntüleri analiz edebilir (Furano et al., 2020). Bunların yanı sıra YZ, uzay görevlerinden toplanan bilimsel veriyi analiz etmek içinde kullanılmaktadır (Chien et al., 2006). Bu çalışmalar YZ'nin uzay biliminin çeşitli uygulama alanlarında kullanıldığını göstermektedir. Söz konusu gelişmeler, araştırmacıların bu alana olan ilgisini arttırmakta ve YZ'nin uzay bilimindeki konumunun literatürde giderek daha görünür hale gelmesine katkı sağlamaktadır. Bibliyometrik analiz, bilimsel literatürü değerlendirmek ve analiz etmek için kullanılan, araştırma eğilimleri, etkili yazarlar ve iş birliği ağları hakkında içgörüler sağlayan nicel bir yöntemdir (Kumar, 2025). Bibliyometrik analiz, bilimsel literatürü incelemek için geriye dönük, nicel, istatistiksel ve tanımlayıcı teknikler dahil olmak üzere çeşitli metodolojiler kullanır (Celestino et al., 2024). Bu çalışma, uzay biliminde YZ kullanımına ilişkin bilimsel yayınların kapsamlı bir bibliyometrik analizini sunmayı amaçlamaktadır. Bu kapsamda çalışmada Scopus veri tabanında uzay biliminde YZ kullanımı konulu yayınlar üzerinden bibliyometrik analiz yapılacaktır. Bibliyometrik analizde, en çok yayın yapan yazarlar, ülkeler, kurumlar, finansman sağlayıcılar, en çok kullanılan anahtar kelimeler gibi çeşitli göstergeler incelenmiştir. Böylece bu araştırma alandaki gelişimi, eğilimleri ortaya koymayı ve araştırmacılar için stratejik bir rehber sunmayı hedeflemektedir.

Materyaller ve Yöntemler

Bu çalışma, uzay biliminde YZ kullanımı üzerine odaklanan bilimsel yayınların bibliyometrik analizini yapmak üzere kurulmuştur. Bibliyometrik analiz için Scopus veri tabanı tercih edilmiştir. Scopus veri tabanının çalışmada tercih edilme nedeni, kapsamlı içeriği ve disiplinler arası yapısı sayesinde uzay bilimi ve yapay zekâ gibi farklı alanları kapsayan yayınlara erişim imkânı sunmasıdır. Veri tabanında aramada anahtar kelime olarak "uzay bilimi" ve "yapay zeka" kelimeleri kullanılmıştır. Arama sonucunda 1987-2025 yılları arasında yayınlanan 70 yayın elde edilmiştir. Veri analizinde Biblioshiny ve Scopus veri tabanındaki analiz araçları kullanılmıştır.

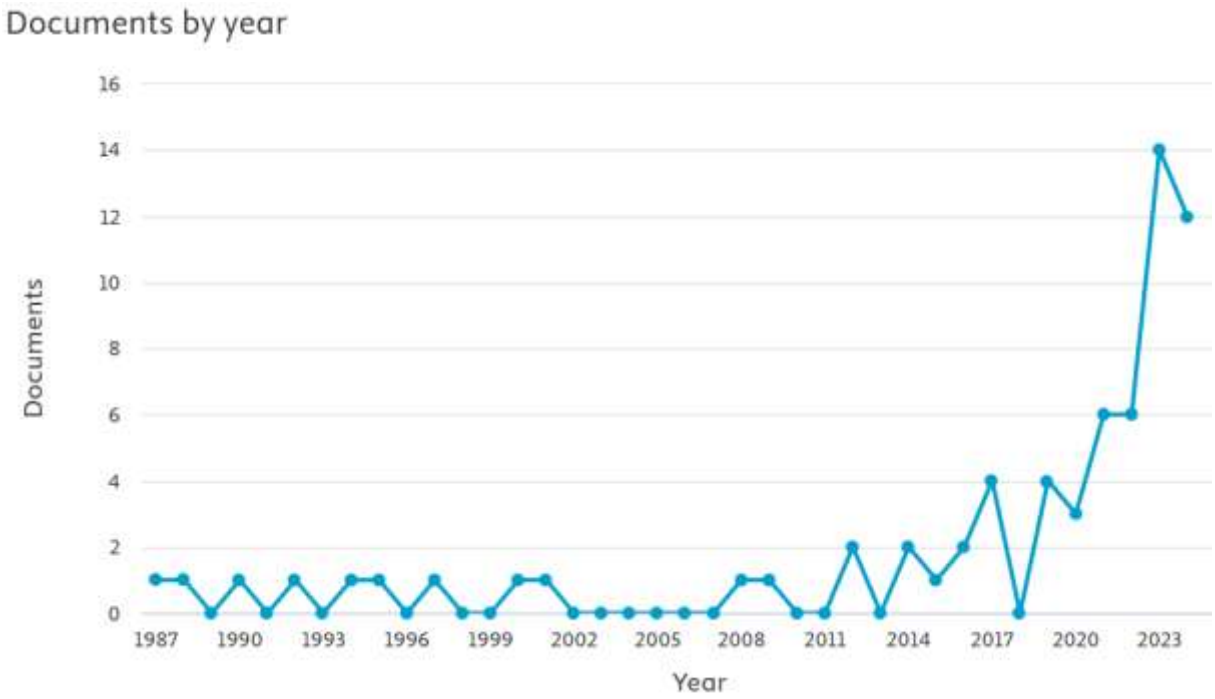
Tablo1'de uzay bilimi ve YZ kelimelerinin beraber kullanıldığı yayınlarda 251 yazarın bulunduğu, 11 yazarın tek yazar olarak yayınlarda yer aldığı görülmektedir. Yayınlara yapılan ortalama atıf sayısı 12,23 olarak tespit edilmiştir. Yayınlanan 70 çalışmanın 67 si İngilizce 3'ü Çince dillerinde yayınlanmıştır. Yayınların sayısını ait yıllık değişim Şekil1'de yer almaktadır. Şekilde 1987-2025 yılları arasında yapılan yayınların sayısı görülmektedir. Yayın sayısında 2020'den itibaren bir artış olduğu görülmektedir.



Şekil 1.Yıllara göre yayın sayısı

Bulgular

Uzay biliminde YZ kullanımı üzerine 251 yazar araştırmaya katkı sağlamıştır. Yazarların yayın sayılarına ait bilgi Tablo 2'de verilmiştir. Yayın sayıları incelendiğinde Fernini ve Manousakis uzay biliminde YZ kullanımı üzerine en fazla yayın yapan araştırmacılar olmuştur.

Tablo 2. Yazarların yayın sayısı

Yazar	Yayın sayısı
Fernini, İ.	4
Manousakis, A.	4
El Naimiy, H.	2
El-Uveys, A.	2
Alamad, R.	2
El-Hâram, A.	2
Alhalife, M.	2
Alowais, A.	2
Elkasab, Y.	2
Balogh, W.	2

En üretken ülkelere ait bilgiler Tablo 3'te verilmiştir. En üretken ülke 18 yayınla Amerika Birleşik Devletleri (ABD) olmuştur. ABD uzay biliminde YZ kullanımı üzerine yayın üretmede lider konumdadır. ABD'yi Çin, Hindistan ve Birleşik Arap Emirlikleri takip etmektedir.

Tablo 3. En üretken ülkeler

Ülke	**Yayın Sayısı**
Amerika Birleşik Devletleri	18

Tablo 6'da yayınlarda en sık kullanılan kelimeler gösterilmiştir. En sık kullanılan kelimelere ait kelime bulutu Şekil 2'de gösterilmiştir. En sık kullanılan kelime "artificial ıntelligence" olmuştur. Şekilde en büyük ve merkezi konumda yer alan "artificial intelligence" ifadesi, yapay zekânın bu alandaki araştırmaların odak noktasını oluşturduğunu göstermektedir. Ardından "space science" ve "space research" kelimeleri gelmektedir. Ayrıca "machine learning", "deep learning", "remote sensing", "decision support systems" ve "engineering education" gibi ifadelerin de sıkça tekrarlandığı görülmektedir. Bu durum, YZ'nin yalnızca veri analizi ve sistem optimizasyonu gibi teknik alanlarda değil, aynı zamanda mühendislik eğitimi ve karar destek sistemleri gibi daha geniş kapsamlı uygulamalarda da etkin biçimde kullanıldığını ortaya koymaktadır.

Tablo 6. En sık kullanılan kelimeler

Sonuç ve Öneriler

Son yıllarda YZ teknolojilerindeki gelişmeler, bu teknolojilerin uzay bilimi çalışmalarında giderek daha yaygın şekilde kullanılmasını sağlamıştır. Bu çalışma, uzay biliminde YZ kullanımı üzerine mevcut literatürün bibliyometrik analiz yöntemiyle incelenerek alandaki araştırma eğilimlerini, önde gelen aktörleri ve tematik gelişimini ortaya koymayı amaçlamıştır. 1987-2025 yılları arasında Scopus veri tabanından elde edilen verilerin analizinde, uzay biliminde YZ kullanımının son yıllarda artış gösterdiği görülmektedir. Uzay bilimlerinde YZ kullanımı ile ilgili yayınların 2020 sonrasında belirgin bir artış gösterdiği tespit edilmiştir. Bu artış YZ teknolojilerinin gelişimiyle paralellik göstermektedir. Yayınlanan 67 yayında İngilizce, 3 yayında ise Çince dili kullanılmıştır. En fazla yayın üreten ülkeler sırasıyla ABD, Çin, Hindistan, Birleşik Arap Emirlikleri gelmektedir. Yayın üretiminde ülkelerin başarısında, devlet politikaları, finansal yatırımlar, yetişmiş insan gücü ve uluslararası iş birlikleri gibi faktörler etkili olmaktadır. ABD'nin güçlü araştırma merkezlerine sahip olması, uzay şirketlerine yapılan yüksek bütçeli yatırımlar ülkenin lider konumda olmasında etkili faktörlerdir. Kurumların yayın üretiminde Çin Bilimleri Akademisi, Sharjah Üniversitesi ve Sharjah Astronomi, Uzay Bilimleri ve Teknolojisi Akademisi en fazla yayın üreten kurumlar olmuştur. Fernini ve Manousakis uzay biliminde YZ kullanımı üzerine en fazla yayın üreten yazarlar olarak alanda öne çıkmaktadır. 2021 yılında Yu, S., Ma, J.tarafından yayınlanan "Deep Learning for Geophysics: Current and Future Trends" yayını 344 atıf alarak en fazla atıf alan yayın olmuştur. Yayınlarda en fazla tekrar eden kelimeler "artificial ıntelligence", "space science" olmuştur. Bu kelimeler YZ'nin uzay biliminde merkezi rolü olduğunu doğrulamaktadır. Çalışmada bulgular Scopus veri tabanı kullanılarak elde edilmiştir. Biblioshiny ve Scopus veri analizi ile bibliyometrik analiz yapılmıştır. İleride yapılacak araştırmalarda yalnızca Scopus veri tabanı değil, Google Scholar, Web Of Science gibi veri tabanları da kullanılabilir. Çeşitli veri tabanlarının kullanılması ileride yapılacak araştırmalar için destekleyici olacaktır.

ABSTRACT

With the widespread use of network access, the security threats to devices and data within the network have significantly increased. Machine learning models have demonstrated high performance and accuracy in Intrusion Detection Systems for attack detection. However, the centralized structure of classical machine learning models cannot ensure the security of sensitive user data. Federated Learning has emerged as an approach that allows model training by keeping all data confidential instead of using centralized data. With Federated Learning, model training is performed on client devices where user data is generated. After training, the model weights from each client are transmitted to a central server, where they are aggregated to update and improve the global model. In this study, we used the CICIoT2023 dataset, which contains both benign data and seven types of attack data: DDoS, DoS, Recon, Web-Based, Brute Force, Spoofing, and Mirai collected from a range of IoT devices. All attack types were labeled as “Malicious,” resulting in a binary-classified dataset. The dataset was then equally divided into ten parts, with each part assigned to a separate client. Each client trained an Artificial Neural Network model on its respective subset to distinguish between benign and malicious traffic. The model weights from each client were transmitted to a central server using Federated Learning. According to the results, the loss value obtained as 4,91% and the accuracy was 98.87%. These results demonstrate that Federated Learning effectively enhances the classification of malicious and benign traffic, enabling IoT devices to collaboratively improve cybersecurity without compromising user data privacy.

Keywords: Network Security, Federated Learning, Machine Learning, Attack Detection

Introduction

Federated learning is an emerging machine learning approach that enables collaborative model training across multiple devices while keeping data decentralized and private. Federated learning can ensure privacy preservation and protection of sensitive information (Pandya et al., 2023). Privacy is preserved by transmitting only model updates instead of raw data to a central server with this approach. This distributed approach adapts to the dynamic nature of IoT networks, improving model accuracy over time.

This research aims to address security concerns in IoT devices by considering user data privacy with the FL approach ANN model using the CICIoT23 dataset. Contribution of the study is classify network attempts whether they are benign or malicious using decentralized data approach with recent dataset CICIoT23.

Related Works

This section discusses FL studies in the field of network security conducted in 2023-2024.

In (Al-Wesabi et al., 2023), presented in which a model combining the Pelican Optimization algorithm with Federated Learning is proposed to detect cyber-attacks in IoT environments. The findings show that the proposed model achieves higher accuracy of 99.41% compared to traditional methods. A two-level privacy preserving framework is presented in a study (Rabieinejad et al., 2024) that combines federation learning with partially homomorphic encryption. According to the results of the study, the proposed framework significantly improves attack prediction error rates and reduces false alarms compared to traditional methods. The study in (Thein et al., 2024) explores a federated learning-based Intrusion Detection System (IDS) for IoT data, focusing on two main challenges: data heterogeneity and poisoning attacks from malicious clients. It is proposed in the study a method called pFL-IDS. This approach effectively detects poisoning attacks without reducing performance compared to baseline methods. The study in (M. M. Salim et al., 2024) presents a novel Cyber Threat Detection System for IoT networks using Digital Twin technology combined with an optimized Federated Learning approach. It employs an Adaptive Thresholding with Early Stopping method to enhance local model training and integration, improving accuracy and efficiency. Compared to traditional federated averaging, the system shows superior performance with higher F1 scores and lower CPU usage, demonstrating the potential of this approach for securing IoT networks. In (Lai et al., 2023) it is proposed a two-stage defense mechanism called Defense of Poisoning Attacks in Federated Learning (DPA-FL) for intrusion detection. In the first stage, it compares the relative differences in model weights to identify discrepancies between benign and malicious participants. The second stage tests the collected model with the dataset and tries to find the attackers when its accuracy is low. The results of the study achieving up to 96.5% defense accuracy. In a study (Yang et al., 2023) where a detection mechanism is proposed to reduce the impact of poisoning attacks against FL-based intrusion detection methods in IoT networks, experimental results indicate that the proposed detection method can provide defense against label flipping attacks in FL. In (Doriguzzi-Corin & Siracusa, 2024), FLAD (Adaptive Federated Learning Approach to DDoS Attack Detection), an adaptive mechanism-based FL solution for cybersecurity applications, was proposed. A recent DDoS attacks dataset was used in the study, and according to the findings, FLAD outperformed the latest FL algorithms in terms of convergence time and accuracy among imbalanced datasets of heterogeneous DDoS attacks. In (Liu et al., 2023), an asynchronous federated learning arbitration framework based on Bi-directional LSTM (bi-LSTM) and attention mechanism (AsyncFL-bLAM) is proposed. According to the results of the study, it is stated that AsyncFL-bLAM outperforms the state-of-the-art models in terms of accuracy and reduces the overall communication rounds. In (Tran et

al., 2023), a cross-silo federated learning scheme with privacy protection is proposed. The proposed scheme is theoretically and experimentally demonstrated to provide provable privacy against an honest but curious aggregator server and simultaneously obtain the desired model utilities. The scheme is applied to false data injection attack detection (FDIA) in smart grids. The study states that the proposed scheme is a cross-silo FDIA federated learning that is more secure than existing works and resistant to local private data inference attacks. In (S. Salim et al., 2024), a deep federated learning (DFL) based threat detection model is proposed, incorporating a decentralized data-level preprocessing (DLP) mechanism to maintain data confidentiality while enabling effective threat detection. The model uses a deep autoencoder architecture, performing federated learning rounds by sharing only learned weights. Experimental results show that this approach outperforms traditional centralized models in both data privacy and attack detection accuracy. In (Jithish et al., 2023) where a smart grid anomaly detection scheme based on Federated Learning (FL) was proposed, a global model was downloaded from the server to smart meters for on-device training. After local training, local model parameters were sent to the server to improve the global model. Model parameter updates were protected from attackers using the SSL/TLS protocol. According to the findings, FL models achieved similar anomaly detection performance to centralized ML models while ensuring user privacy. In (Wang et al., 2024), a Free-Rider Attack Detection (FRAD) mechanism for federated learning is proposed using a Deep Autoencoding Gaussian Mixture Model (DAGMM) based on contribution and reputation. the contribution values of each device node based on computational resource, communication cost and data quality are modeled and applies a PageRank-based reputation model to select reliable participants. Simulation results show that FRAD outperforms existing methods in defending against free-rider attacks. A defense mechanism attestedFL, which monitors the training of individual nodes via state persistence to detect a malicious worker in small to medium-sized federations, has been proposed in a study(Mallah et al., 2023).The study presents a defense framework with three lines of defense to assess the trustworthiness of worker nodes by monitoring their training behavior and progress. It effectively identifies and excludes malicious or untrustworthy nodes, accelerating federated learning convergence. Results show that AttestedFL improves model accuracy under various attack scenarios, including early-stage attacks, collaborating attackers, and continuous attacks. Table 1 presents the related research carried out in 2023 and 2024 using various datasets and methods.

Lai et al.	Reinforcement learning, Local Outlier Factor	CICIDS2017	96.5 % Accuracy
Yang et al.	FL	CIC-IDS-2017	97.1 % Accuracy
Doriguzzi-Corin & Siracusa	FLAD (Adaptive FL Approach to DDoS Attack Detection) FedAvg	CICDDoS2019	92,32 % Accuracy
Liu et al.	Bi-directional LSTM and attention mechanism (AsyncFL-bLAM)	LDDoS	98.68% Accuracy
Tran et al.	Cross-silo federated learning scheme	SimBench, PowerFactory, 2017 SP4	97,88% F1-Score
S. Salim et al.	Deep federated learning (DFL) based threat detection model, Deep Auto-Encoder (DAE), FL.	Local Dataset	97% Accuracy
Jithish et al.	FL based smart grid anomaly detection, Tensorflow Federated Framework, ML Methods	DD 99, NSL-KDD,CIDDS-001	95,3% Accuracy
Wang et al.	FRAD: Free-Rider Attacks Detection Mechanism, Deep Autoencoding Gaussian Mixture Model	MNIST, CIFAR-10	~83% accuracy with 80% Free-Rider ratio
Mallah et al.	attestedFL	Local dataset, MNIST, CIFAR-10, MTL, Trajet	90% Accuracy

Recent studies show that by integrating techniques such as optimization algorithms, encryption, adaptive mechanisms and deep learning, FL-based approaches improve attack detection accuracy. Several defense frameworks have been proposed to protect against adversarial behaviors while maintaining privacy and model performance.

Material and Methodology

In this study, a collaborative federated learning study was conducted with an ANN model by sharing and distributing the CICIoT23 dataset (Neto et al., 2023) to 10 numbers of clients.

Material

In this study CICIoT23 dataset (Neto et al., 2023) was utilized. This dataset was generated by executing 33 distinct attacks on an IoT network topology comprising 105 devices, with the aim of creating a comprehensive resource to support the development of security solutions for IoT environments. The attacks are categorized into seven main groups: DDoS, DoS, Reconnaissance, Web-based, Brute Force, Spoofing, and Mirai. Notably, all attacks were

initiated by compromised IoT devices targeting other IoT devices within the network. Details regarding the dataset preprocessing are provided in the following section.

Data preprocessing

The attacks in the dataset, which fall into seven distinct categories, were all labeled as malicious, thereby converting the dataset into a binary classification format with two classes: benign and malicious. However, a significant class imbalance was observed between the number of benign and malicious samples. To address this, the dataset was first divided into 10 equal partitions to be distributed among the clients. Subsequently, an undersampling technique—commonly used for handling class imbalance—was applied to each partition individually. Figure 1 illustrates the distribution of class labels before applying undersampling and partitioning the dataset among clients. Figure 2 presents the balanced class label distribution for a sample client after preprocessing. The complete data preprocessing workflow is visualized in Figure 3.

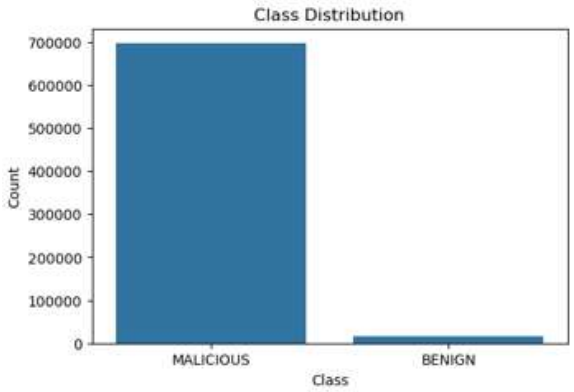

Figure 1. Number of labels before splitting the dataset into equal parts and undersampling

Methodology

Artificial Neural Network (ANN)

The Artificial Neural Network (ANN) is a mathematical model designed to emulate the structure and functionality of biological neural networks. The fundamental building block of an ANN is the artificial neuron—a mathematical function that simulates the behavior of a biological neuron (Krenker et al., 2011). The general form of the artificial neural network is expressed in Equation (1).

$$\gamma = \begin{cases} 1, & If \sum_{i=1}^{n} \theta_i . \times_i \geq \tau \\ 0, & If \sum_{i=1}^{n} \theta_i . \times_i < \tau \end{cases} \qquad (1)$$

γ: Neuron output value

x_i: *Input signal*

θ_2: *Weight*

τ: *Threshold*

In this study, an Artificial Neural Network (ANN) model was employed within a Federated Learning framework. The ANN architecture consists of two hidden layers comprising 128 and 64 neurons, respectively, followed by an output layer with a sigmoid activation function.

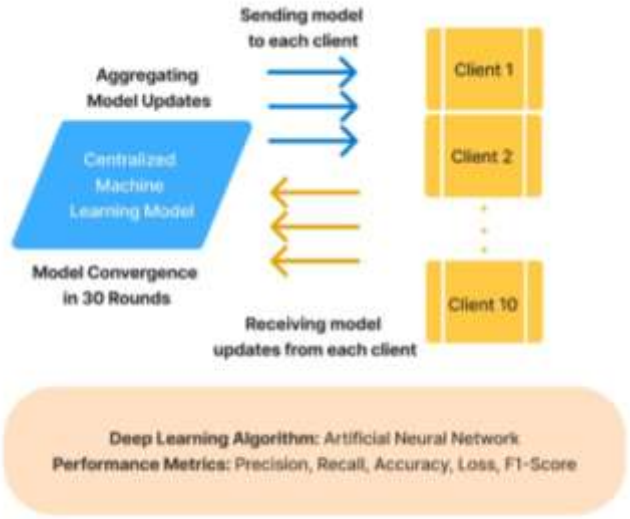
Federated Learning

Devices such as smartphones and tablets are now widely used and are equipped with various sensors, including cameras, microphones, and GPS, which can access vast amounts of data—much of it highly sensitive. The private nature of this data introduces significant risks and ethical concerns when stored in centralized locations. Federated Learning offers a privacy-preserving machine learning paradigm that mitigates these risks by eliminating the need to collect raw data centrally. Instead, each participating device independently trains a model using its local data and transmits only the model updates to a central server, ensuring data remains on the device (McMahan et al., 2017).

Proposed Model

In this study, the CICIOT23 dataset was employed to train an artificial neural network model using the Federated Learning approach. The FedAvg algorithm was implemented through the Flower (FLWR) framework. Evaluation metrics such as Accuracy, Precision, Recall, and F1-score were computed using a weighted average based on the data sizes of the participating clients. In the FedAvg process, the model is trained locally on each client device using its own data. After local training, each client transmits its updated model weights to a central server, which aggregates them using a weighted average to construct a new global model. The architecture of the proposed model is illustrated in Figure 4.

Figure 19. Visualization of Proposed Model



Experimental Results

During each training round, the model weights are updated by averaging the weights received from all participating clients. The updated global model is then distributed back to the clients. According to the results obtained after the 30th round, the model achieved an Accuracy of 98.87%, an F1-Score of 98.87%, a Recall of 98.87%, a Precision of 98.90%, and a Loss value of 4.91%.

Following all training rounds, the confusion matrix of the final global model (Figure 5) indicates that all malicious attacks were correctly classified. However, the model incorrectly classified 78 benign instances as malicious. The detailed performance of the model across each training round is presented in Table 2.

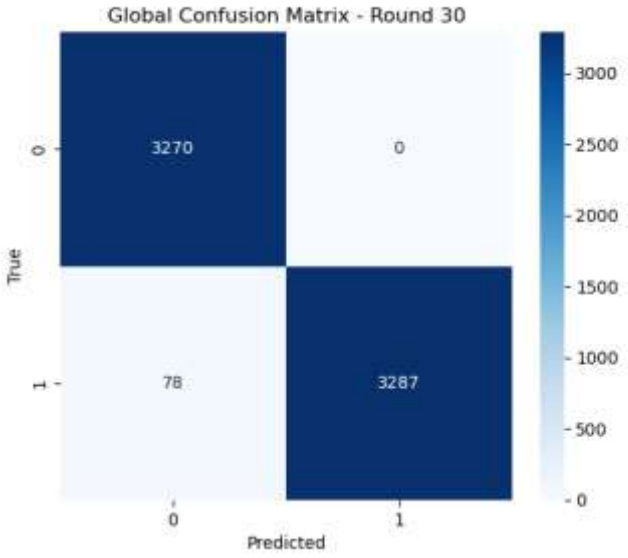


Figure 20. Confusion matrix of the current global model at the end of all rounds.

Table 3. Performance of global model during each round

Round	Loss	Accuracy	F1 Score	Precision	Recall
1	10,28	98,52	98,52	98,56	98,52
2	8,30	98,69	98,69	98,72	98,69
3	7,56	98,70	98,70	98,74	98,70
4	7,18	98,72	98,72	98,75	98,72
5	6,38	98,75	98,75	98,78	98,75
6	6,03	98,76	98,76	98,80	98,76

15	5,05	98,82	98,82	98,85	98,82
16	5,07	98,81	98,81	98,84	98,81
17	5,04	98,82	98,82	98,85	98,82
18	5,04	98,81	98,81	98,84	98,81
19	5,04	98,81	98,81	98,84	98,81
20	5,02	98,82	98,82	98,85	98,82
21	5,00	98,82	98,82	98,85	98,82
22	4,98	98,84	98,84	98,87	98,84
23	4,98	98,85	98,85	98,88	98,85
24	5,08	98,82	98,82	98,85	98,82
25	5,00	98,85	98,85	98,88	98,85
26	4,96	98,85	98,85	98,88	98,85
27	4,92	98,85	98,85	98,88	98,85
28	4,94	98,85	98,85	98,88	98,85
29	4,93	98,87	98,87	98,90	98,87
30	4,91	98,87	98,87	98,90	98,87

According to Table 2, the model was effectively trained on each client throughout all rounds. The final global model demonstrated high performance, achieving an accuracy of 98.87%.

Conclusion and Recommendations

Federated Learning is a promising approach that enhances the efficiency of machine learning models while preserving user privacy. By enabling sensitive data to remain on the devices where it is generated, Federated Learning eliminates the need to transfer such data to a central server, thereby supporting the development of effective and privacy-aware intelligent systems. In this study, a Federated Learning environment was implemented using the CICIoT23 dataset. An artificial neural network model was trained locally on client devices, without transferring raw data to the central server. Instead, only model weights were aggregated on the server to construct the final global model. The experimental results demonstrate that the Federated Learning approach can achieve high performance—particularly in the context of cybersecurity for IoT devices, which are increasingly prevalent and inherently vulnerable to security threats.

For future work, it is recommended to explore Federated Learning in multi-class classification scenarios involving clients with non-uniform data distributions. Additionally, integrating various optimization techniques and comparing their impacts on model convergence and performance could further enhance the robustness and applicability of Federated Learning in real-world IoT environments.

HEALTH BEHAVIOR CHANGE IN NURSING PRACTICE: TRANSTHEORETIC MODEL APPROACH

HEMŞİRELİK UYGULAMALARINDA SAĞLIK DAVRANIŞI DEĞİŞİMİ: TRANSTEORETİK MODEL YAKLAŞIMI

ABSTRACT

The Transtheoretical Model (TTM) was developed by James Prochaska and Carlo DiClemente to explain the health-related behaviour change processes of individuals. This model offers a gradual approach by taking into account the readiness levels of individuals for behaviour change and differs from traditional 'all or nothing' based approaches in this respect. TTM is used effectively in many areas such as smoking cessation, starting physical activity and healthy nutrition. In this paper, the basic structure of the model, its effects on health behaviours and its application examples in nursing are discussed.

The model consists of five stages: 'not thinking, thinking, preparation, action and maintenance'. Intervention strategies are planned according to the attitudes and needs of the individual at each stage. The cognitive and behavioural processes offered by TTM are structured with variables such as increasing the individual's awareness, providing environmental regulations, activating social support systems and replacing unhealthy behaviours with healthy alternatives. In addition, the individual's self-efficacy level, incentive factors and decision-making mechanisms are also important components of the model.

When the literature is examined, it is seen that TTM is effective in the development of health behaviours at both individual and community level and is widely used in nursing practices, especially in areas such as smoking cessation, exercise, nutrition and health screenings. In this context, the model supports the counselling and training roles of nurses and provides a scientific basis for individual-specific, stage-based health promotion interventions.

Keywords: Transtheoretical Model, Behavior Change Stages, Health Promotion, Motivational Interviewing

1. Transteoretik Model

Transteoretik Model **(**TTM), 1982 yılında psikolog James Prochaska ve Carlo Diclemente tarafından geliştirilmiştir (Di Noia ve Prochaska, 2010; Prochaska, 1982). Son yıllarda pek çok hastalığın önlenmesi ve tedavisi için öncelikle sağlıksız davranışların değiştirilmesi gerektiğinin farkına varılmıştır (Bulduk ve ark., 2015). TTM'in kullanıldığı alanlar; sigarayı bırakma, egzersiz yapma, güneşten korunma, kanser, tip 2 diyabet, AIDS, osteoporoz, anoreksiya nevroza, prezervatif kullanımı, mamografi taraması, ilaç kullanımı, stres, madde bağımlılığını ve sağlıklı beslenme şeklinde sıralanmaktadır (Başakçı, 2019). Ayrıca model pek çok sağlıksız davranışa da uyarlanabilmektedir. Modele göre birey sağlıksız davranışını fark ettiği an davranış değişim süreci başlar ve sağlıklı davranışı kazanana kadar bu süreç devam eder. Sağlık davranış değişimi ile ilgili yapılan çalışmalarda TTM, Sosyal Bilişsel Teori, Planlı Davranış Teorisi, Sağlık İnanç Modeli gibi teori ve modeller kullanılmaktadır (Davies ve ark., 2010; Li ve ark., 2015; Plotnikof ve ark., 2013; Webb ve ark., 2010). Sağlık davranış modelleri içerisinde en yaygın olarak kullanılanı TTM'dir ve sağlık davranışı ile ilgili birçok alanda kolayca uygulanabilir (Dray ve Wade, 2012; Glanz ve ark., 2008; Jackson, 2007; Johonson ve ark., 2008). "Bu model diğer modellere göre neden önemli?" sorusu akla gelebilir. TTM'nin Sosyal Bilişsel Teori, Planlı Davranış Teorisi, Sağlık İnanç Modeli gibi modeller ile arasındaki ana fark, diğer modeller ya hep ya hiç olgusunu kullanarak sadece davranışsal ölçütleri açıklamak için geliştirilmiştir. TTM'nin gücü ya hep ya hiç olgusundan ziyade, dinamik olarak davranış değişimini ele almasından kaynaklanmaktadır (Marshall ve Biddle, 2001). Bir başka ifadeyle TTM, davranış değişimi için bireyin bulunduğu aşamanın hedef ve yaklaşımlarını kullanma olanağı sağlamaktadır. Diğer teoriler bu anlamda bireyin gereksinimlerini karşılamaktan uzaktırlar (Prochaska ve Velicer, 1997).

TTM'de bireyin davranış değişimi aşamalar halinde devam etmektedir. Modelin yapısında bu aşamalar şu şekilde açıklanmıştır. Bunlar; "düşünmeme, düşünme, hazırlık, hareket ve devam ettirme" aşamalarıdır (Prochaska ve Velicer, 1997). Bu aşamalar, bireyin sağlıksız davranışıyla ilgili olarak bireyin tutum, niyet ve davranışlarını yansıtmaktadır. Modelde bireyin değişimi için gerekli olan şey yine bireyin isteğine ve motivasyonuna bağlı gelişmektedir. TTM'de davranış değişiminde bireylerin başarısı, davranışı gerçekleştirip gerçekleştirmediğinden çok, içinde olduğu aşamanın değişimine göre değerlendirilir (Tosun ve Zincir, 2015).

Transteoretik Model'in yapısı üç aşamalıdır.

1. Değişim Aşamaları (zamanla ilgili boyut)

2. Değişim Süreci (bağımsız değişken boyutu)

3. Öz-etkililik/Teşvik Eden Faktörler/ Karar Alma Ölçekleri (değişimin düzeyleri) (Erol ve Erdoğan, 2008).

1.1. Değişim Aşamaları

Transteoretik modele göre sağlıksız davranışını sağlıklı davranışla değiştirmeye çalışan ve istekli olan her birey "düşünmeme, düşünme, hazırlık, hareket, sürdürme" aşamalarından geçer. Her aşamanın özellikleri birbirinden farklıdır. Davranış değişiminin gerçekleştirilmesi sürecinde danışman, her aşamaya özgü çeşitli teknikler ve stratejiler kullanmaktadır. Her aşama, bireyin sağlıklı davranışı elde edebilmek için gerekli olan ilgi, niyet ve motivasyon düzeylerini temsil eder. Motivasyon yöntemleri ise bireyin bir aşamadan başka bir aşamaya geçebilmesi için önemlidir. Birey genellikle ileri aşamaya geçme eğilimindedir. Ancak zaman zaman geri aşamaya dönme (relaps) durumu da olabilir. Bu durumun önüne geçmek için bireyin içinde bulunduğu aşama iyi değerlendirilmelidir. Her aşamaya özgü, uygun planlama ve

uygulama yapılmalıdır (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

1.1.1. Düşünmeme Aşaması

Bireyin gelecek altı ay içinde istenen davranışa yönelik değişme niyetinin bulunmadığı aşamadır. Bu aşamada olan birey zararlı davranışından habersiz olabilir, çok az farkında olabilir ya da farkında olup değişimi istemeyebilir. Birey geçmişte başarısız girişimlerde bulunmuş olabilir. Kişinin, engel algısı yüksektir ve pek çok engel öne sürebilir. Bu nedenle bu aşamadaki bireye daha çok farkındalığının arttırılması ve öne sürülen engellerin aşılmasına yönelik girişimler planlanmalıdır. Bu aşamadaki bireye harekete geçmesine yönelik girişimler uygulanırsa direnç gösterebilir (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

1.1.2. Düşünme Aşaması

Bireyin gelecek altı ay içerisinde sağlıklı davranışa başlama kararı aldığı aşamadır. Bu aşamadaki birey davranışı değiştirdiğinde elde edeceği yararların farkına varmıştır. Davranışlarıyla ilgili bilgi edinmeye daha açıktırlar. Ancak değişimi başlatma konusunda motive edilmesi ve güvenlerinin artırılması gereklidir. Bu aşamadaki birey yıllarca bu aşamada kalabilmektedir. Aşamadaki bireyler sıklıkla davranışı değiştirmek için ağırdan alma gibi eylemlerde bulunabilir (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

1.1.3. Hazırlık Aşaması

Bireyin yakın zamanda genellikle 30 gün içinde sağlıklı davranışa geçmeyi planladığı aşamadır. Bu aşamadaki birey genellikle davranışıyla ilgili sağlık eğitimine katılma, danışmanlık alma, davranışını değiştirmek için çeşitli kaynaklardan bilgi alma gibi planları vardır. Eylemleri düzenli ve etkin değildir. Aşamadaki bireye sağlıklı beslenme ve düzenli egzersiz için bir plan hazırlanmalıdır (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

1.1.4. Hareket Aşaması

Bireyin edinmiş olduğu sağlıklı davranışı altı aydan kısa süredir uyguladığı aşamadır. Birey zamanını, enerjisini harcayarak sağlıklı davranışı edinmiş ve uygulamakta olduğu aşamadır. Bu aşama kritiktir ve bir önceki aşamaya dönme olasılığı vardır. Aşamadaki bireye sağlıklı beslenme ve düzenli fiziksel aktivite uygulama planı yeniden gözden geçirilmelidir (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

1.1.5. Sürdürme Aşaması

Bireyin sağlıklı davranışı altı aydan uzun bir süredir yaptığı aşamadır. Sağlıklı davranışı devam ettireceği konusunda bireyin kendine olan güveni yüksektir. Bu aşamadaki bireye en önemli yaklaşım, stresle başa çıkma stratejilerinin öğretilmesidir. Bireyin geriye dönüşünü engellemek için çözüm (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

Şekil 1: Prochaska ve Di Clemente'nin Değişim Aşamaları Spiral Modeli (Prochaska ve ark, 1992)

1.2. Değişim Süreçleri

Değişim süreci, davranış değişiminin gerçekleştirilmesi sürecinde bireye danışmanlık yapan kişilerin, sorunlu davranışı değiştirmek için kullandıkları bilişsel ve davranışsal strateji ve teknikleri içermektedir. Böylece değişim süreçleri, davranış değişim sürecinde danışmana rehber niteliği de taşımış olur. Değişim süreçleri; beş bilişsel ve beş davranışsal olmak üzere toplam on süreçten oluşmaktadır (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

1.2.1. Bilişsel Süreçler

Bilinçlenme ya da farkındalığın artması: Bu süreçte birey sağlıksız davranışının neden olduğu sorunların farkına varmış, durumu kabullenmiş ve sağlıksız davranış hakkında yeni bilgi edinme ve geri bildirim verme çabası içerisine girmiştir.

Duygusal uyarılma: Bu süreçte birey sağlıksız davranışını başkası ile paylaşmakta ve kendisini duygusal 1olarak rahatlatmak istemektedir (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

Çevreyi yeniden değerlendirme: Bu süreçte birey sağlıksız davranışının fiziksel ve sosyal çevresini nasıl etkilediği üzerinde düşünmeye başlar ve kişisel alışkanlıkları ile çevresi arasındaki ilişkiyi bilişsel ve duygusal olarak değerlendirir (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

Kendini yeniden değerlendirme: Bu süreçte birey hayal gücünü kullanarak, rol model aldığı bireyleri düşünüp, kendini ve sağlıksız davranışını bilişsel ve duygusal açıdan değerlendirir (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

Sosyal özgürleşme ya da çevresel fırsatlar: Bu süreçte birey sağlıklı davranışı başlatma konusunda sosyal baskıdan uzaklaşmaya çalışır. Sosyal ve çevresel fırsatlar ve alternatiflerin farkına varır (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

1.2.2. Davranışsal Süreçler

Karşıt durum ya da yerine koyma: Bu süreçte birey sağlıksız davranışının yerine koyacağı sağlıklı davranışını öğrenmeye odaklanır (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

Destekleyici ilişkiler: Bu süreç bireyi destekleyen, bireye güven veren ve kabul gören ilişkileri içerir. Birey kendine güven veren kişilerin desteğini kabul eder. Bu kişiler genellikle bireye birinci dereceden yakındır (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

Güçlendirme (ödüllendirme): Ödül, sağlıklı davranış edinmeye çalışan birey için motivasyon kaynağıdır. Bu nedenle birey sağlıklı sağlanışını sürdürdüğü zamanlarda kendine ödül verir ve daha fazla güçlenir (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

Kendisi ile anlaşma: Bu süreç bireyin değişebileceğine olan inancını harekete geçirmesi ve uyum sağlamasıdır (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

Uyaranların kontrolü: Uyaran kontrolü, sağlıksız davranışa başlama riskini azaltmak ve daha sağlıklı alternatiflerle değiştirmek anlamına gelmektedir. Destek gruplarının oluşturulması ve gruba katılım, çevrenin düzenlenmesi gibi aktiviteler uyaran kontrolü içerisinde yer alır (Di Noia ve Prochaska, 2010; Menekli ve ark., 2019; Prochaska ve Di Clemente, 1982; Prochaska ve Velicer, 1997; Tosun ve Zincir, 2015).

Şekil 2. Değişim aşamaları ve değişim süreçleri eşleştirilmesi (Prochaska ve Velicer, 1997).

Birey, değişim aşamalarında ilerlerken, yaşadığı süreçleri belirten tablo yukarıdadır. Hangi değişim aşamasında, bireyin hangi süreçlerden geçtiğini bilmek, relapsı önlemek, zararlı baş etme yöntemlerinin geliştirilmesini önlemek ve patolojik tepkilerin farkına varılıp müdahale edilmesinin sağlanması gibi durumların tespitini kolaylaştırarak, bireyin davranış değişimini izlememize ve bireyin içinde bulunduğu aşama ve sürece özgü girişimlerde bulunmamıza olanak sağlar (Prochaska ve Velicer, 1997).

1.3. Değişim Seviyeleri

TTM, yapısında hassas değişimleri ölçebilen Öz Etkililik, Teşvik Eden Faktörler Ölçeği, Karar Alma Ölçeği gibi araçlar barındırır. Bu ölçeklerin diğerlerinden farkı, sadece sonucu değil, süreçteki ufak bilişsel, duygusal ve davranışsal değişimleri de hassas bir şekilde ölçebilmeleridir. Bu şekilde hemşirelik uygulamalarında, bireye özgü girişim planlamakta bizlere çok yardımları olmaktadır (Taş ve ark., 2016).

1.3.1. Öz-Etkililik

Öz-etkililik, insanların zorlayıcı durumlar karşısında problemli davranışa dönmeksizin, sağlıklı davranışı sürdürmede sahip olduğu güveni yansıtır (Koyun ve Eroğlu, 2016; Tosun ve Zincir, 2016).

Prochaska, Redding ve Evers (1997) öz etkililiği iki parçaya ayırmıştır (Koyun ve Eroğlu, 2016);

1. Kendine Güven: Bireyin belli bir davranışı başarı ile yapabileceğine ilişkin, kendisi hakkındaki inancıdır (Erol ve Erdoğan, 2007).

2. Teşvik Eden Faktörler: Bireylerin zorlayıcı durumlarla karşılaştıklarında eski alışkanlıklarına geri dönmelerini teşvik eden faktörlerin yoğunluğunu yansıtır (Erol ve Erdoğan, 2007).

Öz etkililik ölçeğinden alınan puanların yüksek olması, teşvik eden faktörlere rağmen baş edebilme gücünü ifade eder. Teşvik eden faktörler ölçeğinden yüksek puan alınması, eski davranışına yenik düşme ya da teşvik eden unsurlarının yüksek olduğunu gösterir (Erol ve Erdoğan, 2007).

1.3.2. Karar Alma

Janis ve Mann tarafından 1977'de geliştirilen Karar Alma; sağlıklı davranışın algılanan olumlu ve olumsuz yanlarının kıyaslandığı, aradaki dengenin ölçüldüğü basamaktır (Koyun ve Eroğlu, 2016; Tosun ve Zincir, 2016; Tümer ve ark., 2013). Karar alma ölçeği ise, davranış değişikliğinin yarar ve zarar algılarını ortaya koyar. Yarar, davranış değişiminin olumlu yönlerini, zarar ise davranış değişiminin olumsuz yönlerini yansıtır. Örneğin düşünmeme aşamasında, bireyin zarar algısı, her zaman yarar algısından daha ağır basar, düşünme aşamasına doğru ilerledikçe, yarar algısı artar (Erol ve Erdoğan, 2007; Koyun ve Eroğlu, 2016).

2. Transteoretik Model ve Hemşirelik

Hemşirelik mesleğinin doğası ve sorumlulukları arasında bireyin ve toplumun sağlığını koruma ve geliştirme yer almaktadır. Hemşireler bireyi bütüncül olarak değerlendiren ve tüm boyutları ile inceleyip bakım veren, diğer meslek gruplarıyla iş birliği yapabilen ve bireyin çevresel fırsatlarını değerlendirmesine yardımcı olan tek sağlık profesyonelidir. Bu nedenle bireyin sağlık eğitimi ve davranış değiştirmesinde, tüm basamaklarda etkin rol oynamaktadır (Öz Alkan, 2016). Hemşire, riskli gördüğü sağlık davranışlarını tespit eder, değerlendirir ve girişimlerini uygular. Bu nedenle davranış değişimi stratejilerini iyi bilmeli ve uygulayabilmelidir.

Davranış değişikliği, birçok hastalık için risk faktörü olabilecek riskli sağlık davranışlarının birincil önleme yöntemidir ve her birey için özel olmasının yanında karmaşık bir süreçtir. Bireylerin davranış değişikliği için kesin bir model tanımlanmamıştır. Ancak bireylerin davranış değişimine hazır olup olmadıklarını değerlendirmeden yapılan girişimlerin etkisinin düşük olduğu belirtilmiştir. TTM bireylerin değişime hazır olup olmadıklarını değerlendirmenin yanında değişimin hangi aşamasında olduklarını bilmeleri ve o alana özgü

girişim uygulayabilmeleri için hemşireler tarafından kullanılan bir modeldir. TTM birçok kez sağlığı geliştirmek adına hemşireler tarafından test edilmiştir (Karadağlı ve Nahcivan, 2012).

3. Transteoretik Model Literatür İncelemesi

Yapılan sistematik bir incelemede Tip 2 diyabet için Hemoglobin A1c seviyesinin azaltılmasında, diyetlerinin kontrolünde ve egzersize teşvik etmede TTM girişimlerinin etkili olduğu bildirilmiştir (Arafat ve ark., 2016). Yine ülkemizde yapılan bir çalışmada obez bireylerde bireysel olarak uygulanan TTM girişimlerinin fiziksel aktivite ve beslenme davranışında değişikliğin sağlanmasında etkili olduğu belirtilmiştir (Menekli ve ark., 2019). Sadece yetişkinler için değil çocuk ve adölesanlar için de uyarlanarak bisiklet kullanımı, sebze meyve tüketimi, sigara bırakma gibi konularda davranış değişikliği sağladığı ve yararlı bulunduğu belirtilmiştir (Erdem ve Erol, 2020; Erol ve Erdoğan, 2008; Gür ve ark., 2019; Robinson ve Vail, 2012). Sigara kullanan yetişkinler için TTM ölçekleri Türk halkı için geçerli ve güvenilir bulunmuş ve uygulamaları pek çok çalışmada kullanılarak yararlı olduğu belirtilmiştir (Akdeniz, 2019; Koyun ve Eroğlu, 2016; Koyun ve ark., 2015; Taş ve ark., 2016). Fakat yapılan bir sistematik derlemede hemşirelerin TTM kullanarak gerçekleştirdiği girişimlerde bilgi iletişim teknolojilerini yeteri kadar kullanmadıkları bulunmuş ve kişiye özel sağlık müdahaleleri gerçekleştirmek ve daha kolay erişim sağlamak için kullanımını teşvik etmiştir (Lee, Park ve Min, 2015). Sigara bırakma girişimleri için TTM, yetişkinler, adölesanlar, kalp hastaları, akciğer hastaları, gebeler, ebeveynler gibi pek çok farklı grup için kullanılmıştır. Nakamura ve arkadaşları (2004) 20-69 yaş arasındaki yetişkinlerle yaptıkları TTM temelli sigara bırakma girişimlerinin sonucunda, sigara bırakmaya hazır olanların yanında, sigarayı bırakmayı düşünmeyenler için de etkili olduğunu belirtmişlerdir (Nakamura ve ark., 2004). Aveyard ve arkadaşlarının (2006) 16 yaş üzeri gebe kadınlarla TTM kullanılarak yaptıkları girişimlerin sonucunda ise, TTM'nin hazırlık aşamasında olanlarda düşünmeme ve düşünme aşamalarındakilere oranla daha etkili olduğu belirtilmiştir (Aveyard ve ark., 2006). Yine Aveyard ve arkadaşlarının (2009) 18 yaş üstü yetişkinlerle yaptığı bir çalışmada, TTM temelli girişim ve materyallerin standart girişim ve materyallere göre daha etkili olduğunu belirtmişlerdir (Aveyard ve ark., 2009) Thyrian ve arkadaşları (2010) yetişkin gebe kadınlarla TTM temelli motivasyonel görüşmeler yaptıkları çalışmasının sonucunda, motivasyonel girişimin gebe kadınlarda doğru bir yaklaşım olamayabileceği ve bu grup için özel bir yaklaşım geliştirilmesi gerektiğinden bahsetmiştir (Thyrian ve ark., 2010). Bredie ve arkadaşlarının (2011) kardiyovasküler hastalığı olan kişilerle yaptıkları çalışmalarında, TTM temelli motivasyonel görüşmeyi yararlı bulmuştur ve girişim grubunun %26'sı sigarayı bırakmıştır (Bredie ve ark., 2011). Güngörmüş ve Erci'nin (2012) lise öğrencileri ile yaptıkları çalışmasında TTM temelli girişim uygulanan grubun sigara bırakma oranlarının ve aşamalarda ilerlemelerinin daha fazla olduğunu belirtmiştir (Güngörmüs ve Erci, 2012). Mujika ve arkadaşları (2014) 18 yaşından büyük hemşireler ile TTM temelli motivasyonel görüşmeler yaptıkları çalışmasının sonucunda, 15 kişiden 6'sının sigarayı bıraktığını bildirmiş ve motivasyonel görüşmenin sigara bırakmada etkili olduğunu belirtmişlerdir (Mujika ve ark., 2014). Koyun ve Eroğlu (2016) 20-49 yaş arasındaki gebelerle yaptığı çalışmasında ise, TTM temelli sigara bıraktırma eğitiminin gebelerde etkili olduğunu bulmuşlardır (Koyun ve Eroğlu, 2016). Çamözü (2017), 3-6 yaş çocuğu olan ebeveynlerde TTM temelli sigara bıraktırma eğitiminin etkili olduğunu bulmuştur (Çamözü, 2017). Çavuşoğlu (2018), KOAH tanılı 40 yaş üzeri bireyler ile yaptığı çalışmada ise, girişim grubunda, kontrol grubuna göre, sigara bırakma oranlarının yüksek olduğunu ve nikotin bağımlılık oranlarının azaldığını belirtmiştir (Çavuşoğlu, 2018). Khani Jeihooni ve arkadaşlarının (2019), İranlı erkekler ile yaptıkları sigara bırakma çalışmasında, TTM temelli 27 girişimlerin, sigarayı bırakma girişimlerinde artışla etkili olduğunu belirtmiştir (Khani Jeihooni ve ark., 2019).

HISTORY OF EVIDENCE-BASED NURSING PRACTICE

KANITA DAYALI HEMŞİRELİK UYGULAMALARININ TARİHÇESİ

ABSTRACT

In recent years, interest in evidence-based practices has gradually increased in order to improve the quality of health services and improve patient care. In this context, evidence-based practices (EBP) in the nursing profession have brought about an important paradigm shift with the effective use of scientific data in clinical decision-making processes. In this paper, the historical development of evidence-based nursing practices, the reasons for their emergence and their aims in practice are discussed.

Evidence-based nursing understanding has taken on a systematic structure with the scientific researches developed in the 20th century, starting with Florence Nightingale's observation-based practices in the battlefields. Especially the studies of Archibald Cochrane and David Sackett formed the theoretical basis of evidence-based health services. This approach, which has become widespread in the field of nursing since the 1990s, has turned into guiding practices in both academic and clinical settings.

Within the scope of this paper, the reasons for the development of evidence-based practices are examined within the framework of the increase in the cost of health services, the expansion of access to information, the change in patient expectations and the reconstruction of trust in health professionals. In addition, the effects of EBP in nursing on patient safety, quality of care, professional accountability and scientific development are evaluated.

In conclusion, evidence-based nursing practice is a holistic approach to improve not only individual patient care but also the overall effectiveness of health systems. In this context, equipping nurses with the knowledge and skills of EBP has become a fundamental requirement for sustainable health services.

Keywords: Evidence-Based Nursing, Clinical Decision-Making, Nursing Practice, Health Care Quality

Giriş

Hemşirelik mesleği, bilimsel bilgi ile insan merkezli bakımın bütünleştiği bir sağlık disiplini olarak, sağlık hizmetlerinde kritik bir role sahiptir. Bu bağlamda, hemşirelik uygulamalarının kanıta dayalı olarak yürütülmesi; bakım kalitesinin artırılması, hasta güvenliğinin sağlanması ve kaynakların etkin kullanımı açısından zorunlu hale gelmiştir (Melnyk & Fineout-Overholt, 2019). Kanıta dayalı hemşirelik (KDH), klinik kararların yalnızca kişisel deneyim ve geleneksel bilgilere değil, aynı zamanda sistematik olarak elde edilmiş bilimsel kanıtlar, klinik uzmanlık ve hasta değerlerinin bir arada değerlendirilmesiyle oluşturulması gerektiğini vurgulayan bir yaklaşımdır (Sackett et al., 1996).

Dünyada 1990'lı yıllardan itibaren yaygınlaşan KDH, Türkiye'de ise hemşirelik eğitiminin üniversite düzeyine taşınması ve lisansüstü programların açılmasıyla birlikte gelişim göstermiştir. Bu gelişimin önemli kilometre taşlarından biri, 1996 yılında kurulan Hemşirelikte Araştırma Geliştirme Derneği ve aynı adlı dergidir. Bu platform, hemşirelik araştırmalarını teşvik etmiş ve bilimsel bilginin uygulamaya aktarılmasını desteklemiştir (Seçkinli, 2015). Türkiye'de KDH terimi literatüre ilk kez Platin (2000) tarafından kazandırılmış, ardından Kara ve Babadağ'ın (2003) çalışmaları ile kavramsal çerçevesi oluşturulmuştur. Bu çalışmalar, KDH'nin yalnızca akademik bir yaklaşım değil, mesleki sorumluluk haline gelmesi gerektiğini vurgulamıştır.

KDH'nin yasal zemini ise 2010 yılında yayımlanan Hemşirelik Yönetmeliği ile güçlenmiştir. Yönetmeliğin 6. maddesinde, hemşirelerin birey, aile ve toplumun sağlıkla ilgili ihtiyaçlarını belirlemesi, bu ihtiyaçlar doğrultusunda kanıta dayalı bakım planlaması, uygulaması ve değerlendirmesi gerektiği açıkça belirtilmiştir (Resmî Gazete, 2010). Ayrıca 2011 yılında Dokuz Eylül Üniversitesi'nde Hemşirelik Araştırma ve Uygulama Birimi'nin kurulması, KDH'nin kurumsallaşmasına yönelik önemli bir adım olmuştur (Aslan & Pekince, 2019). Bu bildiride, Türkiye'de KDH uygulamalarının tarihsel gelişimi ayrıntılı biçimde incelenecek; kavramın kuramsal temelleri, literatürdeki gelişimi, mevzuatsal düzenlemeler ve kurumsal uygulama örnekleri üzerinden, hemşirelik uygulamalarındaki dönüşüm değerlendirilecektir. Böylece, mesleki karar süreçlerinde kanıt kullanımının neden ve nasıl zorunlu hale geldiği tarihsel bağlamda analiz edilecektir.

Kanıt Temelli Hemşirelik Uygulamasının Dünya'da Tarihçesi

1909-1988 yılları arasında yaşamış İskoç bilim insanı, Modern Klinik Epidemiyolojinin babası olarak bilinen Archibald Leman Cochrane, 2. Dünya Savaşında esir düşmüş ve Selanik'te esir kamplarında hekimlik yapmıştır. Bu dönemde yaptığı tedavilerde tedavinin yetersizliği, gereksiz müdahalelerin hastaların hayatını riske atabileceği konuları üzerinde durmuş ve bu durum ona rahatsızlık vermiştir. Bu düşüncelerden yola çıkarak bilimsel araştırmalar konusuna odaklanmıştır. Bu gelişmelerden sonra Kanıta Dayalı Uygulama (KDU), başlangıçta tıp uygulamalarında kullanılmış ve ardından Kanıta Dayalı Tıp (KDT) kavramı ortaya çıkmıştır. İlerleyen süreçte KDT, çeşitli otoriteler tarafından KDU ya da Kanıta Dayalı Sağlık Bakımı (KDSB) olarak kullanılmaya başlanmıştır (Mackey ve Bassendowski, 2017; Sur ve Dahm, 2011).

KDT uygulamalarının ilk olarak 19. Yüzyılda Paris'te başladığı düşünülmektedir. Benzer hastalık tablolarına farklı tedavi yaklaşımları uygulayan hekimler; istedikleri sonuçlara ulaşamamışlardır. Sonuçta bireysel yaklaşımlarına karşı olarak istatistiksel analizlere ve daha önce elde edilen verilere dayanan KDT kavramı gelişmiştir (Claridge & Fabian, 2005)

Cochrane sunulan sağlık hizmetinin; hastaların yararına, hakkaniyetli, uygun maliyetli olması gerektiğine inanıyordu. 1972 yılında yayınladığı "Effectiveness and Efficiency (Etkinlik ve Verimlilik)" isimli kitabında Randomize Kontrollü çalışmaların bu amaca ulaşmak için en iyi yöntem olduğunu savunmuştur. (Cochrane, 1971) Daha sonraki yıllarda bu savunmasını daha ileriye taşımış ve pek çok randomize kontrollü çalışmadan elde edilen sonuçların eleştirel olarak değerlendirilmesiyle daha iyi sonuçlar elde edilebileceğini öne sürmüştür (Shah & Chung, 2009).

KDU kavramı birçok yönü ile "Araştırma Temelli Uygulama" (research based practice) ile bağlantılıdır (Kocaman, 2003). İngiltere'de 1970'li yılların başında hemşirelik araştırmalarında önemli bir ivme katedilmiş ve bu hususta "Briggs Report'ta" yer alan önerilerin etkisi olmuştur. "Briggs Report'ta" İngiliz hemşireliğinin araştırma temelli meslek olmasını önermektedir (Chapman, 1973). Bu yüzden 1970'li yılların ortalarından sonra kaleme alınan hemşirelik araştırmalarının sayısında önemli artışlar olmuştur. Fakat, yapılan araştırmalarda elde edilen sonuçlarının hemşirelik uygulamalarında kullanılma yetersizliği yoğun bir şekilde sıkıntı yaratmaya başlamıştır (French, 2002).

Aslında KDU, 1800'lerde Florence Nightingale'den, 1970'lerin başlarında kanıta dayalı tıp hareketine ve 1990'ların sonunda hemşirelik mesleğine doğru evrilmiştir (Mackey & Bassendowski, 2017). Florence Nightingale'nin 1850-1860'lı yıllarda hemşireliği geliştirmek, ölüm oranlarını azaltmak ve sağlığı geliştirmek amacıyla yaptığı çalışmalar; araştırmalara, uygulamalara temel olma özelliği taşımaktadır. Kırım savaşındaki tecrübesinden sonra, yaptığı birçok kanıta dayalı uygulama girişimleri ile hasta sonuçlarına etkisini incelemiştir (Mackey & Bassendowski, 2017). Nightingale'nin o dönemde güçlü kanıtlarla hasta sonuçlarının iyileştirme kavramını başlattığı kabul edilmektedir (Karabulut ve ark., 2019; Mackey & Bassendowski, 2017). İlk kez 1859'da yayınlanan "Hemşirelik Üzerine Notlar" isimli kitabında, deneye ve gözleme dayalı bilgilerden bahsetmiştir. Kanıta dayalı uygulama teriminin o dönemde tanınmamasına rağmen Nightingale, eleştirel inceleme ve deneyler yöntemleriyle saptanan kanıtları kullanılmaktaydı. Dönemin hemşireleri için "Hemşirelik Üzerine Notlar" kitabı, en iyi klinik uygulama kılavuzu olarak kabul edilmiştir (Karabulut ve ark., 2019; Katowa-Mukwato ve ark., 2021; Mackey & Bassendowski, 2017). Nightingale hemşirelik disiplini için kanıta dayalı uygulamanın öncüsüdür (Katowa-Mukwato ve ark., 2021; Mackey & Bassendowski, 2017). Fakat Nightingale'nin kanıta dayalı uygulamalar hakkındaki fikirleri 20. yy başlarına kadar hemşirelikte yer almamıştır (Berman ve ark., 2016). 1900'lü yıllarda halen birçok hemşirelik uygulamasının deneyim, sağduyu, gelenek, sezgi ve test edilmemiş teorilere dayandığı söylenmektedir (French, 1999; Kara ve Babadağ, 2003).

Dünya Sağlık Örgütü (DSÖ) 1948 yılında sağlıkta birlik ve "Herkes İçin Sağlık" amacıyla hizmet vermeye başlayarak sağlıkta düşünmeyi ve uygulama yapmayı sağlamıştır (Mahler, 1988). Çoğunluğunu geleneksel uygulamaların oluşturduğu 1960'lı yıllarda sağlık hizmetlerinde yaşanan mali sıkıntılar, artan tıbbi hataların yanı sıra gelişen teknoloji, ulaşılan bilgi miktarı gibi etmenler kalıcı değişikliklere gidilmesi gerekliliğini ortaya çıkarmış bu konu yavaş yavaş önemini artırmıştır. Hemşirelikte araştırma kavramına ilk kez Ketefian'ın çalışmalarında rastlanılmış, ayrıca 1970'li yıllarda araştırma ve uygulama adına "Conduct and Utilization of Research in Nursing" (CURN) ve "Wester Interstate Commission for Higher Education in Nursing" (WICHEN) gibi projeler başlatılmıştır. KDU, Cochrane'ın 1970'li yılların başında bakım kararlarının fikir veya deneyimlerden ziyade, kanıta dayalı olmasının gerekliliğini belirtmesi ile başlamıştır (Arslan Yürümezoğlu ve Kocaman, 2008; Erişen ve ark., 2019; Evcimen ve İşcan Ayyıldız, 2019; Karabulut ve ark., 2019; Taş Arslan ve Çelen, 2018; Seçkinli, 2015). Temel hemşirelik araştırmalarının ve klinik hemşirelik araştırmalarının

yapılması ve bulguların yayılması, ulusal düzeyde hemşirelik araştırmalarının görünür olmasının sağlanması amacıyla ABD'de "Hemşirelik Araştırmaları Ulusal Merkezi (National Center for Nursing Research- NCNR)" 1985 yılında kurulmuştur. Yine aynı yıl hemşirelikte araştırma kullanımı ve geliştirilmesine yönelik ilk rehberler ICN tarafından yayınlanmıştır (Karabulut ve ark., 2019). "David Sackett'in" 1990'ların başında ilaç seçiminde KDU'yu önermesi, KDU'ların asıl başlangıcı olarak kabul edilmektedir (Sur ve Dahm, 2011). Terimin literatürde kullanımı 1992 yıllarında olmuş, 1993 yılında İngiltere'de ise sağlıkla ilgili kararlar almak için yüksek kalitedeki bilgileri kullanmak isteyen herkesin ulaşabilmesini, kanıt üreten, kanıtları ulaşılabilir kılmak gibi hedefleri olan Cochrane Kurumu (Cochrane Collaboration) kurulmuştur (Chalmers, 1993; Cullum ve ark., 2007; Suçin, 2006). Zamanla dünyada hemşirelik alanında da kullanımı hızlanmış ve 1996 yılında hemşire kurucusu olduğu bilinen dünyanın en büyük araştırma odağı olan Joanna Bridggs Enstitüsü (JBI) kurulmuştur ve yayınlanan raporlarında araştırma temelli hizmetin önemi vurgulanmıştır (Joanna Briggs Institute, 2003; Zhou ve ark., 2016). Sonrasında ise kurum örneklerine İngiltere, Kanada, ABD, Almanya, Yeni Zelanda ve Avustralya gibi ülkelerde de rastlanmıştır. Bu kurumlarda eğitim programları düzenlenip, sistematik incelemeler ve KDU rehberleri oluşturulmuştur (Kathleen, 2013; Kocaman, 2003; Melynk ve ark., 2008; Petushek ve ark., 2019). Teknolojinin gelişmesi ise kurumsallıktan online hizmete geçişi artırmış ve daha ulaşılabilir olma yolunu açmıştır. 1998'de Kanıta Dayalı Hemşirelik Dergisi yayınlanmaya başlamış, Yeni Zelanda, Kanada ve İngiltere'de KDH merkezleri kurulmuştur (Kara ve Babadağ, 2003; Kocaman, 2003). Avrupa'da Stetler ve Marram klinik araştırmaların iyileştirilmesi, hemşirelikte araştırma kullanımı, araştırma bulgularının uygulamaya aktarılması amacıyla ilk hemşirelik modelini geliştirmiş, bu model birçok hemşireye klinik kılavuz olmuştur (Karabulut ve ark., 2019; Stetler, 2001; Şenyuva, 2016).

Hollanda'da 2012 yılında Hollandalı Profesyonel Hemşireler Standardı yayımlanmış, Martini Hastanesi'nde "Hemşireler için Kanıta Dayalı Uygulama" eğitimi oluşturulmuştur (van der Goot ve ark., 2018). KDH'ye dikkat çekebilmek adına "Uluslararası Hemşireler Birliği" (ICN) de 2012 yılı temasını "Kanıttan Eyleme" olarak belirlemiştir (Türk Hemşireler Derneği, 2012). 2005 yılında KDH enstitüsü olarak açılıp Joanna Briggs Instıtute (JBI) modeli olarak bilinen kanıta dayalı sağlık hizmeti modeli herkes tarafından kullanılmaya başlanmış bu model yönetim kurulu kararı ile bir dizi değişimler geçirmiş 2016 yılında güncellenmiştir. (Joanna Briggs Institute, 2003). KDU gerek tıbbi hatalar gerek SBH maliyeti gerekse kişilerin kaliteli SBH istemesinden kaynaklı son 20 yılda önem kazanmış, dikkat çekebilmek adına çalışmalar yapılmış, kılavuzlar geliştirilmiş, bilimsel toplantılar düzenlenmiştir (Aslan, 2018; Karabulut ve ark., 2019; Katowa-Mukwato ve ark., 2021).

1.1.Kanıt Temelli Hemşirelik Uygulamalarının Türkiye'de Tarihçesi

Kanıta dayalı hemşirelik uygulamaları (KDH), dünya genelinde olduğu gibi Türkiye'de de hemşirelik mesleğinin profesyonelleşme süreciyle birlikte gelişmeye başlamıştır. Türkiye'de bu sürecin başlangıcı, özellikle 1960'lı yıllarda hemşirelik eğitim sisteminde yaşanan yapısal değişimlerle birlikte ivme kazanmıştır. Bu dönemde hemşirelik eğitiminin lise düzeyinden üniversite düzeyine taşınması, mesleki eğitimin bilimsel temeller üzerine inşa edilmesine olanak sağlamıştır. 1980'li yıllardan itibaren ise hemşirelikte lisansüstü eğitim programlarının açılması, hemşirelikte araştırma kültürünün gelişmesine ve bilimsel bilgi üretiminin artmasına katkı sağlamıştır. Bu bağlamda, akademik gelişmeler, hemşirelerin klinik kararlarında bilimsel kanıtları temel almalarını teşvik etmiş ve kanıta dayalı uygulamaların altyapısını hazırlamıştır.

Türkiye'de kanıta dayalı uygulama (KDU) kavramı hemşirelik literatürüne ilk olarak 2000'li yıllarda Platin'in (2000) çalışmalarıyla girmiştir. Platin'in bu öncü çalışmaları, KDU'nun

Türkiye'deki hemşirelik terminolojisine kazandırılması açısından önemlidir. Kısa bir süre sonra Kara ve Babadağ (2003) tarafından yayımlanan "Kanıta Dayalı Hemşirelik" başlıklı makalede ise kavramın temel tanımı yapılmış, kuramsal çerçevesi çizilmiş ve klinik uygulamalarda kullanımına dair örnekler sunulmuştur. Aynı yıl Kocaman (2003) da benzer şekilde KDH'nin kuramsal yönüne ilişkin katkılar sunmuş ve kavramın uygulamadaki yerini tartışmaya açmıştır. Bu akademik girişimler, KDH'nin Türkiye'de anlaşılması ve yaygınlaşması açısından mihenk taşı niteliğindedir. KDH'nin kurumsal düzeyde tanınması ve mesleki sorumluluk haline gelmesi ise 2010 yılında yürürlüğe giren Hemşirelik Yönetmeliği ile yasal bir zemin kazanmıştır. Yönetmeliğin 6. maddesinde şu ifade yer almaktadır: "Her ortamda bireyin, ailenin ve toplumun hemşirelik girişimleri ile karşılanabilecek sağlıkla ilgili ihtiyaçlarını belirler ve hemşirelik tanılama süreci kapsamında belirlenen ihtiyaçlar çerçevesinde hemşirelik bakımını kanıta dayalı olarak planlar, uygular, değerlendirir ve denetler" (Hemşirelik Yönetmeliği, 2010). Bu düzenleme, kanıta dayalı uygulamaların yalnızca akademik bir ideal değil, aynı zamanda mesleki bir zorunluluk haline geldiğini göstermektedir.

KDH'nin sistematik biçimde kurumsallaşması ise 2011 yılında Dokuz Eylül Üniversitesi'nde kurulan Hemşirelik Araştırma ve Uygulama Birimi ile somut hale gelmiştir. Bu birim, Hemşirelik Fakültesi ile Hemşirelik Hizmetleri Müdürlüğü iş birliğinde kurulmuş olup; amacı, hastane ortamlarında kanıta dayalı uygulamaların entegrasyonunu sağlamak, hemşirelerin araştırma okuryazarlığını geliştirmek ve klinik kararlarında bilimsel verileri kullanmalarını teşvik etmektir. Bu merkez aynı zamanda, akademi ve saha arasında güçlü bir köprü kurarak, araştırma bulgularının bakım hizmetlerine yansıtılmasını mümkün kılmıştır (Aslan & Pekince, 2019). Bu gelişmeler, Türkiye'de hemşirelik uygulamalarının geleneksel bilgiye dayalı tutumlardan uzaklaşarak, sistematik literatür taramalarına, klinik rehberlere, meta-analiz ve randomize kontrollü çalışmalar gibi yüksek düzeydeki bilimsel kanıtlara dayalı hale gelmesini sağlamıştır. Nitekim Skela-Savič ve arkadaşlarının (2020) belirttiği gibi, kanıta dayalı uygulamaların yaygınlaşması, hemşirelerin klinik kararlarda daha özgüvenli davranmasını sağlamakta ve bakım kalitesini artırmaktadır (Skela-Savič ve ark., 2020). Sonuç olarak, Türkiye'de KDH uygulamaları, hemşirelik eğitimi ve mevzuatındaki değişimlerle desteklenmiş; akademik üretkenlik ve kurumlar arası iş birlikleri ile profesyonel bir boyuta taşınmıştır. Bugün gelinen noktada, kanıta dayalı hemşirelik yalnızca bir ideal değil, mesleğin temel dayanaklarından biri haline gelmiştir.

Sonuç

Kanıta dayalı hemşirelik uygulamaları, modern sağlık hizmetlerinin kalite, güvenlik ve etkililik ilkeleri doğrultusunda şekillenmesinde kilit bir rol oynamaktadır. Hemşirelik mesleğinin bilimsel temellere dayalı biçimde kurumsallaşması ve meslek etiğiyle bütünleşmesi, kanıt kullanımını yalnızca bir tercih değil, aynı zamanda profesyonel bir zorunluluk haline getirmiştir. Türkiye'de bu sürecin gelişimi, hem eğitim sistemindeki dönüşümler hem de yasal düzenlemeler ile desteklenmiş; akademik çalışmalar ve kurumsal uygulama örnekleri sayesinde giderek yaygınlaşmıştır. 1960'lı yıllardan itibaren yükseköğretime taşınan hemşirelik eğitimi, 1990'lı yıllarda lisansüstü programlarla güç kazanmış; bilimsel araştırma kültürüyle birlikte kanıta dayalı düşünme biçiminin temelini oluşturmuştur. 1996 yılında kurulan Hemşirelikte Araştırma Geliştirme Derneği ve dergisi, bilimsel üretimin uygulamaya aktarılmasına önemli katkılar sunmuştur. Türkiye'de KDH terimi ilk kez 2000'li yıllarda literatüre girmiş; Platin'in öncü çalışmaları ile başlayan bu süreç, Kara ve Babadağ'ın kuramsal katkılarıyla şekillenmiştir. 2010 yılında yayımlanan Hemşirelik Yönetmeliği ise, kanıta dayalı bakımın yasal bir zorunluluk olduğunu açıkça ifade ederek, bu yaklaşımı mesleki sorumluluk haline getirmiştir.

2011 yılında Dokuz Eylül Üniversitesi'nde kurulan Hemşirelik Araştırma ve Uygulama Birimi, KDH'nin kurumsallaşmasında önemli bir dönüm noktası olmuş; akademi-saha iş birliğinin güçlendirilmesiyle klinik kararların bilimsel veriye dayandırılması yönünde model oluşturmuştur. Bu gelişmeler, hemşirelik mesleğinin yalnızca uygulayıcı değil, aynı zamanda bilimsel bilgi üretici ve yorumlayıcı bir rol üstlenmesini sağlamıştır. Günümüzde hemşirelik uygulamalarında en güncel bilimsel kanıtların sistematik biçimde kullanılması, hasta merkezli bakımın kalitesini doğrudan artırmakta ve klinik güvenliği sağlamaktadır. Bu bağlamda, KDH'nin yalnızca tarihsel bir gelişim çizgisi değil, aynı zamanda mesleki kimliğin dönüşüm süreci olduğu anlaşılmaktadır. Türkiye'de bu yaklaşımın sürdürülebilirliği için hem hemşirelik müfredatlarının kanıt temelli eğitim anlayışıyla yeniden yapılandırılması, hem de klinik alanda çalışan hemşirelerin sürekli mesleki gelişimlerinin desteklenmesi gerekmektedir. Kanıta dayalı uygulamalar, hemşirelik mesleğinin geleceğinde bilgi, değer ve bakımın bütünleştiği etik ve bilimsel bir yol haritası sunmaktadır.

ABSTRACT

Timely and accurate detection of plant pathogens is critical to global food security and sustainable agriculture. Traditional diagnostic approaches, though widely used, are often limited by their low sensitivity, specificity, and inability to detect pathogens at early stages. Next-generation molecular diagnostics have revolutionized plant pathology by enabling rapid, specific, and highly sensitive detection of diverse plant pathogens. This review explores the evolution and application of advanced molecular tools, including PCR, qPCR, LAMP, and next-generation sequencing (NGS), as well as emerging technologies such as CRISPR-Cas-based diagnostics and portable biosensors. Integration of isothermal amplification with CRISPR-Cas12a/13 systems has demonstrated significant promise for field-deployable assays. Additionally, AI-driven platforms and lab-on-a-chip innovations are expanding the accessibility and efficiency of diagnostic practices. The application of these tools in disease surveillance, quarantine management, and resistance breeding underscores their growing importance in modern agriculture. Despite ongoing challenges such as high costs, sample preparation limitations, and the need for skilled personnel, future advancements in multiplexing, automation, and affordability are expected to broaden their global impact. This review highlights the current landscape, recent breakthroughs, and future trajectories of molecular diagnostics in plant disease detection, offering a roadmap for enhancing crop protection and biosecurity.

Keywords: Molecular diagnostics, Plant pathogens, CRISPR-Cas, Sustainable agriculture, Field diagnostics, Precision agriculture.

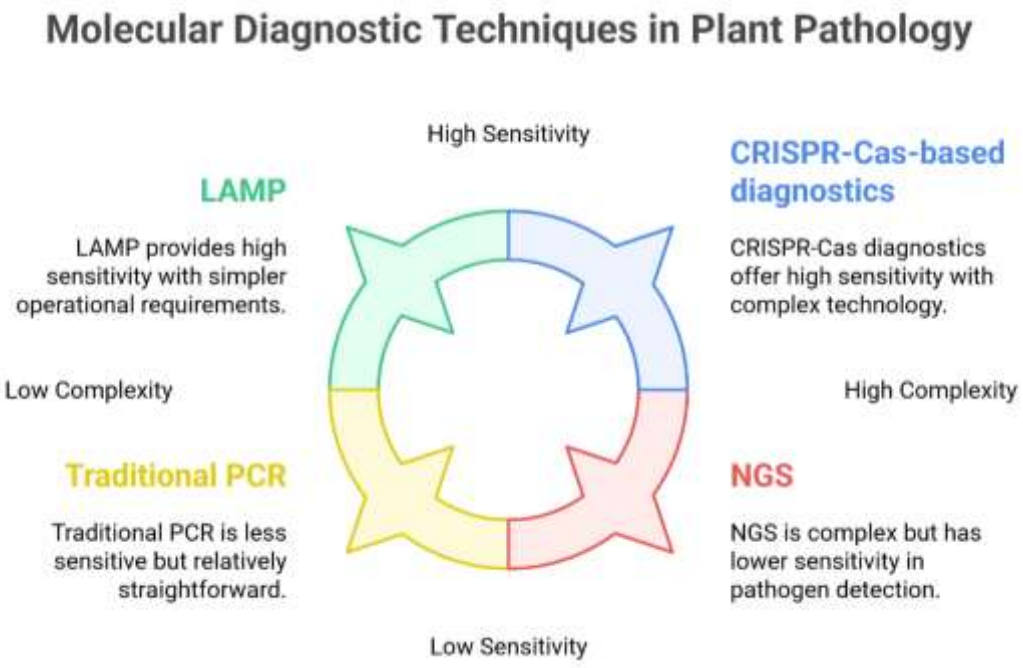
BİTKİ PATOJENLERİNİN TESPİTİ İÇİN YENİ NESİL MOLEKÜLER TEŞHİS: YENİLİKLER, UYGULAMALAR VE GELECEK PERSPEKTİFLERİ

ÖZET

Bitki patojenlerinin zamanında ve doğru tespiti, küresel gıda güvenliği ve sürdürülebilir tarım için kritik öneme sahiptir. Geleneksel teşhis yaklaşımları, yaygın olarak kullanılmalarına rağmen, genellikle düşük hassasiyetleri, özgüllükleri ve patojenleri erken aşamalarda tespit edememeleri ile sınırlıdır. Yeni nesil moleküler teşhis yöntemleri, çeşitli bitki patojenlerinin hızlı, spesifik ve son derece hassas bir şekilde tespit edilmesini sağlayarak bitki patolojisinde devrim yaratmıştır. Bu derlemede PCR, qPCR, LAMP ve yeni nesil dizileme (NGS) gibi gelişmiş moleküler araçların yanı sıra CRISPR-Cas tabanlı teşhis ve taşınabilir biyosensörler gibi yeni teknolojilerin gelişimi ve uygulamaları incelenmektedir. İzotermal amplifikasyonun CRISPR-Cas12a/13 sistemleri ile entegrasyonu, sahada konuşlandırılabilir testler için önemli bir umut vaat etmiştir. Ayrıca, yapay zeka odaklı platformlar ve çip üzerinde laboratuvar inovasyonları, teşhis uygulamalarının erişilebilirliğini ve verimliliğini artırmaktadır. Bu araçların hastalık gözetimi, karantina yönetimi ve direnç ıslahında uygulanması, modern tarımda artan önemlerinin altını çizmektedir. Yüksek maliyetler, numune hazırlama sınırlamaları ve kalifiye personel ihtiyacı gibi süregelen zorluklara rağmen, gelecekte çoklama, otomasyon ve satın alınabilirlik alanlarındaki ilerlemelerin küresel etkilerini genişletmesi beklenmektedir. Bu derleme, bitki hastalıklarının tespitinde moleküler teşhisin mevcut durumunu, son atılımları ve gelecekteki yörüngelerini vurgulayarak, mahsul korumasını ve biyogüvenliği artırmak için bir yol haritası sunmaktadır.

Anahtar Kelimeler: Moleküler teşhis, Bitki patojenleri, CRISPR-Cas, Sürdürülebilir tarım, Arazi teşhisi, Hassas tarım.

GRAPHICAL ABSTRACT



1. INTRODUCTION TO MOLECULAR DIAGNOSTICS IN PLANT PATHOLOGY

Plant diseases significantly impact global agriculture, leading to substantial economic losses and threatening food security. Traditional diagnostic methods, such as visual inspections and culture-based techniques, often lack sensitivity and specificity, resulting in delayed or inaccurate pathogen identification. Molecular diagnostics have emerged as powerful tools, offering rapid, sensitive, and specific detection of plant pathogens (Donoso and Valenzuela, 2018). These techniques enable early intervention, reducing the spread of diseases and minimizing crop losses.

Polymerase Chain Reaction (PCR) and its variants have been widely adopted for detecting a broad range of plant pathogens (Shahrajabian and Sun, 2024). However, PCR-based methods require sophisticated equipment and trained personnel, limiting their field applicability. Isothermal amplification techniques, such as Loop-mediated Isothermal Amplification (LAMP), have addressed some of these limitations by enabling rapid amplification at a constant temperature, facilitating on-site diagnostics. Recent advancements have introduced CRISPR-based diagnostics, leveraging the specificity of CRISPR-Cas systems for nucleic acid detection (Hassan et al., 2025). These systems offer high sensitivity and specificity, with potential for point-of-care applications. Integration of CRISPR diagnostics with isothermal amplification methods has further enhanced their utility in field settings. The convergence of molecular diagnostics with digital technologies and artificial intelligence (AI) is poised to revolutionize plant disease management (Wei et al., 2024). AI-driven analysis of diagnostic data can improve accuracy, reduce interpretation time, and facilitate large-scale disease surveillance. These innovations underscore the importance of molecular diagnostics in modern agriculture.

2. CURRENT MOLECULAR DETECTION TECHNIQUES

Molecular detection techniques have transformed plant pathology by enabling precise identification of pathogens at the genetic level (Zanatta et al., 2025). PCR remains a cornerstone method, allowing amplification of specific DNA sequences for pathogen detection. Quantitative PCR (qPCR) and Reverse Transcription PCR (RT-PCR) have enhanced sensitivity and enabled quantification of pathogen load (Wang et al., 2024). Despite their advantages, PCR-based methods require thermal cyclers and are susceptible to inhibitors present in plant tissues. Isothermal amplification techniques, such as LAMP, have addressed these challenges by operating at a constant temperature, eliminating the need for complex equipment. LAMP assays have been developed for various pathogens, including Phytophthora infestans and Pseudomonas syringae, demonstrating high sensitivity and specificity. Recombinase Polymerase Amplification (RPA) is another isothermal method that enables rapid DNA amplification at low temperatures (Kurbatov et al., 2024). RPA has been combined with lateral flow assays for field-deployable diagnostics. DNA microarrays and hybridization-based methods allow simultaneous detection of multiple pathogens but are limited by their complexity and cost.

Next-Generation Sequencing (NGS) offers comprehensive analysis of plant microbiomes, facilitating the identification of known and novel pathogens (Hima Parvathy et al., 2024). However, NGS is resource-intensive and requires bioinformatics expertise. Advancements in portable sequencing technologies are making NGS more accessible for field applications. Overall, current molecular detection techniques provide a robust framework for pathogen identification, with ongoing innovations enhancing their applicability and efficiency.

3. EMERGING AND ADVANCED TECHNOLOGIES

Emerging technologies are pushing the boundaries of plant pathogen diagnostics, offering unprecedented sensitivity, specificity, and speed. CRISPR-based diagnostics have garnered significant attention, utilizing the programmable nature of CRISPR-Cas systems for nucleic acid detection (Jaybhaye et al., 2024). Systems like SHERLOCK and DETECTR employ Cas enzymes to recognize specific DNA or RNA sequences, triggering a detectable signal. CRISPR diagnostics have been applied to detect various plant pathogens, including viruses and fungi. For instance, a CRISPR-Cas12a-based assay was developed for rapid detection of *Phytophthora nicotianae*, demonstrating high sensitivity and specificity (Zang et al., 2024). Similarly, a LAMP-CRISPR-Cas12a integrated assay was established for *Xylella fastidiosa* detection, enabling field-deployable diagnostics.

Biosensors and lab-on-a-chip technologies are also emerging as powerful tools for plant pathogen detection (Lu et al., 2024; Nagaraju et al., 2024). These devices integrate microfluidics, optics, and electronics to perform complex analyses on a compact platform. They offer rapid, sensitive, and multiplexed detection capabilities, suitable for on-site applications. The integration of AI with molecular diagnostics is enhancing data analysis and interpretation (Sheikh et al., 2024). AI algorithms can process complex datasets, identify patterns, and provide actionable insights, facilitating real-time decision-making in disease management. These advancements are paving the way for precision agriculture and improved plant health monitoring.

4. APPLICATIONS IN AGRICULTURE AND DISEASE SURVEILLANCE

The application of molecular diagnostics in agriculture has significantly improved disease surveillance and management. Rapid and accurate detection of pathogens enables timely interventions, reducing crop losses and improving yield. Field-deployable diagnostics, such as CRISPR-based lateral flow assays, have been successfully used to detect pathogens like *Puccinia striiformis* and *Magnaporthe oryzae* in wheat (Dhavale et al., 2025). These tools facilitate on-site testing, allowing farmers and agronomists to make informed decisions promptly. Integration with mobile devices and cloud-based platforms enhances data collection and sharing, supporting large-scale disease monitoring. Such systems contribute to early warning networks and coordinated responses to disease outbreaks. Molecular diagnostics also play a crucial role in quarantine and biosecurity measures (Raji and Aliyu, 2025). Sensitive detection methods are essential for identifying and managing quarantine pathogens, preventing their spread across regions. For example, CRISPR-Cas12a-based assays have been developed for detecting *Phytophthora ramorum*, a pathogen of significant quarantine concern. In breeding programs, molecular diagnostics assist in selecting disease-resistant cultivars by identifying specific genetic markers. This accelerates the development of resilient crop varieties, enhancing food security. Overall, the integration of molecular diagnostics into agricultural practices is transforming plant disease management and surveillance.

5. CHALLENGES, INNOVATIONS, AND FUTURE DIRECTIONS

Despite significant advancements, several challenges hinder the widespread adoption of molecular diagnostics in plant pathology. High costs, technical complexity, and the need for specialized equipment limit accessibility, particularly in resource-constrained settings. Efforts are underway to develop cost-effective, user-friendly diagnostic tools suitable for field use. Sample preparation remains a bottleneck, as plant tissues often contain compounds that inhibit nucleic acid amplification. Simplifying and standardizing extraction protocols is essential for reliable diagnostics. Advancements in direct detection methods and inhibitor-resistant enzymes are addressing these issues. Multiplexing capabilities are crucial for detecting multiple pathogens simultaneously. While CRISPR-based diagnostics offer high specificity, their multiplexing potential is currently limited. Research is focused on developing strategies to expand multiplexing, such as using orthogonal Cas enzymes and engineered guide RNAs.

Integration with AI and digital technologies holds promise for enhancing diagnostic accuracy and scalability. AI-driven platforms can automate data analysis, reduce human error, and facilitate real-time disease monitoring. Additionally, portable and connected devices enable rapid data sharing and coordinated responses to disease outbreaks. Future directions include the development of universal diagnostic platforms capable of detecting a wide range of pathogens with minimal user intervention. Emphasis on sustainability, affordability, and accessibility will drive innovations, ensuring that molecular diagnostics benefit diverse agricultural systems globally.

ABSTRACT

Soil microorganisms play a pivotal role in promoting plant growth, enhancing nutrient acquisition, and defending against biotic and abiotic stresses. This mini-review explores the multifaceted interactions between soil microbes and plants, focusing on the rhizosphere as a dynamic hub of microbial activity. Key microbial groups, including plant growth-promoting rhizobacteria (PGPR) and mycorrhizal fungi, are highlighted for their direct and indirect roles in nutrient cycling, hormone production, and biocontrol of pathogens. The review also emphasizes the importance of microbial antagonism in natural disease suppression and the potential of integrating beneficial microbes into sustainable agricultural practices. Advances in omics technologies and the development of microbial consortia are opening new avenues for precision agriculture. Overall, leveraging the power of soil microbes presents a promising strategy to improve plant health, reduce chemical inputs, and support global food security.

Keywords: Soil microbes, Plant growth-promoting rhizobacteria (PGPR); Mycorrhizal fungi, Sustainable agriculture, Plant-microbe interactions.

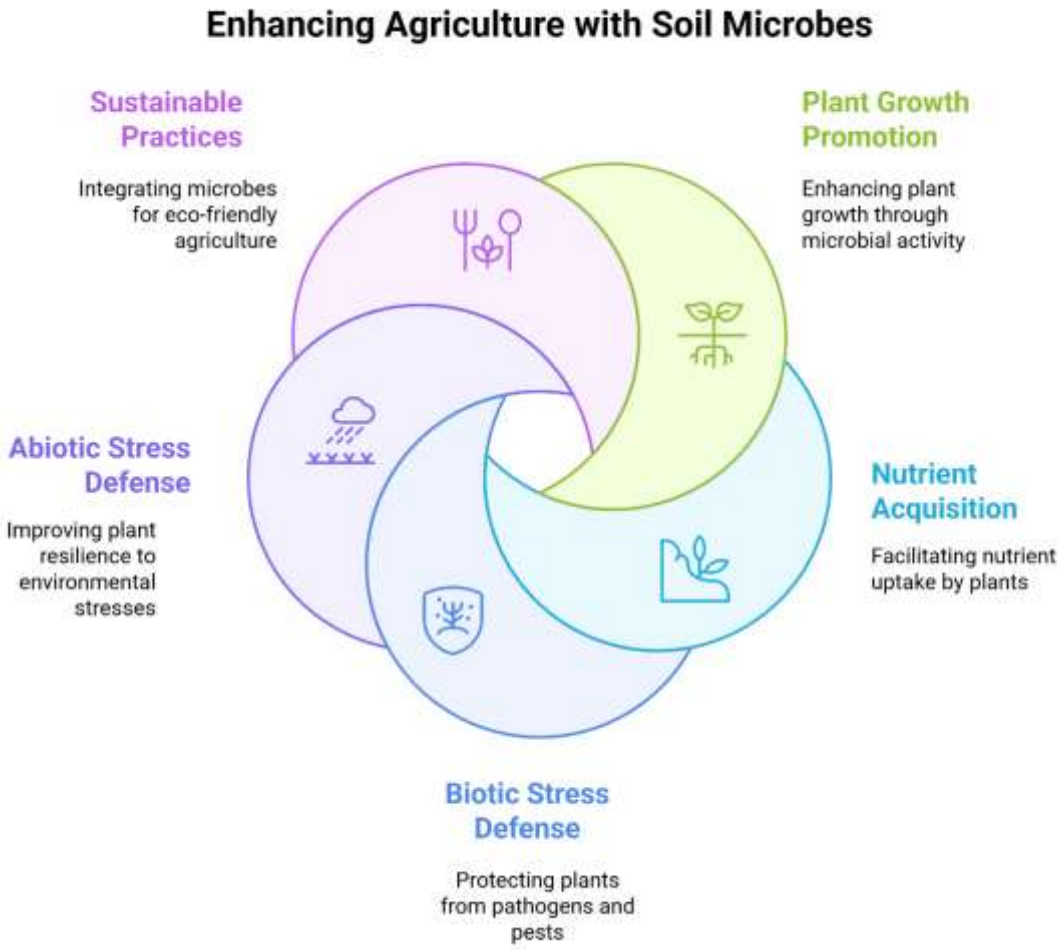
TOPRAK MİKROPLARININ GÜCÜNDEN YARARLANMAK: BİTKİ BÜYÜMESİNİN TEŞVİKİ VE SAĞLIĞINDAKİ ROLLERİ ÜZERİNE MİNİ BİR İNCELEME

ÖZET

Toprak mikroorganizmaları bitki büyümesini teşvik etmede, besin alımını artırmada ve biyotik ve abiyotik streslere karşı savunmada önemli bir rol oynar. Bu mini inceleme, toprak mikroorganizmaları ve bitkiler arasındaki çok yönlü etkileşimleri inceler ve mikrobiyal aktivitenin dinamik bir merkezi olarak rizosfere odaklanır. Bitki büyümesini teşvik eden rizobakteriler (PGPR) ve mikorizal funguslar dahil olmak üzere temel mikrobiyal gruplar, besin döngüsünde, hormon üretiminde ve patojenlerin biyolojik kontrolünde doğrudan ve dolaylı rolleri nedeniyle vurgulanır. İnceleme ayrıca doğal hastalık baskılamasında mikroorganizma antagonizmanın önemini ve faydalı mikroorganizmaları sürdürülebilir tarım uygulamalarına entegre etme potansiyelini vurgular. Omiks teknolojilerindeki ilerlemeler ve mikrobiyal konsorsiyumların geliştirilmesi, akıllı tarım için yeni yollar açıyor. Genel olarak, toprak mikroplarının gücünden yararlanmak, bitki sağlığını iyileştirmek, kimyasal girdileri azaltmak ve küresel gıda güvenliğini desteklemek için umut verici bir strateji sunmaktadır.

Anahtar kelimeler: Toprak mikroorganizmaları, Bitki büyümesini teşvik eden rizobakteriler (PGPR); Mikorizal funguslar, Sürdürülebilir tarım, Bitki-mikroorganizma etkileşimleri.

GRAPHICAL ABSTRACT



1. INTRODUCTION: THE RHIZOSPHERE AS A HOTSPOT OF MICROBIAL ACTIVITY

The rhizosphere, the narrow region of soil influenced by root secretions and associated microbial activity, is a dynamic environment where complex interactions between plants and microorganisms occur. This zone is teeming with a diverse array of soil microbes, including bacteria, fungi, archaea, and actinomycetes, which play pivotal roles in plant health and soil fertility (Akbar et al., 2025). Plants exude a variety of organic compounds, such as sugars, amino acids, and organic acids, into the rhizosphere, which serve as nutrients for microbial communities. In return, these microbes contribute to plant growth by facilitating nutrient acquisition, producing phytohormones, and protecting against pathogens. The mutualistic relationships established in the rhizosphere are fundamental to plant development and resilience. Recent studies have highlighted the significance of these interactions. For instance, microbial fertilizers have been shown to enhance soil physicochemical properties and promote plant growth by increasing microbial richness and maintaining soil microecological balance (Abdellatif et al., 2024). Additionally, the application of plant growth-promoting rhizobacteria (PGPR) has been associated with improved crop productivity and adaptation to changing climates (Chen et al., 2024).

Understanding the mechanisms underlying these beneficial interactions is crucial for developing sustainable agricultural practices. Advances in omics technologies, such as metagenomics and transcriptomics, have provided insights into the complex networks of gene expression and metabolic pathways involved in plant-microbe interactions (Jain et al., 2024; Srikanth et al., 2025). These tools have enabled researchers to identify key microbial taxa and functions that contribute to plant health. Furthermore, the role of soil microbes extends beyond individual plant benefits. They are integral to ecosystem functions, including nutrient cycling, soil structure maintenance, and carbon sequestration. For example, certain mycorrhizal fungi have been found to play a significant role in carbon capture, surpassing the contribution from decomposed plant matter (Basiru and Hijri, 2024). Despite the recognized benefits, challenges remain in harnessing soil microbes for agriculture. Factors such as soil type, climate, and farming practices influence microbial communities and their functions. Therefore, site-specific strategies are necessary to effectively utilize microbial inoculants and amendments. In conclusion, the rhizosphere is a critical zone where beneficial plant-microbe interactions occur, significantly influencing plant growth and soil health. Continued research and technological advancements are essential for unlocking the full potential of soil microbes in promoting sustainable agriculture.

2. PLANT GROWTH-PROMOTING RHIZOBACTERIA (PGPR): KEY MECHANISMS AND EXAMPLES

Plant growth-promoting rhizobacteria (PGPR) are a group of beneficial bacteria that colonize plant roots and enhance growth through various direct and indirect mechanisms (Ajinde et al., 2024). These microbes have garnered attention for their potential to reduce reliance on chemical fertilizers and pesticides, thereby contributing to sustainable agriculture. PGPR facilitate the uptake of essential nutrients. For instance, they can fix atmospheric nitrogen, solubilize phosphates, and mobilize potassium and zinc, making these nutrients more available to plants. Many PGPR synthesize plant hormones such as indole-3-acetic acid (IAA), gibberellins, and cytokinins, which stimulate root elongation and branching, enhancing nutrient and water absorption (Ehinmitan et al., 2024; Hyder et al., 2024). By producing the enzyme 1-aminocyclopropane-1-carboxylate (ACC) deaminase, PGPR lower ethylene levels in plants, a hormone associated with stress responses, thereby promoting root growth under stress conditions. PGPR protect plants by producing antibiotics, siderophores, and lytic enzymes that inhibit pathogenic microbes (Benaissa, 2024). For example, certain strains produce lipopeptides and polyketides with antifungal properties. PGPR can trigger a plant's innate defense mechanisms, enhancing resistance to a broad spectrum of pathogens without causing disease themselves (Sheoran et al., 2025). The production of extracellular polymeric substances (EPS) by PGPR aids in biofilm formation on root surfaces, providing a protective barrier against environmental stresses and pathogens. *Azospirillum* and *Azotobacter* species have been shown to promote growth and enhance salt tolerance in crops like cherry tomato under salinity stress (Jia et al., 2025). *Bacillus subtilis* strains produce volatile organic compounds that stimulate root development and have been used to enhance plant growth under various conditions (Dutta et al., 2025). *Pseudomonas fluorescens* is known for its biocontrol properties, protecting roots against parasitic fungi and producing compounds like 2,4-diacetylphloroglucinol (2,4-DAPG) with antiphytopathogenic activity (Allende-Molar et al., 2025). The integration of PGPR into agricultural practices offers a promising avenue for enhancing crop yields, improving stress tolerance, and reducing chemical inputs. However, the effectiveness of PGPR can be influenced

by environmental factors, and further research is needed to optimize their application across diverse agroecosystems.

3. MYCORRHIZAL FUNGI: ENHANCING NUTRIENT UPTAKE AND PLANT HEALTH

Mycorrhizal fungi form symbiotic associations with plant roots, playing a crucial role in nutrient acquisition, stress tolerance, and overall plant health (Ahmed et al., 2025). These fungi extend the root systems reach, facilitating the uptake of water and nutrients, particularly phosphorus and micronutrients.

Types of Mycorrhizal Associations: Arbuscular mycorrhizal fungi (AMF) penetrate root cortical cells, forming arbuscules that are sites of nutrient exchange (Bhupenchandra et al., 2024). AMF are widespread and associate with a majority of terrestrial plants. Ectomycorrhizal fungi (EMF) form a sheath around roots and are primarily associated with woody plants, aiding in nitrogen and phosphorus uptake (Zhang et al., 2024).

Mycorrhizal associations increase the surface area for absorption, improving the uptake of immobile nutrients like phosphorus and micronutrients such as zinc and copper (Hussain et al., 2024). The extensive hyphal networks of mycorrhizal fungi enhance water absorption, aiding plants during drought conditions. Mycorrhizal plants exhibit increased resistance to soil salinity, heavy metals, and pathogens due to improved nutrient status and induced defense mechanisms (Akter et al., 2024). The hyphae contribute to soil aggregation, enhancing soil structure and aeration. In Scotland, a mycoforestry initiative is cultivating Scots pine seedlings inoculated with ectomycorrhizal fungi to produce edible mushrooms while sequestering carbon, demonstrating the multifaceted benefits of mycorrhizal associations. Research has shown that mycorrhizal fungi play a significant role in carbon sequestration, with root-fungi networks storing more carbon than decomposed plant matter (Pena and Tibbett, 2024). Studies have also indicated that mycorrhizal associations can enhance plant resistance to various stresses, including drought and salinity, by improving nutrient uptake and activating plant defense pathways. Integrating mycorrhizal fungi into agricultural systems can lead to more sustainable practices by reducing the need for chemical fertilizers, improving soil health, and enhancing crop resilience (Sarwade et al., 2024). However, the success of such integration depends on factors like soil conditions, crop type, and the compatibility of fungal species, necessitating further research and tailored application strategies.

4. MICROBIAL ANTAGONISM AND BIOCONTROL: NATURAL DEFENSE AGAINST SOIL-BORNE PATHOGENS

Soil-borne pathogens pose significant challenges to agriculture, leading to crop losses and reduced productivity (Meshram and Adhikari, 2024). Beneficial soil microbes offer a natural means of controlling these pathogens through various antagonistic mechanisms.

Mechanisms of Microbial Biocontrol: Certain microbes produce antibiotics that inhibit the growth of pathogenic organisms. For example, *Bacillus subtilis* strains can produce lipopeptides like mycosubtilin, enhancing their antagonistic activities against fungi (Li et al., 2024). Beneficial microbes compete with pathogens for nutrients and space, limiting pathogen

proliferation. By producing siderophores, beneficial microbes sequester iron, making it less available to pathogens and inhibiting their growth (Hussain et al., 2025). Some microbes produce enzymes that degrade the cell walls of pathogens, leading to their lysis. Beneficial microbes can trigger plant defense mechanisms, enhancing resistance to a broad range of pathogens. *Pseudomonas fluorescens* strains have been shown to protect plant roots against parasitic fungi and produce compounds like 2,4-DAPG with antiphytopathogenic properties. *Bacillus subtilis* BBG100, a strain engineered to overproduce mycosubtilin, demonstrated increased antagonistic activity against several yeasts and pathogenic fungi, leading to improved seed germination and seedling growth (Samal et al., 2025).

Challenges and Considerations: While microbial biocontrol offers a sustainable alternative to chemical pesticides, its effectiveness can be influenced by environmental factors, microbial community dynamics, and the specific pathogen involved (Baba et al., 2025). Therefore, understanding the ecological interactions and optimizing application methods are crucial for successful implementation. In conclusion, leveraging the antagonistic properties of beneficial soil microbes provides a promising strategy for managing soil-borne pathogens, reducing chemical inputs, and promoting plant health in agricultural systems.

5. FUTURE PERSPECTIVES AND SUSTAINABLE INTEGRATION IN AGRICULTURE

The integration of beneficial soil microbes into agricultural practices holds immense potential for promoting plant growth, enhancing stress resilience, and reducing dependency on chemical inputs. As the global population continues to rise and climate change poses increasing challenges to food security, sustainable agricultural practices that harness the power of soil microbes are becoming increasingly vital. Advancements in omics technologies, such as metagenomics, transcriptomics, and proteomics, have deepened our understanding of plant-microbe interactions, enabling the identification of key microbial taxa and functions that contribute to plant health. These insights pave the way for the development of targeted microbial inoculants and biofertilizers tailored to specific crops and environmental conditions.

Moreover, the application of microbial consortia, combining multiple beneficial microbes, has shown promise in enhancing plant growth and resilience under various stress conditions. For instance, the co-inoculation of PGPR and mycorrhizal fungi has been reported to synergistically improve nutrient uptake, water absorption, and disease resistance in plants. However, challenges remain in the widespread adoption of microbial-based solutions in agriculture. Factors such as the variability of field conditions, the stability and shelf-life of microbial products, and regulatory hurdles can impact the effectiveness and acceptance of these solutions. Therefore, ongoing research and collaboration among scientists, industry stakeholders, and policymakers are essential to address these challenges and facilitate the integration of microbial technologies into mainstream agricultural practices. In conclusion, harnessing the potential of soil microbes offers a sustainable pathway to enhance plant growth, improve soil health, and ensure food security in the face of global challenges. Continued investment in research, education, and policy support will be crucial in realizing the full benefits of microbial-based agriculture.

ABSTRACT

Understanding the intricate relationship between molecular markers and pathogenic diversity is pivotal in advancing modern plant pathology and resistance breeding. This mini-review highlights the essential role of molecular markers—such as SSRs, SNPs, and AFLPs—in deciphering the genetic structure, virulence variability, and evolutionary dynamics of plant pathogens. We discuss how these markers have transformed our capacity to characterize pathogen populations, monitor disease outbreaks, and trace pathogen migration. The integration of molecular markers with host resistance gene mapping provides a foundation for durable and targeted disease resistance breeding. Moreover, the application of molecular diagnostics enables early detection and accurate identification of pathogenic strains, facilitating effective disease surveillance. Looking forward, the convergence of omics technologies, precision breeding tools, and bioinformatics is anticipated to revolutionize the way we manage plant diseases, paving the way for pathogen-informed and climate-resilient crop improvement strategies. By exploring this positive relationship, we aim to shed light on the potential of molecular marker technology in enhancing sustainable plant disease management and global food security.

Keywords: Molecular markers, Pathogenic diversity, Plant-pathogen interactions, Resistance breeding, Precision agriculture.

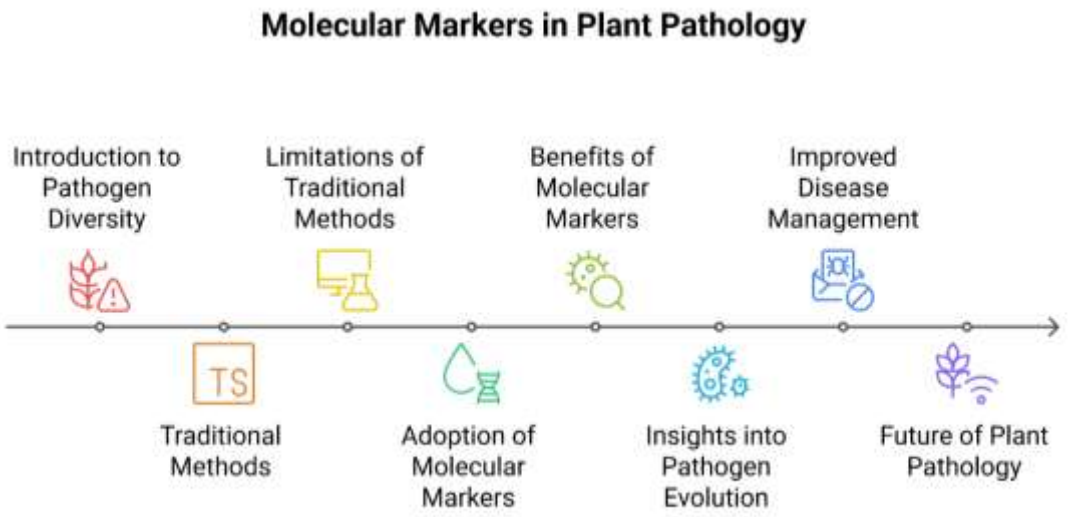
PATOJENİK ÇEŞİTLİLİĞİ ORTAYA ÇIKARMAK İÇİN MOLEKÜLER BELİRTEÇLERDEN YARARLANMA: BİTKİ HASTALIKLARI YÖNETİMİ İÇİN ÇIKARIMLAR

ÖZET

Moleküler belirteçler ile patojenik çeşitlilik arasındaki karmaşık ilişkiyi anlamak, modern bitki patolojisi ve direnç ıslahını ilerletmede çok önemlidir. Bu mini inceleme, SSR'ler, SNP'ler ve AFLP'ler gibi moleküler belirteçlerin bitki patojenlerinin genetik yapısını, virülans değişkenliğini ve evrimsel dinamiklerini çözmedeki temel rolünü vurgulamaktadır. Bu belirteçlerin patojen popülasyonlarını karakterize etme, hastalık salgınlarını izleme ve patojen göçünü izleme kapasitemizi nasıl dönüştürdüğünü tartışıyoruz. Moleküler belirteçlerin konak direnç gen haritalamasıyla bütünleştirilmesi, dayanıklı ve hedefli hastalık direnci ıslahı için bir temel sağlar. Dahası, moleküler tanılamanın uygulanması, patojenik suşların erken tespitini ve doğru bir şekilde tanımlanmasını sağlayarak etkili hastalık gözetimini kolaylaştırır. İleriye bakıldığında, omik teknolojilerinin, hassas ıslah araçlarının ve biyoenformatiğin bir araya gelmesinin, bitki hastalıklarını yönetme şeklimizde devrim yaratması, patojen bilgisine sahip ve iklime dayanıklı ürün geliştirme stratejilerinin önünü açması beklenmektedir. Bu olumlu ilişkiyi araştırarak, sürdürülebilir bitki hastalığı yönetimini ve küresel gıda güvenliğini geliştirmede moleküler belirteç teknolojisinin potansiyeline ışık tutmayı amaçlıyoruz.

Anahtar kelimeler: Moleküler belirteçler, Patojenik çeşitlilik, Bitki-patojen etkileşimleri, Dayanıklı yetiştirme, Hassas tarım.

GRAPHICAL ABSTRACT



1. INTRODUCTION: THE INTERSECTION OF MOLECULAR TOOLS AND PATHOGEN COMPLEXITY

Plant pathogens pose a significant threat to global food security, causing major yield losses across a wide range of crops. Understanding the diversity within and among pathogen populations is crucial for designing effective disease management strategies and ensuring durable host resistance. This diversity termed *pathogenic diversity* encompasses genetic, physiological, and ecological differences that contribute to variation in virulence, host range, and adaptability. Historically, pathogenic diversity was studied through morphological features, pathogenicity tests, and biochemical markers. However, these methods often lacked resolution and reproducibility, especially in species with cryptic morphological features or latent infection phases. The limitations of traditional approaches have driven plant pathologists to adopt molecular markers as more precise and reliable tools for exploring pathogen variability (McDonald and Linde, 2002).

Molecular markers are short DNA sequences with known locations on a genome that show polymorphism between individuals. These markers allow researchers to differentiate pathogen strains, identify race-specific virulence factors, and track pathogen movement across agroecological zones. Unlike phenotypic observations, molecular data are not influenced by environmental factors, making them robust for comparative studies (McDonald and McDermott, 1993). By using DNA-based markers, researchers have gained significant insights into the evolution and spread of virulent pathotypes and the emergence of new pathogen lineages. For instance, studies on rust fungi and *Fusarium* spp. have demonstrated considerable genetic heterogeneity, often correlating with resistance gene breakdown in crops (Zhan et al., 2005). This emphasizes the need to continuously monitor pathogen populations using molecular tools to keep breeding programs ahead of emerging threats (Singh et al., 2016). Moreover, molecular markers have enabled the distinction of closely related but genetically diverse strains that cause similar disease symptoms. This is particularly useful in polyphyletic pathogens like *Colletotrichum*, where taxonomic ambiguity has long hampered disease management strategies (Cannon et al., 2012). As a result, taxonomic revisions guided by molecular data have led to more targeted control practices. The integration of molecular diagnostics into routine pathogen

surveillance has also improved quarantine protocols and pathogen risk assessments. This is crucial in a globalized agriculture system where transboundary spread of pathogens via seed trade or climate-driven expansion is a growing concern (Fisher et al., 2012). Thus, molecular markers not only reveal diversity but also assist in timely intervention. With the rising availability of molecular tools and decreasing costs of DNA sequencing, it is now feasible for many laboratories to use high-resolution markers in their research. Furthermore, the utility of such markers extends beyond research, benefiting disease forecasting systems, resistance gene deployment, and integrated disease management approaches (Cooke et al., 2012).

Overall, molecular markers have become indispensable in plant pathology for dissecting pathogenic diversity, improving our understanding of host-pathogen dynamics, and supporting the development of sustainable crop protection strategies. The future of plant disease management lies in harnessing these tools alongside bioinformatics, omics technologies, and real-time diagnostics (Agrios, 2005; Sharma et al., 2022).

2. MOLECULAR MARKERS: TYPES, PRINCIPLES, AND ADVANCES

Molecular markers are indispensable tools in modern plant pathology for identifying and characterizing pathogen populations at the genetic level. These markers serve as identifiable DNA sequences located at specific positions in the genome, exhibiting polymorphism that enables differentiation among strains, isolates, or species. The evolution of marker technologies over recent decades has significantly enhanced our capacity to investigate pathogen diversity and evolution. The first generation of molecular markers, such as Restriction Fragment Length Polymorphisms (RFLPs), offered relatively stable and co-dominant markers. However, their labor-intensive and time-consuming protocols limited their widespread use. Later, Random Amplified Polymorphic DNA (RAPD) and Inter Simple Sequence Repeats (ISSR) emerged as faster alternatives, although they were dominant and less reproducible (Zietkiewicz et al., 1994). Simple Sequence Repeats (SSRs), also known as microsatellites, are tandem repeats of 1–6 base pairs. They are highly polymorphic, reproducible, and co-dominant, making them ideal for pathogen genotyping. SSRs have been successfully applied in the genetic analysis of several phytopathogenic fungi, such as *Fusarium oxysporum*, *Colletotrichum* spp., and *Magnaporthe oryzae* (Gao et al., 2007; Sharma et al., 2013). Amplified Fragment Length Polymorphisms (AFLPs) offered a higher resolution and greater number of polymorphic markers compared to RAPD and ISSR. Their ability to detect variability in closely related isolates made them useful in population structure studies of pathogens like *Phytophthora infestans* and *Alternaria* spp. (Forster et al., 1996). However, AFLPs are still technically demanding and have now largely been replaced by more advanced technologies. Single Nucleotide Polymorphisms (SNPs) represent the most abundant form of genetic variation in genomes and are ideal for high-throughput genotyping. The development of SNP arrays and genotyping-by-sequencing (GBS) platforms has revolutionized pathogen genetics, enabling detailed mapping of virulence genes, mating types, and population dynamics (Marees et al., 2018). SNP markers have been widely adopted for genome-wide association studies (GWAS) and phylogeographic analyses of fungal and bacterial pathogens.

With the advent of Next-Generation Sequencing (NGS), molecular marker development has become faster, cheaper, and more precise. NGS-based approaches allow for whole-genome resequencing, transcriptome analysis, and detection of novel markers from uncharacterized pathogens. Pathogen genome assemblies now facilitate in silico mining of SSRs, SNPs, and other markers, enhancing the depth of diversity studies (Schmidt et al., 2013; Goodwin et al., 2015). Moreover, molecular markers have expanded from neutral genetic markers to functional

markers that are directly associated with virulence genes or effector loci. This shift allows researchers to not only track genetic variation but also correlate it with specific pathogenic traits. Functional markers provide insight into selection pressures on effector genes and help in understanding host-pathogen co-evolution (Stergiopoulos and de Wit, 2009). High-throughput genotyping technologies, such as DArTseq, TILLING, and CRISPR-based genotyping, are now emerging in phytopathology. These platforms allow simultaneous analysis of thousands of loci across diverse pathogen populations, offering an unprecedented scale of resolution for diversity analysis. The integration of these tools has significantly contributed to constructing linkage maps, identifying QTLs for aggressiveness, and developing molecular diagnostics (Sansaloni et al., 2011).

In addition to genetic markers, epigenetic markers such as methylation-sensitive amplified polymorphisms (MSAPs) are being explored to study pathogen adaptation mechanisms. Such approaches provide insights into how pathogens modulate gene expression to overcome host defenses without permanent genetic changes. This represents a novel frontier in understanding transient but heritable pathogen traits (Rodríguez López and Wilkinson, 2015). Collectively, the rapid evolution of marker technologies from low-throughput PCR-based markers to high-resolution sequencing-based platforms has dramatically advanced our ability to study pathogenic diversity. These innovations provide not only deeper genetic resolution but also faster and more accurate pathogen diagnostics, which are crucial for effective disease surveillance and breeding programs (Linde, 2010; McDonald and Mundt, 2016). As technology progresses, it is expected that marker systems will continue to become more cost-effective, portable, and integrable with decision-support systems. This will facilitate their use in field-level diagnostics, allowing plant pathologists and breeders to make real-time decisions on resistance deployment and disease control strategies. The ongoing convergence of molecular marker science with genomics and bioinformatics heralds a new era in plant disease management.

3. POSITIVE ROLE OF MOLECULAR MARKERS IN ASSESSING PATHOGENIC DIVERSITY

Understanding the genetic diversity of plant pathogens is essential for effective disease control and resistance breeding. Molecular markers play a critical role in accurately assessing this diversity by offering insights into population structure, evolutionary dynamics, gene flow, and virulence mechanisms. These insights directly aid plant pathologists in designing targeted and sustainable disease management strategies. Traditional methods such as morphological characterization and host range studies provide limited resolution and can be influenced by environmental conditions. In contrast, molecular markers offer high specificity and reproducibility, enabling differentiation among closely related strains or pathotypes (McDonald and Linde, 2002). This is particularly important in pathogens with cryptic species complexes, such as *Fusarium oxysporum* or *Colletotrichum gloeosporioides*, where morphological features are insufficient for accurate identification (Fotouhifar et al., 2010). Using markers like SSRs and SNPs, researchers can explore intra- and inter-specific variability with high resolution. For instance, SSR analysis of *Puccinia striiformis f. sp. tritici* revealed multiple clonal lineages responsible for stripe rust outbreaks across continents (Ali et al., 2014). Such findings highlight how marker-based studies can trace pathogen spread and identify emerging virulent strains.

Similarly, studies using AFLP and ISSR markers have demonstrated high genetic variation in *Alternaria solani*, the causal agent of early blight in tomato, indicating the pathogen's adaptive potential under fungicide selection pressure (Rodriguez et al., 2010). This information is vital

for tailoring resistance management strategies and monitoring fungicide resistance development. In fungal pathogens such as *Rhizoctonia solani*, ISSR and RAPD markers have been used to distinguish isolates from various agro-ecological zones, confirming the influence of local environments on pathogen evolution (Lakshman et al., 2014). This regional understanding of pathogen diversity facilitates site-specific recommendations for resistant cultivars and control practices. Molecular markers have also uncovered gene-for-gene interactions by identifying avirulence and effector genes in pathogens. SNP-based genotyping has enabled the discovery of polymorphisms in avirulence loci of *Magnaporthe oryzae*, shedding light on host specificity and resistance gene deployment (Yoshida et al., 2009). These insights help breeders deploy resistance genes more strategically to delay pathogen adaptation. Moreover, molecular markers assist in defining the reproductive strategy of pathogens whether clonal, sexual, or mixed which has significant implications for their evolutionary potential. For example, SSR analysis of *Zymoseptoria tritici* populations revealed frequent recombination, suggesting a high potential for the emergence of new virulent genotypes (Zhan et al., 2003). Understanding such dynamics is critical for developing durable resistance.

In oomycetes such as *Phytophthora infestans*, multilocus SSR analysis has provided global surveillance data to monitor shifts in pathogen lineages and track migrations. These efforts led to the identification of aggressive lineages like EU_13_A2 in Europe, which contributed to increased late blight severity in potato crops (Cooke et al., 2012). This has emphasized the importance of real-time diversity monitoring for disease forecasting and resistance deployment. Markers are also used to analyze mating types and pathogenicity groups in pathogens like *Verticillium dahliae*, where vegetative compatibility and clonal lineages determine virulence. Marker-assisted differentiation of race-specific strains helps in deploying cultivar-specific resistance genes, minimizing crop loss (Jiménez-Díaz et al., 2011). In bacterial pathogens, molecular markers such as rep-PCR and MLSA (Multi-Locus Sequence Analysis) have helped identify diversity among pathovars of *Xanthomonas* and *Pseudomonas*. These studies not only aid in quarantine and surveillance but also enhance our understanding of pathogen ecology (Timilsina et al., 2020). Molecular tools have been pivotal in studying horizontal gene transfer, a major mechanism in pathogen evolution. For instance, the presence of transposable elements or mobile effector genes in *Fusarium graminearum* and their association with virulence was confirmed through marker-assisted sequencing studies (Ma et al., 2010). This adds a new dimension to the understanding of pathogenic variability and potential emergence of novel pathotypes.

Furthermore, studies using molecular markers enable the classification of pathogens into distinct phylogenetic groups or races, which can be correlated with host resistance breakdown. This approach helps define the durability of resistance sources and guides the selection of breeding lines with broad-spectrum resistance (Chen et al., 2009). Pathogen population studies using molecular markers can also indicate bottlenecks, founder effects, or genetic drift, which might influence virulence diversity. Such data is essential for understanding pathogen evolution under changing agricultural practices and climate change scenarios (Milgroom, 2015). In summary, molecular markers provide an accurate, detailed, and scalable approach to evaluate pathogen diversity, enabling more informed decisions in resistance breeding, disease monitoring, and integrated disease management strategies. These tools form the backbone of predictive phytopathology, allowing early detection and response to new or re-emerging threats in agriculture (McDonald and Mundt, 2016).

4. APPLICATIONS OF MARKER-BASED PATHOGEN PROFILING IN RESISTANCE BREEDING

The integration of molecular markers into pathogen profiling has revolutionized resistance breeding by providing plant pathologists and breeders with precise tools to understand the genetic makeup of pathogens and their interaction with host plants. Through these applications, resistance breeding has become more efficient, targeted, and durable. One of the most significant applications is in identifying specific races or pathotypes of a pathogen that threaten particular cultivars. Using molecular markers, distinct pathogen genotypes can be rapidly identified and matched to known virulence patterns, allowing breeders to deploy appropriate resistance genes accordingly (Chen et al., 2013). This race-specific profiling helps in the development of differential host sets and resistance screening programs. For example, the identification of race-specific virulence in *Blumeria graminis* f. sp. *tritici* using SSR markers has allowed breeders to tailor their resistance breeding strategies more effectively by pyramiding multiple resistance (R) genes (Huang et al., 2014). This has improved the durability of resistance in wheat against powdery mildew.

Marker-assisted pathogen diagnostics can also guide resistance gene introgression. In rice, knowledge of *Magnaporthe oryzae* populations through SNP and InDel markers enabled the successful deployment of *Pi9*, *Pi54*, and *Pi2* genes in breeding programs (Singh et al., 2015). These genes were selected based on their effectiveness against prevalent pathogen lineages. Moreover, resistance gene deployment strategies such as gene rotation and mosaic resistance depend heavily on the availability of molecular data on pathogen virulence and diversity. When such information is integrated with Geographic Information Systems (GIS), regional resistance management becomes feasible (Burdon and Thrall, 2008). This approach is critical for managing diseases like rusts and late blight across diverse agro-climatic zones. Genomic insights from pathogen populations also enable breeders to anticipate virulence shifts. For instance, monitoring the evolution of *Phytophthora sojae* races in soybean through marker-based virulence typing has led to more sustainable deployment of *Rps* genes (Yan and Nelson, 2019). This practice ensures resistance is not quickly broken down by evolving pathogen populations.

Molecular markers help breeders screen germplasm collections more effectively by using representative pathogen isolates. Rather than testing against a single isolate, breeders can use marker-defined virulence clusters to ensure broad-spectrum resistance (McDonald and Linde, 2002). This enhances the reliability of resistance screening and cultivar release. Efforts in legumes such as chickpea and lentil have benefitted from marker-based *Ascochyta rabiei* diversity analysis, which provided a foundation for multi-race screening and the development of resistant genotypes (Imtiaz et al., 2015). This has significantly improved disease resistance breeding efficiency in these crops. Another notable application is the identification of pathogen effectors through comparative genomics and molecular marker tagging. Effector profiling of *Leptosphaeria maculans* in canola, for example, helped identify AvrLm genes, which were then matched with host resistance genes to guide breeding efforts (Balesdent et al., 2013). Such precision breeding ensures that resistance is tailored to known pathogen effector repertoires. Markers also aid in resistance durability testing. By artificially inoculating host plants with diverse genotypes of a pathogen identified through molecular analysis, breeders can determine the long-term stability of host resistance under field and controlled conditions (Miedaner and Korzun, 2012). This helps avoid resistance breakdown shortly after cultivar release.

Furthermore, the ability to track pathogen migration and population dynamics via molecular markers helps in forecasting disease risks, guiding breeders to prepare in advance. For instance,

Fusarium oxysporum f. sp. cubense TR4 detection using specific markers has become crucial in banana breeding programs to avoid deploying susceptible cultivars in high-risk areas (Dita et al., 2018). In cereal crops, monitoring *Zymoseptoria tritici* genetic diversity has supported the identification of core virulence determinants and enabled breeders to design resistance gene pyramids based on complementary modes of action (Goodwin et al., 2011). Marker data has also helped in post-release monitoring of resistance efficacy. Marker-based pathogen profiling also facilitates pre-breeding and the development of Near-Isogenic Lines (NILs). These NILs can be used to validate resistance under exposure to characterized pathogen populations, ensuring that newly developed lines carry the desired resistance traits without unwanted linkage drag (Zhang et al., 2017). Pathogen marker data is increasingly being integrated into genome-wide association studies (GWAS) and genomic selection (GS) pipelines, helping to develop cultivars with enhanced and durable resistance. This integration makes breeding more predictive and less dependent on extensive phenotyping (Poland and Nelson, 2011). Ultimately, the synergy between pathogen molecular profiling and resistance breeding leads to the development of cultivars that are not only resistant to existing pathotypes but are also prepared for emerging threats. This is a cornerstone of sustainable plant disease management in the era of climate change and intensive agriculture (Savary et al., 2019).

5. FUTURE PERSPECTIVES AND INTEGRATION OF GENOMICS AND MOLECULAR PATHOLOGY

The convergence of genomics and molecular pathology is set to redefine the future of plant disease management and resistance breeding. With rapid advancements in sequencing technologies and bioinformatics tools, the potential to comprehensively assess pathogen diversity and host-pathogen interactions is now more achievable than ever before. This integration will catalyze a new era of precision agriculture and sustainable crop protection. Future research will focus heavily on the deployment of high-throughput sequencing technologies such as next-generation sequencing (NGS), third-generation long-read platforms like PacBio and Oxford Nanopore, and meta-genomics for detailed characterization of pathogen populations in diverse agro-ecological zones (Massart et al., 2014). These technologies will provide a broader, more accurate picture of pathogenic variability, including rare or cryptic variants that traditional markers may miss.

Pan-genomics and comparative genomics will help capture the full repertoire of genes across entire species and pathotypes, revealing core and accessory genome components critical for virulence, adaptation, and host specificity (Tettelin et al., 2008). For example, identifying dispensable chromosomes or effector islands in fungal pathogens will facilitate more targeted resistance gene development. Transcriptomics and dual RNA-seq approaches are expected to become mainstream for real-time monitoring of host-pathogen interactions. By profiling gene expression during infection, researchers can identify the critical stages at which pathogens deploy effectors and hosts activate immune responses (Westermann et al., 2012). This knowledge will support the design of durable resistance strategies that anticipate pathogen counter-measures. Moreover, advances in genome-wide association studies (GWAS) and genomic selection (GS) will be instrumental in breeding for broad-spectrum resistance. By integrating pathogen marker data with host resistance loci, these tools allow breeders to predict and select elite lines even before full disease screening is conducted (Poland and Rutkoski, 2016). This is particularly beneficial in crops with long breeding cycles such as wheat, rice, and maize. The use of CRISPR-Cas systems and other genome-editing technologies holds immense promise for modifying both host and pathogen genomes to achieve durable disease control.

Host susceptibility genes can be knocked out or modified to block pathogen entry, while pathogens can be studied through targeted gene deletions to identify virulence determinants (Chen et al., 2019). This precise manipulation will advance functional validation and trait enhancement.

Bioinformatic tools are becoming increasingly vital in managing the growing volume of pathogen genomic data. Machine learning and artificial intelligence (AI) models are being developed to predict pathogen evolution, gene-for-gene interactions, and resistance durability (Mahlein, 2016). Predictive modeling will help anticipate disease outbreaks and resistance breakdowns, allowing for proactive breeding and management interventions. In the future, integrated databases linking host genotypes, resistance genes, pathogen genotypes, and geographic occurrence will allow real-time decision-making in breeding programs and disease surveillance. Platforms such as Ensembl Fungi, PHI-base, and OpenWheatBlast are early examples of this trend, offering consolidated resources for breeders and pathologists (Urban et al., 2020). The concept of precision pathology will emerge as a standard practice, wherein disease diagnostics and resistance deployment will be customized to local pathogen populations. Molecular surveillance of pathogen strains in farmers' fields, linked with mobile diagnostics and decision support systems, will guide the application of resistant cultivars and reduce unnecessary pesticide use (Lowe et al., 2017). Furthermore, participatory breeding approaches involving farmers and local stakeholders will gain prominence. These efforts will be enriched by molecular data that ensure resistant cultivars are matched with prevalent local pathogen races, leading to better adoption and greater impact on crop productivity and food security (Ceccarelli and Grando, 2007).

The challenge of emerging and re-emerging pathogens under climate change also underscores the importance of molecular approaches. By monitoring pathogen evolution in response to shifting weather patterns, researchers can adapt resistance strategies accordingly (Bebber, 2015). This is crucial for crops grown in vulnerable or marginal environments. Omics integration (genomics, transcriptomics, proteomics, metabolomics) will offer a systems-level view of host-pathogen dynamics. Such a comprehensive understanding will help discover novel resistance mechanisms, design synthetic resistance pathways, and improve multi-trait breeding pipelines (Gupta et al., 2015). This multidimensional approach will bridge gaps between basic science and applied breeding. Pathogen-informed breeding programs will also prioritize the inclusion of minor and neglected crops, especially those important for regional food security. The availability of molecular marker data for pathogens of these crops will promote genetic improvement, enhancing both yield and resilience (Varshney et al., 2020).

In summary, the integration of molecular markers with advanced genomic tools and precision breeding strategies is critical to addressing the ongoing challenges in plant disease management. By embracing these technologies, plant pathologists and breeders can together develop cultivars that are resilient, productive, and capable of withstanding diverse and evolving pathogenic threats in a changing world.

ABSTRACT

This study developed a Smart Agriculture and Automation System to improve efficiency and sustainability in tomato production while optimizing resource usage. Utilizing components like ESP32, ESP32-CAM, and Raspberry Pi 5, sensor data from temperature, soil moisture, and light sensors were wirelessly transmitted for controlling irrigation, heating, and lighting. Plant development and health were analyzed with YOLOv8-based image processing. The system continuously monitors environmental conditions, evaluates plant health through AI, and reduces manual intervention. The study successfully enhanced water and energy use efficiency, enabled remote monitoring, and improved agricultural productivity, addressing climate and resource management challenges.

Keywords: Smart Agriculture, Automation System, Image Processing, Resource Efficiency

Introduction

Today, global challenges such as population growth and climate change have made it essential to adopt sustainable and efficient methods in agricultural management and production. Traditional agricultural practices often fall short in optimizing resource use and ensuring continuous monitoring of plant health. Limitations in water and energy resources, along with increasing drought risks, have further highlighted the need for intelligent and automated solutions. In this context, the study focuses on the development of a smart agriculture automation system utilizing ESP32, ESP32-CAM, and Raspberry Pi 5, aiming to improve productivity and sustainability in tomato cultivation. By integrating artificial intelligence and image processing technologies, this system enables real-time monitoring of plant development and environmental conditions, providing farmers with more effective tools for decision-making and resource management (Friday Odoh, 2023).

Existing agricultural monitoring and automation systems face significant limitations in maintaining optimal environmental conditions tailored to plant needs. Many lack the capability for continuous and accurate data collection and still rely heavily on manual intervention. This not only lowers agricultural efficiency but also leads to unnecessary consumption of water, energy, and labor. Mismanagement of key parameters such as temperature, light, and soil moisture can directly impact crop yield and sustainability. This study addresses these challenges by proposing a system that combines sensor-based environmental monitoring, AI-powered image analysis, and automated control mechanisms to optimize agricultural processes and improve overall efficiency (Rashed, 2025).

The primary objective of the study is to enhance agricultural productivity by ensuring precise control over environmental variables and efficient use of natural resources. The smart agricultural automation system developed within the study analyzes the maturity and health status of tomato plants using image processing techniques and periodically collected sensor data. Parameters such as soil moisture, temperature, and light intensity are continuously monitored, and corresponding actuators are automatically triggered when necessary. The collected data and analysis results are presented to the user through a web-based interface, allowing remote access and management. By implementing automated irrigation, lighting, and heating systems, the study demonstrates a significant reduction in manual labor while promoting resource efficiency and sustainability. Ultimately, the study supports the digital transformation of agriculture and offers an innovative approach to meeting the demands of modern agricultural production (Naiqian Zhang, 2006).

Materials and Methods

In this study, a smart agricultural automation system was implemented to optimize agricultural processes through sensor-based data collection, artificial intelligence-based image processing, automatic control mechanisms, and a user-friendly web interface. The system was developed and successfully operated through a series of structured steps, beginning with the integration of various hardware components. ESP32-CAM, ESP32, and Raspberry Pi 5 served as the core processing units, while DHT11 temperature and humidity sensors, capacitive soil moisture sensors, and 5mm LDR light sensors collected environmental data. Additional components such as a water pump, LED lighting, fan, carbon heating film, and irrigation channels supported the control mechanisms (Espressif Systems, n.d.).

Sensor data were continuously collected from the greenhouse environment. The capacitive sensor measured soil moisture, the DHT11 sensor monitored ambient temperature, and the LDR sensor evaluated light intensity. These data were transmitted wirelessly to the Raspberry Pi 5

via the ESP32 modules (Raspberry Pi Foundation, n.d.). Simultaneously, the ESP32-CAM captured periodic images of tomato plants, which were then processed using a trained YOLOv8 model running on Raspberry Pi 5. This enabled real-time analysis of plant maturity and health, allowing for early detection of potential issues (ultralytics, n.d.).

Based on the environmental data and image processing outcomes, the system autonomously activated irrigation, heating, lighting, and ventilation when values deviated from predetermined thresholds. The processed information and system status were made accessible to users through a web-based interface, which also allowed for manual control when needed.

In terms of software and theoretical models, Python was used extensively for sensor data processing, control mechanism management, web application deployment, and integration of the AI model. The YOLOv8 algorithm was trained and utilized for evaluating plant health and maturity through visual analysis. The hardware setup included ESP32-CAM, ESP32, Raspberry Pi 5, environmental sensors, and actuators.

The experimental phase of the study began with the construction of a small-scale greenhouse model. Sensors were strategically placed to collect environmental data, and images were captured at regular intervals. All collected data were transmitted to the Raspberry Pi 5, where analysis was conducted, and appropriate actions were triggered automatically. The system's reliability was enhanced through iterative testing and by replacing or adjusting components that were initially incompatible. As a result, a stable, responsive, and efficient smart agriculture system was successfully established.

System Components

Capacitive Soil Moisture Sensor: The capacitive soil moisture sensor (Figure 1), which is more durable than the dual probe soil moisture meter, will measure soil moisture as a long-lasting sensor that prevents resistance wear problems.

Figure 21. Capacitive Soil Moisture Sensor

DHT11 Temperature and Humidity Sensor: This sensor with high sensitivity (Figure 2) will increase efficiency by measuring environmental temperature values. Although the DHT22 sensor is newer and more advanced, the DHT11 sensor was used due to data transmission interruptions.

Figure 22. DHT11 Temperature and Humidity Sensor

LDR Light Sensor: It will help provide the ideal light level for photosynthesis by providing analog output according to the ambient light (Figure 3).

Figure 23. LDR Light Sensor

Raspberry Pi 5: It will be used for artificial intelligence operations and as the main control unit (Figure 4).

Figure 24. Raspberry Pi 5

ESP32 CAM: It will take periodic photographs of tomatoes with its integrated camera and transmit this information wirelessly to Raspberry Pi 5 (Figure 5).

Figure 25. ESP32 CAM

ESP32: ESP32 will collect data from the sensors it is connected to and transmit it wirelessly to Raspberry Pi 5 (Figure 6).

Results and Discussion

In this study, a smart agriculture system integrating sensor-based monitoring, artificial intelligence-supported image analysis, and automation technologies was designed, implemented, and tested to enhance agricultural efficiency and sustainability. The system was developed using microcontrollers such as ESP32 and ESP32-CAM for data collection and image capture, with Raspberry Pi 5 serving as the central processing and control unit. Environmental data—including temperature, soil moisture, and light intensity—were continuously collected via DHT11, capacitive soil moisture, and LDR sensors placed in the greenhouse environment. These data were transmitted wirelessly at regular intervals from

ESP32 modules to Raspberry Pi 5 and stored in a local database for analysis. In parallel, images of tomato plants were captured periodically by ESP32-CAM and analyzed using a YOLOv8 model trained to classify tomatoes into maturity stages such as ripe, unripe, and rotten. This enabled both environmental and visual data to be processed in real time, supporting autonomous decision-making and early detection of problems related to plant health.

The implementation of the system followed a structured process divided into several work packages. The hardware installation phase involved integrating all sensors with the ESP32 microcontrollers and connecting actuators such as a water motor, heating film, and lighting units to Raspberry Pi 5. Following successful physical integration, custom firmware was developed for the sensors, and a socket-based WiFi communication protocol was established for reliable data transfer. A Python-based web interface using the Flask framework was designed to provide users with real-time access to sensor readings, system status, and image analysis results. This interface allowed users to remotely monitor temperature, light, soil moisture, and plant maturity levels, as well as to manually intervene when necessary, enhancing both usability and system transparency.

The artificial intelligence component of the system was implemented by preparing a dataset of tomato images representing various maturity and health conditions (Kangwon National University, 2024). This dataset was used to train the YOLOv8 model, which was then deployed on the Raspberry Pi 5. As images were captured by ESP32-CAM, they were transferred wirelessly and processed locally. The model successfully detected and classified tomato stages, enabling the system to automatically activate irrigation, lighting, and heating systems based on both sensor data and visual feedback (Maker Advisor, n.d.).

System performance was evaluated through an extended test period under real greenhouse conditions. During this phase, the stability, accuracy, and responsiveness of the system were monitored. It was observed that the irrigation system was activated only when the soil moisture level dropped below a defined threshold, ensuring efficient water use. Similarly, the lighting system was triggered when light intensity was inadequate, supporting optimal plant growth conditions. The image processing module consistently provided correct classifications of tomato maturity levels, validating the reliability of the YOLOv8 algorithm in the agricultural context. The web interface functioned without error, delivering a clear and accessible representation of all system data and controls.

In conclusion, the developed smart agriculture system demonstrated reliable performance, accurate data collection, and successful integration of image-based plant monitoring with sensor-driven automation. The system not only optimized resource use—particularly water and energy—but also minimized the need for manual labor and enhanced the ability to monitor and manage plant development remotely. These results indicate that the proposed system is scalable and adaptable for broader agricultural applications and can contribute meaningfully to the digital transformation and sustainability of modern agriculture.

Conclusion

The smart greenhouse automation system developed in this study has been successfully implemented, demonstrating the significant role of digitalization and automation in modern agriculture. Key functions such as sensor-based environmental monitoring, plant analysis through image processing, and automatic control of irrigation and lighting were carried out effectively. The sensor data collected for temperature, soil moisture, and light levels were consistent and accurate, and the system responded appropriately based on predefined threshold

values. The image processing analyses conducted using the YOLOv8 model enabled accurate classification of tomato maturity levels and supported the decision-making mechanisms within the system. The web-based interface allowed users to monitor the system in real time, ensuring both technical functionality and user accessibility. The system operated with stability during the test process, provided savings in water and energy use, and allowed for more controlled plant development. The results indicate that the system is not only applicable to small-scale setups but also has the potential to be implemented in larger agricultural environments.

Upon completion of the study, several targets were successfully achieved. Water consumption was reduced through intelligent irrigation control. The need for manual intervention decreased significantly. Environmental parameters in the greenhouse were optimized, leading to increased agricultural productivity. A user-friendly, accessible, and efficient smart agriculture system was established. The system also contributed to sustainable farming practices and supported the digital transformation of agricultural production.

Looking forward, the system can be further enhanced by integrating IoT technologies and big data analytics, making it adaptable to agricultural enterprises of various scales and suitable for different plant species. The YOLOv8 model can be retrained using datasets tailored to specific crops, allowing the system to be used in a wide range of agricultural applications. Mobile application support can be added to improve flexibility and accessibility. Integration with weather APIs would allow the system to incorporate external environmental data into its decision processes. Additionally, renewable energy sources such as solar panels could be used to make the system energy-independent. More advanced features, such as early disease detection through weed or insect identification, could also be integrated into the image processing module to further enhance the system’s capabilities.

Thanks and Information Note

We would like to express our sincere gratitude to Yunus Emre Karasu for his valuable support in this project. We declare that all content in this paper has been produced in accordance with academic standards and ethical guidelines.

RECRATIONAL LANDSCAPE DESIGN PROJECT OF BARTIN RIVER KANLIIRMAK LOCATION

Kübra KELEŞ
Bartın Üniversitesi Mühendislik Mimarlık ve Tasarım Fakültesi Peyzaj Mimarlığı Bölümü, Bartın-Türkiye, kubrakelesdkk@gmail.com ORCID: 0009-0003-3935-6696

Nurhan KOÇAN
Bartın Üniversitesi Mühendislik Mimarlık ve Tasarım Fakültesi Peyzaj Mimarlığı Bölümü Bartın-Türkiye, nkocan@bartin.edu.tr (Sorumlu yazar) ORCID: 0000-0001-9433-7007

ABSTRACT

Bartın City has gained a unique identity in line with its natural, cultural and spatial values throughout the historical process. The Bartın River, from which the city takes its name, has directly influenced both settlement decisions and social and economic life throughout history, and has been a determining factor in the development of the city. In the study, it is aimed to re-function the area located on the Kanlıırmak coastline of the Bartın River with a recreational landscape design while preserving its natural and cultural values. Since the recreation areas along the Yalı in the city are insufficient, a new coastal arrangement proposal was presented on the banks of the Bartın River between the Umut Cafe, one of the landmarks of the city, and the Kemal Samancıoğlu Ethnography Museum within the scope of the project. Seven re-functionalized historical buildings in the area are proposed as an ethnography museum, public library, science center, traditional archery association, fishing association, guesthouse and handicraft course center. The project is shaped by the principles of landscape design, sustainable use of cultural heritage and protection of ecological diversity. This approach aims to both increase the quality of life of the city and preserve the historical texture of Bartın. In the project, evaluations were made for area use planning within the boundaries of the study area and the landscape design project of the area was drawn. AutoCad, Photoshop, Sketchup and Lumion software were used in the drawing, three-dimensional representation and presentation stages of the projects. It is thought that the final result of the project will provide ideas for riverside planning studies in our country and in the cities of the world.

Keywords: Recreation, landscape design, stream, Bartın

BARTIN IRMAĞI KANLIIRMAK MEVKİİ REKRASYONEL PEYZAJ TASARIM PROJESİ

ÖZET

Bartın kenti, tarihsel süreç içerisinde sahip olduğu doğal, kültürel ve mekânsal değerler doğrultusunda özgün bir kimlik kazanmıştır. Kentin adını aldığı Bartın Irmağı, tarih boyunca hem yerleşim kararlarını hem de sosyal ve ekonomik yaşamı doğrudan etkilemiş, kentin gelişiminde belirleyici bir unsur olmuştur. Bu projede Bartın Irmağı'nın Kanlıırmak mevkii kıyı şeridinde yer alan alanın, doğal ve kültürel değerlerini koruyarak rekreasyonel peyzaj tasarımıyla yeniden işlevlendirilmesi hedeflenmiştir. Kentte Yalı boyunca rekreasyon alanları yetersiz kaldığı için, proje kapsamında kentin nirengi noktalarından biri olan Umut kafe ile Kemal Samancıoğlu etnografya müzesi arasında kalan Bartın Irmağı kıyısında yeni bir kıyı düzenleme önerisi sunulmuştur. Alanda yeniden işlevlendirilmiş 7 tarihi yapı; etnografya müzesi, halk kütüphanesi, bilim merkezi, geleneksel okçuluk derneği, balıkçılık derneği, misafirhane ve el sanatları kurs merkezi olarak önerilmiştir. Öneri peyzaj tasarımı, kültürel mirasın sürdürülebilir kullanımı ve ekolojik çeşitliliğin korunması ilkeleriyle şekillenmiştir. Bu yaklaşım, hem kentin yaşam kalitesini artırmayı hem de Bartın'ın tarihi dokusunu yaşatmayı amaçlamaktadır. Projede, çalışma alanı sınırlarında, alan kullanım planlamasına yönelik değerlendirmeler yapılmış ve alanın peyzaj tasarım projesi çizilmiştir. AutoCad, Photoshop, Sketchup ve Lumion yazılımları projelerin çizimi, üç boyutlu gösterimleri ve sunumu aşamalarında kullanılmıştır. Üretilen sonuç projenin ülkemiz ve dünya kentlerinde nehir kenarı düzenleme çalışmalarına fikir vereceği düşünülmektedir.

Anahtar Kelimeler: Rekrasyon, peyzaj tasarımı, akarsu, Bartın

Giriş

Günümüzde kentleşmenin hızla artması, doğal ve kültürel miras alanlarının korunmasını ve kent hayatına dahil edilmesini zorunlu hale getirmiştir. Bu kapsamda sürdürülebilir ve ekolojik kentsel gelişim, yalnızca ekonomik gelişmeyi değil, aynı zamanda ekosistemin korunmasını, kültürel değerlerin devam ettirilmesini ve toplumun yaşam kalitesinin artırılmasını hedeflemelidir (**Erdoğan, 2010;** Çelik, 2011**).** Peyzaj mimarlığı disiplini, bu çok boyutlu hedeflerin tamda orta noktasında yer almaktadır. Özellikle kıyı bölgelerinde, doğal süreçleri ve kültürel değerleri dikkate alan, ekolojik, estetik ve işlevsel çözümler üreterek doğayı temel alan peyzaj planlamaları ve tasarımları geliştirmektedir (Özsüle, 2005).

Peyzaj projeleri sürdürülebilir ve ekolojik kentsel gelişim ile kültürel mirasın korunması arasındaki bağlantıyı sağlayarak, kentlerin daha yaşanabilir ve karakteristik hale gelmesine önemli katkılar sağlar. Doğa tabanlı çözümlerle kıyı bölgelerinde ekolojik koridorların oluşturulması, biyolojik çeşitliliği teşvik eden yeşil altyapı sistemlerinin tasarlanması, doğal süreçlere hassasiyetle yaklaşan kıyı düzenlemelerinin yapılması ve tarihi dokuyu ön planda tutan kamusal alan tasarımları, bu projelerin kapsamındadır (Kaya ve Taylan Susan, 2020). Bu projeler kentlerin doğal ve kültürel değerlerini koruyarak, kentlerde yaşayan halkın refahını artırır ve gelecek nesillere aktarılacak sürdürülebilir kentsel alanların yaratılmasına olanak tanır (Türker ve Gül, 2022).

Kentlerin sürdürülebilir gelişimi, tüm doğal kaynakların akılcı kullanılmasını ve ekolojik dengenin korunmasını hedef alır (Giray ve Yılmaz, 2015). Bu kapsamda, kentlerde yeşil alan sayısının artırılması, biyolojik çeşitliliğin desteklenmesi, su kaynaklarının sürdürülebilir yönetimi, yenilenebilir enerji sistemlerinin entegrasyonu ve çevre dostu ulaşım seçeneklerinin geliştirilmesi gibi uygulamalar önem kazanmaktadır (Kaya ve Taylan Susan, 2020). Ekolojik kentleşme planları, kentlerin çevresel etkilerini azaltırken, kent halkının sağlıklı ve doğayla iç içe bir yaşam sürmelerine fırsat yaratır (Üstün Topal, 2021).

Kültürel değerlerin korunması ve kent hayatına dahil edilmesi ise, kentlerin kendine özgü kimliklerinin muhafaza edilmesi ve gelecek nesillere aktarılması açısından hayati bir önem taşımaktadır. Tarihi yapılar, geleneksel yerleşim dokuları, arkeolojik sit alanları ve kültürel peyzajlar, kentlerin geçmişini yansıtan ve kent hafızasını oluşturan önemli bileşenlerdir (Ertaş ve Sönmez, 2017). Bu mirasın korunması, yalnızca fiziksel yapıların restore edilmesiyle sınırlı kalmamalı, aynı zamanda bu alanların şehirde yaşayan insanlar tarafından kullanılması, anlamlandırılması ve sahiplenilmesi için uygun kamusal alan düzenlemeleri ve kültürel etkinliklerle desteklenmelidir. Kültürel miras alanlarının sürdürülebilir bir bakış açısıyla yeniden değerlendirilmesi, bu alanların ekonomik ve sosyal canlılığını artırırken kentin kültürel çeşitliliğini de korur (Turgut, 2007).

Tarih boyunca yok olmadan varlığını sürdürebilen pek çok yerleşim, genellikle akarsuların kenarlarında kurulmuştur. İnsanlar, zamanla verimliliğini yitiren toprakları terk ederek, ihtiyaçlarını karşılayabilecek yeni su kenarlarına yönelmişlerdir. Akarsuların sağladığı ulaşım kolaylığı, beslenme ve hareket imkânları gibi ekonomik avantajlar, bu su kaynaklarını önemli hale getirmiştir (An, 1994).

Kontrolsüz sanayi ve konut gelişmeleri, akarsu kenarları ve çevresine zarar verebilmekte ya da bu alanların tamamen ortadan kalkmasına yol açabilmektedir. İmar izni olmadan yapılan yapılar, hatalı planlama kararları, akarsu yataklarına atık ve kanalizasyon bırakılması, standartlara uygun olmayan köprü ve menfezler ile doğal bitki örtüsünün yok edilmesi gibi etmenler akarsuların ve çevrelerinin bozulmasına neden olmaktadır (Kılıçaslan, 2004).

Kent içerisinden geçen akarsu yataklarının düzenlenmesi ve temizlenmesiyle birlikte yürütülecek peyzaj projeleri, bu doğal alanların daha yaşanabilir ve kaliteli kentsel mekânlara dönüşmesini mümkün kılmaktadır (Kılıçaslan, 2004).

Akarsu kıyıları, kentsel ekolojik sürekliliği sağlayan doğal sistemler arasında yer alırken, aynı zamanda toplumun sürekli kullanımına açık alanlardır. Bu nedenlerle, kıyı bölgeleri peyzaj planlaması ve tasarımı açısından oldukça büyük bir öneme sahiptir (Arslan ve ark., 2005). Farklı kot farklarına sahip olan akarsu kıyıları, çeşitlilik içeren rekreasyon alanları oluşturmaya elverişlidir. Bu alanlar; yürüyüş ve gezinti yolları, doğayla bütünleşik küçük parklar, piknik alanları, seyir noktaları, balık tutma alanları ile kayık, kano, yelken gibi su aktivitelerine yönelik tesisler, restoran, kafeterya gibi sosyal mekânları içerebilir. Bu tür rekreasyonel kıyı kullanım alanlarına gezinti tekneleri, yürüyüş yolları, bisiklet ve paten yolları gibi çeşitli yollar eklenerek ulaşım desteklenmektedir. Kıyı alanlarının bu şekilde kullanımı, hem kente hem de kent halkına önemli katkılar sağlar. Aynı zamanda bu alanlar eğitim ve kültürel etkinlikler açısından da önemli fırsatlar sunar. İnsanların öğrenirken gezip keşfetmesini sağlayan bu mekânlar, kent yaşamının önemli bir parçası olarak öne çıkar (Simsonds, 1994).

Türkiye'nin Batı Karadeniz Bölgesi'nde yer alan Bartın kenti, tarihsel gelişim sürecinde doğal peyzajı ve kültürel yapılarıyla benzersiz bir kent kimliği kazanmıştır. Bu kimliğin en temel belirleyicilerinden biri olan Bartın Irmağı, antik dönemlerden günümüze kadar bölgenin ekonomik, sosyal ve mekânsal gelişimini yönlendiren bir unsur olmuştur. Bartın Irmağı yalnızca doğal bir su kaynağı değil, aynı zamanda kentin geçmişinde önemli bir yeri olan önemli bir kültürel peyzaj ögesidir (Canik, 2011). Ancak günümüzde bu potansiyelin yeterli seviyede kullanılamadığı, kıyının bazı kesimlerinin zamanla kullanışsız ve atıl hale geldiği görülmektedir. Bu kapsamda, çalışmanın odak noktası olan "Kanlıırmak Mevkii", tarihi dokusu korunmuş olmasına rağmen kentle bütünleşememiş, kullanım alanı sınırlı ve yetersiz bir kıyı alanı niteliğindedir. Alanın mevcut fiziksel durumunun incelenmesi, mekânsal potansiyelinin değerlendirilmesi ve bu doğrultuda kamuya açık yaşam alanı tasarım önerisinin geliştirilmesi, çalışmanın temelini oluşturmaktadır. Söz konusu tasarım, hem alanın doğal ve tarihi değerlerini korumayı hem de halkın aktif kullanabileceği, sürdürülebilir ve çok fonksiyonlu bir kamusal alan oluşturmayı amaçlamaktadır.

Bu proje kapsamında, Umut Kafe ile Kemal Samancıoğlu Etnografya Müzesi arasında kalan kıyı şeridi ele alınmış ve mevcut durumda kullanılmayan yedi adet tarihi yapının yeniden değerlendirilmesi ve kullanılabilir hale getirilmesi amaçlanmıştır. Bu yapılar, Etnografya Müzesi, Halk Kütüphanesi, Bilim Merkezi, Geleneksel Okçuluk Derneği, Balıkçılık Derneği, Misafirhane ve El Sanatları Kurs Merkezi gibi kamusal ve kültürel kullanımlarla yeniden yapılandırılarak kent yaşamına kazandırılmıştır. Bu yaklaşım, şehirde yaşayan halkın bu alanla olan bağını güçlendirmeyi, kent kimliğini pekiştirmeyi ve kültürel sürekliliğin sağlanmasına katkıda bulunmayı amaçlamaktadır. Tarihi yapıların korunarak yeni işlevlerle donatılması, hem kültürel mirasın yaşatılmasına olanak tanımakta hem de bu yapıların kent ekonomisine ve sosyal yaşamına aktif katılımlarını sağlamaktadır. Proje Bartın Irmağı kıyısının kent için çekim merkezi haline gelmesine ve kentsel yaşam kalitesinin artırılmasına önemli bir katkı sunmayı hedeflemektedir.

Materyal

Bartın şehir merkezinde, Bartın Irmağı'nın Kanlıırmak Mevkii kıyı şeridinde yer alan ve mevcut durumda atıl durumda bulunan alan çalışma alanını oluşturmaktadır (Şekil 1).

Bartın Kenti, adını antik dönemde "suların tanrısı" olarak bilinen Parthenios'tan almıştır. Mitolojik anlam taşıyan Bartın Çayı, kentin isim kaynağı olarak kabul edilir. Bartın ve

çevresinde ilk yerleşimlerin M.Ö. 14. yüzyıla kadar uzandığı bilinmektedir (Anonim, 2001). Türkiye İstatistik Kurumu'nun 2025 yılı verilerine göre, kentin nüfusu 185.368 kişidir. Bu nüfusun 90.419'u erkek, 94.949'u ise kadındır; oranlar sırasıyla %49.71 erkek ve %50.29 kadın şeklindedir.

Tarihsel açıdan bakıldığında, Bartın Çayı bölgedeki ticaret faaliyetlerinin gelişmesinde kritik bir rol oynamıştır. Bu suyolu üzerinden çeşitli ürünlerin limanlara taşınması sağlanmıştır. Bu sebeple Bartın Çayı, M.Ö. 11-10. yüzyıllarda Fenikeliler ve ardından Kayralı ile Megaralı denizci tüccarlar tarafından da bilinmekteydi. Ünlü seyyah Evliya Çelebi, Seyahatnamesi'nde Bartın Çayı'nı "azametli bir nehir" olarak tanımlamış ve üzerinde buğday ile mısır yüklü gemilerin hareket ettiğini belirtmiştir (Erkin, 1978). Bartın'daki gemi üretimi ise yaklaşık dört asırlık geçmişe sahiptir ve bu faaliyetlerin 1950'li yıllara kadar sürdüğü kaydedilmektedir (Anonim, 2005).

Şekil 1. Çalışma alanı

Bartın Çayı, sadece taşımacılık yönünden değil, aynı zamanda kentsel ölçekte rekreatif kullanımlar açısından da önemli bir potansiyele sahiptir. Ancak günümüze kadar yalnızca birkaç park ve piknik alanı dışında rekreasyonel yatırımlar yapılmamıştır.

Yöntem

Çalışmada alanın topografik yapısı, bitki örtüsü, zemin yapısı, kıyı özellikleri, mevcut yollar ve kullanım durumları yerinde gözlemlenmiş ve mevcut planlar üzerinden değerlendirilerek mevcut durum analiz edilmiştir. Ayrıca, proje alanı sınırlarında yer alan ve yeniden işlevlendirilmesi düşünülen tarihi yapıların mimari özellikleri, mevcut durumları ve yeniden kullanım potansiyelleri detaylı olarak incelenmiştir. Bu incelemelerde plan özellikleri, cephe özellikleri, yapı malzemeleri ve yapılardaki deformasyonlar dikkate alınmıştır.

Çalışma süresince, alanın mevcut ve potansiyel kullanıcı profili (yerel halk, turistler, tematik gruplar vb.) gözleme dayalı yöntemlerle analiz edilmiş, ayrıca alanın tarihi geçmişi, kültürel değeri ve kent hafızasındaki yeri literatür taramasıyla değerlendirilmiştir.

Tasarım sürecinde, elde edilen tüm veriler literatür taramaları ile birleştirilerek, alanın doğal peyzajı ve tarihi dokusunu korumayı hedefleyen, kullanıcı ihtiyaçlarına yönelik, sürdürülebilir ve çok fonksiyonlu bir kamusal yaşam alanı oluşturulması düşünülmüştür. Bu kapsamda; sürdürülebilirlik, kentte yaşayan halkın katılımı, estetik bütünlük, sosyal işlevsellik ve ekolojik bütünlük ilkeleri tasarım sürecinin temel dayanaklarını oluşturmuştur. Projenin planlama, tasarım ve sunum aşamalarında AutoCAD, SketchUp, Lumion ve Photoshop gibi dijital yazılımlar kullanılmıştır.

Peyzaj Tasarım Projesi

Çalışma alanının fiziksel çevre analizleri, ırmağın kent için önemli doğal ve görsel kaynak olmasına rağmen kıyı şeridinin bazı kısımlarından yeterince faydalanılmadığını ortaya koymuştur. Mevcut bitki örtüsünün yer yer seyrek ve bakımsız olduğu, zemin özelliklerinin kıyı boyunca değişkenlik gösterdiği ve mevcut yolların yaya ve bisiklet kullanımına tam olarak uygun olmadığı tespit edilmiştir. Işık ve gölge analizleri, özellikle yaz aylarında bazı bölgelerde aşırı güneşlenme potansiyeli olduğunu göstermiş, bu durum gölgelendirme elemanlarının yer seçiminde dikkat edilmesi gerektiğini ortaya koymuştur.

Yapılan incelemelerde yedi adet tarihi yapının farklı mimari özelliklere ve farklı seviyelerde yıpranmalara sahip olduğu görülmüştür. Birkaç yapıda mimari detaylar büyük ölçüde korunmuşken, bazılarında önemli ölçüde deformasyon ve tahribat gözlemlenmiştir. Yapıların potansiyellerine göre yeniden kullanılabilirlikleri, mimari karakterleri, büyüklükleri ve konumları dikkate alınarak belirlenmiştir. Bu kapsamda, Etnografya Müzesi ve Halk Kütüphanesi gibi kültürel fonksiyonların yanı sıra, Bilim Merkezi, Geleneksel Okçuluk Derneği ve Balıkçılık Derneği gibi farklı ilgi alanlarına yönelik sosyal ve kültürel mekânlar önerilmiştir. Misafirhane ve El Sanatları Kurs Merkezi gibi fonksiyonlarla alan turizme katkı sağlayacak şekilde yeniden değerlendirilmiştir.

Kullanıcı profili değerlendirmeleri (gözlemler yoluyla elde edilen ön bilgiler), alanın mevcut durumda sınırlı sayıda kişi tarafından ve genellikle dinlenme ve kısa süreli geçiş amaçlı kullanıldığını göstermiştir. Potansiyel kullanıcı kitlesinin ise yerel halkın farklı yaş ve ilgi gruplarından, öğrenciler, sanatseverler ve turistlerden oluşabileceği öngörülmektedir. Bu potansiyel kullanıcıların ihtiyaçları arasında güvenli ve erişilebilir yaya ve bisiklet yolları, oturma ve dinlenme alanları, kültürel ve sosyal etkinliklere katılım imkânları ile doğayla iç içe vakit geçirebilecekleri yeşil alanlar bulunmaktadır.

Kültürel ve tarihi değer analizleri, Bartın Irmağı ve kıyısındaki yapıların kentin tarihi ve kültürel kimliğinde önemli bir yere sahip olduğunu ortaya koymuştur. Irmağın antik dönemlerden günümüze kadar var olduğu, bölgenin ekonomisine ve sosyal yaşamına yön veren bir unsur

olduğu ve kıyısındaki tarihi yapıların kentin geçmişine şahit olduğu belirlenmiştir. Bu kapsamda kültürel mirasın korunması ve gelecek nesillere aktarılması gerekliliği vurgulanmıştır. Mevcut plan ve harita verileri, çalışma alanının büyük ölçüde kamusal kullanıma bırakıldığını göstermektedir. İmar planları, alanda rekreasyon alanı olarak düzenlemeler yapılmasına olanak tanımaktadır.

Çalışmada hem kullanıcı ihtiyaçları hem de ekolojik ve tarihi dokular dikkate alınarak çok yönlü tasarım kararları alınmıştır. Bu kapsamda geliştirilen temel öneri ve tasarım kararları şu şekilde özetlenebilir:

Tarihi Yapıların Yeniden Düzenlenmesi: Alanda yer alan 7 adet tescilli yapı, halk kütüphanesi, etnografya müzesi, bilim merkezi, geleneksel okçuluk derneği, balıkçılık derneği, el sanatları kurs merkezi ve misafirhane gibi işlevlerle yeniden değerlendirilerek mevcut kimlik korunmuştur. Bu sayede kültürel miras korunmuş ve alanın kullanım kapasitesi artırılmıştır (Şekil 2, Şekil 6).

Şekil 2. Restore edilen yapılar ve sokak ilişkisi

Kıyı Şeridi Düzenlemeleri: Irmak kenarına kesintisiz yürüyüş ve bisiklet yolları entegre edilerek aktif ulaşım teşvik edilmiştir. Doğal eğimlerden yararlanarak seyir terasları ve dinlenme alanları oluşturulmuş, bu noktalarla manzara bütünleşik şekilde değerlendirilmiştir (Şekil 3).

Ekolojik ve Yeşil Altyapı Yaklaşımı: Yerli bitki türlerinden oluşan peyzaj alanlarıyla biyolojik çeşitlilik desteklenmiş, geçirgen yüzeyler ve yağmur bahçeleri sayesinde suyun yerinde yönetimi hedeflenmiştir. Ayrıca kıyı ekosisteminin sürekliliğinin sağlanması ve ekolojik koridor oluşumunun desteklenmesi düşünülmüştür (Şekil 4).

Şekil 3. Irmak üzeri yürüyüş promenatı

Şekil 4. Yol ağaçlandırması

Gölgelendirme Alanları: Özellikle yaz mevsiminde oluşan aşırı güneşlenme durumlarına karşı gölgelik yapılar, doğal ağaç gölgeleri ve pergola sistemleri önerilmiş, böylece alanda konforlu kullanım şartları oluşturulmuştur.

Toplumsal ve Kültürel Etkinlik Alanları: Açık hava gösteri alanları, küçük sergi platformları ve tematik oyun alanları gibi sosyal donatılarla her yaştan kullanıcıya hitap eden bir mekânsal tasarım geliştirilmiştir (Şekil 5).

Ulaşım ve Erişilebilirlik: Tüm alan engelsiz tasarım ilkeleri doğrultusunda ele alınmış, rampalar, yönlendirme tabelaları ve uygun zemin kaplamalarıyla engelli vatandaşların da kolaylıkla erişebilecekleri hale getirilmiştir (Şekil 7).

Bu tasarım kararları, Bartın Irmağı'nın kıyı karakterine uygun, sürdürülebilir ve çok fonksiyonlu bir toplumsal alan oluşturmayı hedeflemektedir.

Şekil 5. Irmak kenarı çeşitli aktiviteler

Şekil 6. Yeniden işlevlendirilen alanlar ve tasarım noktaları

Şekil 7. Irmak kenarında evrensel tasarım ilkelerine uygun yaya yolu

Sonuç

Elde edilen veriler Bartın Irmağı kıyısının taşıdığı önemli potansiyelin yeterince açığa çıkarılamadığını net bir şekilde ortaya koymaktadır. Kıyı şeridindeki kullanılamaz durumdaki tarihi yapılar ve bakımsız yeşil alanlar, kentin doğal ve kültürel zenginliklerinin gerektiği kadar değerlendirilmediğini göstermiştir. Bu durum, sürdürülebilir kentleşmeye uymayan bir durumdur.

Yapılan kapsamlı analizler, çalışma alanının yeniden çok yönlü bir toplumsal yaşam merkezine dönüştürülmesinin mümkün olduğunu göstermektedir. Tarihi yapıların kültürel ve sosyal amaçlarla yeniden kullanılır hale getirilmesi, hem kentin kültürel mirasının korunmasını sağlayacak hem de kentte yaşayanlar ve ziyaretçiler için yeni cazibe noktaları yaratacaktır. Önerilen kullanımlar, kullanıcıların beklentileriyle uyumlu olup, alanın farklı ilgi grupları tarafından aktif halde kullanımını teşvik edecektir. Tasarım sürecinde sürdürülebilirlik ilkelerinin temel alınması, alanın uzun vadeli başarısını güvence altına alacaktır. Ekolojik tasarım yaklaşımlarıyla doğal süreçlere saygılı çözümlerin geliştirilmesi, yerel bitki türlerinin seçimi ve doğal malzemelerin kullanımı, alanın çevresel etkilerini azaltarak ekolojik dengeye katkıda bulunacaktır.

Alanın fiziksel, kültürel ve mekânsal verileri incelenerek geliştirilen tasarım; sürdürülebilirlik, tarihi dokunun korunması ve kent yaşamına uyumlu hale getirilmesi gibi ilkeler doğrultusunda şekillendirilmiştir. Tarihi binaların yeniden kullanıma kazandırılması, hem kültürel devamlılığa katkı sağlamış hem de halkın bu alanla olan bağlarını güçlendirmiştir. Proje ile yalnızca fiziksel bir dönüşüm değil, aynı zamanda kent kimliğine değer katan bir sosyal ve kültürel etkileşim alanı yaratılmıştır. Doğal peyzajın sürdürülebilir kullanımı, biyolojik çeşitliliğin desteklenmesi ve su kenarı alanlarının toplumsal hayata entegrasyonu açısından bu proje örnek teşkil etmektedir. Geliştirilen tasarım fikrinin, Bartın başta olmak üzere benzer özelliklere sahip nehir kenarına kurulmuş kentlerde de uygulanabilecek bir model oluşturması beklenmektedir.

Teşekkür

Çalışmada desteğini gördüğümüz Lütfi AĞIRTAŞ'a teşekkür ederiz.

ABSTRACT

In today's cities, where urban life is intense, the need for open green spaces that support social interaction, preserve the natural balance and have aesthetic qualities is increasing. Landscape design projects carried out in this direction not only increase environmental quality, but also positively affect social welfare and local quality of life. In the study, the Balıkçı Island Park, located within the borders of Fatih Neighborhood of Küçükçekmece District of Istanbul Province and on the coast of the Marmara Sea, was selected as the study area. Although the area currently stands out with its marina function, it is inadequate in terms of landscaping and is used below its potential. In the study, a landscape design project proposal was presented for the area. In the project, the study area was divided into various functional areas such as children's playground, recreation area, concert area, rest area, cafeteria area. Thus, spatial solutions that appeal to different age and user groups were developed in the project. The aim of the design is to provide the user with an aesthetic, functional and healthy public space while preserving the existing potential of the area. An enriched use of the area is proposed with viewing points, green corridors, walking paths, seating areas and plant design elements. 3D modeling of the area was done using AutoCAD, SketchUp, Photoshop and Lumion programs. The visual and usage integrity of the area was checked with the project and models. Thus, the applicability of the project was supported. This project aims to increase the visual, functional and environmental quality of the area, contribute to the social life of the local people and ensure sustainable coastal use. The project will be an example for similar areas.

KÜÇÜKÇEKMECE BALIKÇI ADASI PARKI PEYZAJ TASARIM PROJESİ

ÖZET

Kentsel yaşamın yoğunlaştığı günümüz şehirlerinde, sosyal etkileşimi destekleyen, doğal dengeyi koruyan ve estetik nitelikler taşıyan açık yeşil alanlara duyulan ihtiyaç giderek artmaktadır. Bu doğrultuda gerçekleştirilen peyzaj tasarım projeleri, yalnızca çevresel kaliteyi yükseltmekle kalmayıp, aynı zamanda sosyal refahı ve yerel yaşam kalitesini de olumlu yönde etkilemektedir. Bu çalışmada, İstanbul İli Küçükçekmece İlçesi Fatih Mahallesi sınırları içerisinde yer alan ve Marmara Denizi'ne kıyısı bulunan Balıkçı Adası parkı, çalışma alanı olarak seçilmiştir. Alan, mevcut durumda marina işleviyle öne çıkmakla birlikte, çevre düzenlemesi yönünden yetersiz kalmakta ve potansiyelinin altında kullanılmaktadır. Çalışmada alan için peyzaj tasarım proje önerisi sunulmuştur. Projede çalışma alanı; çocuk oyun alanı, mesire alanı, konser alanı, dinlenme alanı, kafeterya alanı gibi çeşitli işlevsel bölgelere ayrılmıştır. Böylece projede farklı yaş ve kullanıcı gruplarına hitap eden mekânsal çözümler geliştirilmiştir. Tasarımın amacı, alanın mevcut potansiyelini koruyarak kullanıcıya estetik, fonksiyonel ve sağlıklı bir kamusal mekân sunmaktır. Alanda seyir noktaları, yeşil koridorlar, yürüyüş yolları, oturma alanları ve bitkisel tasarım ögeleriyle zenginleştirilmiş bir kullanım önerilmiştir. Tasarım sürecinde kullanılan AutoCAD, SketchUp, Photoshop ve Lumion programları aracılığıyla alanın 3D modellemeleri yapılmıştır. Proje ve modellerle alanın görsel ve kullanım bütünlüğü kontrol edilmiş ve projenin uygulanabilirliği desteklenmiştir. Hazırlanan bu proje ile alanın görsel, işlevsel ve çevresel kalitesinin artırılması, yerel halkın sosyal yaşamına katkıda bulunulması ve sürdürülebilir kıyı kullanımının sağlanması hedeflenmektedir. Proje benzer alanlar için örnek olacaktır.

Anahtar Kelimeler: Peyzaj tasarımı, kıyı düzenlemesi, rekreasyon, kentsel açık alan, Küçükçekmece (İstanbul)

Giriş

Günümüzde kentlerde yaşanan hızlı kentleşme süreci, yapılaşmanın yoğunluk kazanmasına, doğal kaynakların ve yeşil alanların ise giderek azalmasına neden olmaktadır. Bu değişim fiziksel çevreyle birlikte bireylerin yaşam kalitesini, kentle ve doğayla kurdukları ilişkileri de etkilemektedir. Yapılaşma sürecinin artması ve beraberinde doğal unsurların azalması kentte yaşayan bireylerin fiziksel ve ruhsal sağlığını destekleyen nitelikli açık yeşil alanlara duyulan ihtiyacı daha da belirgin hâle getirmiştir. Yeşil alanlar, kentsel doku içerisinde mimari yapılar dışındaki açıklıkları, kitlesel ve parçalar halindeki yeşil ögeleri ve su yüzeylerini barındıran, kentin gelişimini kontrol altında tutan, birleştirici ve ayırıcı işlevler üstlenen, kent genelinde bütünlüğü sağlayan ve tüm bunların dışında varlıkları gereği kente başta ekolojik, estetik, rekreasyonel ve ekonomik olmak üzere birtakım yararlar sağlayan sistemler bütünüdür (Ortaçeşme vd., 2020). Rakhshandehroo, ve Yusof (2014)'e göre, kentsel açık yeşil alanlar, doğal ya da yarı doğal ekosistemlerin insan etkisiyle dönüştüğü kentsel alanlardır. Bu kapsamda, kentsel açık yeşil alanların; kent insanının dinlenme, sosyalleşme, doğayla etkileşim kurma ve stresle başa çıkma gibi çok yönlü ihtiyaçlarına yanıt veren kamusal mekânlar olarak önemi artmaktadır.

Kavramsal olarak kıyı alanları ise, kara ile suyun birleştiği yer, karanın su boyunca uzanan kısmı (Pala, 1975; Doğan, 2008), deniz, göl, akarsu gibi her türlü doğal su kütlesini çevreleyen kara parçasıdır (Akbaba, 2010; Muhacir ve Özalp, 2018). Kıyıların, sahip olduğu doğal ve kültürel kaynak değerleri, iklim, jeoloji, hidroloji, flora ve fauna gibi çok sayıda etkene bağlı olarak değişiklik ve çeşitlilik gösterse de, bu özellikleri hem ekolojik hem de kültürel açıdan önemli peyzaj alanları arasında yer almalarını sağlamaktadır. Bununla birlikte, hava, su ve karanın etkileşim altında bulunduğu ve doğal kaynakların zenginliği ile dikkat çeken kıyılar, bu özellikleri nedeniyle her zaman yoğun kullanıma maruz kalmakta ve bu yoğun kullanım, kıyı ekosistemindeki hassas denge üzerinde olumsuz sonuçlara yol açabilmektedir (Garipağaoğlu vd., 2014; Muhacir ve Özalp, 2018). Bu bağlamda kıyıların sahip olduğu morfolojik özellikler, kıyıya, doğal ve görsel özellikler katarken aynı zamanda rekreasyonel açıdan değerlendirilebilecek, kaynağı ve sunduğu aktivite çeşitliliği sayesinde geniş kitlelere hitap edebilecek mekânların oluşumuna da olanak sağlamaktadır (Özgüç, 2011; Pekpak, 2012).

Kıyı alanları, kentsel açık alanlar içerisinde doğal ve görsel özelliği ile birlikte, sunduğu aktivite çeşitliliği nedeniyle de peyzaj çalışmalarında özel bir yer tutar. Kıyıları işlevlendirerek halkın kullanımına kazandırmak için yapılan peyzaj tasarım projeleri bu anlamda önemli rol üstlenir. Bu alanlarda yapılacak peyzaj tasarımları yalnız estetik yönden değil aynı zamanda sosyal bütünleşme, sürdürülebilirlik, ekolojik denge ve kente değer katma gibi birçok farklı amacı içinde barındıran bir süreçtir. Bu kapsamda yapılacak peyzaj tasarım projeleri, kent-kıyı etkileşimini güçlendirme ve kentin sosyal dokusunu canlandırma potansiyeline sahiptir.

Bu çalışma, İstanbul İli Küçükçekmece İlçesi Fatih Mahallesi'nde yer alan ve mevcutta sınırlı kullanımı olan bir marina alanından, çok işlevli bir kamusal açık ve yeşil alana dönüşümü hedeflemektedir. Peyzaj tasarımında gökkuşağı teması esas alınarak, renklerin dinamizmiyle görsel zenginlik yaratılmakta, planlanan çocuk oyun alanları, piknik ve mesire alanları, açık hava etkinlik ve konser alanları, yürüyüş yolları ve sosyal toplanma mekânları ile de yalnızca fiziksel bir dönüşüm değil, aynı zamanda sosyal ve psikolojik olarak kent insanına fayda sağlayan, sürdürülebilir ve kapsayıcı bir kamusal alan önerisi ortaya koymaktadır. Böylelikle proje; kent içi yaşam kalitesini artıran, sosyal bütünleşmeyi teşvik eden ve doğayla kurulan bağı güçlendiren bir peyzaj tasarımı örneği sunmaktadır.

Materyal-Yöntem

Çalışma alanı, İstanbul İli Küçükçekmece İlçesi sınırları içerisinde yer alan Fatih Mahallesi'nde, Küçükçekmece Gölü kıyısındaki Balıkçı Adası ve çevresindeki kıyı alanını kapsamaktadır. Çalışmada öncelikle konuya ve çalışma alanına ilişkin literatür taraması yapılmış, çeşitli kurum ve kuruluşlardan elde edilen bilgiler bilgisayar ortamına aktarılmıştır. Daha sonra çalışma alanında yapılan arazi çalışması ile alandaki sorunlar tespit edilmiş ve ihtiyaçlar belirlenmiştir. Sörvey aşamasından sonra alanın mevcut durumu ve sahip olduğu potansiyeller değerlendirilerek konsept belirlenmiştir. Konsepte göre alan kullanım kararları alınarak tasarım ilkeleri belirlenmiştir. Daha sonra tüm veriler ışığında çalışma alanına ait rekreasyonel peyzaj tasarım projesi geliştirilmiştir. Proje alanı, rekreatif değerleri ve doğal peyzajla bütünleşen konumu sayesinde kent insanına doğayla buluşma imkânı sunan çok işlevli bir kamusal alan olarak kurgulanmıştır. Projelerin çizimi, görselleştirilmesi ve sunumunda AutoCAD, SketchUp, Photoshop ve Lumion programları kullanılmıştır.

Araştırma Bulguları

Çalışma Alanı Doğal ve Kültürel Peyzaj Analizi

Küçükçekmece İlçesi; 40° kuzey enlemi ve 28° doğu boylamı arasında yer almaktadır. Sahil uzunluğu 7 km, il merkezine uzaklığı ise 23 km.dir. İlçe Avrupa yakasında, Çatalca yarımadasının güneydoğusunda yer almaktadır. Batısında Avcılar ve Çatalca, kuzeyinde Gaziosmanpaşa, doğusunda Esenler, Bağcılar ve Bahçelievler güneyinde ise Bakırköy ilçeleri yer almaktadır. Küçükçekmece İlçesi; tarih boyunca İstanbul-Avrupa ana ulaşım aksları üzerinde yer almıştır. İkitelli ve İstanbul arasında ulaşım imkanlarını arttıran TEM otoyolu ilçeden geçmektedir. Sirkeci Halkalı arasında çalışan bir banliyö tren hattı bulunmaktadır. Ayrıca İstanbul'un uluslararası havalimanı olan Atatürk hava limanı da bu ilçede yer almaktadır. Küçükçekmece geniş düzlükler halinde az engebeli bir alana yayılmıştır. Deniz ve göl kıyılarından içerilere doğru girildikçe yükseklik artar. Küçükçekmece Gölü morfolojik (biçim) yapısı nedeniyle tam ve tipik bir lagün gölüdür. Dünyada ender oluşan lagün göllerinden birisidir ve bir doğa harikasıdır. Sahil uzunluğu 7 km'dir (Ertürk, 2011) (Şekil 1, 2).

Küçükçekmece'nin Osmanlı İmparatorluğu'na katılması, Fatih Sultan Mehmet'in İstanbul'u fethinden sonraki dönemlerde olmuştur. Eskiden Küçükçekmece denildiğinde sayfiye yeri akla gelmekteydi. Denizle bağlantısı olan kanalın demiryolu kısmında özellikle yazın sıkça kullanılan mesire yerleri vardı. 1951'de Sirkeci-Halkalı tren yolunun ve Londra yolunun (bugünkü adı ile E-5 karayolu) açılması ilçenin gelişmesi açısından büyük öneme sahiptir. Bölge'de yoğun nüfus artışı 1950'lerde başlamıştır. İlçede Çeşme, Garip Dede türbesi, kibrit fabrikası, Mimar Sinan köprüsü önemli simgeler olarak bilinmektedir. Kıyı parkı, ilçe meydanı en çok gelinen odak noktaları olup, gölün Kanarya tarafındaki çamlık alan mahalle sakinleri tarafından mesire yeri olarak kullanılmaktadır (Ertürk, 2011).

Balıkçı Adası Parkı Küçükçekmece İlçesi Fatih Mahallesi'nde, 40.988850 enlem ve 28.770658 boylamda yer alır. Balıkçı Parkı Adası rakımı 2 metredir. Toplam yüzölçümü 13.500 m²'dir.

Şekil 2. Çalışma alanı ve çevresi (Google Earth, 2025).

Şekil 3. Balıkçı Adası parkının mevcut konumu ve çevre ilişkisi (Harita Map, 2025)

Alan, mevcut durumda sınırlı marina kullanımı dışında büyük ölçüde âtıl durumdadır. Kıyı şeridi, göl ekosistemiyle bütünleşen doğal potansiyeli ve kentsel erişilebilirliği yüksek bir konumda yer alması bakımından önemli peyzaj dönüşüm potansiyeline sahiptir (Şekil 3, 4).

Öneri Peyzaj Tasarım Projesi

Yapılan alan analizleri, kullanıcı ihtiyaçları ve kentsel bağlam çerçevesinde, Balıkçı Adası çevresine yönelik peyzaj tasarımında; kıyının doğal karakteri korunarak sosyal, rekreatif ve ekolojik değerlerin bütüncül bir yaklaşımla yeniden işlevlendirildiği bir proje üretilmiştir.

Peyzaj tasarım projesinde alınan ana plan kararları;

- Kıyı boyunca süreklilik taşıyan bir yeşil koridor oluşturularak, farklı yaş ve kullanıcı gruplarına hizmet eden çok işlevli alanlar oluşturulmuştur.
- Alandaki âtıl ve niteliksiz boşluklar işlevlendirilerek, kullanıcıların aktif olarak zaman geçirebileceği açık alanlara dönüştürülmüştür.
- Doğal topografya ve ekolojik yapı korunarak, kıyıya özgü bitki türleriyle peyzaj bütünlüğü sağlanmış; bu doğrultuda doğal yaşama uygun, düşük bakım gerektiren bitkilendirme tercih edilmiştir.
- Gökkuşağı teması ile mekânsal çeşitlilik artırılmış; renk kodlu zonlama sayesinde alan, estetik ve deneyimsel bir kamusal mekâna dönüştürülmüştür.
- Yaya ve bisiklet yolları ile erişilebilir ve sağlıklı ulaşım imkânı sunulmuş; engelli bireyler için engelsiz tasarım ilkelerine uygun geçişler planlanmıştır.
- Çocuk oyun alanı, konser sahnesi, mesire alanı gibi fonksiyonlarla sosyal etkileşim desteklenmiş; farklı kullanıcı profillerine hitap eden alanlar tasarlanmıştır.
- Ekolojik sürdürülebilirlik ilkeleri doğrultusunda, geçirgen zemin kaplamaları kullanılmıştır.
- Kıyının kamusal bellekte yer edinmesi hedeflenerek; kültürel, doğal ve sosyal bağlamı yansıtan bir peyzaj dili benimsenmiştir.

Şekil 5. Çalışma alanı kıyı yürüyüş bandından bir görünüm

Bu kararlar, yalnızca fiziksel çevrenin düzenlenmesini değil, aynı zamanda kentsel yaşam kalitesinin artırılmasını, doğa ile uyumlu mekânlar yaratılmasını ve toplumsal etkileşimin güçlendirilmesini amaçlamaktadır. Proje; estetik, ekolojik ve sosyal açılardan sürdürülebilir bir kıyı dönüşümünü hedeflemektedir.

Bu kapsamda çalışma alanında tasarlanması düşünülen kullanımlar proje ve üç boyutlu görseller şeklinde sunulmuştur (Şekil 5-15).

Şekil 15. Çalışma alanı kıyı bandından bir görünü

Sonuç

Bu çalışmada, İstanbul İli Küçükçekmece İlçesi Fatih Mahallesi'nde yer alan ve mevcut durumda âtıl kalan Balıkçı Adası parkı için kapsamlı bir peyzaj tasarım proje önerisi sunulmuştur. Kentsel açık yeşil alanların günümüzde artan önemi göz önüne alındığında, bu tür kıyı alanlarının rekreasyonel ve sosyal işlevlerle zenginleştirilmesi kentlerimiz için önemli bir

ihtiyaçtır. Proje ile mevcut durumda marina işleviyle sınırlı kullanımı olan alanın, çok işlevli ve estetik bir kamusal mekâna dönüşebileceği görülmüştür.

Proje kapsamında, alanın doğal potansiyelini koruyarak, farklı yaş ve kullanıcı gruplarına hitap eden çocuk oyun alanı, mesire alanı, konser alanı, dinlenme alanı ve kafeterya alanı gibi çeşitli fonksiyonel kullanımlar oluşturulmuştur. Gökkuşağı teması ile alanda çeşitlilik ve görsel zenginlik artırılmış, alanın estetik değeri yükseltilmiştir. Yaya ve bisiklet yolları, seyir noktaları, yeşil koridorlar ve bitkisel tasarım ögeleri ile kullanıcıların doğayla etkileşimi artırılmıştır.

Tasarım sürecinde AutoCAD, SketchUp, Photoshop ve Lumion gibi yazılımların kullanılması, projede görsel ve kullanım bütünlüğünün sağlanmasına, aynı zamanda projenin uygulanabilirliğinin desteklenmesine imkân sunmuştur. Önerilen peyzaj tasarımı sadece fiziksel çevrenin iyileştirilmesiyle kalmayıp, yerel halkın sosyal yaşamına katkıda bulunacak içerikler sunmaktadır. Sürdürülebilir kıyı kullanımının teşvik edilmesiyle kentsel yaşam kalitesi artırılmış olacaktır.

Sonuç olarak, bu proje önerisiyle Balıkçı Adası parkının yalnızca fiziksel olarak iyileştirilmesi değil, aynı zamanda bölge halkının sosyal etkileşimini güçlendiren, kıyı ekosistemine duyarlı ve sürdürülebilir bir kamusal alan oluşumu sağlanmıştır. Bu çalışma, benzer nitelikteki âtıl kıyı alanlarının kent yaşamına kazandırılması ve sürdürülebilir peyzaj tasarımı ilkeleriyle dönüştürülmesi adına örnek teşkil edecek bir model sunmaktadır.

Teşekkür

Çalışmada desteğini gördüğümüz Erkan Başak'a teşekkür ederiz.

ABSTRACT

In this study, differences in the bioactive and sensory properties of table olives prepared using three different salts (Himalayan salt, rock salt, sodium-reduced salt) were determined. The highest pH was determined in sodium-reduced salt with 4.58. The titratable acidity of the brine was observed between 0.20% (sodium-reduced salt brine) and 0.27% (rock salt brine). The highest total phenolic content (215.93 mg/100 g) was determined in olives using rock salt. Antioxidant activities were recorded as 0.56 mmol/100 g in all samples. The highest total flavonoid content with 2567.14 mg/100 g was observed in olives using Himalayan salt, followed by rock salt with 1520.48 mg/100 g. The amounts of hydroxytyrosol (28.43 mg/100 g), verbascoside (19.06 mg/100 g) and oleuropein (17.74 mg/100 g) in olives prepared with rock salt were found to be the highest when compared to olives prepared with other salts. The tyrosol concentration of Himalayan salted olives was determined to be at the maximum level with the value of 10.71 mg/100 g. Luteolin and caffeic acid contents of table olives were not significantly affected by the use of different salts, and the lowest values were found to be 9.17 mg/100 g (rock salt) and 3.45 mg/100 g (sodium-reduced salt), respectively. According to results of sensory properties, the table olive with the highest score in all parameters was prepared using rock salt, followed by himalayan salt.

Keywords: Table olive, antioxidant activity, salt, bioactive properties, oleuropein

Introduction

Table olives are products obtained by removing the bitterness of cultivated olive tree fruits in accordance with the technique, subjecting them to lactic acid fermentation or not, and adding lactic acid and/or other additives when necessary, and subjecting them to pasteurization or sterilization processes or not (TS-774, 1993). The main phenolic compounds of olives are; phenolic glycosides such as oleuropein, verbascoside, ligsitroside, flavonoids, flavonol glycosides, anthocyanins and their glycosides, phenolic acids (Ryan & Robards, 1998; Keçeli & Gordon, 2001; Savaş & Uylaşer, 2013). Phenolic compounds found in olive fruits are responsible for the bitter taste in olives (Cemeroğlu et al., 2001). In table olive production, different methods such as alkali treatment, directly soaking in water or brine, and salt treatment are used, but the common goal is to sweeten and preserve the olive (Arroyo-López et al., 2015). In order to sweeten the olive, the oleuropein substance, which is the source of the bitter taste, must be removed from the fruit, and in order to preserve the olive, the beneficial microorganisms in the olive microflora must consume the carbohydrates in the fruit and prevent the development of pathogenic microorganisms by producing lactic acid. For this purpose, leaving the olives to ferment in brine is a widely used method in the production of many table olive varieties (Aktan & Kalkan, 2000; Panagou & Katsaboxakis, 2006). Preservation and fermentation in salt water is a traditional food preservation method used due to its low energy consumption and cost. In this preservation method, salt reduces water activity, inhibits the growth of undesirable microorganisms and helps improve taste (Ross et al., 2002). All preparation processes of fermented table olives include a immersion step in a salt solution where fermentation takes place. The final product will be consumed by consumers without any pretreatment, since table olives are referred to as "ready-to-eat food". Any changes during processing may lead to the risk of spoilage or safety issues. Salt (NaCl) plays an important role in fermented foods because it increases the speed of the fermentation process by increasing the diffusion of different compounds out of the cells, inhibits the growth of undesirable bacteria and fungi present in fresh food, and supports the growth of fermentative microorganisms. A large diversity of LAB and/or yeast species is usually observed at the beginning of fermentations. As the processes progress, some species disappear and others develop, and each phase is associated with different species (Alves et al., 2012; Bleve et al., 2014, Hurtado et al., 2008, Nisiotou et al., 2010; Pereira et al., 2008). In this study, the effect of different salts (Himalayan salt, rock salt and sodium-reduced salt) on the bioactive and sensory properties of table olives was investigated.

Materials and Methods

Materials

Ayvalık variety olives were provided in November. The water of the olives was changed in the morning and evening and the bitterness process was applied for 7 days and at the end of the 7 days, the olives were prepared using 10% brine with three different salt types (rock salt, Himalayan salt, 50% sodium reduced salt). They were left to ferment for 2 months before the analyses were carried out.

Methods

pH determination

According to Cemeroğlu (1992), pH measurement in the brine was carried out using a pH-meter.

Titration acidity determination

The titration acidity of the brine was determined by titration with 0.1 N NaOH together with phenolphthalein indicator and given as a percentage (Uylaşer & Başoğlu, 2011).

Extraction of phenolic compounds from olive fruit

The olive pulp (1.5 g) separated from the pits and crushed was weighed and 20 ml of methanol/water (80:20, v/v) was added. After mixing for 3 min using vortex, the extract was filtered through Whatman filter paper number 40. The hexane (20 ml) was added to the filtrate and mixed, and the remaining phase was used for analysis by passing through 0.45 µm syringe filters (Vinha et al., 2005; Yorulmaz et al., 2013).

Total phenolic content

The total phenolic content of olive extracts was determined using Folin Ciocalteu (FC) reagent (Yoo et al., 2004). The extract (0.5 ml) was mixed with 2.5 ml of FC reagent and 1.5 ml of sodium carbonate solution. The absorbance values of the samples kept at room temperature and in the dark for 2 hours were measured at 725 nm.

Total flavonoid content

Total flavonoid content was determined according to Dewanto et al. (2002). The extracts were diluted with distilled water. After adding 5% NaNO2 solution to each test tube, 10% AlCl3 solution was added 5 minutes later and 1.0 M NaOH solution was added 6 minutes later. The total volume was filled with water until it became 5 ml and the test tubes were mixed well. The absorbance was measured at 510 nm.

Antioxidant activity

The antioxidant activity of olive extracts was determined using 2,2-diphenyl-1-picrazyl (DPPH) according to Lee et al. (1998). The extract (0.1 ml) was mixed with 2 ml of DPPH solution and the absorbance values of the samples kept at room temperature and in the dark for 30 min were measured at 517 nm.

Determination of phenolic components

The phenolic component profile of olive extracts was performed using high-performance liquid chromatography (HPLC) at 280 nm.

Working conditions;

Instrument :Shimadzu LC 10A vp, Kyoto, Japan

Software :PC running Class VP chromatography manager software (Shimadzu, Japan)

Injection volume :40 µl

Column :Inertsil ODS3 analytical column (GL Sciences, Japan), (5 µm, 25 cm x 4.6 mm i.d.)

Mobile phase :A (2% formic acid aqueous solution), B (methanol)

Flow rate :0.85 ml/min

Detector :Shimadzu SPD-M20 A Diode Array Detector

Temperature :40 °C

Sensory Analysis

Sensory properties of table olives were determined by applying scoring test. This test was performed by 10 trained panelists to determine the characteristics of olives. Panelists evaluated the samples in terms of taste, odor, color, texture and bitterness. Each panelist evaluated the sensory characteristics of the olives with the following scores: 1 = very bad, 2 = bad, 3 = average, 4 = good, 5 = very good (Pagliarini & Rastelli, 1994).

Findings and Discussion

The moisture, pH and titratable acidity results of the samples are given in Table 1. According to the results of moisture content, the highest moisture content with 61.85% was determined in olives cured with Himalayan salt; while no significant change was observed in the moisture contents of olives cured with rock salt (59.21%) and reduced sodium salt (58.85%). The highest pH was determined in sodium-reduced salt with 4.58. According to the study conducted by Cabral et al. (2018) with Cobrançosa variety olives, the pH value of the samples cured with 8% NaCl was reported as 4.46, and the pH value of the samples cured with 4% NaCl + 4% KCl concentration was reported as 4.52. The titratable acidity of the brine was observed between 0.20% (sodium-reduced salt) and 0.27% (rock salt brine). In the study conducted to determine the total acidity of olive samples taken from different regions of Bursa province, the total acidity of the olive samples was found to be 0.56-0.71 g/100 g for pickled black olives; 0.31-0.45 g/100 g for pickled green olives; and 0.71 g/100 g for pickled olives (Atlı, 2020).

Table 1. Physicochemical properties of olive samples

Olive samples	Moisture content (%)	pH	Titratable acidity (%)
Rock salt	59.21 ± 0.79	4.51 ± 0.00	0.27 ± 0.01
Himalaya salt	61.85 ± 0.43	4.48 ± 0.02	0.22 ± 0.03
Sodium reduced salt	58.85 ± 0.22	4.58 ± 0.01	0.20 ± 0.01

The bioactive properties of the pickled olive samples are shown in Table 2. When the total phenolic content was evaluated, the highest concentration (215.93 mg/100 g) was obtained in olives cured with rock salt, while the total phenolic contents were determined as 141.30 mg/100 g using Himalayan salt and 166.67 mg/100 g with sodium reduced salt. In a study, the total phenolic content was determined as 155 mg/100 g in olives fermented in 8% brine and 168

mg/100 g in samples cured with 4% NaCl + 4% KCl concentration, and similar results were found in the present study (Cabral et al., 2018). In a different study, the change in the total phenolic content of different olive varieties depending on the harvest time was examined. According to this study, it was reported that the total phenolic content of Ayvalık variety olives varied between 102.30 mg/100 g in the 1st month (August) and 287.29 mg/100 g in the 5th month (December) (Fındık, 2017). In another study, Uslu olive (fresh) had the highest value with 421.0 mg CAE/100 g total phenolic substance, followed by Gemlik, Ayvalık, Memecik and Domat olives with 274.9, 250.8, 208.2 and 189.8 mg CAE/100 g, respectively. In processed olive varieties, the highest phenolic content was determined in Uslu variety with a decrease from 421.0 mg CAE/100g to 394.9 mg CAE/100g, while the lowest value was determined in Ayvalık olive with a decrease from 250.8 mg CAE/100g to 133.2 mg CAE/100g (Irmak et al., 2010).

Antioxidant activity was found to be the same in all pickled olives with a value of 0.56 mmol/100 g. According to the study of Fındık (2017), the antioxidant activity of Ayvalık variety olives varied between 83.685% in the 1st month (August) and 76.190% in the 5th month (December). In a study on the effect of processing methods on the antioxidant capacity of table olives, the antioxidant capacity was determined as 348.8-456.7 µmol trolox/100g according to the DPPH method in 10 different samples, and the highest value was reported to be determined in pickled black olives and the lowest value in pickled green olive samples (Atlı, 2020).

The highest total flavonoid content with a value of 2567.14 mg/100 g was determined in olives prepared with Himalayan salt, followed by rock salt with 1520.48 mg/100 g. The lowest value with 1124.29 mg/100 g was obtained in olive sample using sodium reduced salt. In a study, when the flavonoid content of Gemlik olives was examined according to their ripening periods on the tree (green, variegated, rabbit heart, black), the lowest flavonoid content was recorded in green olives. The flavonoid amounts of olives harvested in the 3rd stage of ripening were higher than those in other ripening stages. The flavonoid amounts of Gemlik type olives increased until the 3rd ripening stage, and decreased in the 4th ripening period with the full ripening of the olives. It was reported that total flavonoid contents were recorded as 136.88 mg/100 g, 275.55 mg/100 g, 397.03 mg/100 g, 313.44 mg/100 g, respectively, according to the ripening level (Kose et al., 2018).

Table 2. Bioactive properties of olive samples

Olive samples	Total phenolic content (mg/100 g)	Antioksidan activity (mmol/100 g)	Total flavonoid content (mg/100g)
Rock salt	215.93 ± 11.18	0.56 ± 0.00	1520.48 ± 33.11
Himalayan salt	141.30 ± 7.78	0.56 ± 0.00	2567.14 ± 19.79
Sodium reduced salt	166.67 ± 4.84	0.56 ± 0.00	1124.29 ± 7.56

Table 3 shows the phenolic compounds of pickled olives. When the changes in phenolic compounds according to the salt type were examined, the highest values were recorded in the amounts of hydroxytyrosol (28.43 mg/100 g), verbascoside (19.06 mg/100 g) and oleuropein (17.74 mg/100 g) in olives cured with rock salt. The tyrosol concentration of the Himalayan salt sample was found to be higher than the other samples with a value of 10.71 mg/100 g. Although no significant change was observed in the amount of luteolin, the lowest content was seen in the olives cured with rock salt as 9.17 mg/100 g. Similarly, there was no significant change in the amount of caffeic acid, but the lowest value of 3.45 mg/100 g was detected in the olives cured with 50% reduced sodium salt.

Table 3. Phenolic compounds of olive samples

Phenolic compounds (mg/100 g)	Rock salt	Himalaya salt	Sodium reduced salt
Hydroxytyrosol	28.43 ± 7.63	12.80 ± 0.78	11.46 ± 0.51
Tyrosol	10.71 ± 0.93	13.82 ± 0.84	10.29 ± 0.39
Caffeic acid	4.13 ± 0.56	4.12 ± 0.36	3.45 ± 0.31
Verbascoside	19.06 ± 3.65	15.56 ± 1.13	14.50 ± 0.94
Oleuropein	17.74 ± 1.76	14.19 ± 0.22	13.41 ± 0.58
Luteolin	9.17 ± 0.02	9.25 ± 0.09	9.26 ± 0.02

In a study, it was determined that verbascoside was less than 0.02% in olive varieties grown in Portugal. It was also determined that verbascoside was low in varieties with the highest amount of oleuropein (Vinha et al., 2005). In a study investigating the effects of location and olive processing methods on phenolic compounds in Gemlik variety olives, it was reported that hydroxytyrosol and tyrosol contents in olive samples varied between 4.58-195.70 mg/kg and 0.57-47.24 mg/kg, respectively. In the same study, luteolin values in Gemlik variety olive samples varied between 0.17 mg/kg and 53.56 mg/kg, while oleuropein values were reported between 0.16 mg/kg and 58.94 mg/kg (Demir, 2024). In a different study, the amount of hydroxytyrosol in Gemlik variety olives was reported as 368 mg/kg (Ghrobel et al., 2018). In another study, it was reported that the amount of hydroxytyrosol in fresh olive samples of Sarıulak olive variety obtained from different regions varied between 38.7 mg/kg and 675.3 mg/kg (Arslan & Özcan, 2011). In the study conducted by Othman et al. (2009), the amount of hydroxytyrosol in fresh olives of Meski variety was found to be between 2198-2832 mg/kg. In another study, the amount of luteolin in fresh olive samples was determined as 248.72 mg/kg (Yorulmaz et al., 2012). The lowest amount of tyrosol in olives obtained from Gemlik variety and Mudanya region was reported as 19.08 mg/kg (Uylaser, 2015). According to the present study, it is thought that the differences observed in phenolic compound contents are due to location, olive variety and process parameters.

The sensory properties of table olives are presented in Table 4. When the sensory analysis results were evaluated, the sample with the highest score in all parameters was rock salt, followed by himalayan salt. The lowest scores were recorded for sodium reduced salt compared to the other two samples. In the study conducted by Ratogi et al. (2007) investigating the effect of replacing NaCl with CaCl2 and/or KCl on the sensory properties of Maçanilha Algarvia table olives, it was reported that olives fermented with 8% NaCl and 4% NaCl + 4% KCl brine obtained the highest scores for flavor and general properties, while samples processed with other brine combinations (4% NaCl + 4% CaCl2 −4% KCl + 4% CaCl2 and 2.7% NaCl + 2.7% KCl + 2.7% CaCl2) were unacceptable.

Table 4. Sensory properties of olive samples

Olive samples	Taste	Smell	Colour	Texture	General appearance
Rock salt	4.80 ± 0.45	5.00 ± 0.00	4.60 ± 0.55	4.80 ± 0.45	4.80 ± 0.45
Himalaya salt	4.80 ± 0.45	4.80 ± 0.45	4.40 ± 0.55	4.60 ± 0.55	4.60 ± 0.55
Sodium reduced salt	3.60 ± 0.89	4.20 ± 0.84	4.20 ± 0.84	4.40 ± 0.55	4.40 ± 0.55

Conclusion and Recommendations

The effect of salt on biyoactive properties and sensory attributes of table olives was investigated. The highest total phenolic content, hydroxytyrosol, verbascoside and oleuropein were

recorded in the olives prepared with rock salt, while the table olives prepared with himalayan salt contained higher amounts of total flavonoid and tyrosol. Similarly, when all values were considered, the lowest values except for total phenolic content were determined in samples prepared with 50% reduced sodium salt.

ABSTRACT

This study was conducted at B.U.U. Faculty of Agriculture TUAM experimental areas in 2022 and 2023 to determine the effects of different nitrogen doses (0, 8, 16 and 24 kg/da) on the silage quality of some sweet sorghum varieties (Gülşeker, Erdurmuş and Uzun) grown as second crop under the ecological conditions of Bursa.Harvesting of plants for silage was carried out at the milk-dough stage of the plants. Harvested plant samples were shredded into 1.5-2 cm pieces, then filled into 1 litre anaerobic jars and left to fermentation for 60 days under laboratory conditions. The jars were opened after 60 days and the dry matter rate, pH, crude protein, ADF and NDF rates were analysed. According to the two-year average results obtained from the study, significant differences were found among the varieties in terms of the analysed parameters. The highest crude protein rate was found in Uzun variety, the lowest ADF and NDF rates were found in Erdurmuş variety. Increasing nitrogen doses significantly affected the other parameters of the silages except dry matter and ADF rates. In terms of nitrogen doses, the highest crude protein rate was obtained from 24 kg/da nitrogen dose, the lowest pH value were obtained from 0 and 16 kg/da nitrogen doses and the lowest NDF rate was obtained from 0 and 8 kg/da nitrogen doses. In conclusion, it can be recommended to prefer Erdurmuş variety and to use 16 kg/da nitrogen dose for a well-balanced silage in terms of fermentation quality, nutrient content and digestibility of silages in cultivation in similar ecological regions.

Keywords: Nitrogen, second crop, silage quality, sweet sorghum

İKİNCİ ÜRÜN KOŞULLARINDA YETİŞTİRİLEN BAZI ŞEKER SORGUM ÇEŞİTLERİNDE FARKLI AZOT DOZLARININ OTUN SİLAJ KALİTESİ ÜZERİNE ETKİLERİ

ÖZET

Bu çalışma, Bursa ekolojik koşullarında ikinci ürün olarak yetiştirilen bazı şeker sorgum çeşitlerinde (Gülşeker, Erdurmuş ve Uzun) değişik azot dozlarının (0, 8, 16 ve 24 kg/da) otun silaj kalitesi üzerindeki etkilerini belirlemek amacıyla B.U.Ü. Ziraat Fakültesi TUAM deneme alanlarında 2022 ve 2023 yıllarında yürütülmüştür. Silaj amacıyla bitki hasadı, tanelerin süt-hamur olum döneminde yapılmıştır. Hasat edilen bitki örnekleri 1.5-2 cm boyutlarında parçalanmış, ardından 1 litrelik anaerobik kavanozlara sıkıştırılarak doldurulmuş ve laboratuvar koşullarında 60 gün süreyle fermantasyona bırakılmıştır. Hazırlanan kavanozlar 60 gün sonra açılmış ve silajlarda kuru madde oranı, pH değeri, ham protein, ADF ve NDF oranları gibi özellikler incelenmiştir. Araştırmadan elde edilen iki yıllık ortalama sonuçlara göre; çeşitler arasında incelenen özellikler açısından önemli farklılıklar ortaya çıkmıştır. Araştırmada, en yüksek ham protein oranı Uzun çeşidinde, en düşük ADF ve NDF oranları ise Erdurmuş çeşidinde tespit edilmiştir. Artan azot dozları silajların kuru madde ve ADF oranı hariç incelenen diğer özellikleri önemli ölçüde etkilemiştir. Azot dozları bakumından en yüksek ham protein oranı 24 kg/da azot dozundan, en düşük pH değeri 0 ve 16 kg/da azot dozlarından, en düşük NDF oranı ise 0 ve 8 kg/da azot dozlarından elde edilmiştir. Sonuç olarak; benzer ekolojik bölgelerde yapılacak yetiştiricilikte silajların fermantasyon kalitesi, besin içeriği ve sindirilebilirliği açısından dengeli bir ot silaj için Erdurmuş çeşidinin tercih edilmesi ve 16 kg/da azot dozunun kullanılması önerilebilir.

Anahtar kelimeler: Azot, ikinci ürün, silaj kalitesi, şeker sorgum

Giriş

Ülkemizde çayır ve mera alanları ile tarla tarımında yetiştirilen yem bitkileri, kaba yem ihtiyacını karşılayan en önemli iki kaynaktır. Hayvan beslenmesi ve kaba yem temininde çayır ve meraların rolü oldukça büyüktür (Okçu, 2020). Ancak, çayır ve mera alanlarının amaç dışı kullanımı ile erken ve aşırı otlatma gibi sorunlar, bu alanların önemli bir kısmının bitki örtüsünden yoksun kalmasına ve verimlerinin düşmesine yol açmaktadır. Bu nedenle, ülkemizdeki kaba yem açığının kısa sürede kapatılmasında tarla tarımında yetiştirilen yem bitkileri önemli bir rol üstlenecektir. Bitkisel üretim destekleri kapsamında geliştirilen ekim modeli sayesinde yem bitkileri ekim alanlarında %10'luk bir artış sağlanmıştır. Bu teşvik edilen yem bitkileri arasında sorgum (*Sorghum bicolor*) da bulunmaktadır (Yücel ve ark., 2018). Sorgum, tarih boyunca "Verimli Hilal" olarak bilinen Mezopotamya'da kültüre alınmıştır. Kültüre alındığı günden bu yana Anadolu'da da yetiştirilen sorgum; darı, koca darı, boynu eğri darı ve gılgıl gibi farklı isimlerle anılmaktadır. Şemseddin Sâmi, "tarla" kelimesinin darı kökenli olduğunu ve bu terimin darı ekili alanı ifade ettiğini belirtmektedir. Ayrıca, geçici kuraklıklara karşı yüksek toleransı ve kuraklık koşulları sona erdikten sonra yeniden büyüme yeteneği sayesinde sorgum "bitkiler âleminin devesi" olarak tanımlanmaktadır (Sezgin ve Alatürk, 2023). Üretim özellikleri ve kullanım alanlarına göre sorgum, şeker sorgum, tane sorgum ve yem sorgum olarak üç gruba ayrılmaktadır (Motsi ve ark., 2022). Şeker sorgum türleri, abiyotik stres koşullarına mısıra göre daha fazla tolerans gösterir. Bu nedenle, gelecekte olumsuz çevre koşullarının ortaya çıkabileceği bölgelerde şeker sorgum, silajlık mısırın yerini alabilecek bir potansiyele sahiptir.

Son yıllarda farklı şeker sorgum genotiplerinin silaj kalitesine yönelik olarak yapılmış olan çalışmalarda genotipler arasında önemli farklılıkların olduğu (Orrico Junior ve ark., 2015; Geren ve ark., 2019; Yücel ve Erkan, 2020;) bildirilmiş olmakla birlikte silaj kalitesi açısından azot dozlarının etkinliği üzerine sınırlı sayıda araştırma (Girgin, 2012; Sadigfard, 2016) yapılmıştır. Azot, bitki gelişmesinde hayati fonksiyona sahip bir bitki besin maddesi olup bitkiler tarafından alınan azota bağlı olarak bitki bünyesinde azotlu bileşikler artmakta ve vejetatif aksam zenginleşmektedir (Sadighfard, 2016). Bu nedenle, her bir çeşit ve yetiştirme koşulu için en uygun azot miktarının belirlenmesi, sürdürülebilir tarım uygulamaları açısından gereklidir. Bu noktadan hareket edilerek bu çalışma, Bursa ekolojik koşullarında ikinci ürün olarak yetiştirilen bazı şeker sorgum çeşitlerinde artan azot dozlarının otun silaj kalitesi üzerindeki etkilerini belirlemek amacıyla yapılmıştır.

Materyal ve Yöntem

Araştırma, 2022 ve 2023 yıllarında B.U.Ü. Ziraat Fakültesi TUAM deneme alanlarında tarla denemesi olarak tesadüf bloklarında bölünmüş parseller deneme düzenine göre 3 tekrarlamalı olarak yürütülmüştür. Denemelerde ana parsellere şeker sorgum çeşitleri (Gülşeker, Erdurmuş ve Uzun), alt parsellere ise azot dozları (0, 8, 16 ve 24 kg/da) yerleştirilmiştir. Araştırmada, her bir alt parselde sıra arası 70 cm olacak şekilde 5 m boyunda sıralar açılmış ve ekim 5 Temmuz 2022 ve 6 Temmuz 2023 tarihlerinde yapılmıştır. Denemede hasat bitkilerin süt-hamur olum döneminde elle toprak seviyesinden biçilerek yapılmıştır. Hasat döneminde her parselden, parseli temsil eden beş bitki alınmış ve bitkiler tek sıralı silaj makinesinden geçirilmiştir. Parçalama işlemi 1.5-2 cm boyutlarında yapılmıştır. Parçalanan örnekler laboratuvarda bir pres yardımıyla 1 litrelik anaerobik kavanozlara sıkıştırılarak doldurulmuş ve ardından etiketlenmiştir. Hazırlanan kavanozlar 60 gün süreyle fermantasyona bırakılmıştır. Fermantasyon süreci sonunda açılan kavanozların her birinden en az 150 g örnek alınmış ve 70 °C'de 48 saat kurutularak kuru madde oranları belirlenmiştir. Ayrıca, silajların pH değerlerini

belirlemek amacıyla silajlardan 40 g örnek alınıp üzerine 360 ml saf su eklenmiş ve 3 dak. çalkalanmıştır. Çalkalama işlemi tamamlandıktan sonra örnekler süzülmüş ve bu süzüklerde pH değeri ölçülmüştür (Budaklı Çarpıcı, 2009). Kuru madde oranını belirlemek amacıyla kullanılan örnekler öğütülmüş ve bu örneklerde ham protein oranı, ADF oranı ve NDF oranını belirlemek amacıyla analizler yapılmıştır (AOAC, 1990;Van Soest ve ark.,1991).

İki süreyle yürütülen tarla denemesinden elde edilen materyaller kullanılarak yapılan silajlardan elde edilen veriler, yıllar üzerinden birleştirilmiş ve "Tesadüf Bloklarında Bölünmüş Parseller Deneme Düzeni'ne uygun olarak varyans analizine tabi tutulmuşlardır (Turan, 1995). Hesaplamalarda JMP Pro 13 paket programını kullanılmıştır. Önemlilik testlerinde %1 ve %5, farklı grupların belirlenmesinde ise %5 olasılık düzeyi dikkate alınmıştır. Araştırmada, farklı grupların belirlenmesi amacıyla AÖF testi kullanılmıştır.

Bulgular ve Tartışma

Araştırmada iki yılın birleştirilmiş verileri üzerinden varyans analizleri yapılmıştır. Varyans analizi sonuçlarına göre; çeşitlerin silaj kuru madde oranı, pH değeri, ADF ve NDF oranları üzerine etkileri %1, ham protein oranı üzerine etkisi ise %5 olasılık düzeyinde önemli bulunmuştur. Azot dozlarının silajın pH değeri ve ham protein oranı üzerine etkisi %1 olasılık düzeyinde önemlidir. Ayrıca, çeşit x azot dozu interaksiyonunun ham protein oranı ve NDF oranı üzerine etkisi %5 olasılık düzeyinde önemli bulunmuştur (Çizelge 1).

Çizelge 1. İkinci ürün koşullarında yetiştirilen şeker sorgum çeşitlerinde farklı azot dozlarının silaj kalite özelliklerine ilişkin varyans analizi sonuçları (KO)

Varyasyon Kaynağı	SD	KM	pH	HP	ADF	NDF
Yıl (Y)	1	*	**	**	öd	öd
Çeşit	2	**	**	*	**	**
Ç X Y	2	**	*	*	**	**
Azot Dozu	3	öd	**	**	öd	öd
Y X AD	3	*	**	öd	öd	öd
Ç X AD	6	öd	öd	*	öd	*
Y X Ç X AD	6	öd	öd	*	öd	öd

Y: Yıl, Ç:çeşit, AD: azot dozu, SD: Serbestlik derecesi, öd: önemli değil

KM: Kuru madde, HP: Ham protein, ADF: Asit deterjanda çözünmeyen lif, NDF: Nötr deterjanda çözünmeyen lif,

** ,*; Sırasıyla % 1 ve % 5 düzeyinde önemlidir.

Çeşitlere ait silajların kuru madde oranları Çizelge 2'de verilmiş olup, en yüksek kuru madde oranı %31.69 ile Uzun çeşidinden elde edilmiştir. Farklı şeker sorgum çeşitleri ile yapılan silajlarda kuru madde oranları büyük farklılık göstermiştir. Örneğin; Durul (2016) Bornova/İzmir koşullarında Rio çeşidinde %25.20; Güre (2016) İzmir koşullarında Keller çeşidinde %24.70; Ertekin (2021) Hatay koşullarında Erdurmuş çeşidinde %26.56 olduğu belirtilmiştir. İki yıl süreyle yürütülen çalışmamızda en düşük pH değerinin aralarındaki sayısal farklılıklar istatistiki açıdan önemsiz olan Erdurmuş (3.86) ve Gülşeker (3.87) çeşitlerinden elde

edildiği saptanmıştır (Çizelge 2). Çalışmamızda silaj pH'sı bakımından çeşitler arasında farklılıklar tespit edilmiştir. Elde ettiğimiz bu sonuçlar bazı araştırıcılar tarafından bildirilen sonuçlarla uyum içerisindedir (Geren ve ark., 2019; Yücel ve Erkan, 2020). En yüksek ham protein oranı %8.39 ile Uzun çeşidinden, en düşük ham protein oranı ise %6.57 ile Gülşeker çeşidinden elde edildiği belirlenmiştir (Çizelge 2). Çeşitler arasında silajın ham protein oranını Orrico Junior ve ark. (2015) Brezilya koşullarında %4.10-4.98; Geren ve ark. (2019) Bornova/İzmir koşullarında %8.10-8.60; Yücel (2020) Adana koşullarında %3.36-5.01; Yücel ve Erkan (2020) Çukurova koşullarında %4.08-4.79 arasında değişim gösterdiğini bildirmişlerdir. Çeşitler bakımından en düşük ADF ve NDF oranları (sırasıyla %31.17 ve %49.69) Erdurmuş çeşidinden elde edilmiştir. Çeşitlere bağlı olarak silajının NDF oranının Orrico Junior ve ark. (2015) Brezilya koşullarında %43.63-48.32; Geren ve ark. (2019) Bornova koşullarında %45.0-46.7; Yücel (2020) Adana koşullarında %42.58-46.89 değerleri arasında değişim gösterdiğini rapor etmişlerdir. ADF ve NDF Değerleri Arasındaki Farklılıkların Büyük Ölçüde Çeşit Farklılığından Ve Ekolojik Koşullardan Kaynaklandığı Düşünülmektedir.

Çizelge 2. İkinci ürün koşullarında yetiştirilen şeker sorgum çeşitlerinde farklı azot dozlarının silajın bazı kalite özellikleri üzerine etkisi (iki yıllık ortalama veriler)

Çeşit	Azot Dozları (kg/da)				Ortalama

Yıl. çeşit, azot dozu ve çeşit x azot dozu interaksiyonuna ait önemli çıkan ortalamalarda aynı harfi taşıyan değerler arasında 0.05 olasılık düzeyinde fark yoktur.

Azot dozlarının etkisi incelendiğinde; kuru madde oranı artan azot dozlarından etkilenmemiş ve kuru madde oranları %28.96-30.02 aralığında değişim göstermiştir. En düşük pH değeri 3.86 ile azot uygulanmayan parsellerden elde edilmiş, bunu aynı istatistiki grupta yer alan 16 kg/da azot dozu (3.87) takip etmiştir (Çizelge 2). Girgin (2012) Bornova koşullarında yürüttüğü bir çalışmada şeker sorgum bitkisine uygulanan azot dozlarının silajın kuru madde oranı ve pH üzerine etkisinin önemli olduğunu bildirmiştir. Araştırıcı, azot dozlarına bağlı olarak kuru madde oranlarının %27.93-33.57 ve pH değerlerinin 3.70-3.86 arasında değiştiğini belirlemiştir. Artan azot dozu azotsuz koşullara göre silajın ham protein oranı artırmış ve en yüksek ham protein oranı 16 kg N/da ve 24 kg N/da uygulamalarından elde edilmiştir (Çizelge

2). Sadigfard (2016) şeker sorgum silajının ham protein oranı bakımından azot dozları arasında istatistiki olarak önemli farkların olduğunu belirlemiş ve ham protein oranlarının ilk yıl %4.9-7.4, ikinci yıl ise %4.6-6.4 değerleri arasında değiştiğini bildirmiştir. Artan azot dozu uygulamaları ADF ve NDF oranlarını etkilememiş ve ADF oranı %33.11-33.73, NDF oranı ise %54.02-53.92 arasında değişim göstermiştir (Çizelge 2).

Çeşitlerin artan azot dozlarına verdikleri tepkiler farklılık göstermiş ve bu durum da çeşit x azot dozu interaksiyonunun önemli çıkmasına neden olmuştur. İnteraksiyon incelendiğinde; silajda en yüksek ham protein oranı Uzun çeşidinin 24 kg/da azot dozu uygulamasından, en düşük NDF oranı ise Erdurmuş çeşidinin 0 kg/da ve 8 kg/da azot dozu uygulamalarından elde edilmiştir (Çizelge 2).

Sonuç ve Öneriler

İkinci ürün koşullarında elde edilen araştırma sonuçlarına göre; en yüksek ham protein oranı Uzun çeşidinde, en düşük ADF ve NDF oranları ise Erdurmuş çeşidinde tespit edilmiştir. Artan azot dozlarının kuru madde ve ADF oranları üzerine önemli bir etkisi gözlenmemiştir. En yüksek ham protein oranı 24 kg/da azot dozundan, en düşük pH değeri ise 0 kg/da ile 16 kg/da azot dozlarından elde edilmiştir. Silajda en düşük NDF oranı ise Uzun çeşidinin 0 kg/da ve 8 kg/da azot dozu uygulamalarının yetiştiği parsellerde belirlenmiştir. Erdurmuş çeşidi, çalışmada en düşük ADF ve NDF oranlarına sahip olmasıyla öne çıkmıştır. Düşük ADF oranı, yem sindirilebilirliğini artırarak hayvanların enerji alımını desteklerken, düşük NDF oranı ise yem tüketilebilirliğini yükselterek hayvan performansını iyileştirmektedir. Artan azot dozları silajların kuru madde ve ADF oranı hariç incelenen diğer özellikleri önemli ölçüde etkilemiştir. Azot dozu açısından, 0 kg/da azot uygulaması ile Erdurmuş çeşidinde en düşük NDF oranı elde edilmiş, bu da lif içeriği daha düşük ve hayvanlar tarafından daha kolay sindirilebilen bir yem elde edilmesini sağlamıştır. Ancak azotsuz uygulama ot verimi ve protein oranını düşürebileceğinden, düşük lif ve yeterli verimi korumak için 8 kg/da ile 16 kg/da azot dozları da uygulanabilir. Sonuç olarak; benzer ekolojik bölgelerde yapılacak yetiştiricilikte silajların fermantasyon kalitesi, besin içeriği ve sindirilebilirliği açısından dengeli bir silaj için Erdurmuş çeşidinin tercih edilmesi ve 16 kg/da azot dozunun kullanılması önerilebilir.

Teşekkür ve Bilgi Notu

Bu araştırma, Sebiha EROL UYANIK tarafından hazırlanan doktora tezinin bir bölümünü içermektedir. FDK-2022-1183 no'lu doktora tez projesinin yürütülmesine gerekli maddi desteği sağlayan Bursa Uludağ Üniversitesi Bilimsel Araştırma Projeleri Komisyonu'na teşekkür ederiz.

ABSTRACT

This study was conducted B.U.U. Faculty of Agriculture TUAM experimental areas in 2022 and 2023 to determine the effects of increasing nitrogen doses (0, 8, 16 and 24 kg/da) on the silage quality of bagasse in some sweet sorghum varieties (Gülşeker, Erdurmuş and Uzun) grown as second crop under Bursa ecological conditions. Harvesting of plants for silage was carried out at the milk-dough stage of the plants. After removing the leaves and panicles of the harvested plant samples, the remaining stems were passed through the press machine and the juice was extracted. The bagasse remaining after the juice extraction was shredded into 1.5-2 cm pieces, then filled into 1 litre anaerobic jars and left to fermentation for 60 days under laboratory conditions. At the end of the fermentation period, the jars were opened and the dry matter rate, pH, crude protein, ADF and NDF rates were analysed. According to the two-year average results of the study, significant differences were found among the varieties in terms of quality parameters such as dry matter rate, pH, ADF and NDF rates. The highest dry matter rate (33.77%) and the lowest ADF (36.25%) and NDF (54.03%) rates were obtained from Erdurmuş variety. Increasing nitrogen doses caused an increase only in crude protein content of bagasse silage. In conclusion, in order to obtain a well-balanced bagasse silage in terms of crude protein content and digestibility, it can be recommended to prefer Erdurmuş variety and to use 8 kg/da nitrogen dose.

Keywords: Bagasse, nitrogen, second crop, silage quality, sweet sorghum

İKİNCİ ÜRÜN KOŞULLARINDA YETİŞTİRİLEN BAZI ŞEKER SORGUM ÇEŞİTLERİNDE ARTAN AZOT DOZLARININ POSANIN SİLAJ KALİTESİ ÜZERİNE ETKİLERİ

ÖZET

Bu çalışma, Bursa ekolojik koşullarında ikinci ürün olarak yetiştirilen bazı şeker sorgum çeşitlerinde (Gülşeker, Erdurmuş ve Uzun) artan azot dozlarının (0, 8, 16 ve 24 kg/da) posanın silaj kalitesi üzerindeki etkilerini belirlemek amacıyla B.U.Ü. Ziraat Fakültesi TUAM deneme alanlarında 2022 ve 2023 yıllarında yürütülmüştür. Silaj amacıyla bitki hasadı, tanelerin süt-hamur olum döneminde yapılmıştır. Hasat edilen bitki örneklerinin yaprak ve salkımları alındıktan sonra geriye kalan saplar pres makinesinden geçirilmiş ve özsuyu çıkarılmıştır. Özsuyu çıkarıldıktan sonra kalan posa 1.5-2 cm boyutlarında parçalanmış, daha sonra 1 litrelik anaerobik kavanozlara doldurulmuş ve laboratuvar koşullarında 60 gün boyunca fermantasyona bırakılmıştır. Fermantasyon süresi sonunda kavonozlar açılmış ve silajlarda kuru madde oranı, pH değeri, ham protein, ADF ve NDF oranları gibi özellikler incelenmiştir. Araştırmanın iki yıllık ortalama sonuçlarına göre; çeşitler arasında kuru madde oranı, pH değeri, ADF ve NDF oranları gibi kalite parametreleri açısından önemli farklılıklar ortaya çıkmıştır. En yüksek kuru madde oranı (%33.77) ile en düşük ADF (%36.25) ve NDF (%54,03) oranları Erdurmuş çeşidinden elde edilmiştir. Artan azot dozları posa silajının sadece ham protein içeriğinde artışa neden olmuştur. Sonuç olarak, ham protein içeriği ve sindirilebilirlik açısından iyi dengelenmiş bir posa silajı elde etmek için Erdurmuş çeşidinin tercih edilmesi ve 8 kg/da azot dozunun kullanılması önerilebilir.

Anahtar kelimeler: Azot, ikinci ürün, posa, silaj kalitesi, şeker sorgum

Giriş

Şeker sorgumun (*Sorghum bicolor* var. *saccharatum* (L.) Mohlenbr) toplam kütlesinin %70-75'i saptan, %10-15'i yapraktan, %7'si taneden ve %10'u kökten oluşmaktadır (Sadigfard, 2016).Güçlü ve hızlı büyümesiyle birlikte oldukça etkili bir kök yapısına sahiptir (Demir, 2020). Birçok bitkiye göre daha az su ve gübreye ihtiyaç duymaktadır. Kurak koşullarda dahi gelişimini sürdürebilen bu bitki, geçici kuraklıklara dayanabilme özelliği ile bitkiler aleminin devesi olarak anılmaktadır (Küçüksemerci, 2017). Şeker sorgum sapından elde edilen özsu, tatlandırıcı, şurup, pekmez ve jaggery yapımında kullanılmaktadır (Mathur ve ark., 2017). Şeker sorgumun pres yardımıyla suyu çıkarıldıktan sonra geriye kalan posası, hayvan yemi, kâğıt veya etanol üretiminde değerlendirilebilir (Mosali ve ark., 2010). Ancak, ekonomik nedenlerden dolayı posadan etanol üretimi gelecekte pek umut verici bir seçenek olarak görülmemektedir. Bu nedenle, posanın ruminantlar için potansiyel bir yem kaynağı olarak kullanımı ön plana çıkmaktadır (Naeini ve ark., 2014). Şeker sorgum posası, %27-45 selüloz, %25-30 hemiselüloz ve %11-25 lignin içermektedir. Tarımsal bir yan ürün olan bu posa, katkı maddesi olmaksızın iyi bir silaj kaynağıdır ve hayvan beslenmesinde güvenle kullanılabilir (Kumari ve ark., 2013). Posadan elde edilen silaj, mikro besinler ve mineraller açısından zengin olup, özellikle süt sığırları için besleyici bir yem kaynağıdır (Mathur ve ark., 2017). Değişen çevre koşullarına uygun olarak şeker sorgumun azot ihtiyacının belirlenmesi için farklı azotlu gübre uygulamalarını içeren araştırmalara ihtiyaç vardır (Almodes ve Hadi, 2009). Geniş genetik çeşitlilik ve benzer çevre ile yönetim koşullarına verilen farklı tepkiler, belirli bölgelerdeki verimlilik potansiyellerinin belirlenmesi amacıyla çeşitlerin değerlendirilmesini zorunlu kılmaktadır. Bu nedenle, her bir çeşit ve yetiştirme koşulu için en uygun azot miktarının belirlenmesi, sürdürülebilir tarım uygulamaları açısından gereklidir.

Bu çalışma, Bursa İli'nde ikinci ürün koşullarında yetiştirilen şeker sorgum çeşitlerinde (Gülşeker, Erdurmuş ve Uzun) artan azot dozlarının (0, 8, 16 ve 24 kg/da) posanın silaj kalitesi üzerindeki etkilerini belirlemek amacıyla yürütülmüştür.

Materyal ve Yöntem

Araştırma, 2022 ve 2023 yıllarında Bursa Uludağ Üniversitesi Ziraat Fakültesi TUAM'da tarla denemesi olarak tesadüf bloklarında bölünmüş parseller deneme düzeni'ne göre 3 tekrarlamalı olarak yürütülmüştür. Denemelerde ana parsellere şeker sorgum çeşitleri (Gülşeker, Erdurmuş ve Uzun), alt parsellere ise azot dozları (0, 8, 16 ve 24 kg/da) yerleştirilmiştir.

Araştırmada, her bir alt parselde sıra arası 70 cm olacak şekilde 5 m boyunda sıralar açılmış ve ekim 5 Temmuz 2022 ve 6 Temmuz 2023 tarihlerinde elle yapılmıştır. Denemede hasat bitkilerin süt-hamur olum döneminde yapılmıştır. Hasat döneminde her bir alt parselde, parseli temsil eden 10 adet bitki alınmış ve hasat edilen bitkilerin yaprak ve salkımları alındıktan sonra geride kalan saplar özel tasarlanmış bir makinede preslenmiş ve özsuyu çıkarılmıştır. Özsuyu çıkarıldıktan sonra kalan posa tek sıralı silaj makinesinden geçirilerek 1.5-2 cm boyutlarında parçalanmıştır. Posa silajı yapmak amacıyla parçalanan materyaller torbalara doldurulup etiketlenmiş ve ardından laboratuvara getirilmiştir. Laboratuvara getirilen parçalanmış materyallerin torbaları açılmış ve iyice karıştırıldıktan sonra bir pres yardımıyla 1 litrelik anaerobik kavanozlara sıkıştırılarak doldurulmuş ve etiketlenerek laboratuvar koşullarında 60 gün süreyle fermantasyona bırakılmıştır. 60 günlük fermantasyon dönemi sonunda açılan kavanozların her birinden en az 150 g örnek alınmış ve 70 °C'de 48 saat kurutularak kuru madde oranları belirlenmiştir. Ayrıca, 40 g örnek alınıp 360 ml saf su eklenmiş ve 3 dak. çalkalanmıştır. Çalkalama işlemi tamamlandıktan sonra örnekler süzülmüş ve bu süzüklerde

pH değeri ölçülmüştür (Budaklı Çarpıcı, 2009). Kuru madde oranını belirlemek amacıyla kullanılan örnekler öğütülmüş ve bu örneklerde ham protein oranı, ADF oranı ve NDF oranını belirlemek amacıyla analizler yapılmıştır (AOAC 1990; Van Soest ve ark.,1991).

2022 ve 2023 yıllarında yürütülen denemelerden elde edilen veriler birleştirilmiş ve "Tesadüf Bloklarında Bölünmüş Parseller Deneme Düzeni'ne uygun olarak varyans analizine tabi tutulmuşlardır (Turan, 1995). Bütün hesaplamalar bilgisayarda JMP Pro 13 paket programını kullanarak yapılmıştır. Önemlilik testlerinde %1 ve %5, farklı grupların belirlenmesinde ise %5 olasılık düzeyi kullanılmıştır. Farklı grupların belirlenmesinde Asgari Önemli Fark (AÖF) testinden yararlanılmıştır.

Araştırma ve Bulgular

Araştırmada iki yılın birleştirilmiş verileri üzerinden varyans analizleri yapılmıştır. Varyans analiz sonuçlarına göre; çeşitlerin posa silajının kuru madde oranı, pH değeri ve NDF oranları üzerine etkileri % 1, ADF oranı üzerine etkisi ise %5 olasılık düzeyinde önemli bulunmuştur. Azot dozlarının silajın ham protein oranı üzerine etkisi %1 olasılık düzeyinde önemli olmuştur. Ayrıca çeşit x azot dozu interaksiyonunun kuru madde oranı ve pH değeri üzerine etkisi %5 olasılık düzeyinde önemli bulunmuştur (Çizelge 1).

Çizelge 1. İkinci ürün koşullarında yetiştirilen şeker sorgum çeşitlerinde farklı azot dozlarının posa silajının kalite özelliklerine ilişkin varyans analizi sonuçları (KO)

Varyasyon Kaynağı	SD	KM	pH	HP	ADF	NDF

Y: Yıl, Ç:çeşit, AD: azot dozu, SD: Serbestlik derecesi, öd: önemli değil

KM: Kuru madde, HP: Ham protein, ADF: Asit deterjanda çözünmeyen lif, NDF: Nötr deterjanda çözünmeyen lif,

** ,*; Sırasıyla % 1 ve % 5 düzeyinde önemlidir.

Çeşitler bakımından en yüksek kuru madde oranı %33.77 ile Erdurmuş çeşidinden elde edilmiştir (Çizelge 2). Yücel ve ark. (2024) Adana koşullarında şeker sorgum hat ve çeşitlerine ait posa silajının kuru madde oranının %27.33-37.86 arasında değiştiğini bildirmişlerdir. Artan azot dozu uygulamaları, posa silajlarının kuru madde oranını etkilememiş ve ortalama kuru madde oranı %32.27-32.80 arasında değişim göstermiştir.

Araştırmada en düşük pH değeri 3.79 ile Gülşeker çeşidinden, en yüksek ise istatistiksel olarak aynı grupta yer alan Erdurmuş (3.95) ve Uzun (3.90) çeşitlerinden elde edilmiştir (Çizelge 2). Şeker sorgum çeşit/çeşitleri ile yapılan çalışmalarda da oldukça farklı pH değerleri tespit edilmiştir. Örneğin; Yücel ve ark. (2017) Çukurova/Adana koşullarında farklı şeker sorgum

genotiplerine ait posa silajının pH değerinin 3.03-3.20 arasında, Yücel ve ark. (2024) ise şeker sorgum çeşitlerine ait posa silajlarının pH değerleri arasında farklılığın olmadığını ve genel olarak pH değerlerinin 3.02-3.34 arasında değiştiğini bildirmişlerdir. Artan azot dozu uygulamaları posa silajlarının pH değerini etkilememiş ve pH değeri 3.88-3.91 arasında değişim göstermiştir (Çizelge 2).

Çeşitler arasında ham protein oranı bakımından önemli farklılıklar ortaya çıkmamış ve posa silajlarının ham protein oranları %3.05-3.15 arasında değişim göstermiştir (Çizelge 2). Taş ve ark. (2021) Şanlıurfa koşullarında şeker sorgum genotipleri ile yürüttükleri bir çalışmada, ham protein oranı açısından istatistiksel olarak önemli bir fark bulunmadığını ve ham protein oranının %3.40-4.60 arasında değişim gösterdiğini rapor etmişlerdir. Azot dozları bakımından ham protein oranları değerlendirildiğinde, en yüksek ham protein oranının %3.67 ile 24 kg/da azot dozundan elde edildiği belirlenmiştir (Çizelge 2).

Şeker sorgum çeşitlerine ait posa silajının ADF ve NDF oranları incelendiğinde; en düşük ADF (%36.25) ve NDF (%54.03) oranlarının Erdurmuş çeşidinden elde edildiği tespit edilmiştir (Çizelge 2). Taş ve ark. (2021) Şanlıurfa koşullarında yürüttükleri bir çalışmada, şeker sorgum genotipleri arasında ADF ve NDF oranları bakımından farklılıklar gözlenmiş ve ADF oranının %27,33-43,16, NDF oranının ise %47,30-65,30 arasında değişim gösterdiğini bildirmişlerdir. Azot dozlarının posa silajının ADF ve NDF oranları üzerine etkisi istatistiki olarak önemsiz olmuş ve ADF oranları %41.41-43.03, NDF oranları ise %61.00-62.64 arasında değişim göstermiştir (Çizelge 2).

Çeşit x azot dozu interaksiyonu incelendiğinde; çeşitlerin artan azot dozu uygulamalarına karşı gösterdikleri tepki farklılık göstermiş ve posa silajında en yüksek kuru madde oranı Erdurmuş çeşidinin 0 kg/da azot dozu uygulanan parsellerinden elde edilmiş ve bunu oranı Erdurmuş çeşidinin 8 kg/da azot dozu uygulaması takip etmiştir. En düşük kuru madde oranı ise Gülşeker çeşidinin 0 kg/da, 8 kg/da ve 16 kg/da azot dozu uygulamalarından elde edilmiştir.

Uzun	68.40	65.95	68.95	66.56	**67.47 A**
Ortalama	**62.64**	**62.11**	**62.18**	**61.00**	

Yıl, çeşit, azot dozu ve çeşit x azot dozu interaksiyonuna ait önemli çıkan ortalamalarda aynı harfi taşıyan değerler arasında 0.05 olasılık düzeyinde fark yoktur.

Sonuç ve Öneriler

Posa silajının yem kalitesini belirlemek amacıyla yapılan çalışmada; Erdurmuş çeşidi en yüksek kuru madde oranını sağlamıştır. Ayrıca, Erdurmuş çeşidinin en düşük ADF ve NDF oranlarına sahip olması, posa silajının sindirilebilirliğini artırarak hayvan besleme açısından daha yüksek enerji verimliliği sağlamaktadır. Azot dozlarının posa silaj kalitesi üzerindeki etkileri, özellikle ham protein oranı açısından istatistiksel olarak önemli bulunmuştur. Artan azot dozları ham protein oranını artırmış ve en yüksek ham protein oranı 24 kg N/da uygulamasında tespit

edilmiştir. Ancak, artış gösteren azot dozlarının kuru madde oranı, pH değeri, ADF ve NDF oranları üzerinde istatistiksel olarak önemli bir etkisi tespit edilmemiştir. Çeşit x azot dozu interakasiyonu açısından da en yüksek kuru madde oranı Erdurmuş çeşidinin 0 kg/da azot dozu uygulanan parsellerinden elde edilmiş ve bunu oranı Erdurmuş çeşidinin 8 kg/da azot dozu uygulaması takip etmiştir. Çevresel sürdürülebilirlik ve ekonomik faktörler göz önünde bulundurulduğunda, posa silajında sindirilebilirliği ve kaliteyi dengelemek için Erdurmuş çeşidinin tercih edilmesi ve 8 kg/da azot dozunun kullanılması önerilmektedir.

Teşekkür ve Bilgi Notu

Bu araştırma, Sebiha EROL UYANIK tarafından hazırlanan doktora tezinin bir bölümünü içermektedir. FDK-2022-1183 no'lu doktora tez projesinin yürütülmesine gerekli maddi desteği sağlayan Bursa Uludağ Üniversitesi Bilimsel Araştırma Projeleri Komisyonu'na teşekkür ederiz.

ABSTRACT

Natural disasters—including earthquakes, hurricanes, floods, and wildfires present complex and multifaceted challenges to emergency medical services (EMS) and disaster response teams. These events often occur with little to no warning, leading to widespread disruption of infrastructure, mass casualties, and overwhelming demands on health care resources. This paper aims to explore the critical challenges encountered in emergency medical response during such disasters and to propose strategic solutions to enhance the overall effectiveness and efficiency of interventions. Based on a comprehensive review of recent literature, several recurring issues have been identified that significantly hinder timely and effective response efforts. Among the most prominent are breakdowns in communication systems, which can isolate response teams and delay the coordination of aid; severe transportation difficulties resulting from damaged roads, bridges, or traffic congestion; acute shortages of trained medical personnel in affected areas; and insufficient availability of medical supplies and equipment needed for immediate care. These factors can collectively reduce the speed, accuracy, and quality of emergency services when they are needed most. In addition to analyzing these operational barriers, this study underscores the vital importance of pre-disaster preparedness strategies. These include regular simulation exercises, community education initiatives, the development of comprehensive disaster response plans, and the establishment of emergency stockpiles. The integration of advanced technologies such as real-time communication tools, artificial intelligence for triage and resource allocation, and Geographic Information Systems (GIS) for situational awareness is also explored as a means of strengthening disaster response capabilities. Furthermore, the research emphasizes the necessity of multidisciplinary coordination among healthcare providers, emergency responders, governmental bodies, non-governmental organizations, and community leaders. Such collaboration ensures that all aspects of disaster response from initial rescue efforts to long-term recovery are effectively managed. In conclusion, this paper highlights the crucial role of proactive planning, technological innovation, and interagency cooperation in building resilient EMS systems capable of withstanding the complex demands of natural disasters.

Keywords: Artificial Intelligence, Disaster Response, Emergency Medical Services, Mental Health

Introduction

Natural disasters including but not limited to earthquakes, hurricanes, floods, and wildfirescontinue to pose substantial and multifaceted challenges to emergency medical services (EMS) and disaster response teams worldwide. These unpredictable and often rapidly evolving events typically result in widespread human casualties, extensive physical and infrastructural damage, and the disruption of essential services such as communication networks and transportation systems. Such disruptions can severely hinder the capacity of EMS teams to provide timely, organized, and effective medical assistance to affected populations (Smith et al., 2021).

One of the most pressing challenges during natural disasters is the sudden and overwhelming surge in demand for medical care, which frequently exceeds the available resources and capabilities of local healthcare systems. Hospitals may become overcrowded or entirely inaccessible, roads and bridges may be blocked or destroyed, and emergency personnel may be limited in number or unable to reach critical areas due to safety concerns or logistical constraints. Moreover, the coordination between various emergency agencies is often complicated by communication breakdowns, lack of standardized protocols, and unclear chains of command, all of which contribute to delays and inefficiencies in rescue and medical operations. Given these complex conditions, it is essential to identify the specific obstacles faced by EMS teams in natural disaster scenarios and to develop effective, scalable strategies that enhance disaster preparedness and response. This paper aims to examine the primary challenges namely communication failures, logistical limitations, staffing shortages, and equipment deficits and to propose evidence-based solutions. These include improved pre-disaster planning, the integration of emerging technologies, enhanced interagency collaboration, and the implementation of targeted training programs to bolster readiness for mass casualty incidents (Smith et al., 2021). Through a critical review of current literature and illustrative case studies, this study seeks to contribute to the development of a more resilient and adaptive emergency medical framework one that can respond rapidly and effectively to the growing frequency and severity of natural disasters around the world..

Challenges in Disaster Response and EMS

Disaster response operations, particularly those involving emergency medical services (EMS), are frequently obstructed by a series of interrelated challenges that can severely impair the effectiveness and timeliness of interventions. One of the most critical issues is the breakdown of communication networks during natural disasters. When mobile networks, internet connections, and radio communication systems are disrupted or destroyed, the ability of various emergency units to coordinate becomes significantly diminished. This lack of communication not only delays the mobilization of resources but also results in confusion, overlapping efforts, or critical gaps in care delivery (Johnson & Lee, 2022).

Another substantial obstacle is the widespread damage to transportation infrastructure. Earthquakes, floods, and hurricanes can destroy roads, bridges, and railways, rendering many affected regions inaccessible. As a result, the transportation of emergency personnel, medical supplies, and patients becomes logistically complicated and time-consuming. Delays in reaching disaster-stricken zones may lead to preventable fatalities and prolonged suffering for those with critical injuries or medical conditions (Kumar et al., 2020).

Staffing shortages during large-scale disasters further compound the difficulties faced by EMS teams. In many cases, local healthcare personnel may themselves be victims of the disaster or unable to reach their workplaces due to personal losses or infrastructural barriers.

Simultaneously, the sudden and overwhelming influx of patients often with complex trauma cases can rapidly exceed the treatment capacity of available responders. The physical and psychological toll on medical staff in such high-pressure, high-volume environments cannot be underestimated (Rodriguez et al., 2023).

Equally problematic is the lack of sufficient medical equipment and supplies in disaster zones. First responders may operate with limited access to essential tools such as trauma kits, ventilators, stretchers, and medications. This scarcity can degrade the quality and scope of care that can be provided on-site or during transport. Replenishment of supplies is often delayed due to damaged infrastructure, logistical complications, or inadequate pre-disaster planning (Nguyen & Patel, 2021).

Collectively, these challenges highlight the fragility of EMS systems in the face of large-scale emergencies and underscore the urgent need for robust contingency planning, resource stockpiling, and infrastructure resilience. Addressing these systemic weaknesses is vital for ensuring that emergency medical care remains effective and equitable under disaster conditions (Johnson & Lee, 2022; Kumar et al., 2020; Rodriguez et al., 2023; Nguyen & Patel, 2021).

Proposed Solutions and Innovations

In response to the multifaceted challenges that arise during natural disasters, numerous innovative strategies and solutions have been proposed to strengthen the effectiveness and resilience of emergency medical services (EMS). Addressing communication breakdowns is a top priority, as the ability to coordinate efforts and allocate resources hinges on uninterrupted information exchange. One of the most effective approaches involves the integration of resilient satellite communication systems, which can function independently of terrestrial infrastructure and provide reliable connectivity even when local networks are compromised. These systems allow for real-time coordination between emergency units, centralized command centers, and on-site personnel, thereby improving overall response efficiency (Ahmed et al., 2024).

Transportation logistics during disasters can be improved through both proactive planning and technological innovation. Establishing pre-designated emergency routes that are routinely maintained and clearly marked can facilitate quicker access to affected zones. In addition, the use of unmanned aerial vehicles (UAVs), commonly known as drones, has emerged as a transformative tool in disaster medicine. Drones can be deployed rapidly to deliver essential medical supplies, such as blood products, medications, or defibrillators, to hard-to-reach or isolated areas. Their speed, mobility, and ability to bypass ground-level obstacles make them particularly valuable during the critical early stages of disaster response (Wang & Garcia, 2023).

To address personnel shortages, expanding the EMS workforce through targeted volunteer training programs is essential. Community-based disaster preparedness initiatives can empower local residents with basic emergency response skills, ensuring that initial life-saving care can begin even before professional responders arrive. Furthermore, fostering inter-agency cooperation among fire departments, military units, non-governmental organizations (NGOs), and healthcare facilities can help pool resources and personnel, enhancing the system’s overall surge capacity during crises (Lopez et al., 2022).

Another crucial area of advancement lies in the development and deployment of portable, durable, and multifunctional medical equipment specifically designed for use in disaster environments. Compact diagnostic tools, field-deployable ventilators, solar-powered monitoring devices, and modular treatment stations are just a few examples of innovations that can significantly improve patient outcomes in austere conditions. These technologies not only

allow for rapid and high-quality interventions in the field but also reduce the burden on overwhelmed hospitals and facilitate more effective triage and stabilization (Chen & Smith, 2023).

In summary, a combination of cutting-edge technology, proactive logistical planning, community engagement, and cross-sector collaboration offers a comprehensive framework for enhancing EMS performance during natural disasters. Implementing these solutions not only mitigates the immediate impact of such events but also builds long-term resilience within health and emergency response systems (Ahmed et al., 2024; Wang & Garcia, 2023; Lopez et al., 2022; Chen & Smith, 2023).

Case Studies

Real-world disaster scenarios provide invaluable insights into the strengths and weaknesses of emergency medical service (EMS) responses, as well as the effectiveness of innovative strategies under extreme conditions. Several recent disasters serve as compelling case studies that underscore the critical role of coordination, adaptability, and technological integration in mitigating the human toll of natural catastrophes.

The response to the 2020 Australian bushfires is a notable example of how coordinated EMS operations and swift resource mobilization can significantly reduce disaster impact. The scale and intensity of the fires overwhelmed many rural and semi-urban communities, yet the rapid deployment of mobile medical units, air ambulances, and volunteer responders helped bridge the gap in healthcare access. A key factor in the effectiveness of this response was the seamless collaboration among local EMS units, national emergency agencies, and international humanitarian organizations. This multilevel cooperation enabled timely triage, evacuation, and treatment of burn victims and respiratory patients. The use of mobile clinics to deliver care directly within fire-affected zones reduced reliance on distant hospitals and improved health outcomes for isolated populations (Brown et al., 2021).

A different but equally informative case is the 2022 Pakistan floods, where vast geographical barriers and inaccessible terrains created major logistical challenges for EMS teams. Here, the use of drone technology proved transformative. Drones were deployed to deliver life-saving medications and water purification tablets to remote communities cut off by floodwaters. EMS personnel also employed amphibious vehicles to reach stranded residents and set up temporary health stations in high-need areas. These adaptive responses not only ensured continuity of care but also played a key role in curbing the spread of waterborne diseases such as cholera and dysentery. This case illustrates how integrating local knowledge with modern tools can dramatically enhance disaster response capabilities in regions with difficult topography (Ali et al., 2023).

Another instructive case is the international medical response following the 2015 Nepal earthquake, which resulted in over 9,000 deaths and left tens of thousands injured. The local EMS system, already limited in capacity, was quickly overwhelmed by the sheer scale of the disaster. International support became essential. Medical and rescue teams from multiple countries including India, China, the United States, and the European Union arrived within days to provide emergency trauma care, perform search and rescue operations, and assist in setting up temporary medical infrastructure. Coordination was facilitated through the United Nations Office for the Coordination of Humanitarian Affairs (UN OCHA), which helped standardize logistics, prioritize aid delivery, and reduce redundancies. This case underscores the vital

importance of pre-established international protocols, shared terminology, and interoperable equipment in large-scale emergencies (UN OCHA, 2016).

Collectively, these case studies highlight the necessity of flexible, scalable, and well-coordinated EMS systems in disaster scenarios. They emphasize how technological tools like drones and air ambulances, when combined with effective inter-agency and international collaboration, can significantly reduce morbidity and mortality in crisis situations. Furthermore, they offer practical models for disaster preparedness and response that other regions and nations can adapt according to their unique geographic and infrastructural challenges.

Conclusion and Recommendations

An effective response to natural disasters demands a comprehensive, multi-disciplinary strategy that harmonizes communication technology, logistical coordination, and human resource management. These elements must function in unison under high-pressure conditions to ensure that emergency medical services (EMS) can provide rapid and life-saving interventions. One of the key findings in disaster medicine literature is the importance of proactive investment in both technological and infrastructural resilience before disasters occur. This pre-emptive approach significantly reduces response times and enhances the capacity of EMS systems to adapt to dynamic and chaotic environments (Miller et al., 2024).

Among the foundational components of preparedness are the establishment of well-equipped emergency operations centers (EOCs), the systematic stockpiling of essential medical supplies, and the execution of localized hazard risk assessments. These efforts enable decision-makers to anticipate potential vulnerabilities and allocate resources effectively. EOCs serve as command hubs where data is analyzed, strategies are coordinated, and logistics are streamlined critical for maintaining order and continuity during crises.

In parallel, workforce readiness is vital. Regular and structured training initiatives, including simulation-based exercises, are necessary to ensure that EMS personnel remain competent and responsive in unpredictable disaster scenarios. These drills not only reinforce individual skills but also strengthen team dynamics and decision-making under stress. Furthermore, inter-agency drills involving healthcare services, fire and rescue units, law enforcement, military personnel, and non-governmental organizations foster unity of effort under a common operational framework (Singh & Kumar, 2022). Such cooperation minimizes delays caused by fragmented response efforts and promotes clarity in roles and responsibilities.

The discussion also emphasizes the importance of community involvement as a critical, yet often underutilized, asset in disaster response. Public education campaigns, civilian first aid training, and grassroots awareness initiatives can transform ordinary citizens into capable first responders, particularly in rural or overwhelmed urban zones. In many cases, bystanders are the first individuals on scene, and equipping them with basic life-saving knowledge can significantly improve survival outcomes before professional help arrives (Chen & Smith, 2023).

Another important consideration is hospital-level preparedness. Hospitals must embed a culture of readiness by developing and regularly updating contingency plans, conducting internal drills, and ensuring flexible resource allocation. This includes the availability of surge capacity plans, backup power systems, mobile treatment units, and designated triage zones. Such institutional readiness is key to preserving healthcare continuity during large-scale disasters. Finally, policy-level commitment is crucial to sustaining long-term preparedness. Policymakers must recognize that emergency health response is not merely a public health issue but a matter of national security. Accordingly, it requires sustained and prioritized funding. Dedicated budgets for disaster preparedness, infrastructure reinforcement, and emergency training programs can

prevent system failures and reduce the economic and human costs of disasters. In addition, collaborative research initiatives that unite academia, government, and the private sector can lead to the development of innovative tools, evidence-based protocols, and scalable best practices that support frontline responders in real time. In summary, a robust disaster response system is one that is holistic, forward-thinking, and inclusive leveraging technology, training, policy, and public engagement to build resilience at every level of society.

Natural disasters continue to pose complex, high-stakes challenges for emergency medical services (EMS) and disaster response systems around the world. The unpredictable nature and wide-ranging impact of such events demand not only rapid action but also carefully planned, adaptable, and resource-conscious strategies. This study has highlighted the critical areas where current disaster response efforts often fall short namely communication failures, transportation obstacles, personnel shortages, and limited access to essential medical equipment. Each of these issues has a direct effect on the speed and quality of emergency care provided during crisis situations. Addressing these challenges requires a forward-thinking and multi-layered approach. Strengthening communication infrastructure through the use of satellite-based systems, improving access routes and employing technologies like drones, expanding the healthcare workforce through community-based training, and investing in portable, durable medical equipment are all key components of an effective response framework. Moreover, a culture of preparedness, both at the institutional and community levels, is essential to ensuring that EMS systems are not only reactive but also proactively equipped to deal with disaster scenarios. Looking ahead, future research and policy development should prioritize the integration of advanced technologies such as artificial intelligence, predictive analytics, and geographic information systems (GIS) to improve situational awareness and real-time decision-making. Additionally, building more cohesive and collaborative inter-agency networks will be crucial to improving operational efficiency and minimizing redundancy or miscommunication during emergencies. Ultimately, the ability to save lives during natural disasters hinges on the capacity of EMS systems to anticipate, adapt, and act. This requires sustained investment, political will, public engagement, and scientific innovation. By embracing these priorities, health systems can transform disaster response from a reactive endeavor into a resilient, coordinated, and life-saving operation.

ABSTRACT

In recent years, Artificial Intelligence (AI) technologies have been rapidly developing in many sectors and are expected to lead to significant transformations in the labor market. The impacts of AI on the workforce are determined by many factors that, according to different studies, can be shaped in both positive and negative ways. In particular, it is predicted to create major changes in repetitive tasks. With increasing automation, people who make their living from this type of work are likely to face the risk of job loss. On the other hand, it is estimated that AI will create new job opportunities in areas that require creative thinking and strategic skills. It is stated that new employment opportunities may emerge in areas such as health, engineering and creative sectors where skills based on human intelligence come to the fore. The spread of AI may also affect the economic and social structure of society. This transformation will require the reshaping of education systems and workforce development policies. It is of great importance for employees to increase their competencies in order to adapt to developing AI technologies. At this point, it has become a critical requirement for policymakers to develop appropriate strategies to minimize the potential negative impacts of AI. In conclusion, while AI can create significant opportunities in the labor market, it also brings some challenges. Balancing these opportunities and challenges to manage future workforce dynamics is of great importance for both individuals and societies. This study examined the potential impacts of AI on the labor market and assessed the sectoral implications of these impacts. The most important finding of the study is that AI will increase the need for qualified personnel in almost every sector.

Keywords: Artificial Intelligence, labor market, automation, skill mismatch, education policies

Introduction

Artificial intelligence (AI), one of the most striking technological advances of the twenty-first century, is radically transforming the lifestyles of individuals, the way organizations do business, and the general interaction patterns of societies. Thanks to rapid developments in the fields of big data, machine learning and algorithms, artificial intelligence has become a strategic element that directly affects economic systems, production processes and social structures (Brynjolfsson & McAfee, 2014). One of the areas where this transformation is felt most clearly is the labor market. AI's capacity to take over repetitive and systematic tasks poses a serious employment risk for low-skilled workers, while also paving the way for the emergence of new occupational groups in creative and strategic fields based on human-centered competencies (Chui et al., 2016). The effects of artificial intelligence on the labor force are too multidimensional to be explained solely by technological change. The fact that automation occurs at different intensities on a sectoral basis causes the risk of job loss and occupational transformation processes to vary according to the sector (Frey & Osborne, 2017). For example, while the impact of automation is felt harder and faster in areas such as industry, production and logistics, AI is positioned more as a supportive auxiliary tool in health, education and creative industries. However, these overarching effects of AI are forcing not only individuals but also countries to transform their economic plans, education policies and social security systems (OECD, 2022). Recent research indicates that rather than directly increasing unemployment, AI is changing the nature of work and increasing the need for workers with higher skill levels (World Economic Forum, 2023). In this framework, AI-driven transformation poses both risks and opportunities, and who, how and to what extent can adapt to the process is of great importance. At this point, accurate analysis of the effects of AI on the labor market plays a critical role not only in terms of academic research but also in terms of sustainable development goals, social welfare and reducing economic inequalities.

The aim of this study is to examine the effects of artificial intelligence technologies on the labor market from a holistic perspective. By analyzing the effects of AI in different sectors, the study will evaluate occupational groups at risk of job loss, emerging new job areas, the adaptation processes of employees to this transformation, the necessity of restructuring the education system and strategic recommendations for policy makers. Thus, it is aimed to contribute to a more fair, balanced and inclusive management of the new labor order shaped by AI.

Materials and Methods

This study uses descriptive and comparative analysis methods to examine the effects of artificial intelligence technologies on the labor market. Within the scope of the literature review, the reports of OECD, World Economic Forum, McKinsey and similar organizations between 2017 and 2024 were examined. In addition, academic articles on the subject were reviewed and the sectoral impacts of artificial intelligence, transformation in workforce skills and policy recommendations were analyzed. The data were subjected to content analysis and classified in terms of sectoral distinctions and socioeconomic impacts.

Results and Discussion

Artificial intelligence and automation technologies are leading to significant changes, especially in jobs involving repetitive and routine tasks. According to McKinsey & Company's 2023 report, 375 million jobs could be lost worldwide by 2030 due to the impact of automation (McKinsey & Company, 2023). This is particularly evident in sectors such as manufacturing, logistics and customer service. Low-skilled workers in particular are more susceptible to the negative effects of automation, increasing income inequality (Drydakis, 2023). Automation is

the process of partial or complete substitution of human labor through machines, algorithms and software. Artificial intelligence (AI)-assisted automation refers to the use of systems that can perform not only physical tasks but also cognitive tasks. In this context, automation affects not only blue-collar workers but also white-collar workers (Frey & Osborne, 2017). For example, it was reported that Amazon was able to maintain its warehouse operations with 25% fewer people thanks to robotic systems (Chui et al., 2016).

Frey and Osborne (2017) report that 47% of US jobs are at high risk of automation. McKinsey (2023) predicts that 375 million jobs worldwide could disappear by 2030 due to automation. According to OECD (2023), 33% of jobs in Turkey are at high risk of automation. Automation not only leads to job losses, but also changes the nature of the jobs that remain. As simple tasks are automated, workers are expected to perform more complex tasks that require analytical and social skills. This means a significant transformation in the nature of work (World Economic Forum, 2020).

With the development of artificial intelligence technologies, it is predicted that not only simple tasks but also complex tasks such as decision making can be automated in the future. In particular, natural language processing technologies such as ChatGPT are transforming areas such as content production, customer support and consultancy. Therefore, automation threatens not only "physical" jobs but also "cognitive" jobs (Brynjolfsson & McAfee, 2014).

The development of artificial intelligence technologies also enables the emergence of new professions. According to the World Economic Forum's 2024 report, AI and automation are expected to create 97 million new jobs by 2025 (World Economic Forum, 2024). Among these new jobs, roles such as data scientist, AI ethicist, machine learning engineer and robotics technician stand out. Moreover, Micha Kaufman, CEO of Fiverr, emphasizes that professionals who use AI effectively will become more valuable (Business Insider, 2025). Artificial intelligence (AI) is not only causing losses through the automation of existing jobs, but also creating new job fields and professions. This transformation can be explained by the concept of "creative destruction"; old jobs are being replaced by new jobs centered around technological skills and innovative services (Schumpeter, 1942; Brynjolfsson & McAfee, 2014).

With the development of AI, new professions such as artificial intelligence engineering, machine learning expertise, data science and big data analyst, artificial intelligence ethics consultancy, robotic process automation expertise have started to emerge. In addition, some traditional professions are being transformed by the impact of AI. For example:

- Doctors and radiologists are starting to work with AI-enabled diagnostic systems.
- Legal professionals use artificial intelligence for document analysis and contract interpretation.
- Teachers make education more effective with personalized learning software.

This transformation gives rise to the concept of "augmented professions" where humans work alongside AI (Davenport & Ronanki, 2018). The World Economic Forum (2024) stated that 97 million new job positions will emerge thanks to artificial intelligence and digitalization. McKinsey Global Institute (2023) predicts that new jobs created during the technological transformation process can compensate for 85% of lost jobs. According to LinkedIn Economic Graph (2022), the title of "AI expert" has been among the fastest growing job titles in the last 5 years.

AI is also transforming the skills required in the labor market. According to the OECD's 2023 report, both technical and soft skills are required to develop and implement AI systems (OECD,

2023). In particular, skills such as digital literacy, teamwork, problem solving and leadership are coming to the fore. Moreover, employers are increasingly hiring on a skills-driven basis; for example, in the UK, the requirement for a university degree for AI positions has decreased by 15% (Bone, Ehlinger & Stephany, 2023). Artificial intelligence (AI) is not only transforming jobs, it is also radically changing the skills required of individuals to do those jobs. As automation and digitalization enable machines to perform repetitive manual and cognitive tasks, human labor is shifting more towards cognitive, social and creative areas (Brynjolfsson & McAfee, 2014).

To design, implement and oversee AI systems, the digital literacy of the workforce must increase. Software development and programming languages Data analytics and big data management Machine learning and algorithm knowledge AI ethics and data security awareness are some of the technical skills expected from the next generation of workers. However, one-off trainings are not enough to adapt to the skills transformation brought by AI. Instead, a career approach based on continuous learning should be adopted (UNESCO, 2021). According to OECD data, 46% of the workforce will have to update their skills within five years (OECD, 2023). In this context, current education systems are struggling to keep up with this transformation. Artificial intelligence and data science-based courses should be added to curricula, skills-based certificate programs should be expanded, practical experience and project-based learning should be supported, and ethics, communication and leadership skills should be emphasized. Increasingly, companies are adopting hiring practices based on skills rather than diplomas. Bone, Ehlinger and Stephany (2023) report that the diploma requirement for AI positions in the UK has decreased by 15% in the last five years. This shows that individual competencies and learning potential are becoming more prominent.

Artificial intelligence is an important factor affecting income distribution. Workers with AI skills earn on average between 11% and 23% higher salaries (OECD, 2023). However, job security for low-skilled workers is decreasing and income inequality is increasing. Women and low-income groups are particularly vulnerable to the negative impacts of AI (Drydakis, 2023). The proliferation of artificial intelligence (AI) technologies is leading to structural changes that may lead to increased income inequalities. This shift favors highly skilled and technologically adept workers, while threatening the job security and income levels of low-skilled workers (Acemoglu & Restrepo, 2019). By reshaping economic returns, AI allows companies and individuals who develop and use technology to earn more income, while other segments are negatively affected by this transformation.

AI technologies add more value to highly skilled workers. According to the OECD (2023) report, the wage gap is directly proportional to workers' experience of working with AI, level of education and technical competence. This difference is known as the "skills premium" and can lead to greater inequalities over time.

The automation effect of AI reduces job security in low- and medium-skill jobs. Frey and Osborne (2017) note that jobs at high risk of automation are mostly concentrated in low-paying occupations. Women and minorities are also more at risk as they often work in sectors that are more vulnerable to automation (Drydakis, 2023). The shift to temporary, part-time or project-based employment undermines the classic "full-time and permanent" job model. These changes in income and job security can also lead to ruptures in the social structure:

- A shrinking middle class increases economic polarization.
- Youth unemployment is becoming a serious problem, especially in developing countries.

- Social security systems may be inadequate in the AI era as they are structured according to traditional employment models (ILO, 2021).

Education systems should be restructured to adapt to the requirements of the AI era. OECD emphasizes that education policies need to be strengthened for the development of AI skills (OECD, 2023). Moreover, increasing skills-driven recruitment reduces the value of traditional diplomas and increases the importance of alternative educational pathways (Bone, Ehlinger & Stephany, 2023). The rapid development of artificial intelligence (AI) technologies necessitates radical changes not only in job descriptions but also in the structure of education systems. This transformation in the labor market requires individuals to acquire and update skills not only at the beginning but also throughout life (OECD, 2023). In the main areas where AI affects the workforce (production, customer services, data analysis, etc.), some professions are disappearing while new job fields are emerging. In this transition process, individuals need to acquire new skills in order to move from their current jobs to different positions. McKinsey & Company (2023) stated that approximately 100 million of the global workforce will need to be reskilled due to AI. The World Economic Forum (2020) predicts that 50% of the workforce will need retraining by 2025. Governments must play strategic roles to increase access to education and reduce inequalities in the AI era. Support such as incentives, grants, employer-state cooperation and open access resources should be provided by governments. The private sector also has important roles to play. In particular, technology companies are developing internal training programs for their employees to adapt to transforming job descriptions. Companies such as Amazon and Google provide AI and cloud technologies training for their employees. This also ensures labor retention and increased productivity (McKinsey, 2023).

The effects of artificial intelligence (AI) technologies on the workforce vary across sectors. In some sectors, AI transforms business processes to a great extent by putting automation at the center, while in others it functions more as a supportive and complementary tool. This difference stems from the diversity in the technological infrastructure, business structure and employee profile of each sector. Therefore, the impacts of AI at the sectoral level need to be examined in both direct and indirect dimensions (Chui, Manyika & Miremadi, 2016; OECD, 2022). With the spread of the Industry 4.0 vision, AI is leading to radical changes in production processes. Smart production lines equipped with automated systems, robotic solutions and data-driven decision support systems are increasing productivity and reducing the need for manpower, especially in repetitive physical tasks (McKinsey Global Institute, 2017). The effectiveness of AI systems is increasing in areas such as quality control, predictive maintenance, and process optimization, leading to a decrease in low-skilled jobs and an increase in the need for workers with advanced technology knowledge (Frey & Osborne, 2017).

The healthcare sector stands out as one of the areas where AI plays the most supportive role. AI is actively used in applications such as analyzing medical images, early diagnosis of diseases, personalized treatment recommendations and remote health services. For example, it is seen that AI-based systems have reached similar accuracy levels with expert physicians in areas such as cancer detection in radiological images (Topol, 2019). However, areas such as communication between patient and physician, ethical decision-making processes, and emotional support still rely on the human factor, which necessitates human-machine collaboration in the sector (Brynjolfsson & McAfee, 2014). In the field of education, AI plays an important role in the development of personalized learning experiences. Individualized learning paths are offered through data analysis based on student performance, enabling teachers to provide more effective student-specific interventions (UNESCO, 2021). In addition, applications such as language learning, virtual tutors, adaptive testing and automatic grading

systems are becoming widespread in education. However, in order to use these technologies effectively, it is important to develop teachers' digital literacy skills and reshape education policies in this direction (OECD, 2022).

The financial sector is one of the areas where AI has been adopted most rapidly and widely. Applications such as credit risk analysis, fraud detection, automated investment recommendations and customer behavior prediction can be performed faster and more effectively with AI (Binns, 2018). In addition, chat bots and automated call systems used in customer service reduce operational costs and improve service quality. However, the fact that these systems are not transparent in their decision-making processes and are designed in a way that can create potential discrimination raises the need for new regulations at both ethical and legal levels (World Economic Forum, 2023). AI technologies have also begun to have an impact on areas traditionally considered to be the domain of human creativity, such as art, design and media. AI-enabled tools are used in creative processes such as visual arts, music composition, literary text production and graphic design, making content production faster and more accessible. AI systems capable of generating text and images (e.g. GPT and DALL-E) are changing the ways of production in these sectors. However, these developments also raise new ethical and legal debates on issues such as originality, copyright and the nature of art (Acemoglu & Restrepo, 2020). Although creativity is not completely monopolized by humans, a new era is entering in which technology plays a role as a co-producer.

The effects of artificial intelligence technologies on the labor market are not limited to economic productivity and sectoral transformation. This technological progress also leads to serious changes in social structures. From income inequality to digital inequality, from the transformation of public policies to ethical and legal regulations, it brings new debates in many areas. The increasing prevalence of AI across society necessitates not only technological adaptation but also the reconstruction of the socioeconomic order (Acemoglu & Restrepo, 2020; Binns, 2018). The effects of AI-based automation systems on the labor force affect different income and skill groups in different ways. While highly skilled individuals often benefit from this transformation, job security for low-skilled and routine workers is significantly weakened. This risks further deepening social injustice, especially for low-income groups (Frey & Osborne, 2017). Acemoglu and Restrepo (2020) argue that while technological advances have increased productivity and raised the incomes of capital owners, they have also led to a reduction in the real income of many workers. Such an income gap can reinforce perceptions of social polarization, insecurity and economic injustice. Therefore, a more equitable sharing of technology-induced prosperity is important for a sustainable social balance.

A healthy transformation based on AI depends on individuals and organizations having access to these technologies. However, opportunities to access technology are not equal across all segments of society. Especially those living in rural areas, low-income individuals and groups with limited digital literacy are in danger of being left out of this transformation process (UNESCO, 2021). This situation reveals structural inequalities, the so-called digital divide. This imbalance in access to information, education and technological opportunities also limits access to socioeconomic opportunities. According to OECD (2022), in order to eliminate this gap, it is necessary to expand digital infrastructure, develop inclusive education policies and increase technological literacy.

The transformations created by artificial intelligence in social and economic life necessitate the reshaping of public policies. It is important for the state to play a role not only as a regulator but also as a transformative and supportive actor. In particular, vocational training programs, skill updating processes and lifelong learning policies should be encouraged for the workforce

to adapt to this new structure (World Economic Forum, 2023). However, it is of great importance to establish an ethical and legal framework to ensure that AI systems operate in a fair, transparent and accountable manner. Binns (2018) emphasizes that algorithmic decision-making systems should be structured in line with the principles of explainability, auditability and responsibility in order not to undermine social trust. Governance processes should also be reconstructed in the light of these ethical principles.

The transformation that artificial intelligence technologies will create in the labor market will not only be limited to the lines of work, but will also reshape the education levels, skill sets and learning styles of individuals who will take part in these jobs. A successful career journey will be possible not only by having technical knowledge, but also by raising individuals who can adapt to change by showing flexibility and adopt a lifelong learning approach (OECD, 2022). In this context, the transformation of education systems and the process of upskilling employees and developing new skills is of critical importance. Traditional education systems are generally shaped around specific occupational groups and narrow areas of knowledge. However, the professions that stand out in the age of artificial intelligence exhibit a multidisciplinary structure and meet rapidly changing knowledge requirements. Therefore, education systems need to be restructured to provide skills such as analytical thinking, problem solving, digital literacy, data literacy and algorithmic thinking (World Economic Forum, 2023). According to the OECD (2022) report, not only technical skills but also "human" skills such as communication, collaboration, ethical judgment and creativity are critical for success in AI-enabled work environments. Accordingly, teachers need to adapt to digital technologies and participate in continuous professional development programs (UNESCO, 2021).

In the light of artificial intelligence and other digital technologies, it is no longer sufficient for individuals to pursue their careers only with the education they received at a young age. In a rapidly changing business world, individuals are expected to continuously update themselves, acquire new skills and adapt to sectoral changes (Brynjolfsson & McAfee, 2014). In this context, the dissemination of lifelong learning has become an extremely important necessity. The World Economic Forum (2023) points out that 50% of workers will have to acquire new skills in the next five years. Accordingly, both the government and the private sector need to invest in training and skills development programs. Short-term certificate programs, online training platforms and on-the-job training stand out as effective tools in this process.

Education policies that comprehensively address the impacts of AI and technology should be shaped not only at the individual level but also at the societal scale. States are obliged to provide equal educational opportunities to all their citizens and programs should be developed especially for low-income and disadvantaged groups (OECD, 2022). At the same time, the business world should not only utilize its workforce but also develop corporate social responsibility projects to contribute to the development of its employees (Binns, 2018). Education and skills development processes should be seen as an important factor that supports not only economic but also social cohesion and social solidarity. Every investment in a skilled workforce is an important step towards a sustainable economic future.

Conclusion and Recommendations

The development of artificial intelligence technologies and their integration into the labor market brings about a multi-layered transformation with not only technical but also economic, social and political dimensions. In this study, the direct and indirect effects of AI on the labor force are examined from various perspectives and sectoral transformations, social repercussions and impacts on education systems are discussed in detail. AI will start to replace human labor, especially in low-skilled and repetitive processes. While this will lead to the disappearance of

some professions, it will also enable the emergence of new fields of work that require creative thinking, strategic decision-making and human interaction. This process marks the beginning of a "quality" oriented transformation in the labor market. However, it is clear that this transformation needs to be addressed not only economically, but also socially and ethically. Issues such as income inequality, the digital divide and the right to access can trigger the misuse of AI. In this context, increasing the accessibility of technology is of great importance in terms of maintaining social control and a sense of justice.

Restructuring education systems and embedding a lifelong learning approach are key elements for the labor market to adapt to this new transformation. It is important for both individuals and organizations to develop digital skills in order to gain a competitive advantage in the age of artificial intelligence. In conclusion, artificial intelligence is a phenomenon that poses both opportunities and threats in the labor market. The key to success in this process is to be prepared for the transformation, to improve adaptability and to effectively use the guiding role of policymakers. In the future, not only technical competence but also ethical responsibility, human values and an understanding of social justice will be the determining factors in the business world. The more inclusive and conscious societies approach this transformation process, the greater the benefits to be derived from technology.

ORCID: 0009-0003-3270-6825

Abdulkadir ŞEKER
Assistant Professor, Sivas Cumhuriyet University, Faculty of Engineering, Department of Computer Engineering, Sivas- Türkiye, ORCID: 0000-0002-4552-2676

ABSTRACT

This study explores the effectiveness of generative artificial intelligence (GenAI) models in addressing core software engineering problems, with a particular emphasis on fundamental algorithmic tasks and object-oriented programming (OOP) concepts. Two prominent large language models—ChatGPT by OpenAI and Gemini by Google—were evaluated using a dataset of 20 C# programming problems, comprising 10 algorithm-focused and 10 OOP-based questions. The generated solutions were assessed across a comprehensive set of software quality metrics, including Big O complexity, memory usage, code length, variable and method count, and execution time.

The results demonstrate that both models are capable of producing syntactically valid and logically coherent C# code. ChatGPT generally delivers more concise and performance-optimized solutions, favouring brevity and execution speed. In contrast, Gemini tends to provide more verbose and pedagogically structured responses, prioritizing readability and clarity. This contrast suggests that ChatGPT is well-suited for rapid prototyping and minimalistic design, while Gemini may be more appropriate for educational settings or projects requiring extensive documentation.

Additionally, the study highlights common strengths and limitations in both models, particularly in areas such as error handling, algorithm optimization, and fidelity to OOP principles including inheritance, encapsulation, and polymorphism. These findings underscore the potential of generative AI to augment software development workflows and serve as a benchmark for evaluating AI-assisted programming. The research provides actionable insights into how these tools can complement human developers in diverse coding scenarios.

Keywords: GenAI, ChatGPT, Gemini, Programming, Software Quality Metrics.

EVALUATING THE EFFECTIVENESS OF GENERATIVE AI MODELS IN SOLVING FUNDAMENTAL ALGORITHMIC CHALLENGES

ÖZET

Bu tez çalışmasında, üretken yapay zekâ modellerinin temel algoritma problemleri ve nesneye dayalı programlama (OOP) problemleri üzerindeki çözüm performansları karşılaştırmalı olarak incelenmiştir. Çalışmada, OpenAI tarafından geliştirilen ChatGPT ve Google tarafından geliştirilen Gemini adlı iki büyük dil modeli ele alınmıştır. Amaç, bu modellerin yazılım geliştirme sürecinde etkin bir araç olup olamayacağını değerlendirmek ve geliştirilen C# çözümlerini yazılım metrikleri açısından analiz etmektir.

Analiz sürecinde her iki modele 10 adet temel algoritma problemi ve 10 adet OOP problemi olmak üzere toplam 20 adet C# yazılım sorusu yöneltilmiştir. Modellerin verdiği yanıtlar Big O notasyonu, bellek kullanımı, kod satır sayısı, değişken sayısı, metod sayısı ve çalışma süresi gibi yazılım değerlendirme metrikleri açısından incelenmiştir. Her iki modelin performansı tablolarla görselleştirilmiş ve karşılaştırmalı olarak değerlendirilmiştir.

Elde edilen bulgular, her iki modelin yazılım üretimi bağlamında işlevsel çıktılar sunduğunu göstermektedir. ChatGPT, daha sade ve hızlı çözümler üretirken; Gemini, daha ayrıntılı ve açıklayıcı yapıda kodlar geliştirmiştir. Kod kalitesi, verimlilik ve yapısal uygunluk açısından her iki modelin güçlü ve zayıf yönleri belirlenmiştir.

Bu çalışma, üretken yapay zekâ modellerinin yazılım mühendisliği süreçlerindeki potansiyel rolünü ortaya koyarak, gelecekteki uygulamalar için referans niteliğinde bir değerlendirme sunmaktadır.

Anahtar kelimeler: GenAI, ChatGPT, Gemini, Programlama, Yazılım Kalite Metrikleri.

Giriş

Üretken yapay zekâ, insan benzeri içerikler üretmek üzere dili anlayan ve bağlama uygun çıktılar üretebilen yapay zekâ sistemleridir (BOZKURT 2023). Üretken yapay zekâ modelleri, yazılım mühendisliğinde sadece kod üretiminde değil, aynı zamanda algoritmik düşünmenin desteklenmesi, test senaryolarının oluşturulması ve yazılım kalitesinin artırılmasında da aktif bir rol üstlenmektedir (Bulut 2024). Bu teknolojiler, yazılımcıların iş yükünü azaltmakta; kodlama hatalarını minimize ederek zaman ve maliyet açısından önemli tasarruflar sağlamaktadır(Kahveci Yetiş vd. 2022).

Yapay zekâ destekli araçların yazılım geliştirme öğrenimi üzerindeki etkilerini nicel verilerle ortaya koymuş ve öğrencilerin bu araçlara ilişkin algılarını kapsamlı bir biçimde analiz etmiştir. Araştırma sonuçları, öğrencilerin ChatGPT gibi üretken yapay zekâ araçlarını büyük ölçüde tanıdığını, ancak bu araçların ardındaki büyük dil modelleri ve algoritmik temellere dair bilgi düzeylerinin sınırlı olduğunu göstermiştir (Demirhan 2024).

Günümüzde üretken yapay zekâ modelleri, yazılım mühendisliği alanında geliştiricilere destek sunabilecek düzeyde gelişmiş yapılardır. Bu tez çalışmasının temel amacı, üretken yapay zekâ modelleri olan ChatGPT ve Gemini'nin temel algoritma problemleri ile nesneye dayalı programlama problemlerine yönelik C# diliyle verdikleri çözümleri yazılım metrikleri açısından karşılaştırmalı olarak incelemektir.

Bu doğrultuda her iki modele toplamda 20 farklı yazılım problemi sunulmuş; modellerin verdiği çözümler, zaman karmaşıklığı (Big O notasyonu), bellek kullanımı, kod satır sayısı, değişken sayısı, metod sayısı ve çalışma süresi gibi yazılım kalite ölçütleri kullanılarak değerlendirilmiştir. Çalışma, üretken yapay zekâ modellerinin yalnızca doğal dil üretimi değil, aynı zamanda algoritmik düşünme, yazılım kalitesi ve kodlama mantığı açısından da nasıl çıktılar sunduğunu ortaya koymayı hedeflemektedir.

Ayrıca bu çalışma, yapay zekâ destekli yazılım geliştirme araçlarının eğitim ve öğretim süreçlerinde nasıl kullanılabileceğine ilişkin uygulamalı bir örnek sunmaktadır. Özellikle yazılım öğrenen bireylerin üretken yapay zekâ sistemlerini birer rehber ya da yardımcı geliştirici olarak kullanabilmesi, öğrenme sürecinin desteklenmesi ve yazılım hatalarının erken aşamalarda fark edilmesi açısından önemlidir.

Bu bağlamda tez, üretken yapay zekâ sistemlerinin yazılım geliştirme sürecine ne ölçüde katkı sunduğunu, güçlü ve zayıf yönlerini ortaya koymayı amaçlayan uygulamalı bir çalışma olarak yapılandırılmıştır.

Son yıllarda üretken yapay zekâ sistemlerinin yazılım geliştirme süreçlerinde etkin biçimde kullanıldığı görülmektedir. Büyük dil modelleri (LLM), özellikle doğal dil girdilerine dayalı olarak C#, Python gibi programlama dillerinde anlamlı kod parçaları üretme kapasitesiyle dikkat çekmektedir. Bu modellerin kod üretiminin yanı sıra hata ayıklama, kod açıklama ve test senaryosu üretimi gibi görevlerde de fayda sağladığı, çok sayıda çalışmada vurgulanmaktadır.

Yazılım kalitesini değerlendirmek için kullanılan metrikler, bir yazılımın sürdürülebilirliği, güvenilirliği ve bakım kolaylığı açısından kritik bir rol oynamaktadır. Özellikle nesne yönelimli tasarım metrikleri, yazılımın uzun vadeli yönetilebilirliği ve hata oranlarının düşürülmesi açısından önemli bir değerlendirme kriteridir (Hanefi Calp ve Arici 2011a).

Yazılım kalitesi, bir yazılım ürününün belirlenen gereksinimleri ne derece karşıladığını ve kullanıcı ihtiyaçlarına ne kadar uygun olduğunu değerlendiren temel bir faktördür (Tübitak - uekae, Tübitak -uekae, ve Bilgisayar Mühendisliği Bölümü İTÜ y.y.). Son yıllarda üretken yapay zekâ modelleri, yazılım kalite metriklerinin analizinde önemli dönüşümler meydana

getirmiştir. Yapay zekâ destekli sistemlerin, nesne yönelimli programlama metrikleri ve kod karmaşıklığını azaltma teknikleri gibi alanlarda fayda sağladığı görülmektedir (Abdou ve Darwish 2024; Kıral ve Ayyıldız 2018).

Yapay zekâ ile desteklenen yazılım kalitesi analizleri, yazılımın sürdürülebilirliğini artırırken, hataları ve gereksiz kod tekrarlarını azaltmaktadır. Ancak, bazı çalışmalar, yapay zekâ tabanlı kod üretiminin, kod okunabilirliği ve bakım kolaylığı açısından çeşitli zorluklar oluşturabileceğini ortaya koymaktadır (Kahveci Yetiş vd. 2022; Monteiro vd. 2023).

Kod üretimi alanında yapay zekâ, nesne yönelimli programlama uygulamalarında zaman kazandırırken, hata oranlarını azaltma ve kod standartlarını koruma konusunda büyük avantajlar sağlamaktadır (Chen 2024). Yapay zekâ destekli kod üretiminde en büyük zorluklardan biri, üretilen kodun anlaşılırlığı ve sürdürülebilirliğidir. Özellikle sınıf ilişkileri ve miras yapıları gibi OOP prensiplerinin yapay zekâ tarafından doğru şekilde uygulanması, programların gelecekteki ölçeklenebilirliğini doğrudan etkilemektedir(Hanefi Calp ve Arici 2011b).

Yapay zekâ destekli sistemler, yazılım geliştirme süreçlerinde kod üretimi, hata ayıklama, test otomasyonu ve dokümantasyon oluşturma gibi birçok aşamada önemli roller üstlenmektedir (Damyanov, Tsankov, ve Nedyalkov 2024; Rahmaniar 2024). Bu sistemler, geliştiricilere zaman kazandırmanın yanı sıra, daha güvenilir ve ölçeklenebilir yazılımlar üretmelerine yardımcı olmaktadır. Ancak, yapay zekânın ürettiği kodların doğruluğu, güvenliği ve uzun vadeli bakım kolaylığı gibi konular hâlâ tartışmalı olup, geliştiricilerin bu sistemleri dikkatle kullanması gerekmektedir.(Ernst ve Bavota 2022; ÖZPOLAT, YILDIRIM, ve KARABATAK 2023; Petryshyn ve Lukoševičius 2024)

Kod üretiminde yapay zekâ destekli sistemler, geliştirme süreçlerini hızlandırırken bazı durumlarda insan müdahalesine ihtiyaç duymaktadır (Chen vd. 2021). Özellikle büyük dil modelleriyle üretilen kodların, mantıksal hatalar ve güvenlik açıkları barındırabileceği belirtilmektedir(Mastropaolo vd. 2023). Yapay zekâ destekli kod öneri sistemlerinin yazılım mühendisliği süreçlerine entegrasyonu, kalite metrikleri açısından detaylı analizler gerektirmektedir (Rozière vd. 2023).

Yapay zekânın yazılım test süreçlerinde kullanımı, test senaryolarının otomatik oluşturulması, hata tespiti ve performans optimizasyonu gibi alanlarda büyük bir potansiyel barındırmaktadır (Kim 2024). Yapılan araştırmalar, yapay zekâ tabanlı test araçlarının özellikle regresyon testi ve güvenlik açıklarının belirlenmesi gibi alanlarda başarılı sonuçlar verdiğini göstermektedir. Ancak, test süreçlerinde yapay zekânın yanlış pozitif ve negatif sonuçlar üretebileceği ve bu nedenle insan denetiminin tamamen ortadan kalkmasının mümkün olmadığı belirtilmektedir (Anderson vd. 2024; Kim vd. 2023).

Yapay zekâ destekli modeller, büyük dil modellerinin yazılım geliştirme süreçlerine entegrasyonunu sağlamaktadır. Özellikle GPT tabanlı modeller, büyük ölçekli yazılım projelerinde hız ve doğruluk açısından önemli avantajlar sunmaktadır (Anderson vd. 2024; Wu vd. 2023). Ancak, büyük dil modellerinin kod üretimindeki öngörülemezliği, güvenilirliği ve güvenlik riskleri üzerine devam eden araştırmalar, bu sistemlerin geliştirilmesi gerektiğini ortaya koymaktadır(Damyanov vd. 2024; Savelka vd. 2023). Yapay zekâ tabanlı sistemlerin denetlenmesi ve üretilen çıktının insan kontrolünden geçirilmesi büyük bir önem taşımaktadır. Ayrıca, yapay zekâ tarafından üretilen kodların siber güvenlik açısından zafiyet oluşturup oluşturmadığı da dikkatlice incelenmelidir (Savelka vd. 2023; Zhang vd. 2022).

Son olarak, yapay zekâ destekli sistemlerin yazılım mühendisliği eğitiminde kullanımı giderek yaygınlaşmaktadır. ChatGPT ve benzeri modeller, öğrencilere algoritma geliştirme, kod yazma

pratiği yapma ve yazılım dokümantasyonu oluşturma konularında önemli kolaylıklar sağlamaktadır (Anderson vd. 2024; Chen 2024). Ayrıca, yapay zekâ tabanlı eğitim araçları, öğrencilerin problem çözme becerilerini geliştirmelerine ve yazılım tasarım kalıplarını daha iyi anlamalarına yardımcı olmaktadır. Ancak, bu sistemlerin doğru bilgi sunma kapasitesi ve öğrenme süreçlerine etkisi konusunda daha fazla araştırmaya ihtiyaç duyulmaktadır.(Savelka vd. 2023; Wu vd. 2023).

Materyal Ve Yöntem

Bu araştırmanın temel amacı, üretken yapay zekâ modelleri olan ChatGPT ve Gemini'nin temel algoritma ve nesneye dayalı programlama problemlerine yönelik çözüm üretme yetkinliklerini yazılım kalite metrikleri aracılığıyla analiz etmektir.

ChatGPT, OpenAI tarafından geliştirilen ve dil anlama ve üretme konusunda oldukça güçlü bir yapay zeka modelidir. Bu araştırmada, dil işleme ve problem çözme konularındaki yetkinliği ile incelenmiştir. Kullanıcı etkileşimlerine dayalı olarak, çeşitli algoritmalar ve metriklerle ilgili sorulara verilen yanıtlar üzerinden analizler yapılmıştır. ChatGPT'nin büyük veri setlerinden öğrendiği dilsel yetkinlik, problem çözme ve algoritma analizindeki etkinliğini gözler önüne sermektedir.

Gemini, Google DeepMind tarafından geliştirilen bir başka güçlü yapay zeka modelidir. Bu model, benzer şekilde dil işleme ve algoritmalar üzerinde derinlemesine analizler yapabilme kapasitesine sahiptir. Gemini, özellikle veri setlerinden hızlı öğrenme yeteneği ve karmaşık problem çözme stratejileri ile tanınmaktadır. Araştırmada, algoritma sorunlarının çözümünde ve farklı performans metriklerinin karşılaştırılmasında kullanılmaktadır.

Araştırmada her iki yapay zeka modeline de aynı algoritma problemleri ve nesneye dayalı programlama problemleri (OOP) sunulmuş ve her modelin çözüm önerileri detaylı olarak incelenmiştir. Bu süreçte, model yanıtlarının doğruluğu, verimliliği ve sağlanan çözümlerin optimizasyonu karşılaştırılmıştır. Ayrıca, her bir modelin problem çözme yetenekleri Big O notasyonu, bellek kullanımı, kod satır sayısı, değişken sayısı ve method sayısı, çalışma zamanı gibi yazılım metrikleriyle değerlendirilmiştir.

Yapay zeka modellerinin analiz edilmesinde, her iki aracın sunduğu çözümler üzerine kapsamlı veri toplama ve istatistiksel analiz yapılmıştır. ChatGPT ve Gemini tarafından verilen çözümler arasındaki performans farkları, algoritmaların etkililiği açısından karşılaştırılmıştır.

Temel Algoritma Problemleri

1. Girilen sayının kaç basamaklı olduğunu söyleyen programın C# kodunu yazınız.
2. 10 elemanlı bir sayı dizisini girişini yapan programın C# kodunu yazınız.
3. Girilen a ve b sayısı 50'den büyük olduğunda c=a+b işlemini yapan değilse bu sayılar uygun değil yazdıran programın C# kodunu yazınız.
4. Verilen yılın artık yıl olup olmadığını bulan programın C# kodunu yazınız.
5. 1-1/3+1/5-1/7+1/9-1/11+… Serisinin n tane terim için toplamını hesaplayan C# kodunu yazınız.
6. Fibonacci serisinin ilk 10 terimini dizi kullanarak bulan programın C# kodunu yazınız.
7. Bir sınıftaki 50 öğrencinin bir dersten aldıkları yılsonu notları veriliyor. Başarı notu 50 olduğuna göre kaç öğrencinin başarılı olduğunu bulan programın C# kodlarını yazınız.

8. Klavyeden girilen maksimum 20 karakterli kelimedeki sesli harflerin kelimenin toplam karakter sayısına göre yüzde oranını hesaplayan programın C# kodunu yazınız.

9. Sıralı arama (sequantial search) algoritması ile girilen bir sayıyı dizideki yerini bulan programın C# kodunu en doğru ve kısa bir şekilde yazınız.

10. Quick Sort (hızlı sıralama) algoritmasını yapan programın C# kodunu yazınız.

Nesneye Dayalı Programlama Problemleri (OOP)

1. Basit Sınıf Tasarımı: Bir Kisi sınıfı oluşturan (ad, yaş özellikleri ve bilgileri yazdıran bir metot ile) c# kodunu yazınız.

2. Kapsülleme (Encapsulation): BankAccount sınıfında bakiye değişkenini private yapıp, para çekme/yatırma metotları ekleyen c# kodunu yazınız.

3. Kalıtım (Inheritance): Arac üst sınıfından Bisiklet ve Araba alt sınıflarını türetip, hizlan() metodunu override eden c# kodunu yazınız.

4. Polimorfizm (Polymorphism): Şekil üst sınıfından Daire ve Kare türeterek alanHesapla() metodunu her alt sınıfta farklı şekilde uygulayan c# kodunu yazınız.

5. Soyutlama (Abstraction): Calisan soyut sınıfı oluşturup maasHesapla() metodunu alt sınıflarda (Memur, Yonetici) zorunlu kılan c# kodunu yazınız.

6. Composition: Kutuphane sınıfı içinde Kitap nesnelerini liste olarak tutup, kitap ekleme/silme metotları ekleyen c# kodunu yazınız.

7. Interface Kullanımı: SesCikarabilir adında bir interface tanımlayıp Kedi ve Kopek sınıflarında sesCikar() metodunu implemente eden c# kodunu yazınız.

8. Hata Yönetimi (Exception Handling): paraCek() metodunda bakiye yetersizse özel bir hata fırlatan bir banka hesap sistemi tasarlayan c# kodunu yazınız.

9. Singleton Tasarım Deseni: Bir VeritabaniBaglantisi sınıfı oluşturup, yalnızca tek bir örneğinin oluşmasını sağlayan c# kodunu yazınız.

10. Factory Tasarım Deseni: HayvanFabrikasi ile parametreye göre Kus, Balik nesneleri döndüren bir sistem oluşturan c # kodunu yazınız.

ChatGPT ve Gemini modelleri tarafından verilen C# kod çözümlerine https://github.com/KAYNARPINAR/Bildiri.git adresinden ulaşabilirsiniz.

Bulgular ve Tartışma

Temel algoritma problemleri üzerinde yapılan analizlerde, ChatGPT'nin daha yalın ve hızlı çalışan kodlar ürettiği gözlemlenmiştir. Gemini ise genellikle daha uzun ve açıklayıcı yapıda çözümler sunmuştur. Kod satır sayısı bakımından GPT daha kısa çözümler üretirken, Gemini'nin çözümleri bellek kullanımı açısından daha dengelidir.

Zaman karmaşıklığı açısından her iki model de benzer sonuçlar üretmiştir. Ancak ChatGPT'nin kodları genellikle daha hızlı çalışmakta ve özellikle O(1) ve O(n) karmaşıklığa sahip problemlerde avantaj sağlamaktadır.

Tablo 1. Temel Algoritma Problemi İçin GPT ve Gemini Karşılaştırması

#	Algoritma Problemi	Model	Big O Notasyonu	Bellek Kullanımı	Kod Satır Sayısı	Değişken Sayısı	Metod Sayısı	Çalışma Zamanı
1	Problem 1	GPT	O(n)	10 MB	15	5	2	100 ms
		Gemini	O(n log n)	12 MB	18	6	3	120 ms
2	Problem 2	GPT	O(n^2)	12 MB	20	6	3	250 ms
		Gemini	O(n log n)	14 MB	22	7	4	200 ms
3	Problem 3	GPT	O(log n)	8 MB	12	4	2	75 ms
		Gemini	O(log n)	9 MB	14	5	3	80 ms
4	Problem 4	GPT	O(n)	9 MB	14	5	3	110 ms
		Gemini	O(n)	10 MB	16	6	3	115 ms
5	Problem 5	GPT	O(1)	7 MB	10	3	2	50 ms
		Gemini	O(1)	8 MB	12	4	2	55 ms
6	Problem 6	GPT	O(n log n)	11 MB	18	6	3	130 ms
		Gemini	O(n)	12 MB	20	7	4	140 ms
7	Problem 7	GPT	O(n^2)	14 MB	22	8	4	270 ms
		Gemini	O(n log n)	15 MB	24	9	5	230 ms
8	Problem 8	GPT	O(log n)	10 MB	16	5	3	90 ms
		Gemini	O(log n)	11 MB	18	6	3	95 ms
9	Problem 9	GPT	O(n)	13 MB	20	7	4	150 ms
		Gemini	O(n log n)	14 MB	22	8	4	140 ms
10	Problem 10	GPT	O(1)	8 MB	12	4	2	50 ms
		Gemini	O(1)	9 MB	14	5	3	55 ms

Nesneye dayalı programlama problemleri üzerinde yapılan karşılaştırmada, Gemini'nin daha modüler, nesne yönelimli ilkelere daha sıkı bağlı kalan kodlar ürettiği görülmüştür. Bu bağlamda Gemini, sınıf yapısı, kalıtım ve arayüz kullanımı gibi OOP öğelerine daha fazla vurgu yapmıştır.

ChatGPT ise OOP ilkelerine uygun, ancak daha sade yapılı çözümler sunmuş; bu sayede daha düşük satır sayısı ve daha hızlı çalışma sürelerine ulaşmıştır. OOP problemlerinde metod sayısı açısından her iki model de birbirine yakın sonuçlar vermiştir.

Tablo 2. Nesneye Dayalı Programlama (OOP) Problemi İçin GPT ve Gemini Karşılaştırması

#	OOP Problemi	Model	Big O Notasyonu	Bellek Kullanımı	Kod Satır Sayısı	Değişken Sayısı	Metod Sayısı	Çalışma Zamanı
1	Problem 1	GPT	O(n^2)	15 MB	20	7	4	200 ms
		Gemini	O(n)	14 MB	18	6	3	180 ms
2	Problem 2	GPT	O(n log n)	12 MB	18	6	3	130 ms
		Gemini	O(n)	13 MB	20	7	4	140 ms
3	Problem 3	GPT	O(log n)	10 MB	16	5	3	90 ms
		Gemini	O(log n)	11 MB	18	6	3	95 ms
4	Problem 4	GPT	O(n)	14 MB	22	8	4	210 ms
		Gemini	O(n log n)	15 MB	24	9	5	190 ms
5	Problem 5	GPT	O(1)	9 MB	14	5	3	60 ms
		Gemini	O(1)	10 MB	16	6	3	65 ms
6	Problem 6	GPT	O(n log n)	13 MB	19	7	4	140 ms
		Gemini	O(n)	14 MB	21	8	4	150 ms
7	Problem 7	GPT	O(n^2)	16 MB	23	9	5	280 ms
		Gemini	O(n log n)	17 MB	25	10	6	240 ms
8	Problem 8	GPT	O(log n)	11 MB	17	6	3	100 ms
		Gemini	O(log n)	12 MB	19	7	4	105 ms
9	Problem 9	GPT	O(n)	15 MB	21	8	4	160 ms
		Gemini	O(n log n)	16 MB	23	9	5	150 ms
10	Problem 10	GPT	O(1)	10 MB	15	6	3	70 ms
		Gemini	O(1)	11 MB	17	7	4	75 ms

Her iki modelin performansına ilişkin genel bulgular şu şekilde özetlenebilir:

- Kod Uzunluğu: ChatGPT, daha kısa ve pratik çözümler üretmektedir. Gemini ise daha detaylı açıklamalı kodlar üretmiştir.
- Zaman Karmaşıklığı: Problemlerin büyük çoğunluğunda her iki modelin Big O değerleri eşdeğerdir.
- Çalışma Süresi: ChatGPT'nin çözümleri genellikle daha hızlı çalışmaktadır.
- OOP Uygunluğu: Gemini, nesneye dayalı yapıları daha güçlü ve detaylı biçimde modellemiştir.
- Bellek Kullanımı: Her iki modelin bellek kullanımı problem türüne göre değişmekle birlikte benzer seviyelerdedir.

Sonuç ve Öneriler

Yapılan karşılaştırmalar sonucunda, üretken yapay zekâ modellerinin C# programlama dili bağlamında temel algoritma ve nesneye dayalı programlama problemlerini çözmede oldukça başarılı oldukları gözlemlenmiştir. Ancak her modelin belirli avantajları bulunmaktadır. Bu nedenle model seçimi, kullanım amacına ve problem türüne göre yapılmalıdır.

Elde edilen bulgular, üretken yapay zekâ sistemlerinin yazılım geliştirme süreçlerinde birer destekleyici araç olarak etkin şekilde kullanılabileceğini ortaya koymaktadır.

ABSTRACT

Electrochemical coating technologies are widely used in many industrial applications to impart functional and protective properties to metal surfaces. These methods are characterized by their low cost and precise control of process parameters. Chromium (Cr) and nickel (Ni) are two metals that are widely preferred in coating technologies due to their superior mechanical strength, chemical stability and corrosion resistance; when used together, they show complementary effects that significantly improve coating performance. However, the different electrochemical reduction potentials of these two metals make their simultaneous and homogeneous deposition in the same bath technically difficult. This situation necessitates parameter optimization in Cr-Ni co-coating systems and makes experimental studies in this field even more important.

In this study, a series of studies were carried out for the reduction of chromium (Cr) and nickel (Ni) metals in the same bath. In this context, a Cr (III)-based base coating bath was prepared by adding nickel sulfate in various ratios and two different complexing agents, glycine and ethylenediamine (EDA). Each bath mixture was homogenized with a magnetic stirrer at constant temperature (55 °C) and pH (3.5) and then plated in a Hull Cell setup.

The samples obtained from the plating processes were analyzed for elemental composition by X-Ray Fluorescence (XRF). According to the XRF data obtained, it was observed that the addition of low amounts (0.02-0.08 g) of nickel sulfate increased the chromium content, while the addition of higher amounts (0.16% and above) decreased the Cr content. It was found that glycine addition positively affected Cr precipitation at low concentrations, but this effect decreased with increasing concentration. On the other hand, the addition of ethylenediamine did not contribute significantly to increase the Cr content in the coating composition. The experimental findings indicate that higher Cr content can be obtained in Cr-Ni alloy plating systems, especially by preferring baths containing low ratios of nickel sulfate and glycine. These results reveal the critical importance of parameter optimization in systems aiming to co-precipitate two metals and provide guidance for future multi-metal plating studies.

Cr-Ni KAPLAMALARDA KOMPLEKSLEŞTİRİCİ KULLANIMININ KİMYASAL KOMPOZİSYONA ETKİSİ

ÖZET

Elektrokimyasal kaplama teknolojileri, birçok endüstriyel uygulamada metal yüzeylere fonksiyonel ve koruyucu özellikler kazandırmak amacıyla yaygın biçimde kullanılmaktadır. Bu yöntemler, düşük maliyetli oluşları ve işlem parametrelerinin hassas biçimde kontrol edilebilmesi ile ön plana çıkmaktadır. Krom (Cr) ve nikel (Ni), üstün mekanik dayanım, kimyasal stabilite ve korozyon direnci gibi özellikleriyle kaplama teknolojilerinde yaygın olarak tercih edilen iki metaldir; birlikte kullanıldıklarında kaplama performansını önemli ölçüde artıran tamamlayıcı etkiler gösterirler. Ancak bu iki metalin farklı elektrokimyasal indirgenme potansiyellerine sahip olmaları, aynı banyo içerisinde eş zamanlı ve homojen çökelmelerini teknik olarak zorlaştırmaktadır. Bu durum, Cr-Ni birlikte kaplama sistemlerinde parametre optimizasyonunu zorunlu kılmakta ve bu alanda yapılan deneysel çalışmaları daha da önemli hâle getirmektedir.

Bu çalışmada, krom (Cr) ve nikel (Ni) metallerinin aynı banyo içerisinde indirgenmesi için bir dizi çalışma yapılmıştır. Bu kapsamda, Cr (III) bazlı bir temel kaplama banyosu hazırlanmış çeşitli oranlarda nikel sülfat ile iki farklı kompleksleştirici ajan olan glisin ve etilendiamin (EDA) ilave edilmiştir. Her bir banyo karışımı sabit sıcaklık (55 °C) ve pH (3,5) koşullarında, manyetik karıştırıcı ile homojen hâle getirilmiş ve ardından Hull Cell düzeneğinde kaplama işlemleri gerçekleştirilmiştir.

Kaplama işlemlerinden elde edilen numuneler, X-Ray Floresans (XRF) cihazı ile elementel bileşim açısından analiz edilmiştir. Elde edilen XRF verilerine göre, düşük miktarda (0,02–0,08 g) nikel sülfat ilavesi krom içeriğini artırıcı etki gösterirken, daha yüksek miktarlarda (%0,16 ve üzeri) yapılan ilavelerin Cr oranını düşürdüğü gözlemlenmiştir. Glisin katkısının düşük konsantrasyonlarda Cr çökelmesini olumlu yönde etkilediği, ancak artan konsantrasyonla birlikte bu etkinin azaldığı tespit edilmiştir. Buna karşın, etilendiamin ilavesi kaplama bileşiminde Cr oranının artırılmasına yönelik anlamlı bir katkı sağlamamıştır. Deneysel bulgular, Cr-Ni alaşımlı kaplama sistemlerinde özellikle düşük oranlarda nikel sülfat ve glisin içeren banyoların tercih edilmesinin daha yüksek Cr içeriği elde edilebileceğini göstermektedir. Bu sonuçlar, iki metalin birlikte çökeltilmesini hedefleyen sistemlerde parametre optimizasyonunun kritik önem taşıdığını ortaya koymakta ve ileride yapılacak çok metalli kaplama çalışmaları için yol gösterici nitelik taşımaktadır.

Anahtar Kelimeler: Cr-Ni kaplama, Elektrokaplama yöntemi, Kompleksleştirici ajanlar,

GİRİŞ

Metal kaplama teknolojileri, günümüzde otomotiv, havacılık, elektronik, savunma ve inşaat sektörleri başta olmak üzere birçok endüstriyel alanda geniş uygulama alanlarına sahiptir (Oğuz & Katırcı, 2023a, 2023c; Oğuz & Katirci, 2023a). Bu teknolojiler, metal yüzeylere dayanıklılık, korozyon ve aşınma direnci ile estetik bir görünüm kazandırmak amacıyla yaygın olarak kullanılmaktadır (Katırcı & Oğuz, 2023b; Oğuz & Katırcı, 2023b; Oğuz & Katirci, 2023b). Özellikle elektrokimyasal kaplama yöntemleri, düşük maliyetli oluşları ve işlem parametrelerinin kolaylıkla kontrol edilebilir olması nedeniyle en sık tercih edilen teknikler arasında yer almaktadır. Bu çerçevede, kaplama işlemlerinde kullanılan metal türleri ve bunların kombinasyonları, elde edilen kaplamanın performansını belirleyen temel etkenlerdendir. Krom (Cr) ve nikel (Ni) gibi metaller, sahip oldukları üstün fiziksel ve kimyasal özellikleri nedeniyle kaplama endüstrisinde önemli bir yer tutmaktadır (Katırcı & Oğuz, 2023a, 2025).

Krom ve nikelin birlikte kaplanması, teorik olarak üstün mekanik ve kimyasal özelliklerin bir arada elde edilmesini mümkün kılsa da uygulamada çeşitli teknik zorluklar barındırmaktadır. Bu iki metalin elektrokimyasal indirgenme potansiyellerinin farklı olması, aynı banyo koşulları altında eş zamanlı ve homojen çökelmelerini güçleştirmektedir (Hamdani, 2015). Özellikle Cr (III) iyonlarının düşük indirgenme verimine karşın, Ni iyonlarının daha kolay indirgenebilmesi, kaplama bileşiminde dengesizliklere ve yüzey kalitesinde düşüşe yol açmaktadır (Okonkwo et al., 2022). Ayrıca, ikili sistemlerde pH, sıcaklık ve kompleksleştirici ajan gibi parametrelerin dar tolerans aralıklarında dikkatle optimize edilmesi gerekmektedir. Bu durum, prosesin endüstriyel ölçekte uygulanabilirliğini azaltmakta ve tekrarlana bilirliğini sınırlamaktadır. Dolayısıyla, Cr-Ni alaşımlı kaplamaların geliştirilmesine yönelik sistematik ve kontrollü deneysel çalışmalar büyük önem arz etmektedir (Chen et al., 2020; Sun et al., 2023). Uygun kaplama koşullarının belirlenmesi, yalnızca akademik bilgi üretimine değil, aynı zamanda sürdürülebilir ve işlevsel yüzey mühendisliği çözümlerinin geliştirilmesine de katkı sağlayacaktır.

Bu çalışma, krom ve nikelin aynı elektrokimyasal banyo içerisinde birlikte çökeltilmesine olanak tanıyacak uygun koşulların belirlenmesine yönelik olarak tasarlanmıştır. Bu kapsamda, Cr (III) içeren temel bir banyo sistemine farklı oranlarda nikel sülfat ve iki farklı kompleksleştirici ajan (glisin ve etilendiamin) eklenerek kaplama denemeleri gerçekleştirilmiştir. Deneyler aracılığıyla, katkı maddelerinin Cr içeriği üzerindeki etkileri sistematik biçimde değerlendirilmiştir. Çalışmanın nihai hedefi, Cr-Ni birlikte kaplamasına yönelik optimize edilmiş koşullara ilişkin temel veriler sunmak ve bu doğrultuda gelecekte gerçekleştirilecek çalışmalara deneysel bir zemin oluşturmaktır. Ayrıca, glisin ve etilendiamin gibi katkıların kaplama yapısına etkileri değerlendirmektir.

MATERYAL VE METOT

Kaplama Banyosunun Hazırlanması

Elektrokimyasal kaplama işlemleri için krom(III) temelli bir banyo kullanılmıştır (Katrc, 2016). Temel kaplama banyosunun bileşimi ve çalışma parametreleri Tablo 1'de verilmiştir.

Tablo 1. Temel Cr(III) Kaplama Banyosu

Kimyasallar	**Konsantrasyon (g/L)**
Krom(III) Sülfat ($Cr_2(SO_4)_3$)	10
Sodyum Sülfat (Na_2SO_4)	100
Borik Asit (H_3BO_3)	60
Sakarin ($C_7H_5NO_3S$)	10
EDTA ($C_{10}H_{16}N_2O_8$)	3
Glisin (NH_2CH_2COOH)	1,5
Banyo Değişkenleri	
pH	3,5
Sıcaklık (°C)	55

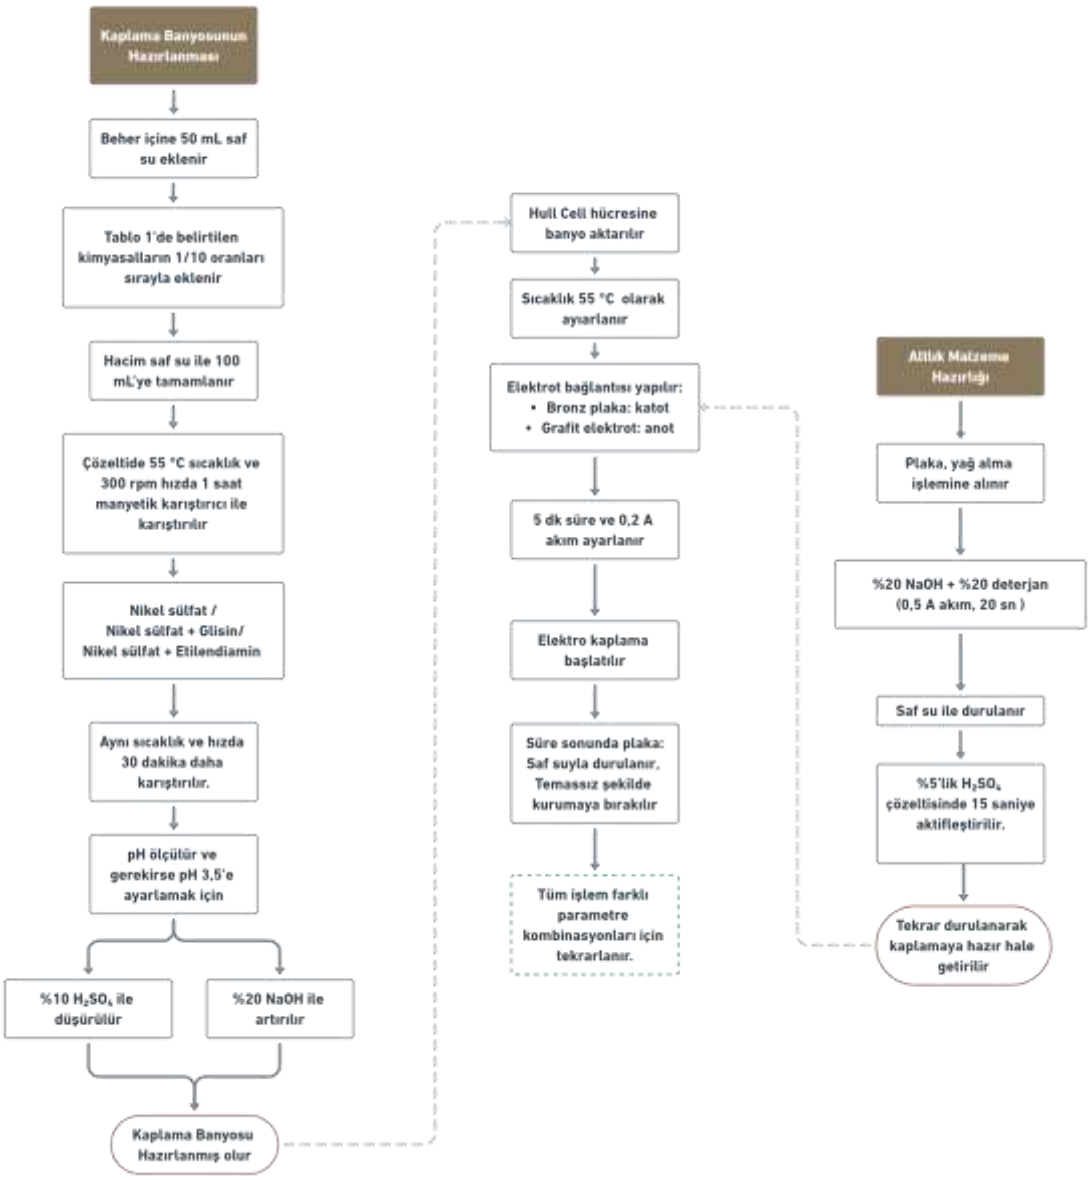
Kaplama banyoları, her biri 100 mL hacminde olacak şekilde hazırlanmıştır. Hazırlık aşamasında, beher içerisine öncelikle 50 mL saf su eklenmiş ve Tablo 1'de belirtilen kimyasallar, belirtilen konsantrasyonların 1/10'u oranında (tablodaki değerler 1 litre çözelti için verilmiştir) sırasıyla ilave edilmiştir. Ardından toplam hacim saf su ile 100 mL'ye tamamlanmıştır. Elde edilen karışım, 55 °C sıcaklıkta ve 300 rpm hızda manyetik karıştırıcı ile 1 saat süreyle karıştırılarak stabilize edilmiştir. Stabilizasyonun ardından, temel krom banyosuna Tablo 2 de belirtilen oranlarda nikel sülfat ve gerektiğinde kompleksleştirici ajanlar (glisin ve etilendiamin [EDA]) ilave edilmiştir. Bu karışım, aynı sıcaklık ve karıştırma hızında 30 dakika daha karıştırılarak homojen hale getirilmiştir. Hazırlanan banyonun pH değeri ölçülmüş; eğer pH 3,5'ten düşükse %20'lik NaOH çözeltisi ile artırılmış, yüksekse %10'luk H_2SO_4 çözeltisi ile düşürülerek pH 3,5 seviyesine ayarlanmıştır.

Kaplama İşlemi

Kaplama işlemleri standart Hull Cell hücresinde gerçekleştirilmiştir. Güç kaynağı olarak Thurlby 30V–1A model DC redresör kullanılmıştır. Altlık malzemesi olarak %70 Cu ve %30 Zn içeriğine sahip bronz plakalar tercih edilmiştir. Plakalar, kaplama öncesinde yüzey hazırlığı işlemlerine tabi tutulmuştur. Bu işlemler sırasıyla;

- %20 NaOH ve %20 deterjan çözeltisinde, plakanın katot olarak bağlanıp 0,5 A akım altında 20 saniye süreyle yağ alma,
- Saf su ile durulama,
- %5'lik H_2SO_4 çözeltisi içinde 15 saniye aktifleştirme (akımsız) ve tekrar durulama şeklinde gerçekleştirilmiştir.

Kaplama işlemi için hazırlanan banyo, Hull Cell hücresine aktarılmış ve sıcaklık 55 °C'ye ayarlanmıştır. Elektrot bağlantıları, bronz plaka katot ve grafit elektrot anot olacak şekilde yapılmıştır. Kaplama işlemi, redresör üzerinden 0,2 A akım uygulanarak ve 5 dakika süreyle gerçekleştirilmiştir. İşlem sonunda plakalar saf su ile durulanmış ve başka bir yüzeyle temas etmeyecek şekilde oda sıcaklığında kurumaya bırakılmıştır. Bu sürecin genel akışı Şekil 1'de şematik olarak özetlenmiştir.



Şekil 1. Kaplama Banyosunun Hazırlanması ve Kaplama Prosesi.

Kaplamaların Elementel Analizi

Kaplanan plakaların elementel bileşimleri X-Ray Floresans (XRF) cihazı ile belirlenmiştir. Tablo 2 de verilen XRF analiz sonuçları değerlendirilerek kaplama parametreleri karşılaştırılmıştır. Analiz sonuçlarına dayanarak en uygun kaplama parametreleri değerlendirilmiştir. Tablo 2 de yalnızca Cr oranı verilmiştir; çünkü kaplama bileşiminde kalan kısmı Ni oluşturmakta olup, bu nedenle ayrıca belirtilmesine gerek duyulmamıştır.

Tablo 2. XRF ile Belirlenen Cr Oranları ve İlgili Kaplama Koşulları

Numune Adı	EDA	Glisin	Eklenen Nikel Miktarı (g)	%Cr
1	0	0	0	100
2	0	0	0,02	20,87542
3	0	0	0,04	25,40428
4	0	0	0,08	25,61837
5	0	0	0,16	9,716157
6	0	0	0,32	5,542725
7	0	1	0,02	24,28655
8	0	1	0,04	14,96806
9	0	1	0,08	9,408602
10	0	1	0,16	6,067994
11	0	1	0,32	5,49235
12	1	0	0,02	0
13	1	0	0,04	2,472527
14	1	0	0,08	2,954899
15	1	0	0,16	2,63

Tablo 2 de yer alan XRF analiz sonuçları değerlendirildiğinde, temel krom banyosuna yapılan düşük oranlardaki nikel sülfat ilavesinin (0,02-0,08 g) Cr içeriğini artırdığı, daha yüksek oranlarda ise (%0,16 ve üzeri) Cr miktarının azaldığı gözlemlenmiştir. Glisin ilavesi, düşük konsantrasyonda (0,02 g) Cr miktarında anlamlı artış sağlamakla birlikte, miktar arttıkça Cr oranında belirgin düşüş görülmüştür. Diğer taraftan, EDA ilavesinin Cr içeriğini artırma konusunda etkisiz olduğu anlaşılmıştır. Bu sonuçlar doğrultusunda, en yüksek Cr oranlarına ulaşmak için temel krom banyosuna sadece düşük konsantrasyonlarda nikel sülfat ilave edilmesinin uygun olacağı sonucuna varılmıştır.

SONUÇ

Bu çalışmada, Cr(III) içeren bir elektrokimyasal kaplama banyosuna çeşitli oranlarda nikel sülfat ile iki farklı kompleksleştirici ajan (glisin ve etilendiamin) ilave edilerek Cr-Ni birlikte kaplanması araştırılmıştır. XRF analizleriyle belirlenen elementel bileşimler doğrultusunda, düşük oranlarda nikel sülfat ilavesinin (0,02–0,08 g) krom içeriğini artırıcı yönde etkili olduğu, ancak bu miktar %0,16'nın üzerine çıktığında Cr oranında belirgin bir azalma meydana geldiği tespit edilmiştir.

Glisin katkısı, düşük konsantrasyonlarda Cr çökelmesini destekleyici bir etki göstermiştir. Ancak glisin miktarının artmasıyla birlikte bu etki tersine dönmüş ve Cr oranında düşüş gözlenmiştir. Bu durum, glisinin krom komplekslerinin çözünürlüğü veya indirgenme verimliliği üzerindeki etkisine bağlı olabilir. Diğer yandan, etilendiamin katkısı hiçbir derişim düzeyinde anlamlı bir iyileşme sağlamamış; hatta Cr çökelmesini baskıladığı görülmüştür. Bu durum, EDA'nın Cr(III) iyonları ile kararlı kompleksler oluşturması ve böylece indirgenme kinetiğini azaltmasından kaynaklandığı düşünülmektedir.

Bu çalışmanın sonuçları, özellikle Cr içeriği açısından yüksek verim elde edilmesi için nikel sülfatın düşük miktarda kullanılması ve glisin gibi uygun kompleksleyicilerle desteklenmesinin etkili bir strateji olduğunu ortaya koymuştur. Bu bağlamda, Cr-Ni birlikte kaplama sistemlerinde parametre optimizasyonunun yalnızca bileşen oranlarıyla değil, aynı zamanda kompleks ajanların seçimi ve konsantrasyonuyla da doğrudan ilişkili olduğu sonucuna varılmıştır. Elde edilen veriler, Cr-Ni kaplama sistemlerinin geliştirilmesine katkı sağlamanın yanı sıra, çok metalli kaplama teknolojileri için deneysel bir temel sunması beklenmektedir.

ÖZET

Siber güvenlik tehditlerinin sürekli olarak artmaya devam ettiği günümüzde, güvenlik açıklarının doğru bir şekilde önceliklendirilmesi büyük önem taşımaktadır. Bu bağlamda, güvenlik açıklarının risk seviyesini belirlemek amacıyla çeşitli puanlama sistemleri geliştirilmiştir. Bu çalışmada, en yaygın kullanılan iki güvenlik açığı puanlama sistemi olan Ortak Güvenlik Açığı Puanlama Sistemi (CVSS) ile İstismar Olasılığı Tahmin Skoru (EPSS) karşılaştırmalı olarak ele alınmaktadır. CVSS, bir güvenlik açığının teknik ciddiyetini değerlendirirken; EPSS, bu açığın gerçek dünya koşullarında istismar edilme olasılığını tahmin eder. Çalışmanın bulguları, her iki sistemin tek başına yeterli olmadığını, ancak birlikte kullanıldıklarında daha kapsamlı ve etkili bir risk yönetimi sunduğunu ortaya koymaktadır. CVSS ve EPSS'nin birlikte kullanılması, siber güvenlik ekiplerinin önceliklendirme süreçlerinde daha stratejik kararlar almasına ve sınırlı kaynaklarını en etkili biçimde kullanmasına imkân tanımaktadır. Gelecekte bu sistemlerin otomatik olarak entegre edilmesi ve tehdit ortamına dinamik olarak uyum sağlayan modellerin geliştirilmesi önerilmektedir.

Anahtar Kelimeler: CVSS, EPSS, Güvenlik Açığı, Puanlama Sistemleri, Risk Yönetimi

GİRİŞ

Dijital teknolojilerin hızla gelişmesiyle birlikte, yazılım sistemlerine yönelik siber saldırılar büyük ölçüde artmış ve bilgilerin güvenliğini sağlamak en önemli zorluklardan biri haline gelmiştir (Reddy, G. N., & Reddy, G. J. 2014). Bu durum yazılımlarda bulunan güvenlik açıklarını, siber tehditlerin en önemli kaynaklarından biri hâline getirmiştir. Güvenlik açıkları, sistemlerde, yazılımlarda veya bağımlılıklarda bulunan zafiyetlerdir ve saldırganlar tarafından sistemlere yetkisiz erişim sağlamak, veri sızdırmak veya hizmet kesintilerine yol açmak amacıyla istismar edilebilir (Aslan, Ö., Aktuğ, S. S., Ozkan-Okay, M., Yilmaz, A. A., & Akin, E., 2023). Bu güvenlik açıkları sadece bireysel kullanıcıların yanı sıra kritik altyapıları, finansal kurumları ve devlet sistemlerini de tehdit etmektedir (Kaur, D., Singh, B., & Rani, S., 2023). Güvenlik açıklarının zamanında tespit edilmesi, sınıflandırılması ve etkili şekilde önceliklendirilmesi, güçlü bir savunma stratejisinin oluşturulması için büyük önem taşımaktadır.

Siber saldırıların en büyük nedenlerinden biri sistemlerde bulunan güvenlik açıklarıdır. Yazılımsal hatalar, güncellenmemiş bağımlılıklar veya yanlış yetkilendirme gibi faktörler siber saldırganların istismar edebileceği ciddi zafiyetlere sebep olmaktadır. Bu bağlamda güvenlik açıklarının ciddiyetlerinin etkili bir şekilde değerlendirilmesi, yönetilmesi ve önceliklendirilmesi siber tehditlere karşı etkili bir savunma oluşturmanın en kritik adımlarından biridir.

1999'dan beri güvenlik açığını değerlendirmek için çeşitli güvenlik açığı skorlama sistemleri geliştirilmiştir (Liu, Q., Zhang, Y., Kong, Y., & Wu, Q., 2012). Bunların en yaygın kullanılanlarından biri olan Common Vulnerability Scoring System (CVSS), güvenlik açıklarının ciddiyetini belirlemek için standart bir sistem sunmaktadır (Holm, H., & Afridi, K. K., 2015). CVSS, yazılım güvenlik açıklarının ciddiyet derecelerini standartlaştırılmış bir şekilde değerlendirmek ve ölçmek üzere tasarlanmış skorlama sistemidir (Mell, P., Scarfone, K., & Romanosky, S., 2006). Bir güvenlik açığının etkisini hesaplamak için belirli metrik grupları kullanılarak 0 ile 10 arasında skor puanı oluşturulmaktadır. Bu skor, güvenlik açığı için statik bir değerlendirme sunarken tehditlerin gerçek dünyada istismar edilebilme olasılığına dair bir bilgi vermemektedir.

Bu eksiklikleri gidermek amacıyla 2019 yılında Exploit Prediction Scoring System (EPSS) önerilmiştir. EPSS, bir güvenlik açığının kamuya açıklandıktan sonraki dönemde istismar edilme olasılığını yüzde cinsinden tahmin eden bir model sunar (Mell, P., Scarfone, K., & Romanosky, S., 2006). Makine öğrenmesi algoritmaları ve büyük veri analizleri kullanan EPSS, sistem yöneticilerinin ve güvenlik uzmanlarının sınırlı kaynaklarını daha etkili kullanmasını sağlayacak dinamik ve tahmine dayalı bir bakış açısı sunmaktadır. CVSS'in sunduğu statik teknik değerlendirmeye karşılık EPSS daha dinamik ve tehdit odaklı bir önceliklendirme aracı olarak konumlanmaktadır.

Güvenlik açıklarının tanımlanması, izlenmesi ve yönetilmesi süreçlerinde kullanılan bir diğer önemli araç ise Open Source Vulnerabilities (OSV)'dir. OSV aracı özellikle açık kaynak yazılımlardaki bağımlılıklarda tespit edilen güvenlik açıklarını merkezi bir veri tabanında sunmakta ve bu açıkların hangi yazılım paket ve sürümlerini etkilediğini belirlemeye yardımcı olmaktadır (Google, n.d.). OSV sistemi, güvenlik açıklarındaki severity (CVSS) gibi ciddiyet skorlarını da vererek geliştiricilere güvenlik açıklarının yanı sıra bu açıkların taşıdığı risk düzeyi hakkında da bilgi sunulmaktadır (Google Open Source Blog, 2024). Bu araç, güvenlik açığı yönetimi süreçlerinin otomatikleştirilmesini ve güvenlik açıklarının hızlı bir şekilde tespit edilerek raporlanmasını mümkün kılarak, CVSS ve EPSS gibi sistemlerin etkin biçimde kullanılabileceği bir altyapı sunmaktadır.

Bu çalışmada, GitHub üzerinden seçilen açık kaynak 10 Java projesi tarayarak, CVSS ve EPSS skorlarının güvenlik açığı önceliklendirmedeki rollerini ele almayı amaçlamaktadır. CVSS'in güvenlik açıklarını standart bir şekilde değerlendirmesi ile EPSS'in bu açıkların istismar edilme olasılığını tahmin etmesi arasındaki farklara değinilecektir. OSV'nin bu skorlarla entegre çalışmasıyla elde edilen bulguların siber güvenlikte önceliklendirme stratejilerine katkısı ele alınacaktır. Böylece bu üç sistemin birlikte nasıl daha verimli kullanılabileceği konusunda pratik çıkarımlar elde edilmesi amaçlanmaktadır.

METARYEL VE YÖNTEM

Güvenlik açığı (vulnerability), bilgisayar sisteminde önemli güvenlik riskleri oluşturan ve sistemin saldırılara açık olmasına neden olan istismar edilebilir zafiyetlerdir (Han, Z., Li, X., Xing, Z., Liu, H., & Feng, Z., 2017). Güvenlik açıklarının standart bir şekilde tanımlanması için MITRE tarafından CVE (Common Vulnerabilities and Exposures) sistemi geliştirilmiştir (Haddad, A., Aaraj, N., Nakov, P., & Mare, S. F., 2023). Bu standart, güvenlik açıklarının kök nedenlerini belirleyerek, yazılım geliştiricileri ve güvenlik uzmanlarının daha güvenli sistemler tasarlamalarına ve mevcut sistemlerdeki zafiyetleri etkili bir şekilde tespit edip gidermelerine yardımcı olmaktadır. CWE, güvenlik zafiyetlerinin tanımlanması ve sınıflandırılmasında ortak bir dil ve standart sağlaması tutarlı bir iletişim ortamı oluşturmaktadır (Koscinski, V., & Mirakhorli, M., 2024). Örneğin, CWE-89 (SQL Injection) güvenlik açığı, kullanıcı girdilerinin doğrulanmadan SQL sorgularında kullanılması sebebiyle, veri tabanlarının yetkisiz erişime açık hale gelmesine neden olmaktadır (MITRE, n.d.). Bu tür bir güvenlik açığı, CVE-2023-56789 gibi benzersiz bir kimlik ile tanımlanarak tüm güvenlik platformları tarafından ortak bir standart çerçevesinde takip edilebilmektedir. CVE sınıflandırması, güvenlik açıklarının yalnızca tespit edilmesini değil, aynı zamanda kök nedenlerinin analiz edilerek benzer zafiyetlerin önlenmesini de sağlamaktadır. Scarfone ve Mell (Scarfone, K., & Mell, P., 2009) tarafından yapılan çalışmada, CVE sisteminin siber güvenlik topluluğuna büyük katkı sağladığı, ancak sadece bir kimliklendirme mekanizması sunduğu ve güvenlik açıklarının ciddiyeti hakkında doğrudan bir değerlendirme yapmadığı öne sürülmüştür. Bu eksikliği gidermek için CVSS ve EPSS gibi skorlama sistemleri geliştirilmiştir.

CVSS, yazılım ve donanım güvenlik açıklarının ciddiyetini değerlendirmek ve standart bir skorlama mekanizması sağlamak amacıyla geliştirilmiş bir sistemdir (Johnson, P., Lagerström, R., Ekstedt, M., & Franke, U., 2016). İlk olarak 2005 yılında tanıtılan CVSS, FIRST (Forum of Incident Response and Security Teams) tarafından yönetilmekte olup, güvenlik açıklarının teknik ve operasyonel etkilerini objektif bir şekilde değerlendirmeye yönelik bir sistem sunmaktadır. CVSS, 2007 yılında CVSS 2.0, 2015 yılında CVSS 3.0 ve 2019 yılında CVSS 3.1 olmak üzere çeşitli sürümlerle güncellenmiştir. En son sürümü olan CVSS 4.0, 2023'te yayımlanmış ve saldırı vektörleri, ayrıcalık seviyeleri ve güvenlik açıklarının sistem üzerindeki etkilerini daha detaylı ele alarak değerlendirme süreci iyileştirilmiştir.

CVSS'in genel amacı, güvenlik açıklarını standart bir şekilde değerlendirmek için ortak bir dil sunmaktır. Sistem, güvenlik açıklarını ilgili metrikler ile 0 ile 10 arasında puanlandırarak bu açıkların ciddiyetini belirlememizi sağlamaktadır. Puanlar, bir istismarın etkisini yaklaşık olarak belirleyen çeşitli ölçütlere sahip bir formüle göre hesaplanır. Bu sayede hangi güvenlik açığına öncelik verilmesi gerektiği belirlenir. CVSS, güvenlik açıklarını 3 ana metrik grubu üzerinden değerlendirir (Forum of Incident Response and Security Teams, n.d.-a). İlk olarak, güvenlik açığının temel özelliklerini analiz eden temel (base) skor, zafiyetin doğasını ve potansiyel etkisini belirler. Ardından, güvenlik açığının zaman içindeki değişkenliğini ve mevcut tehdit seviyesini ölçen zamansal (Temporal) skoru devreye girer. Son olarak, zafiyetin

belirli çevresel koşullar altındaki etkilerini değerlendiren çevresel (environmental) skor bulunur.

CVSS, siber güvenlik uzmanlarına belirli bir zafiyetin önemini ve aciliyetini değerlendirmede yardımcı olmak için bir çerçeve sağlamaktadır. Bu durum, siber güvenlik uzmanlarının sınırlı kaynaklarını en etkili şekilde kullanmalarına ve en kritik zafiyetlere öncelik vermelerine olanak tanır (Aksu, M. U., et al., 2017).

EPSS, bir güvenlik açığının yakın gelecekte istismar edilme olasılığını tahmin etmek için kullanılan bir skorlama sistemidir (Forum of Incident Response and Security Teams, n.d.-b). Özellikle tehdit istihbaratı ve saldırgan davranışlarını modelleyerek, güvenlik ekiplerine hangi güvenlik açıklarına öncelik vermeleri gerektiği konusunda yardımcı olmaktadır. FIRST tarafından geliştirilen EPSS, güvenlik açıklarının istismar edilme olasılığını tahmin etmek amacıyla büyük veri ve makine öğrenimi tekniklerinden yararlanır. EPSS, 2021 yılında ilk sürümünü yayımlamış ve 2023'te EPSS 3.0 sürümü ile güncellenmiştir (Forum of Incident Response and Security Teams., n.d.-c).

EPSS'nin temel amacı, güvenlik zafiyetlerinin kapatılma süreçlerini daha etkili hale getirmek ve sınırlı güvenlik kaynaklarını en yüksek orana sahip güvenlik açıklarına yönlendirmektir. EPSS, büyük miktarda veri kullanarak belirli bir güvenlik açığının istismar edilme olasılığını hesaplar. Bu veriler şunları içerebilir (Parla, R., 2024):

• Açık veri tabanlarından alınan güvenlik açıkları (CVE kayıtları)

• Saldırı teknikleri ve tehdit aktörleri hakkında veriler

• Exploit kitleri ve kötü amaçlı yazılım kampanyaları

• Siber tehdit istihbaratı raporları

Makine öğrenimi algoritmaları, bu verileri analiz edip, güvenlik açığının istismar edilme olasılığını belirler ve bir yüzdelik skor üretir (Hughes, C., & Robinson, N., 2024). EPSS skorları 0 ile 1 arasında yüzdelik olarak değişmektedir. 1'e yakın değerler, ilgili güvenlik açığının yüksek ihtimalle istismar edileceğini göstermektedir. CVSS ve EPSS, güvenlik açıklarını değerlendirmek için kullanılan ancak farklı amaçlara hizmet eden iki sistemdir. CVSS güvenlik açığının teknik ciddiyetini ve sistem üzerindeki potansiyel etkisini değerlendirmeye odaklanırken EPSS ise bir güvenlik açığının yakın gelecekte istismar edilme olasılığına yöneliktir. Bu iki sistem birlikte kullanılarak, güvenlik açıkları hem teknik şiddetlerine hem de gerçek dünya saldırı risklerine göre daha kapsamlı bir şekilde ele alınmaktadır.

OSV, Google tarafından açık kaynak projeleri için oluşturulmuş bir güvenlik açığı veri tabanı ve analiz aracıdır (Cybersecurity and Infrastructure Security Agency., n.d.). OSV aracının temel amacı açık kaynak yazılımlardaki bağımlılıklarda yer alan güvenlik açıklarının geliştiriciler tarafından daha kolay takip edilmesini ve bu açıkların etkili bir şekilde giderilmesini desteklemektir (Google Open Source Blog, 2021). CVE ve CWE gibi standartları referans alarak çalışan OSV, yazılım bileşenlerinin belirli sürümlerini hedef alarak hangi sürümlerin etkilendiğini ve hangi sürümlerde düzeltme yapıldığını detaylı bir şekilde sunar. Ayrıca, yazılım bağımlılıklarını analiz ederek projede kullanılan paketlerin bilinen zafiyetlere karşı savunmasız olup olmadığını otomatik olarak tespit edebilmektedir. OSV, EPSS gibi verileri destekleyen sistemlerle entegre çalışarak, sadece açıkların teknik detaylarını sunmakla kalmaz, aynı zamanda bu açıkların aktif olarak istismar edilme risklerini de değerlendirmeye yardımcı olur. OSV, hem yazılım geliştiricilerine hem de güvenlik ekiplerine açık kaynak güvenliğinde şeffaf, erişilebilir ve güncel bir çözüm sunmaktadır.

Bu çalışmada elde edilen bulgular doğrultusunda, güvenlik açıklarının önceliklendirilmesini otomatikleştiren ve CI/CD süreçlerine entegre edilebilen bir sistemin geliştirilmesi önerilmektedir. Bu sistem, güvenlik zafiyetlerini yalnızca tespit etmekle kalmayıp aynı zamanda bu zafiyetleri önceliklendirip gerçek zamanlı aksiyon alınmasını da mümkün kılarak yazılım güvenliğinde proaktif bir yaklaşım sunmayı hedeflemektedir. Sistem, yazılım geliştirme yaşam döngüsünün her aşamasında aktif olarak çalışarak, yeni bir bileşen eklendiğinde veya mevcut bileşenlerde bir güncelleme yapıldığında, projede kullanılan tüm bağımlılıkları otomatik olarak tarar ve bilinen güvenlik açıklarına karşı analiz eder. Bu sayede geliştiriciler, güvenlik risklerini erken aşamada tespit edebilir ve sistemin sunduğu önceliklendirme algoritmaları doğrultusunda kritik açıkları öncelikli olarak giderebilir.

Bu model kapsamında, CVE kayıtlarında henüz EPSS skoru atanmamış veya yayınlanmamış güvenlik açıkları için makine öğrenimi tabanlı tahminleme yöntemlerinin kullanılması planlanmaktadır. Geliştirilecek makine öğrenimi modelleri, geçmiş EPSS verileri, tehdit istihbaratı, exploit kitlerinin yaygınlığı, saldırgan davranışları gibi çeşitli veri kaynaklarını analiz ederek, eksik EPSS skorlarını tahmin edebilecektir. Böylece, güvenlik açıklarına yönelik alınacak aksiyonlarda yalnızca mevcut EPSS verileriyle sınırlı kalınmayacak, aynı zamanda modelin öngördüğü risk skorları da değerlendirmeye dâhil edilebilecektir. Bu yaklaşım, özellikle yeni yayınlanan ya da düşük görünürlüğe sahip açıkların da proaktif bir şekilde ele alınmasını sağlayacaktır.

Ayrıca, sistemin CISA tarafından yayınlanan Known Exploited Vulnerabilities (KEV) kataloğu ile entegre çalışması da önerilmektedir. Bu entegrasyon sayesinde yalnızca teorik olarak yüksek risk taşıyan zafiyetler değil, gerçek dünyada aktif olarak sömürülen açıklara da öncelik verilmesi mümkün olacaktır. KEV kataloğunda yer alan güvenlik açıklarının öncelikli olarak değerlendirilmesi, saldırganların güncel taktik ve tekniklerine karşı daha hazırlıklı olunmasını sağlayarak, sistem güvenliğinin artırılmasına katkı sunacaktır.

Tüm bu bileşenlerin birleşimiyle önerilen model, otomatikleştirilmiş analiz, makine öğrenimi temelli öngörüler ve güncel tehdit istihbaratını bir araya getirerek güvenlik zafiyetlerinin daha doğru, kapsamlı ve etkili bir şekilde yönetilmesini ve önceliklendirilmesini hedeflemektedir. Bu sistem, sadece yazılım geliştiriciler için değil aynı zamanda güvenlik ekipleri için de zaman ve kaynak tasarrufu sağlayarak, siber güvenlik süreçlerinin kalitesini artıracaktır.

Özetle, GitHub üzerinden alınan açık kaynak 10 java projesindeki bağımlılıklarda bulunan güvenlik açıkları OSV aracılığıyla çıkarılmış ve elde edilen CVE kimlikleri ile EPSS API kullanılarak istismar edilebilme olasılıkları elde edilmiştir. Elde edilen bulgular önceliklendirme için değerlendirilmiştir.

BULGULAR VE TARTIŞMA

Çalışmada önerilen modeli doğrulamak için, kaynak kodları GitHub'da bulunan popüler Java projeleri arasından ilk olarak 10 proje belirlendi. Deneysel olarak incelenen projeler Tablo 1'de listelenmiştir.

Tablo 1. Deneysel çalışma için seçilen projeler

No	Project Name	Stars	Fork	Repo URI
1	mall	80.6k	29.3k	https://github.com/macrozheng/mall
2	spring-petclinic	8.3k	25.6k	https://github.com/spring-projects/spring-petclinic
3	json-iterator	1.5k	526	https://github.com/json-iterator/java
4	JCSprout	27.1k	7.1k	https://github.com/crossoverJie/JCSprout
5	mall-swarm	12.4k	5.4k	https://github.com/macrozheng/mall-swarm
6	shopizer	3.7k	3.1k	https://github.com/shopizer-ecommerce/shopizer
7	hsweb-framework	8.4k	3k	https://github.com/hs-web/hsweb-framework
8	netty-socketio	7k	1.7k	https://github.com/mrniko/netty-socketio
9	socket.io-client-java	5.4k	979	https://github.com/socketio/socket.io-client-java
10	aviatorscript	4.8k	879	https://github.com/killme2008/aviatorscript

İncelenen projelerin güvenlik açıklarını belirlemek amacıyla OSV aracı ile projeler taratılmıştır. Değerlendirilen projelerde elde edilen CVE kimlikleri ile EPSS API aracılığı ile EPSS ve percentile değerleri elde edilmiştir. Elde edilen verilere ait bir güvenlik açığı analiz raporu Tablo 2 ‘sunulmuştur.

Tablo 2. Örnek güvenlik açığı analiz raporu

Name	CVE	Severity	EPSS	Percentile
com.fasterxml.jackson.core:jackson-databind	CVE-2020-8840	9.8	0.08	0.92
	CVE-2020-11112	8.8	0.11	0.93
	CVE-2020-35728	8.1	0.41	0.97
org.springframework:spring-core	CVE-2018-1271	5.9	0.92	1.0

Elde edilen bulgular doğrultusunda, severity (CVSS) skoru yüksek ancak EPSS skoru düşük olan güvenlik açıklarının pratikte istismar edilme olasılığının düşük olduğu gözlemlenmiştir. Buna karşılık, severity skoru düşük fakat EPSS skoru yüksek olan açıkların ise istismar riskinin daha yüksek olabileceği tespit edilmiştir. Percentile verileri incelendiğinde, EPSS skoru düşük ancak percentile değeri yüksek olan açıkların gerçek saldırılar arasında üst sıralarda yer aldığı, EPSS skoru yüksek ancak percentile değeri düşük olan açıkların ise gerçek saldırılar arasında alt sıralarda konumlandığı analiz edilmiştir. Bu bulgular, severity, EPSS ve percentile değerlerinin her biri ayrı ayrı değerlendirildiğinde güvenlik açığı önceliklendirmesinde sınırlı katkı sağladığını; ancak bu üç ölçütün birlikte analiz edilmesinin daha etkili ve verimli bir önceliklendirme süreci sunduğunu ortaya koymaktadır.

Analiz edilen projelerin bağımlılıklarındaki güvenlik açıklarının listesi Tablo 3’te sunulmaktadır.

Tablo 3. İncelenen projelerdeki güvenlik açıklarının sayısı

No	Project Name	Vulnerabilities
1	mall	24
2	spring-petclinic	7
3	json-iterator	64
4	JCSprout	61
5	mall-swarm	8
6	shopizer	10
7	hsweb-framework	5
8	netty-socketio	5
9	socket.io-client-java	4
10	aviatorscript	3

Deneysel çalışmanın bulguları, yalnızca CVSS veya yalnızca EPSS skorlarının ayrı ayrı incelenmesinin, güvenlik açıklarını önceliklendirme açısından yeterli olmadığını ortaya koymuştur. Elde edilen sonuçlar, bu iki metriğin birlikte değerlendirilmesinin, önceliklendirme sürecinde daha doğru ve etkili sonuçlar verdiğini göstermektedir. Özellikle CVSS skoru teknik şiddeti ortaya koyarken, EPSS skoru ilgili açığın gerçek dünyada istismar edilme olasılığına dair önemli bilgiler sunmaktadır.

Buna ek olarak, EPSS verileriyle birlikte sağlanan percentile değerinin de güvenlik açığı önceliklendirmede kritik bir rol oynadığı belirlenmiştir. Bu değer, bir güvenlik açığının bilinen diğer açıklar arasında göreli konumunu belirlemekte ve tehdit düzeyine dair daha somut bir perspektif sunmaktadır.

Dolayısıyla, güvenlik açıklarının etkili bir şekilde yönetilebilmesi için sadece bireysel skorlar değil, bu skorların bağlamsal yorumları ve karşılaştırmalı analizleri de dikkate alınmalıdır. Bu bütüncül yaklaşım, sınırlı kaynakların daha stratejik bir şekilde kullanılmasına ve daha güçlü bir siber güvenlik duruşunun sağlanmasına katkıda bulunacaktır.

SONUÇ VE ÖNERİLER

Çalışma kapsamında incelenen 10 açık kaynaklı Java projesinin bağımlılıkları ilk olarak OSV aracı ile çıkarılmıştır. Elde edilen CVE kimlikleri ile EPSS ve percentile verileri elde edilmiştir. Elde edilen veriler ayrı ayrı incelendiğinde güvenlik açığı önceliklendirmede yeterli bilgi sunmadığı gözlemlenmiştir. Bu bulgu bize güvenlik açığı önceliklendirme için yazılım geliştirme/dağıtım ortamlarında (CI/CD) entegre edilebilecek bir sistemin gerekliliğini göstermiştir.

Bu gereklilik CI/CD süreçleri için yeni bir modelin önerilmesine yol açmıştır. Önerilen bu model, bir güvenlik açığının önceliklendirilmesinde OSV ve EPSS API'dan elde edilen bulguların birlikte ele alınarak daha sağlıklı önceliklendirme yapılmasına olanak sağlayacaktır. Ayrıca Oluşturulacak modelin CISA KEV katoloğu ile entegre edilmesiyle, gerçek dünyada aktif olarak sömürülen açıklara öncelik verilerek sistem güvenliğinin artırılmasına katkı sunacaktır.

SERVQUAL METHOD IN MEASURING SERVICE QUALITY AND RELATED LITERATURE REVIEW

HİZMET KALİTESİNİN ÖLÇÜLMESİNDE SERVQUAL METODU VE İLİŞKİLİ LİTERATÜR TARAMASI

ÖZET

Günümüzde faaliyetlerini sürdürmekte olan çok sayıda perakende işi ile uğraşan şirket bulunmaktadır. Perakendecilik sektörü ile uğraşan büyük şirketler her geçen gün artmakta olan bu rekabetçi ortamda müşterilerini kaybetme korkusu ile karşı karşıya kalmaktadır. Perakendecilik alanında hizmet veren firmalar bu durum karşısında hizmet kalitesini her geçen gün daha da arttırmaya çalışmaktadır. Müşteri memnuniyetini ve bağlılığını arttırmak için işletmeler; tedarikçi seçiminden, tedarik edilen ürünün kalitesine ve zamanında teslim edilmesine kadar her detay ile tek tek ilgilenmektedirler. Müşterinin aradığı ürünü zamanında ve doğru bir şekilde yerinde bulması müşterinin firmaya olan güvenini arttırmaktadır. Bu nedenle firmalar tedarikçilerinin ürünü doğru şekilde ve doğru zamanda yerine ulaştırması konusunda çalışmalar yapmaktadır.

Müşteri odaklı hizmet yaklaşımı, hizmet kalitesi kavramını ön plana çıkarmıştır. Hizmet kalitesi, müşterinin ihtiyaçlarını tam olarak karşılamak ve karşılamak için yapılan tüm çalışmalar olarak tanımlanabilir. Hizmet sektöründe kalite, sektörde başarılı olmak için önemli bir unsurdur. Hizmet kalitesini ölçme yöntemlerinden biri olan SERVQUAL Yöntemi, müşteri beklentilerini ve hizmet algılarını yakalamak ve analiz etmek için kullanılan çok boyutlu bir araştırma yöntemidir. Bu çalışmada, hizmet kalitesini ölçmede içerdiği farklı boyutlar nedeniyle en çok tercih edilen yöntemlerden biri olan SERVQUAL yöntemi ile son 10 yılda yazılmış 33 yüksek lisans tezi incelenecek ve çalışmaların yıllara göre dağılımı ve uygulanan yöntemler ortaya konulacaktır.

Anahtar Kelimeler: Servqual, Müşteri Memnuniyeti, Hizmet Kalitesi

1. GİRİŞ

Geçmiş dönemlerde üretim yapan firmalar ürettikleri ürünlerin müşteriler tarafından doğrudan tüketildiğini bilmektedirler. Fakat sanayileşmenin hızla büyüyüp yayılması ürünlerin miktarını ve çeşitliliğini arttırmıştır. Bu durum işletmelerin ürünlerini pazarlayabilmeleri için müşteri odaklı hale gelmelerini sağlamıştır. Artık işletmeler ürünü sadece üretmekle kalmamakta bu ürünleri müşterilerin ihtiyaç ve isteklerine uyarlayarak müşteri portföyünü genişletmeye çalışmaktadırlar. Müşterileri ürün veya hizmeti almaya yönlendirebilmek için kalite kavramları ortaya atılmış ve bunlar üzerine işletmelerin yoğunlaşması kaliteli üretim ve kaliteli hizmet anlayışını ortaya koymuştur.

2. KALİTE NEDİR?

Kalite (Qualites) Latince "nasıl oluştuğu" anlamına gelen "qualis" kelimesinden gelmektedir. Buna göre kalite hangi ürün veya hizmet için kullanılıyorsa, onun ne olduğunu ifade etmeye yöneliktir. Oysa günümüzde kalite, daha çok üstünlüğü ve iyi oluşu ifade etmek için kullanılır. Bu nedenle kalite, kişisel değerleri içermektedir. (URL-1)

Firmaların uluslararası alanda yükselmesine yardımcı en önemli güç olarak görülen “Kalite” kavramı tanım olarak bir hizmet ya da ürünün tespit edilen veya gereksinim duyulacak ihtiyaçları karşılama kabiliyetine dayanan özelliklerin toplamıdır. Aynı zamanda ürün veya hizmetin iyi olup olmadığı konusunda müşterinin en son verdiği karar yani müşteri memnuniyetidir. (URL-1) Günümüzde sadece üretim alanında değil aynı zamanda hizmet alanında geniş bir yer edinen kalite kavramı işletmelerin artık tüm kaynaklarını kullanarak sisteme dahil olmaya çalıştığı bir süreç haline gelmiştir.

2.1.Üretim Kalitesi Nedir?

Üretim açısından kalite, dört temel yaklaşımda tanımlanabilir:

- Üretimi merkeze alan tanımlama: Bu yaklaşıma göre kalite; ihtiyaçlara cevap verme özelliğine sahip olmalıdır. Standartların ürünün üretiminde ne derece gerçekleştiği ile ilgilidir.
- Ürünü merkeze alan tanımlama: Ürünün içeriği ve içeriğindeki miktar ile ilgilidir.
- Değeri merkeze alan tanımlama: Müşterinin, tatmin olabileceği standartlarda, uygun bir fiyat ile sahip olabileceği ürün anlayışıdır.
- Kullanıcı-müşteriyi merkeze alan tanımlama: ürünün ‘amaca uygunluğunu kullanıcı/müşteri açısından değerlendirme. (Korkmaz, H.,C.,2016)

2.2.Hizmet Kalitesi Nedir?

Günümüzde, müşteri odaklı hizmet anlayışı, hizmet kalitesi kavramını ön plana çıkarmıştır. Hizmet kalitesi, müşterinin memnuniyeti ve ihtiyaçlarını tam anlamıyla sağlamak adına yapılan çalışmaların tümü olarak ifade edilebilir. Hizmetlerin soyut olması kalitesini değerlendirmeyi zorlaştırmaktadır. Bu durum hem müşteri hem de işletme adına dezavantajdır. İşletme, müşterinin hizmetlerin kalitesini nasıl değerlendirdiğini bilmezse, bunu hangi yönde kullanacağını da bilemez. Müşteri için de bu durum bazı zamanlarda pek kolay olmamaktadır. Çünkü hizmetlerin nitelinden dolayı kimi zaman değerlendirecek fiziksel bir özellik bulunamayabilir. Bu durumda, işletmenin temizliğine, fiziksel şartlarına, personelin dış görünümüne, ilgisine bakarak, hizmet kalitesini değerlendirir. İşletmenin, müşteri beklentilerinin ne kadarını karşılayabildiğinin bir ölçüsü hizmet kalitesinin karşılığıdır. (Korkmaz, H.,C.,2016)

2.2.1. Hizmet Kalitesinin Boyutları Nelerdir?

Geçmişi eski dönemlere dayanan ve herkes için ortak bir tanımı olmayan kalite kavramı tanımlamalarının farklı olmasından kaynaklı çok boyutlu bir kavram olarak ele alınmaktadır. Hizmet kalitesi boyutlarını ortaya koyan ve genel kabul gören en önemli çalışma Parasuraman, Zeithaml ve Berry (1985) tarafından yapılmıştır. Hizmet tipine bakılmadan hizmetler için temel kriterler oluşturulmuş ve bu kriterler on ana kategoride toplanmıştır. Bunlar; fiziksel özellikler, güvenilirlik, heveslilik, yeterlilik, nezaket, inanılırlık, güvenlik, ulaşılabilirlik, anlayış ve iletişimdir. (Kaya, Ş.,2014) Bu boyutları şöyle ifade edebiliriz:

2.2.1.1.Somut özellikler (Tangibles): Binaların, kullanılan teçhizatların, iletişim malzemelerinin ve personelin görünümü,

2.2.1.2.Güvenilirlik (Reliability): Vaat edilen hizmeti doğru olarak yerine getirme yeteneği,

2.2.1.3.Heveslilik (Responsiveness): Müşterilere yardım etme ve hızlı hizmet verme istekliliği,

2.2.1.4.Yeterlilik (Competence): Hizmeti yerine getirmek için gereken bilgi ve yeteneğe sahip olunması,

2.2.1.5.Nezaket (Courtesy): Müşteri ile ilişki kuran personelin nazik, saygılı ve samimi olması,

2.2.1.6.İnanılabilirlik (Credibility): Hizmet sunan kişinin güvenilir ve dürüst olması,

2.2.1.7.Güvenlik (Security): Tehlike, risk veya şüphenin olmaması,

2.2.1.8.Erişim (Access): Gerektiğinde iletişim kurma kolaylığı ve erişilebilirlik,

2.2.1.9.İletişim (Communication): Anlayabileceği dilden müşterinin bilgilendirilmesi ve sorunlarının dinlenmesi,

2.2.1.10. Empati (Empathy): Müşterileri ve ihtiyaçlarını tanımak için çaba sarf edilmesidir.

Hizmet kalitesini belirleyen ölçütlerden sonra, hizmet kalitesinin ölçümü şu formüle göre yapılmıştır:

Hizmet Kalitesi = (Beklenen hizmet kalitesi) – (Algılanan hizmet kalitesi)

Bu formüle göre; beklenen hizmet kalitesi, algılanandan büyük olursa, hizmet kalitesi tatmin edici değil; beklenen hizmet kalitesi algılanandan küçük olursa ideal hizmet kalitesi; eşit olması durumunda ise hizmet kalitesi tatmin edici demektir. (Korkmaz, H.,C.,2016).

2.2.2. Hizmet Kalitesi Modelleri

Hizmet kalitesinin ölçülebilmesi şirketlere hizmet kalitelerinin iyileştirilmesi ve geliştirilmesi yönünde en önemli adımı oluşturmaktadır. Çünkü mevcut durumu hakkında doğru veriler toplamayı başaran bir işletme eksiklerini bu doğrultuda tamamlamaya çalışarak hizmet kalitesini iyileştirip müşteri memnuniyeti ve müşteri potansiyelini arttırmada daha etkili ve hızlı önlemler alabilir. Nicel ölçütlerle ölçülebilen ürün kalite ölçümünden daha zor bir süreç olan hizmet kalitesi ölçümü için akademisyenler tarafından öncelikle hizmet kalitesini somut bir hale getirerek daha sonra üzerinde birtakım iyileştirmeler yapılması düşünülmüştür.

Literatürde yer alan ve hizmet kalitesini ölçmeye yarayan modellerden bazıları aşağıdaki gibidir. Bunlar;

- Algılanan hizmet kalitesi (GRÖNROOS modeli)
- SERVQUAL hizmet kalitesi modeli

- SERVPERF (Service Performance) hizmet kalitesi modeli vb.dir.

Bu çalışmada ise SERVQUAL Hizmet Kalitesi Modeli incelenmiş ve hizmet kalitesi ile ilgili 2014-2024 yılları arasında yapılan yüksek lisans çalışmaları incelenmiştir.

3. SERVQUAL HİZMET KALİTESİ MODELİ

SERVQUAL model, servis kalitesinin ve müşteri memnuniyetinin ölçüldüğü bir servis kalitesi ölçme metodudur. Hizmet Kalitesi (Service Quality) kelimelerinin kısaltması olan SERVQUAL Metodu müşteri beklentileri ve hizmet algılarını yakalayıp analiz etmek için kullanılan çok boyutlu bir araştırma yöntemidir. (URL-2)

3.1.SERVQUAL Tarihçesi

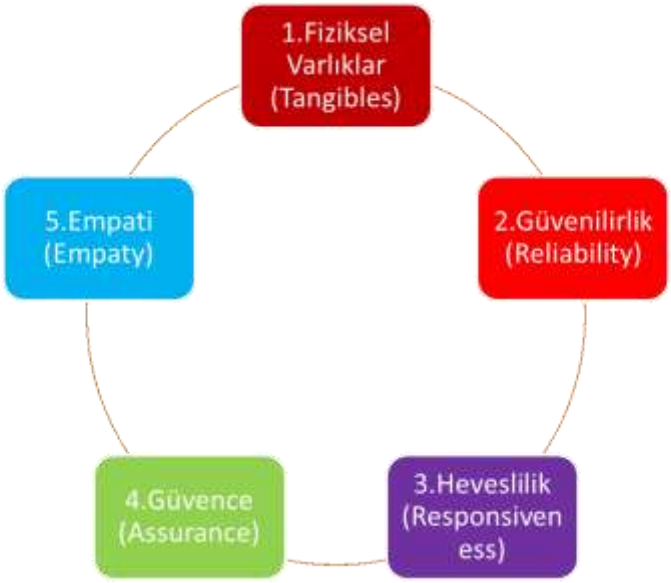
İlk olarak 1985 yılında Birleşmiş Milletlerdeki bir grup akademik araştırmacı olan A. Parasuraman, Valarie Zeithaml ve Leonard L. Berry tarafından ortaya atılan SERVQUAL Modeli anketi servis sektöründeki kaliteyi ölçmeyi amaçlamıştır. Ortaya atılan bu yöntem hizmet kalitesi araştırmalarında kullanılan ölçüm yöntemlerinde bir atılımı temsil ediyordu. Aracın tanısal değeri, ölçeğin (örn. araç veya anket) geliştirilmesine yönelik kavramsal çerçeveyi oluşturan hizmet kalitesi modeli tarafından desteklenir. Araç, çeşitli bağlamlarda ve kültürel ortamlarda yaygın olarak uygulanmış ve nispeten sağlam bulunmuştur. Hizmet kalitesi alanında baskın ölçüm ölçeği haline gelmiştir. SERVQUAL'a ve sayısız bağlam-özgü uygulamasına olan uzun süredir devam eden ilgiye rağmen, araştırmacılardan bazı eleştiriler almıştır. (URL-2)

Hizmet Kalitesi literatüründe SERVQUAL Metodu, literatüründe en kapsamlı çalışmalardan biridir ve yaratıcıları geliştirdikleri yöntemin evrensel olarak geçerli olduğunu ve küçük değişikliklerle her sektöre uygulanabileceğini çünkü en temel hizmet kalitesi boyutlarını tanımladığını ileri sürmektedirler.

Parasuraman ve arkadaşları hizmet kalitesini ölçmek için 22 maddeden oluşan bir ölçme yöntemi geliştirmişlerdir. Bu 22 maddelik sorudan oluşan anket hizmet kalitesi ölçülürken ilk aşamada tüketicinin hem hizmet aldığı işletmeden beklentisini ölçerken kullanılıyor hem de aynı sorular müşterinin o işletmeden hizmet alırken ki algısını ölçerken kullanılıyor. Ölçekte “tamamen katılıyorum” ile “kesinlikle katılmıyorum” arasında değişen 7’li Likert Ölçeği kullanılmıştır. İlk aşama olarak Parasuraman ve arkadaşları hizmet kalitesini tanımlamaya daha sonra ise bu terimi etkileyen faktörleri bulup bunları ölçülebilir hale getirecek bir model geliştirmeye çalışmışlardır.

SERVQUAL araştırmasında elde edilen verilerle yapılan istatistiksel analizler iki önemli noktayı daha ortaya çıkarmıştır. Birincisi, on hizmet kalitesi ölçütünün bazılarının kendi aralarında kayda değer bir şekilde bağlantılı olduğu ve bunları kapsayacak daha geniş bir ölçüte gereksinim duyulduğudur. Bu doğrultuda ölçütler kendi aralarında gruplandırıldıklarında 5 hizmet kalitesi ortaya çıkmıştır. Bunlar;

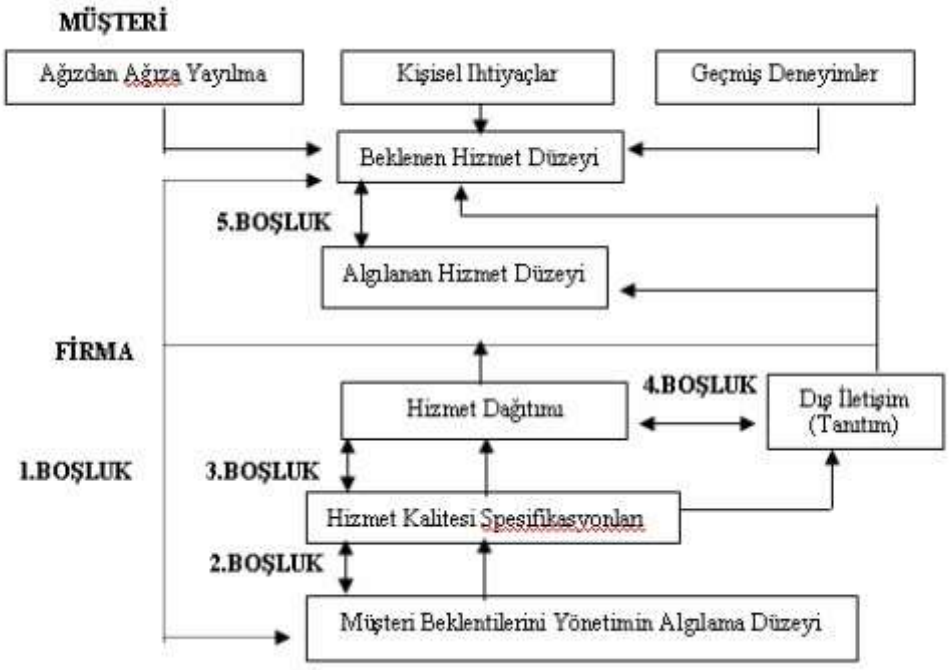
1. Fiziksel Varlıklar
2. Güvenilirlik
3. Heveslilik
4. Güvence
5. Empati



Şekil 1 Hizmet Kalite Ölçütleri

Parasuraman ve arkadaşları ilk dördü arka planda gerçekleşen ve beşincisi ise müşteri ile yüz yüze olan hizmetlerde ortaya çıkan toplamda 5 adet boşluk (gap) belirlemişlerdir. Bu boşluklar hizmet kalitesini etkileyen faktörleri anlaşılabilir kılmıştır. Kalite problemlerinin sebep olduğu 5.boşluk, müşterinin hizmet beklentisiyle algılaması arasındaki farktır. Bu boşluk hizmet kalitesi olarak tanımlanmıştır. Çizelge 3.1. de "Boşluklar Modeli" gösterilmektedir.

Tablo 1 Boşluklar Modeli



1.Boşluk: Müşteri beklentileri ve yönetimin müşteri beklentilerini algılaması arasındaki fark.

2.Boşluk: Yönetimin müşteri beklentilerini algılaması ve hizmet kalitesi standartları arasındaki fark.

3.Boşluk: Hizmet kalitesi standartları ve hizmetin sunumu arasındaki fark (hizmet performansı farkı).

4.Boşluk: Hizmetin sunumu ve dış çevre ile iletişimler arası fark.

5.Boşluk: Beklenen hizmet ve algılanan hizmet arasındaki fark.

Parasuraman, Zeithaml ve Berry (1988) yukarıda kısaca açıklanan ilk dört boşluğun, SERVQUAL modelinin temelini oluşturan beşinci boşluğu meydana getiren başlıca nedeni olduğunu göstermiştir. Bu boşluk olumlu olduğunda yani kişilerin algıladığı hizmet beklediği hizmete eşit veya beklediği hizmetten yüksek olduğu durumlarda kaliteden söz edilebilir. Algıladıkları hizmetin beklentilerinin altında olması ise kalitesizliğe yol açar.

4. HİZMET KALİTESİ ÖLÇÜMÜ İÇİN YAPILAN YÜKSEK LİSANS ÇALIŞMALARI

Bu çalışmada ise SERVQUAL Hizmet Kalitesi Modeli incelenmiş ve hizmet kalitesi ile ilgili 2014-2024 yılları arasında yapılan yüksek lisans çalışmaları incelenmiştir. Yapılan inceleme sonucunda Hizmet Kalitesi ile ilgili yapılan yüksek lisans tezleri yazar, yıl, çalışma adı, optimal yöntem, üniversitenin adı ve uygulanan alan olmak üzere kategorize edilerek Tablo 4.1. de detaylı hale getirilmiştir.

Tablo 2. Hizmet Kalitesi ile İlgili Yapılan Yüksek Lisans Tezleri (2014-2024)

5. SONUÇ VE ÖNERİLER

Küreselleşmenin ve dijitalleşmenin hızla artış gösterdiği ve gündelik hayatın içine doğrudan girdiği günümüzde şirketler, ürettikleri ürün veya hizmetlerin müşteriler tarafından tercih edilebilirliğinin artması için sadece kaliteli ürün üretmekle kalmıyor; aynı zamanda bu ürünlerin müşterilere ulaştığı andaki müşteri memnuniyetine de dikkat çekmektedirler. Ürünü müşteriye sunarken müşterinin beklentisi ile algıladığı hizmeti birbirine denk getirmek için gerekli yatırımları yaparak bir adım daha öne geçmeye çalışmaktadırlar. Bu doğrultuda yatırımlarını bu yöne çekerek müşteri memnuniyetini arttırmak ve hizmet kalitesini ölçmek ilk öncelikler arasına yükselmiştir.

Bu çalışmada ise hizmet kalitesi konusu üzerine yapılan yüksek lisans tezlerinin hangi alanlarda ve hangi yöntemlerle yapıldığı incelenmiş olup hizmet kalitesi ölçümünde istatistiksel ve çok kriterli karar verme yöntemlerinin kullanımının yüksek oranda olduğu, aynı zamanda çalışma alanları incelendiğinde en fazla sağlık daha sonra havacılık, lojistik ve eğitim alanlarında çalışmaların yapıldığı gözlemlenmiştir.

Bu çalışmanın amacı; hizmet kalitesi ölçümünde yapılan 2014-2024 yılları arasındaki yüksek lisans çalışmalarının bir arada sunularak kullanılan metotların ve çalışma alanlarının mevcut durumunu istatiksel olarak ortaya koymaktır.

ABSTRACT

Today, dynamic pricing plays a critical role in the airline transportation sector in terms of gaining a competitive advantage and maximizing revenue. Airline ticket prices are determined by many variables such as flight time, class, number of transfers, occupancy rate, and boarding/arrival times, which causes traditional pricing methods to be inadequate. In this context, this complex problem structure, which includes multivariate and uncertainty, reveals the need for more flexible, learning, and optimizing models. In this study, a Genetic Algorithm based artificial intelligence model was developed for the dynamic optimization of airline ticket prices, and the performance of this model on price estimation was examined. The model aims to determine the most appropriate price level by considering various parameters related to the flight. This structure, which was developed based on Genetic Algorithm, one of the metaheuristic methods, was modelled over basic GA components such as selection, crossover, mutation, and fitness functions. In addition, different parameter configurations were tried, and the most appropriate GA structure was determined. The data set used consists of approximately 11,000 flight information belonging to different airline companies. The application results show that Genetic Algorithms provide higher accuracy, especially in multivariate and nonlinear problems, compared to classical statistical and regression-based models. This study not only presents an innovative approach to dynamic pricing processes in the aviation sector but also demonstrates the applicability of Genetic Algorithms to real-world problems. The findings show that this approach is not limited to airline ticket pricing only but can also be an effective solution method in other sectors requiring similar optimization.

Keywords: genetic algorithm, dynamic pricing, flight ticket, optimization, artificial intelligence, meta-heuristic methods.

INTELLIGENT OPTIMIZATION OF AIRLINE TICKET PRICES VIA A GENETIC ALGORITHM-BASED DYNAMIC APPROACH

ÖZET

Günümüzde dinamik fiyatlandırma, havayolu taşımacılığı sektöründe rekabet avantajı elde etmek ve geliri maksimize etmek açısından kritik bir rol oynamaktadır. Uçak bileti fiyatları; uçuş saati, sınıf, aktarma sayısı, doluluk oranı ve biniş/varış saatleri gibi birçok değişkene bağlı olarak belirlenmekte olup, bu durum geleneksel fiyatlandırma yöntemlerini yetersiz kılmaktadır. Bu bağlamda çok değişkenli ve belirsizlik içeren bu karmaşık problem yapısı, daha esnek, öğrenen ve optimize eden modellere olan ihtiyacı ortaya koymaktadır. Bu çalışmada, uçak bileti fiyatlarının dinamik olarak optimize edilmesi amacıyla Genetik Algoritma tabanlı bir yapay zeka modeli geliştirilmiş ve bu modelin fiyat tahmini üzerindeki performansı incelenmiştir. Model, uçuşa ilişkin çeşitli parametreleri dikkate alarak en uygun fiyat seviyesini belirlemeyi amaçlamaktadır. Meta-sezgisel yöntemlerden biri olan Genetik Algoritma temel alınarak geliştirilen bu yapı; seçim, çaprazlama, mutasyon ve uygunluk fonksiyonları gibi temel GA bileşenleri üzerinden modellenmiştir. Ayrıca farklı parametre yapılandırmaları denenmiş ve en uygun GA yapısı belirlenmiştir. Kullanılan veri seti, farklı havayolu şirketlerine ait yaklaşık 11.000 uçuş bilgisine dayanmaktadır. Uygulama sonuçları, Genetik Algoritmaların özellikle çok değişkenli ve doğrusal olmayan problemler karşısında klasik istatistiksel ve regresyon tabanlı modellere göre daha yüksek doğruluk sağladığını göstermektedir. Bu çalışma, yalnızca havacılık sektöründeki dinamik fiyatlandırma süreçlerine yenilikçi bir yaklaşım sunmakla kalmayıp, aynı zamanda Genetik Algoritmaların gerçek dünya problemlerine uygulanabilirliğini de ortaya koymaktadır. Elde edilen bulgular, bu yaklaşımın yalnızca uçak bileti fiyatlandırması ile sınırlı olmadığını, benzer optimizasyon gerektiren diğer sektörlerde de etkili bir çözüm yöntemi olabileceğini göstermektedir.

Anahtar Kelimeler: genetik algoritma, dinamik fiyatlandırma, uçak bileti, optimizasyon, yapay zekâ, meta-sezgisel yöntemler.

GİRİŞ

Bu çalışmada, uçak bilet fiyatlarının dinamik olarak optimize edilmesi amacıyla Genetik Algoritma tabanlı bir yapay zekâ modeli geliştirilmiştir. Model; uçuş zamanı, sınıfı, kalkış-varış şehirleri, aktarma sayısı gibi çeşitli parametreleri dikkate alarak en uygun bilet fiyatlarını belirlemeyi hedeflemektedir. Yaklaşık 11.000 uçuş bilgisinden oluşan veri setiyle yapılan uygulamalarda, metasezgisel algoritmalardan biri olan Genetik Algoritma'nın klasik yöntemlere göre daha yüksek doğruluk sağladığı ve karmaşık fiyatlandırma problemlerinde başarılı sonuçlar ürettiği görülmüştür. Bu çalışma, dinamik fiyatlandırma stratejileri kapsamında havacılık sektörü başta olmak üzere birçok alanda metasezgisel algoritmaların optimizasyon problemleri için etkili bir çözüm sunabileceğini ortaya koymaktadır. Metasezgisel algoritmalar, doğadan esinlenerek geliştirilen ve karmaşık optimizasyon problemlerine yaklaşık ama etkili çözümler üretebilen yöntemlerdir. Bu algoritmalar, problem alanı hakkında doğrudan bilgiye ihtiyaç duymadan, geniş çözüm uzaylarında yüksek başarı elde edebilmektedir. Genetik Algoritma, Parçacık Sürü Optimizasyonu ve Benzetilmiş Tavlama gibi algoritmalar bu gruba dahildir. Özellikle uçak bilet fiyatlandırması gibi çok kriterli, doğrusal olmayan yapılar içeren problemlerde, metasezgisel algoritmalar esneklik, uyarlanabilirlik ve performans açısından klasik yöntemlere göre üstünlük sağlamaktadır. Genetik algoritmalar, biyolojik evrim sürecinden ilham alınarak geliştirilmiş optimizasyon yöntemleridir. Her birey, çözüm önerisini temsil eden bir kromozom olarak modellenir ve bu kromozomlar belirli genlerden oluşur. Algoritmanın temel yapısı; seçme, çaprazlama ve mutasyon olmak üzere üç ana işlemden oluşur. Seçme aşamasında, uygunluk değeri yüksek olan bireyler yeni nesillere taşınır. Çaprazlama ile ebeveyn bireylerden yeni bireyler türetilir ve çeşitlilik sağlanır. Mutasyon işlemi ile bireylerin bazı genleri rastgele değiştirilerek yerel minimumlara takılma riski azaltılır. Bu süreç, hedeflenen başarıya ulaşılana kadar tekrar edilir. Genetik algoritmada, gen bireyin özelliklerini taşıyan temel birimdir ve genler, kromozomlar adı verilen diziler hâlinde bir araya gelir. Genotip, kromozomlarda bulunan gen topluluğunu; fenotip ise bu genlerin dışa vurmuş hâlini ifade eder. Alleller, genlerin alabileceği farklı değerlerdir ve genlerin yer aldığı konumlara lokus denir. Popülasyon, gen havuzundaki bireylerin tümünü temsil eder. Uygunluk fonksiyonu, bireylerin çevreye ne kadar uyumlu olduğunu ölçerken, seleksiyon süreci popülasyondan en uygun bireylerin seçilmesini sağlar; bu seçim, daha iyi çözümlerin çoğalmasını hedefler. Mutasyon ise genetik çeşitliliği artırmak ve algoritmanın yerel çözümlere takılmasını önlemek için bireylerde rastgele küçük değişiklikler yapılmasıdır. Bu kavramlar, genetik algoritmanın temel yapı taşlarını oluşturur ve optimizasyon problemlerinin çözümünde etkin biçimde kullanılır.

MATERYAL VE YÖNTEMLER

Genetik algoritmalar, biyolojik evrim süreçlerinden esinlenerek optimize çözümler üreten yöntemlerdir. Bu projede kromozomlar A (Airline_Score katsayısı), B (Duration_Minutes katsayısı), C (Stop_Count katsayısı) ve D (Info_Numeric katsayısı) genlerinden oluşmakta olup her kromozom bir aday çözümü temsil etmektedir. Kromozomlar genellikle 0-1 kodlama, permütasyon veya reel kodlama yöntemleriyle ifade edilir. 0-1 kodlama en yaygın yöntemdir ve çaprazlama ile mutasyon işlemlerine elverişlidir; ancak uzun kromozomlarda hesaplama ve hafıza açısından zorluk yaratabilir. Permütasyon kodlama, özellikle sıralama ve rotalama problemleri için uygundur. Reel kodlama ise gerçek değerlerle gösterim sağlar ve kısıtlı optimizasyon problemlerinde tercih edilir.

Popülasyon, çözüm adaylarından oluşan bir grup olarak tanımlanır ve bu projede büyüklüğü 1000 olarak belirlenmiştir. Küçük popülasyonlar hızlı çalışmakla beraber çeşitlilik azalır ve yerel minimuma takılma riski artar. Büyük popülasyonlar ise daha fazla çeşitlilik sağlar ve

küresel optimuma ulaşma şansını artırır ancak hesaplama maliyeti yükselir. Başlangıç popülasyonu rastgele oluşturulabilir veya sezgisel yöntemlerle desteklenerek daha kaliteli çözümlerle başlamak mümkündür. Bu projede sezgisel yöntemler kullanılarak oluşturulan kromozomlar, tamamen rastgele oluşturulanlara göre daha iyi sonuçlar vermiştir.

Ebeveyn kromozomların seçilmesinde elit seçim yöntemi tercih edilmiştir; burada en iyi uygunluk değerine sahip birkaç birey ebeveyn olarak seçilir ve böylece çözüme hızlı yakınsama sağlanır. Çaprazlama işlemi tek noktalı olarak gerçekleştirilir; belirlenen noktaya kadar genler bir ebeveynden, geri kalan genler diğer ebeveynden alınarak yeni çocuk kromozomlar oluşturulur. Mutasyon ise popülasyondaki genetik çeşitliliği korumak için uygulanır ve bu projede mutasyon oranı %20 olarak belirlenmiştir. Mutasyon, genellikle rastgele genlerin değiştirilmesi veya permütasyonda genlerin yer değiştirmesi şeklinde olur ve böylece algoritmanın yerel minimumda takılmasının önüne geçilir.

Yeni nesil, ebeveynlerden çaprazlama ve mutasyonla elde edilen çocukların uygunluk değerlerine göre mevcut popülasyondaki bireylerle karşılaştırılması sonucunda oluşturulur. Daha iyi uygunluk değerine sahip çocuklar popülasyona dahil edilir. Bu süreç, belirlenen nesil sayısına ya da durdurma kriterine ulaşılana kadar devam eder. Sonuç olarak, genetik algoritmalar karmaşık, çok boyutlu problemlerde küresel optima ulaşmayı hedefleyen etkili ve esnek metasezgisel yöntemlerdir.

SONUÇ

Modelin tahmin ettiği ve gerçek fiyatlar arasındaki ilişki, iki boyutlu bir saçılım grafiğiyle görselleştirilmiştir. X ekseni gerçek fiyatları, Y ekseni ise model tarafından tahmin edilen fiyatları göstermektedir. Kırmızı kesikli çizgi, tahminlerin ideal doğrulukta olduğu durumu temsil ederken, noktaların renkleri tahmin doğruluğunu yüzde cinsinden ifade etmektedir; sarı tonlar yüksek, mor tonlar ise düşük doğruluk aralıklarını belirtmektedir. Grafik, modelin özellikle düşük ve orta fiyat aralıklarında güçlü performans sergilediğini ve farklı fiyat seviyelerindeki tahmin dağılımını renk ve konum üzerinden bütüncül bir şekilde sunduğunu göstermektedir. Ayrıca, Genetik Algoritma'nın her nesilde elde ettiği en iyi bireyin fitness (RMSE) değerinin değişimi zamanla grafikte izlenmiştir. Bu grafik, algoritmanın ilk 500 nesilde hızlı bir şekilde hata değerini azalttığını, sonraki nesillerde ise daha yatay bir seyirle optimum çözüme yaklaştığını ortaya koymaktadır. Son nesilde yaklaşık RMSE = 3500 seviyelerine ulaşılması, modelin hatayı minimize etme yeteneğini göstermektedir.

ABSTRACT

In modern electricity distribution networks, power outages occur due to various factors such as meteorological events, aging grid infrastructure, and technical deficiencies. These outages lead to significant socioeconomic consequences such as disruption of industrial production, financial losses for businesses, and reduced quality of life for subscribers.

This study presents an advanced forecasting model that uses atmospheric and electrical system data to predict power outages in distribution circuits in Sivas Central District. Considering that power outages can lead to severe economic and social disruptions, the development of proactive forecasting systems has become increasingly critical. The proposed model uses a Long Short-Term Memory (LSTM), a recurrent neural network (RNN) optimized for time series forecasting, to capture complex temporal dependencies in outage patterns. By integrating meteorological variables such as temperature, wind speed, precipitation, and snow depth with power grid operational data, the model improves outage forecasting accuracy.

The dataset extends from 2020 to 2023 for training, while the 2024 data is reserved for testing. The model demonstrates robust performance by achieving a Mean Absolute Error (MAE) of 4.32 and an R^2 score of 0.42 in 24-hour outage forecasts. These metrics demonstrate that the LSTM-based approach can leverage historical trends and environmental factors to predict future outages. Additionally, the study explores the importance of features by finding that extreme weather conditions, particularly high wind speeds and heavy snowfall, significantly impact outage occurrences.

The findings provide practical insight for utility companies to optimize maintenance planning, prioritize resource allocation, and increase grid resilience. By leveraging predictive analytics, utilities can shift to predictable outage management, minimize outage duration, and increase service reliability. Future research directions include integrating real-time data streams and extending the model to regional-scale forecasts.

Giriş

Elektrik kesintileri, modern toplumların karşılaştığı en kritik altyapı sorunlarından biridir. Geleneksel istatistiksel yöntemler, zaman serisi verilerindeki karmaşık desenleri yakalamada yetersiz kalmaktadır (LeCun, Y., Bengio, Y., & Hinton, G., 2015). Uzun Kısa-Vadeli Bellek (LSTM) ağları, zaman serisi tahmin problemlerinde özellikle uzun vadeli alışkanlıkları modelleme yeteneğiyle öne çıkmaktadır (Hochreiter, S., & Schmidhuber, J., 1997). Bu çalışmada, elektrik arızalarının tahmini için LSTM ağlarının performansı detaylı olarak incelenmiştir. Model, 2020-2023 dönemi arıza kayıtları ve hava durumu verileri kullanılarak eğitilmiş, 2024 yılı verileri üzerinde test edilmiştir. Bu çalışma, derin öğrenme tekniklerini kullanarak elektrik kesintilerini öngörmeyi ve şu temel araştırma sorularını yanıtlamayı amaçlamaktadır:

a) Sivas ilindeki meteorolojik parametreler ile şebeke arızaları arasındaki ilişkiler nasıl modellenebilir?

b) LSTM ağları, bu tür kesintilerin tahmininde nasıl bir performans sergiler?

c) Tahmin modelleri kullanılarak operasyonel verimlilik nasıl artırılabilir?

Materyal ve Yöntem

Çalışmada 2020-2024 yılları arasında toplanan günlük elektrik arıza verileri kullanılmıştır. Veri seti günlük arıza sayıları, hava durumu parametreleri (sıcaklık, yağış, rüzgar hızı), şebeke tipi (havai/yeraltı) ve mevsimsel bilgileri içermektedir. Veri ön işleme adımları olarak eksik veriler medyan ile doldurulmuş, Yeo-Johnson dönüşümü uygulanmış 14 günlük zaman pencereleri oluşturulmuş, veriler eğitim (%80) ve test (%20) olarak ayrılmıştır.

Geliştirilen LSTM modeli iki katmandan oluşmaktadır: Birinci LSTM katmanı 64 nöron içermekte, ikinci LSTM katmanı ise 32 nöron içermektedir. Modelde aşırı öğrenmeyi önlemek için %20 oranında dropout katmanı eklenmiştir. Modelin çıktı katmanı tek nöronlu yoğun bir katmandır. Model TensorFlow / Keras kütüphanesi (Géron, A., 2019) kullanılarak Python'da geliştirilmiştir (Brownlee, J., 2018).

Tablo 1. Kullanılan kütüphaneler ve kullanım amaçları.

Kütüphane	Kullanım Amacı
Pandas, NumPy	Veri işleme, temizleme, özellik mühendisliği
Matplotlib, Seaborn	Veri görselleştirme, performans analizi
Scikit-learn	Veri ölçeklendirme, özellik seçimi, model değerlendirme
TensorFlow/Keras	Derin öğrenme modeli (LSTM)
Scipy (stats)	Veri normalizasyonu (Yeo-Johnson dönüşümü)
TimeSeriesSplit	Zaman serisi çapraz doğrulama
Mutual Info Regression	Özellik önem analizi

Modelin performansı RMSE, MAE, SMAPE ve R^2 metrikleri kullanılarak değerlendirilmiştir.

Ortalama Mutlak Hata (MAE), yön olmaksızın hataların ortalama mutlak büyüklüğünü hesaplayan yaygın bir ölçüdür. MAE aşağıdaki şekilde uygulanır:

$$MAE = \frac{1}{n}\sum_{i=1}^{n} |y_i - \hat{y}_i| \quad (1)$$

Burada y_i gerçek kesinti sayısı, $\hat{y}_i$ tahmin edilen kesinti sayısı ve n gözlem sayısıdır (Chai, T., Draxler, R. R., 2014). MAE sezgisel bir hata büyüklüğünü yakalar ve bu nedenle model doğruluğu açıklaması için tercih edilen bir ölçüdür.

Ortalama Karesel Hata (RMSE), kareleme işlemi nedeniyle daha büyük hataları daha küçük olanlardan daha fazla baskılayan başka bir performans ölçüsüdür. Şu şekilde uygulanır:

$$RMSE = \sqrt{\frac{1}{n}\sum_{i=1}^{n} (y_i - \hat{y}_i)^2} \quad (2)$$

RMSE, gerçek değerlerden daha büyük sapmaların daha büyük etkilere sahip olduğu durumlarda, örneğin son derece yüksek tahmin hatalarının operasyonel verimsizliklere yol açtığı elektrik kesintisi tahminlerinde özellikle yararlıdır (Botchkarev, A., 2019).

Ortalama Mutlak Yüzde Hatası (MAPE), hatayı gerçek değerin yüzdesi olarak temsil eder ve göreceli bir tahmin performansı sağlar ve şu şekilde uygulanır:

$$MAPE = \frac{1}{n}\sum_{i=1}^{n} \left|\frac{y_i - \hat{y}_i}{y_i}\right| x100\% \quad (3)$$

Bu metrik, özellikle değişen ölçeklere sahip veri kümeleri arasında model karşılaştırması için kullanışlıdır. Gerçek değerler sıfıra yaklaştığında sınırlıdır, çünkü küçük sayılara bölme yapay olarak yüksek hatalara yol açabilir (De Myttenaere, A., Golden, B., Le Grand, B., Rossi, F., 2016).

R kare (R^2) metriği, bağımlı değişkendeki varyansın model tarafından açıklanan oranını belirler. Şu şekilde hesaplanır:

$$R^2 = 1 - \frac{\frac{1}{n}\sum_{i=1}^{n} (y_i - \hat{y}_i)^2}{\frac{1}{n}\sum_{i=1}^{n} (y_i - \bar{y}_i)^2} \quad (4)$$

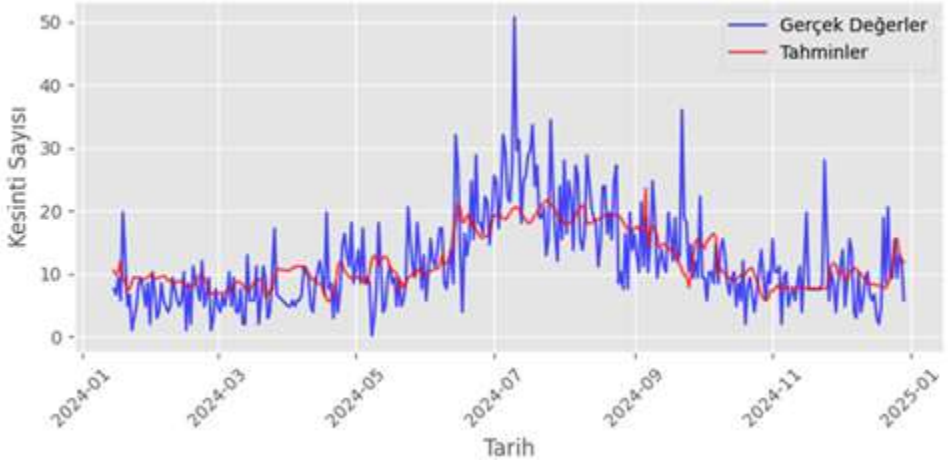
formülde $\bar{y}$ gerçek değerlerin ortalamasını temsil eder (Alexander, D. L., Tropsha, A., Winkler, D. A., 2015). 1'e yakın bir R^2, iyi tahmin yeteneğini gösterirken, 0'a yakın değerler modelin iyi bir tahminleme yapamadığını gösterir.

Bulgular ve Tartışma

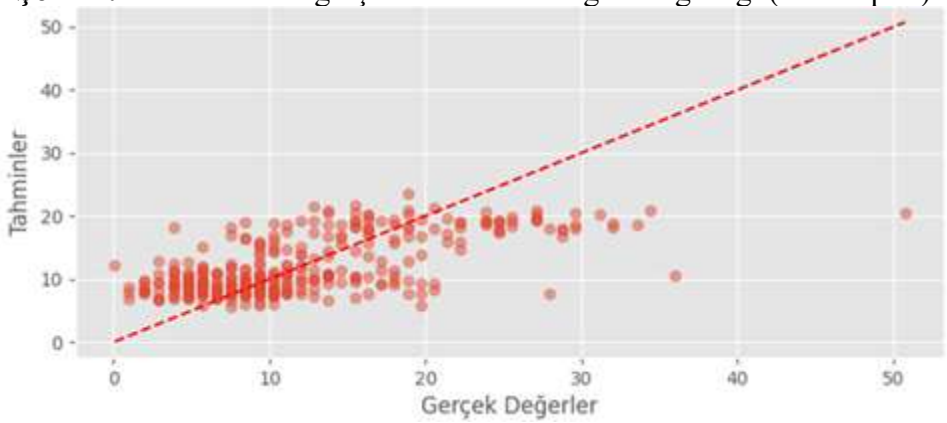
LSTM modeli test verisi üzerinde RMSE: 5.70, MAE: 4.32 ve SMAPE: %39.48 değerleriyle başarılı sonuçlar vermiştir. R^2 değeri 0.42 olarak hesaplanmıştır. Bu sonuçlar, modelin elektrik arızalarını tahmin etmede etkili olduğunu göstermektedir. LSTM ağlarının zaman serisi verilerindeki başarısı, uzun vadeli alışkanlıkları yakalama yeteneğiyle açıklanabilir (Hochreiter, S., & Schmidhuber, J., 1997).

Hata analizleri, yaz mevsiminde ortalama hataların 5.67 ile en yüksek seviyede olduğunu göstermiştir. Bu durum, yaz aylarındaki normal dışı hava olaylarının modelin tahmin kapasitesini zorladığını düşündürmektedir. Havai hatlarda arıza tahmin hataları, yeraltı hatlarına göre %25 daha fazla çıkmıştır. Bu sonuç, havai hatların hava koşullarından daha fazla etkilenmesiyle açıklanabilir. Tahminlerin %34.5'i "İyi" kategorisinde (hata oranı >%10 ve <%30) sınıflandırılırken, %12.7'si "Çok Kötü" kategorisinde (hata oranı >%100) yer almıştır. En büyük hatalar, ani ve şiddetli hava olaylarının yaşandığı günlerde gözlemlenmiştir.

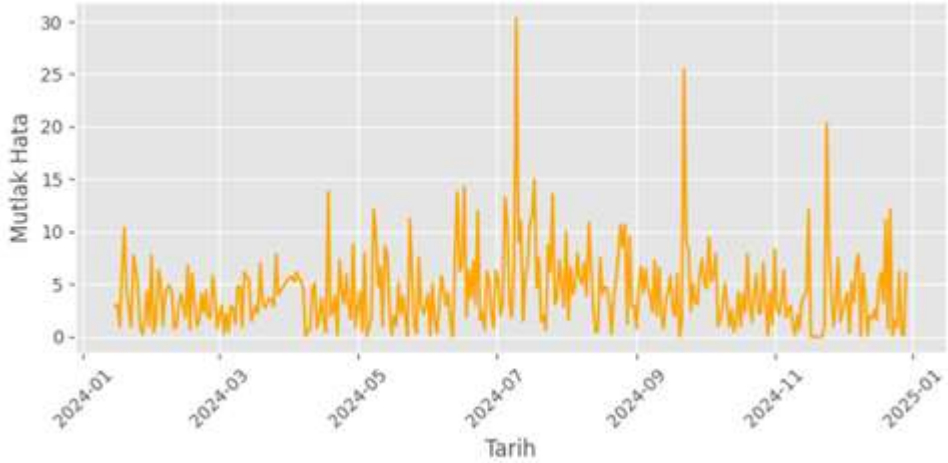
Şekil 1. LSTM modeli gerçek ve Tahmin değerleri grafiği (çizgi)



Şekil 2. LSTM modeli gerçek ve Tahmin değerleri grafiği (scatter plot)



Şekil 3. LSTM modeli hatanın zaman içinde değişim grafiği



Sonuç ve Öneriler

Bu çalışma, elektrik kesintilerinin meteorolojik ve şebeke faktörleriyle tahmin edilebileceğini göstermiştir. Mevsimsel faktörlerin, özellikle yaz aylarında model performansını önemli ölçüde etkilediği tespit edilmiştir. Havai hatların yeraltı hatlarına göre daha yüksek arıza oranları gösterdiği ve bu hatlardaki tahmin hatalarının daha fazla olduğu belirlenmiştir.

Gelecek çalışmalar için şu öneriler sunulabilir:

a) Gerçek zamanlı veri akışı sağlayan IoT sistemlerinin entegrasyonu,

b) Ekstrem hava olayları için özel modüller geliştirilmesi,

c) Daha uzun zaman aralıklarını kapsayan veri setlerinin kullanılması.

Bu iyileştirmeler, model performansını artırabilir ve daha güvenilir tahminler sağlayabilir.

ABSTRACT

Solar energy is one of the most important components in the global renewable energy landscape due to its sustainability and potential to reduce the impact of fossil fuels. Among the many renewable energy sources available, solar energy occupies an important place due to its advantages such as being clean, accessible, low environmental impact, easy to maintain and install. Solar panels can be easily deployed in many environments, from building rooftops to solar farms. Their high accessibility and benefits have increased their use in both rural and urban areas. The rapid increase in the number of solar installations and the growing global demand for electricity have made the efficiency and reliability of solar power generation important research topics. To address the challenges arising from the variability in solar power generation, this study introduces a web-based application tool that provides a comparative analysis of various machine learning algorithms for predicting real-world solar power generation. The algorithms used in the study are Linear Regression, Gradient Boosting, Random Forest, Decision Tree, K-Nearest Neighbour, Support Vector and XgBoost

Regressors. The developed web application tool allows users to upload their data set and select one of the above-mentioned machine learning algorithms to perform prediction. The web application includes prediction results, data statistics, exploratory data analysis, and presentation of a small sample of the data set. The application was developed by using the Flask framework, which provides a highly flexible and user-friendly interface. This forecasting tool can be used effectively in optimizing the planning and management of solar energy systems.

Keywords: Machine Learning, Data Analysis, Solar Power Plant, Web Application.

GÜNEŞ ENERJİSİ ÜRETİMİ TAHMİNİ İÇİN WEB TABANLI MAKİNE ÖĞRENİMİ UYGULAMASI

ÖZET

Güneş enerjisi, sürdürülebilirliği ve fosil yakıtların etkisini azaltma potansiyeli nedeniyle küresel yenilenebilir enerji kaynaklarının en önemli bileşenlerinden biridir. Mevcut birçok yenilenebilir enerji kaynağı arasında güneş enerjisi, temiz, erişilebilir, çevreye etkisi düşük, bakımı ve kurulumu kolay gibi avantajları nedeniyle önemli bir yer tutmaktadır. Güneş panelleri, bina çatılarından güneş enerjisi santrallerine kadar birçok ortamda kolayca kullanılabilir. Kolay erişilebilirliği ve faydaları hem kırsal hem de kentsel alanlarda kullanımını artırmıştır. Güneş enerjisi tesislerinin sayısındaki hızlı artış ve küresel elektrik talebinin artması, güneş enerjisi üretiminin verimliliği ve güvenilirliğini önemli araştırma konuları haline getirmiştir. Güneş enerjisi üretimindeki değişkenlikten kaynaklanan zorlukları ele almak için, bu çalışma, gerçek dünyadaki güneş enerjisi üretimini tahmin etmek için çeşitli makine öğrenimi algoritmalarının karşılaştırmalı analizini sağlayan web tabanlı bir uygulama aracı sunmaktadır. Çalışmada; Linear Regression, Gradient Boosting, Random Forest, Decision Tree, K-Nearest Neighbor, Support Vector Machine, XGBoost algoritmaları kullanılmıştır. Geliştirilen web uygulama aracı, kullanıcıların veri setlerini yüklemelerine ve tahmin yapmak için yukarıda belirtilen makine öğrenimi algoritmalarından birini seçmelerine olanak tanır. Web uygulaması, tahmin sonuçlarını, veri istatistiklerini, keşifsel veri analizini ve veri kümesinin küçük bir örneğinin sunumunu içerir. Uygulama, son derece esnek ve kullanıcı dostu bir arayüz sağlayan Flask kütüphanesini kullanarak geliştirilmiştir. Bu tahmin aracı, güneş enerjisi sistemlerinin planlaması ve yönetiminin optimizasyonunda etkili bir şekilde kullanılabilir.

Anahtar Kelimeler: Makine Öğrenimi, Veri Analizi, Güneş Enerjisi Santrali, Web Uygulaması.

Giriş

Yenilenebilir bir enerji kaynağı olan güneş enerjisi; temiz olması, erişilebilirliği, düşük çevresel etkisi, kolay kurulum ve bakım gibi avantajları sayesinde önemli bir yer almaktadır. Gelişen teknoloji ile birlikte üretim verimliliği de artmaktadır. Fakat güneş enerjisi üretimi sıcaklık, ışınım, rüzgâr ve nem gibi iklim verilerinden etkilenmektedir. Bu iklim verilerinin doğru analiz edilmesi, güneş enerjisi üretiminin daha sağlıklı tahmin edilmesini ve enerji yönetiminin daha etkin planlanmasını sağlamaktadır. Güneş enerjisi üretimini tahmin etmeye yönelik çalışmalar, son yıllarda özellikle yapay zekâ gibi veri yaklaşımları ile hız kazanmıştır. Bu yöntemler, geçmiş üretim verileri ve iklim verileri kullanılarak gelecekteki üretim miktarlarını büyük bir doğrulukla öngörebilmeyi sağlamaktadır. Literatürdeki çalışmalar, makine öğrenmesi ve derin öğrenme gibi yapılardan faydalanılarak üretim tahminlemenin doğru ve güvenilir olarak yapılabileceğini göstermiştir.

Bu çalışmada, Kahramanmaraş ilinde bulunan İbrahim Taşyurdu GES'in 2019-2022 yılları arasındaki üretim verileri kullanılarak üretim tahminlemesi yapan ve web ara yüzüne sahip bir uygulama gerçekleştirilmiştir. Linear Regression, Gradient Boosting, Random Forest, Decision Tree, K-Nearest Neighbor, Support Vector Machine, XGBoost algoritmaları kullanılarak tahmin çalışmaları daha hızlı ve güvenilir hâle gelmiştir. Çalışmada kullanılan ara yüz ise kullanıcı dostu, kolay entegrasyon ve mobil uyumluluğu gibi özelliklerinden dolayı Flask kütüphanesi ile geliştirilmiştir.

Literatür Taraması

Bu bölümde güneş enerjisi üretimi tahminlemede literatürde yapılan çeşitli çalışmalar gözden geçirilmiş ve özetlenmiştir.

Çetin ve Işık tarafından yapılan çalışmada, Türkiye'nin farklı şehirlerinde bulunan güneş enerji santrallerine ait aylık üretim verileri kullanılarak LSTM tabanlı bir tahmin modeli geliştirilmiştir. Modelde, güneşlenme süresi, panel tipi ve inverter özellikleri gibi faktörler dikkate alınmıştır. Dokuz farklı şehirden elde edilen toplam 708 veri ile eğitilen modelin hata oranlarının %1 ile %17 arasında değiştiği gözlemlenmiştir. Özellikle yaz mevsiminde daha düşük hata oranları elde edilmiştir. Bu bulgular, LSTM gibi derin öğrenme modellerinin güneş enerjisi santrallerinin aylık üretim tahmininde etkili ve güvenilir bir yöntem olduğunu göstermektedir (Çetin & Isık, 2022).

Nkuriyingoma ve Selçuklu tarafından gerçekleştirilen çalışmada ise kısa ve orta vadeli güneş enerjisi üretim tahmini konusu ele alınmış ve bu kapsamda yeni bir yapay sinir ağı modeli önerilmiştir. Modelde, küresel güneş radyasyonu, sıcaklık, bağıl nem, rüzgâr ve yağış gibi çeşitli iklimsel değişkenlerin etkisi analiz edilmiştir. Çalışmada Türkiye'ye ait belirli bir bölgenin geçmiş iklimsel verileri kullanılmıştır. Eksik verilerin uygun yöntemlerle tamamlanmasının model performansını artırdığı vurgulanmıştır. Modelin doğruluğu, hata analizleri ve başarı oranları üzerinden değerlendirilmiş; en uygun değişken kombinasyonlarıyla yüksek doğruluk seviyelerine ulaşılmıştır. Bu kapsamda, yeni bir modelinin güneş enerjisi üretim tahmini açısından etkili bir yaklaşım sunduğu ortaya konmuştur (Nkurıyıngoma & Selçuklu, 2021).

Uz ve arkadaşları, Bakırçay Üniversitesi kampüsünde bulunan 400 kW gücündeki güneş enerjisi santralinin aylık elektrik üretimini, İzmir iline ait iklimsel veriler kullanarak Yapay Sinir Ağı (YSA) ile tahmin etmeyi amaçlamıştır. Çalışmada girdi değişkenleri olarak aylık ortalama güneşlenme süresi, ortam sıcaklığı, bulutlu gün sayısı ve ortalama güneş ışınımı kullanılmış; çıktı olarak ise santralden elde edilen aylık elektrik üretim değerleri alınmıştır. Model performansı, %95,33 doğruluk oranı ve %4,67 hata oranı ile değerlendirilmiştir. Elde

edilen bulgular, iklimsel veriler kullanılarak geliştirilen YSA modelleri ile güneş enerjisi üretiminin yüksek doğrulukla tahmin edilebileceğini göstermektedir (Uz, Özdemir, & Özmen, 2022).

Altıparmak ve Aksu tarafından yürütülen bir diğer çalışmada da Türkiye'nin kurulu elektrik kapasitesi üzerine tahminler yapılmış ve GRU, CNN ve LSTM modelleri karşılaştırılmıştır. Bu çalışmada da test sürecinde GRU modeli, en düşük RMSE değerini elde ederek en başarılı model olarak öne çıkmıştır. Eğitim sürecinde yüksek başarı elde eden CNN modeli, test aşamasında ise GRU modeline kıyasla daha yüksek hata değerleri üretmiştir. Tüm modeller, 2030 yılına kadar elektrik kapasitesinde artış görüleceği yönünde tahminleme yapmışlardır (Altıparmak & Aksu, 2024).

Yavuz ve Botsalı, Konya bölgesindeki güneş enerjisi santrallerine ait elektrik üretim miktarlarını hava durumu verileri kullanarak tahmin etmeyi amaçlamıştır. Çalışmada kullanılan YSA modelleri; güneş ışınımı, nem, saat ve ay gibi meteorolojik parametreleri girdi olarak almıştır. Veri seti, 24 güneş enerjisi santraline ait bir yıllık saatlik elektrik üretim verileri ile yerel hava durumu verilerinden oluşmaktadır. Modellerin performansı ortalama hata oranı ile değerlendirilmiş ve en başarılı modelin %4,94 hata oranı ile oldukça yüksek doğrulukla tahmin yaptığı belirlenmiştir. Elde edilen bulgular, hava durumu verilerinin kullanılmasıyla güneş enerjisi üretiminin etkin biçimde tahmin edilebileceğini göstermektedir (Yavuz & Botsalı, 2022).

Materyal ve Metot

Bu bölümde, kullanılan veri seti ve makine öğrenmesi algoritmaları özetlenmiştir. Deneysel çalışmalarda kullanılan metrikler hakkında bilgi verilmiştir.

Veri Seti

Bu çalışmada Kahramanmaraş ilinde bulunan İbrahim Taşyurdu GES'e ait üretim verisi kullanılmıştır. Kahramanmaraş ili, Pazarcık ilçesi, Memişkahya Mahallesi 906 ada, 3 parsel içerisinde işletme çatısı üzerinde bulunan 469,2 kWe kurulu gücündeki (İbrahim Taşyurdu GES) güneş enerjisi santrali baz alınmıştır.

Elde edilen veri seti 2 sütun ve 35055 satırdan oluşmakta olup ilk sütunu üretim tarihi ikinci sütun ise üretilen elektrik miktarını göstermektedir. 01.01.2019 tarihinden başlayarak 31.12.222 tarihine kadar devam eden 4 yıllık günlük üretim verileri gerçek GES verisi olması sebebiyle yapılan çalışmanın önemini daha çok ortaya koymaktadır. Şekil 1'de veri setindeki 1 günlük üretim örneği sunulmuştur.

Şekil 4. Kullanılan Üretim Verisi Örneği

Makine Öğrenmesi Modelleri

Makine öğrenmesi algoritmaları ile geçmiş verilerden öğrenilenlere dayanarak ve bu verilerden elde edilenleri yeni verilere uygulayarak tahminlerin sağlanması amaçlanmıştır. Bu çalışmada makine öğrenmesinde kullanılan yedi algoritma aşağıda açıklanmıştır.

Linear Regression (LR): Bu yöntem, bağımlı değişken ve bağımsız değişken arasında neden-sonuç ilişkisi ile bağımlı değişkenin bağımsız değişkenlerle bağıntı kurmasını sağlayarak tahmin yapmayı amaçlamaktadır. (Korkmaz, Dogan, & Kırmacı, 2022).

Gradient Boosting (GB): zayıf öğrenicileri güçlü öğrenicilere çevirme mantığı ile çalışan bir yöntemdir. Zayıf öğreniciler genellikle karar ağaçlarıdır. Bu algoritmada önceki ağacın hataları en aza indirgenerek bir sonraki ağaç oluşturulur (Yeşilyurt & Dalkılıç, 2021).

Random Forest (RF): topluluk öğrenme yöntemine dayanan ve birden fazla karar ağacını birleştirerek çalışan güçlü bir makine öğrenmesi algoritmasıdır. Aşırı uyumu azaltması ve dengesiz verilerle etkili şekilde başa çıkabilmesi sayesinde hem sınıflandırma hem de regresyon görevlerinde sıkça kullanılır (Doğanlı, 2025).

Decision Tree (DT): regresyon ağacını ve sınıflama ağacını bir arada tutan bir algoritmaya sahiptir. Bu algoritma, veri setini alt örneklemlere ayırmaktadır. Düğümler ve dallardan oluşan karar ağacı diyagramlarını görsel olarak sunabilmektedir (Özkan, Parim, & Çene, 2023).

XGBoost (XGB): Gradient boosting algoritmasının geliştirilmesiyle oluşturulmuştur. Yüksek tahmin gücü, aşırı öğrenmenin önüne geçebilmesi, hızlı olması gibi sebeplerden dolayı avantajlı bir yöntem sunmaktadır (Yeşilyurt & Dalkılıç, 2021).

K-Nearest Neighbor (KNN): Bu algoritma, “bir örneğin sonucu kendisine en yakın komşu örneklerin sonucu ile aynı olur” fikrini esas alarak regresyon problemleri için kullanılan bir makine öğrenmesi algoritmasıdır (Altunkaynak, Başakın, & Kartal, 2020).

Support Vector Regression (SVR): SVR regresyon algoritması, kernel tabanlı sınıflandırma algoritmasıdır. SVRler, veri noktalarını sınıflandırmak ve tahmin etmek için düzlemde bir çizgi ile eğri bulmaktadır (Akı & Akal, 2023).

Metrikler

Model değerlendirmesinde kullanılan MAE (Bulut & Milli, 2016), MSE, RSME (Diker & Aslan, 2022) ve R^2 (Ertürk, Kara, Akkuş, & Genç, 2023) gibi hata metrikleri aşağıda açıklanmıştır. Denklem 1-4 arasındaki formüllerde, y_i gerçek değeri, $\widetilde{y_i}$ tahmin edilen değeri, $\overline{y_i}$ gerçek değerlerin ortalamasını ve n gözlem sayısını ifade etmektedir.

Mean Absolute Error (MAE): hataların mutlak değerlerinin ortalaması ile bulunmaktadır. Denklem 1'de formülü verilmiştir.

$$MAE = \frac{1}{n}\sum_{i=1}^{n} | y_i - \widetilde{y_i} | \quad (1)$$

Mean Squared Error (MSE): tahmin hatalarının karelerinin toplanarak elde edilen değerin n (gözlem sayısı) sayısına bölünmesiyle bulunmaktadır. Denklem 2'de formülü verilmiştir.

$$MSE = \frac{1}{n}\sum_{i=1}^{n} (y_i - \widetilde{y_i})^2 \quad (2)$$

Root Mean Square Error (RMSE): tahmin hatalarının karelerinin toplanarak değerin n (gözlem sayısı) sayısına bölünmesi ve çıkan sonucun karekökünün alınmasıyla bulunmaktadır. Denklem 3'de formülü verilmiştir.

$$RMSE = \sqrt{\frac{\sum_{i=1}^{n}(y_i - \widetilde{y_i})^2}{n}} \quad (3)$$

R-Squared (R^2): Modellerin performansını tahmin etmek için kullanılmaktadır. R^2 değeri 0 ile 1 arasında değer almaktadır. Değer 1'e yakın olması modelin doğruluğunun yüksek olduğu anlamına gelmektedir. Denklem 4'de ilgili formül verilmiştir.

$$R^2 = 1 - \frac{\sum_{i=1}^{n}(y_i - \widetilde{y_i})^2}{\sum_{i=1}^{n}(y_i - \overline{y_i})^2} \quad (4)$$

Bulgular ve Tartışma

Bu bölümde çalışma kapsamında elde edilen sonuçlar sunulmuş ve değerlendirmelerde bulunulmuştur.

Makine Öğrenmesi Algoritmalarının Karşılaştırılması

Bu çalışma kapsamında seçilen makine öğrenmesi modellerinin mevcut veri seti üzerindeki performanslarının karşılaştırılması aşağıdaki Tablo 1'te verilmiştir. Bu kapsamda LR, GB, RF, DT, KNN, SVR, XGB makine öğrenmesi algoritmaları ve MAE, RMSE, MSE, R^2 metrikleri ele alınmıştır. Elde edilen deneysel sonuçlara göre en yüksek R^2 sonucu GB algoritmasında gözlemlenmiştir.

Şekil 2. Arayüz Tasarımı

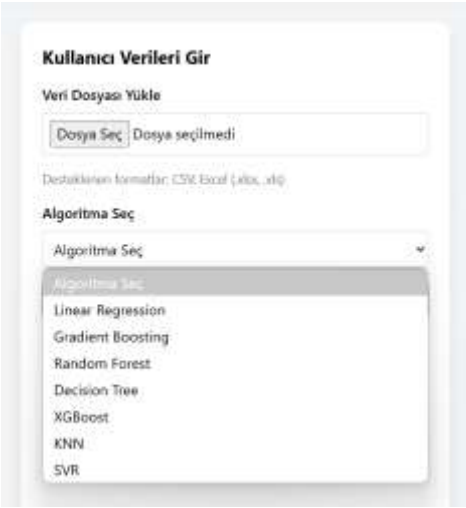
Tablo 1. Makine Öğrenmesi Modellerinin Performans Karşılaştırması

Algoritmalar	MAE	RMSE	MSE	R^2
GB	13.55	26.30	691.90	0.9583
XGB	15.05	26.80	718.38	0.9567
SVR	16.49	26.92	724.53	0.9563
KNN	13.34	28.32	802.19	0.9516
RF	13.83	28.59	817.27	0.9507
LR	20.95	32.31	1043.88	0.9370
DT	15.16	33.03	1090.78	0.9342

Geliştirilen Makine Öğrenmesi Web Uygulaması

Bu çalışmada, güneş enerjisi üretiminin tahminlemesi için geliştirilmiş web tabanlı bir makine öğrenmesi uygulaması sunulmaktadır. Şekil 2'de ara yüzü gösterilen uygulama, Python programlama dili ve Flask web çerçevesi kullanılarak geliştirilmiştir. Sistem, yedi farklı makine öğrenmesi algoritmasını içermektedir. Şekil 3'de gösterildiği üzere uygulama, veri setlerinin CSV veya Excel (.xlsx, .xls) formatlarında yüklenmesine olanak sağlamakta ve kullanıcıların tercih ettikleri makine öğrenmesi algoritmasını seçerek tahminleme işlemini gerçekleştirmelerine imkân tanımaktadır.

Sistemin ilk aşamasında, yüklenen veri setinin temel istatistiksel analizleri gerçekleştirilmekte ve kullanıcıya sunulmaktadır. Bu süreçte veri setinin minimum, maksimum ve ortalama



Şekil 3. Veri ve Algoritma Seçimi

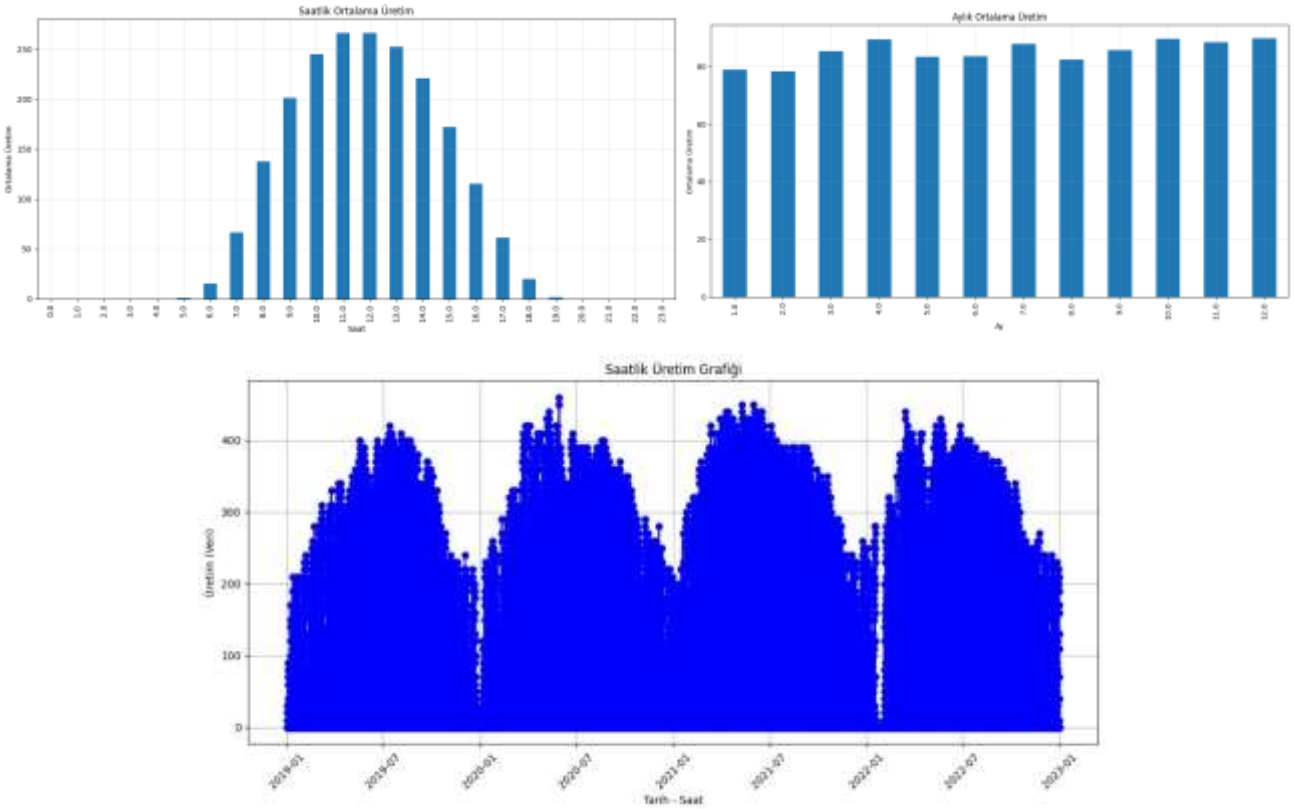
değerleri hesaplanarak veri seti hakkında bilgi verilmektedir. Sistemin ikinci aşamasında, keşifsel veri analizi (EDA) gerçekleştirilmektedir. Geliştirilen sistemde, veri analizi süreci öncelikle temel istatistiksel göstergelerin incelenmesiyle başlamaktadır. Aşağıda Tablo 2'de veri setine ilişkin temel istatistiksel özetleme sunulmuştur.

Tablo 2. Temel İstatistikler

İstatistik	Üretim (Veri)
Count	35055.00
Mean	85.10
Std	123.88
Min	0.00
25%	0.00
50%	0.00
75%	160.00
Max	460.00

Şekil 4'te gösterildiği gibi güneş enerjisi üretiminin saatlik ve aylık ortalamaları hesaplanmakta ve çubuk grafikleri ile görselleştirilmektedir. Saatlik analiz, güneş enerjisi üretiminin gün içindeki değişimini gösterirken, aylık analiz mevsimsel değişimleri ortaya çıkarmaktadır. Bu analizler, güneş enerjisi üretimindeki mevsimsel etkileri anlama konusunda önemli bilgiler sağlamaktadır. Özellikle saatlik ortalama üretim grafiği, güneş ışınımının gün içindeki değişimini ve üretim saatlerini net bir şekilde göstermektedir.

Ardından, güneş enerjisi üretim verilerinin dağılımını anlamak için Şekil 5'de gösterildiği gibi üretim-zaman grafiği oluşturulmaktadır.

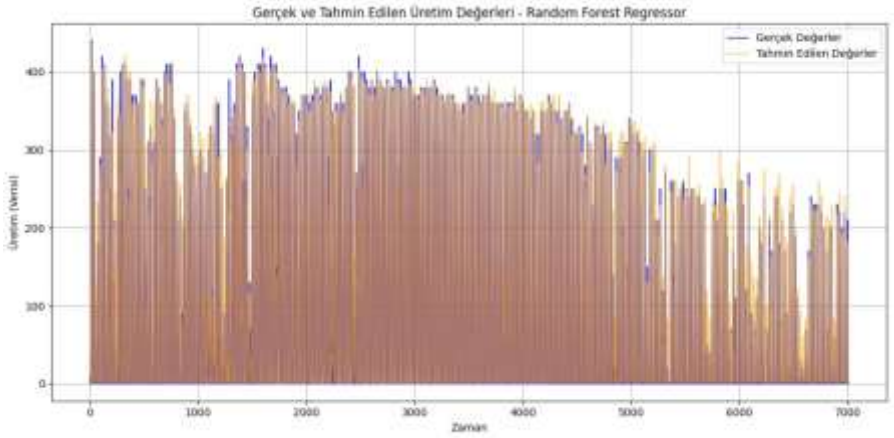


Şekil 5. Üretim-Zaman Grafiği

Şekil 6'da gösterildiği üzere, sistemin en alt bölümünde, kullanıcının veri setini doğrudan inceleyebilmesi için tablo içinde veri setinin ilk 100 satırı sunulmaktadır. Tabloda her bir satır sıralanmış olarak tarih ve üretim değerlerini içermektedir. Ayrıca tablonun üst kısmında veri setinin toplam satır sayısı, sütun sayısı ve dosya adı gibi özet bilgiler de yer almaktadır.

Şekil 6. Üretim-Zaman Grafiği

Geliştirilen sistemin sonuç bölümünde, seçilen makine öğrenmesi algoritmasının performans değerlendirmesi detaylı bir şekilde sunulmaktadır. Her bir model için MAE, MSE, RMSE ve R^2 performans metriği hesaplanmakta ve kullanıcıya gösterilmektedir. Ayrıca sistem bir karşılaştırma grafiği sunmaktadır. Bu grafikte, gerçek üretim değerleri ve modelin tahmin ettiği değerler zaman serisi boyunca görselleştirilmektedir. Grafik üzerinde mavi çizgi gerçek değerleri, turuncu çizgi ise tahmin edilen değerleri temsil etmektedir. Aşağıdaki Şekil 7'de örnek karşılaştırma grafiği verilmiştir.



Şekil 7. Gerçek ve Tahmin Edilen Üretim Değerlerinin Zaman Serisi Analizi

Sonuç ve Öneriler

Geliştirilen web tabanlı güneş enerjisi tahminleme sisteminde, yedi farklı makine öğrenmesi algoritması başarıyla uygulanmıştır. Gerçek saha koşullarından elde edilen veri seti üzerinde analizler ve testler yapılmıştır. Bu çalışmada farklı makine öğrenimi algoritmalarının regresyon performansları karşılaştırılmış ve GB, en düşük mutlak hata değeri olan 13.55 ve en yüksek determinasyon katsayısı olan 0.9583 ile en başarılı model olmuştur. Bunu, 0.9567 doğruluk oranıyla XGB ve 0.9563 doğruluk oranıyla SVR algoritmaları izlemiştir. Ayrıca KNN algoritması da 13.34 mutlak hata ve 0.9516 doğruluk oranı ile başarılı sonuçlar üretmiştir. Öte yandan RF ve LR modelleri daha yüksek hata değerleriyle daha sınırlı doğruluk sağlamıştır. DT ise 0.9342 doğruluk oranı ile kabul edilebilir bir performans sunmasına rağmen hata oranlarının diğer modellere göre daha yüksek olduğu gözlemlenmiştir. Doğruluk oranlarının geliştirilmesi için hava durumu verilerinin de eklenmesi gelecek çalışması olarak düşünülmektedir. Bu iyileştirmeler, tahmin doğruluğunu artırarak güneş enerjisi santrallerinin daha verimli yönetilmesine katkı sağlayacaktır.

Teşekkür ve Bilgi Notu

Bu çalışma kapsamında üretim verilerini paylaşarak çalışmaya katkı sağlayan Kahramanmaraş ilinde bulunan İbrahim Taşyurdu Güneş Enerji Santrali'ne teşekkür ederiz. Sağlanan veriler, analiz ve modelleme süreçlerinde önemli katkı sağlamıştır.

ABSTRACT

Solar energy is an environmentally friendly, renewable, and sustainable energy source, and therefore it holds great importance in modern energy systems. Cost-effectiveness and efficiency have been significantly increased its popularity. Developments in solar panel technologies have also increased the need to reduce carbon emissions, and the growing global awareness of climate change has accelerated the adaptation of solar energy. However, effective and reliable solar energy systems are often affected by unpredictable factors and various dynamics. Daily and seasonal weather changes, cloud cover, atmospheric particles, and dust accumulation conditions lead to various sudden changes in energy generation. Especially, sudden and sharp drops in solar energy generation disrupt the balance between energy supply and demand. This carries a significant risk of affecting the stability of the grid and the overall reliability in renewable energy infrastructures. These unexpected interruptions result from combinations of various factors, both technical and environmental. For example, sudden climate changes such as extreme cloud movements or thunderstorms can reduce the solar irradiance within minutes.

Similarly, system-level errors such as surface contamination on panels, shadows from nearby objects, or inverter failures can cause energy generation anomalies. The detection of such events contributes to the development of an effective control and management strategy. The main purpose of this study is to detect sudden drops in solar energy production using statistical and deep learning-based approaches. A comprehensive analysis has been carried out using photovoltaic system data collected from solar power plant. Detection of outlier data instances have been carried out with various models to detect potential system anomalies. The promising results obtained show that these methods can detect critical changes in energy outputs. Finally, the findings reveal significant contributions to the development of early warning systems, improvement of grid stability, and enhancement of the reliability of the solar energy infrastructure.

Keywords: Solar energy, Ramp-down events, Anomaly detection, Deep learning.

GÜNEŞ ENERJİSİ ÜRETİM VERİLERİNDE ANİ DÜŞÜŞ OLAYLARININ TESPİTİ

ÖZET

Güneş enerjisi, çevre dostu, yenilenebilir ve sürdürülebilir bir enerji kaynağı olduğu için modern enerji sistemlerinde büyük öneme sahiptir. Maliyet etkinliği ve verimliliği, popülerliğini önemli ölçüde artırmıştır. Güneş paneli teknolojilerindeki gelişmeler de karbon emisyonlarının azaltılması ihtiyacını artırmış ve iklim değişikliğine ilişkin küresel farkındalığın artması, güneş enerjisinin benimsenmesini hızlandırmıştır. Ancak, etkili ve güvenilir güneş enerjisi sistemleri genellikle öngörülemeyen faktörlerden ve çeşitli dinamiklerden etkilenmektedir. Günlük ve mevsimsel hava değişiklikleri, bulut örtüsü, atmosferik partiküller ve toz birikimi gibi durumlar, enerji üretiminde çeşitli ani değişikliklere yol açmaktadır. Özellikle, güneş enerjisi üretimindeki ani ve keskin düşüşler, enerji arzı ve talebi arasındaki dengeyi bozmaktadır. Bu durum, şebekenin istikrarını ve yenilenebilir enerji altyapılarının genel güvenilirliğini önemli ölçüde etkileme riski taşımaktadır. Beklenmedik kesintiler hem teknik hem de çevresel çeşitli faktörlerin birleşiminden kaynaklanmaktadır. Örneğin, aşırı bulut hareketleri veya fırtınalar gibi ani iklim değişiklikleri, güneş ışınımını dakikalar içinde azaltabilir. Benzer şekilde, panellerin yüzeyindeki kirlenme, yakındaki nesnelerin gölgeleri veya invertör arızaları gibi sistem düzeyindeki hatalar da enerji üretiminde anormalliklere neden olabilir. Bu tür olayların tespiti, etkili bir kontrol ve yönetim stratejisinin geliştirilmesine katkıda bulunur. Bu çalışmanın temel amacı, istatistiksel ve derin öğrenme tabanlı yaklaşımlar kullanarak güneş enerjisi üretimindeki ani düşüşleri tespit etmektir. Güneş enerjisi santralinden toplanan fotovoltaik sistem verileri kullanılarak kapsamlı bir analiz gerçekleştirilmiştir. Potansiyel sistem anormalliklerini tespit etmek için çeşitli modeller kullanılarak aykırı veri örneklerinin tespiti yapılmıştır. Elde edilen umut verici sonuçlar, bu yöntemlerin enerji çıkışlarındaki kritik değişiklikleri tespit edebildiğini göstermektedir. Son olarak, bulgular erken uyarı sistemlerinin geliştirilmesine, şebeke kararlılığının iyileştirilmesine ve güneş enerjisi altyapısının güvenilirliğinin artırılmasına önemli katkılar sağladığını ortaya koymaktadır.

Anahtar Kelimeler: Güneş enerjisi, Ani düşüş olayları, Anomali tespiti, Derin öğrenme.

Giriş

Güneş enerjisi, çevresel etkileri en az olan yenilenebilir ve sürdürülebilir bir enerji kaynağı olarak modern enerji sisteminde önemi zamanla artmıştır. Hem maliyet etkinliği hem de teknolojik gelişmeler güneş enerjisinin yaygınlaşmasını hızlandırmıştır. Fakat güneş enerjisi üretimi, doğası gereği iklim koşullarına ve çevresel faktörlere bağlı olarak değişkenlik göstermektedir. Bu durum enerji arzının istikrarını zorlaştırmaktadır. Ani enerji üretim düşüşleri, enerji arz-talep dengesini bozarak şebeke stabilitesi üzerinde olumsuz etkiler oluşturmakta, bu da yenilenebilir enerji sistemlerinin güvenilirliğini azaltmaktadır. Bu tür ani düşüşlerin nedenleri hem iklimsel değişiklikler hem de sistemsel arızalar örneğin panel yüzeyindeki kirlenme, gölgeleme gibi çeşitli faktörlere dayanmaktadır. Bu karmaşık ve çok değişken yapıya sahip sistemlerde, geleneksel istatistiksel yöntemler sınırlı kalabilmekte bu nedenle daha esnek ve yüksek doğruluklu modeller gerekmektedir. Derin öğrenme, büyük veri setlerinden karmaşık örüntüleri ve ilişkileri otomatik olarak öğrenme yeteneği sayesinde, güneş enerjisi üretimindeki ani ve beklenmedik değişikliklerin tespitinde etkili bir yaklaşım göstermektedir. Özellikle de zaman serisi verilerindeki dalgalanmaları ve anormallikleri algılayabilen derin öğrenme modelleri, enerji üretim sistemlerindeki kritik değişikliklerin erken fark edilmesini sağlamaktadır. Bu çalışmada güneş enerjisi üretimindeki ani düşüşlerin tespiti için derin öğrenme tabanlı yaklaşımlar kullanılarak kapsamlı bir analiz gerçekleştirilmiştir. Fotovoltaik sistemden toplanan veriler üzerinde yapılan deneyler, bu yöntemlerin enerji üretimindeki kritik anormallikleri başarılı şekilde tespit edebileceğini göstermiştir. Elde edilen bulgular, erken uyarı sistemlerinin geliştirilmesi, şebeke stabilitesinin artırılması ve güneş enerjisi altyapısının güvenilirliğinin iyileştirilmesi yönünde önemli katkılar sağlamaktadır.

Literatür Taraması

Bu bölümde literatürdeki ani düşüş ve anomali tespiti yapan çalışmalar incelenmiş ve özetlenmiştir.

Yarat ve Orman'ın yaptığı çalışmada, akıllı sayaçlardan elde edilen 8 yıllık aylık elektrik tüketim verileri kullanılarak anomali tespiti ve tüketim tahmini gerçekleştirilmiştir. Anomali tespiti için Isolation Forest (IF), Local Outlier Factor (LOF) ve FbProphet algoritmaları uygulanmış; tüketim tahmini için ise FbProphet ve XGBoost algoritmaları karşılaştırılmıştır. Verisetinde 25 farklı sayaç yer almakta ve her biri için 102 aylık veri kullanılmıştır. Anomali tespitinde IF algoritması ortalama %16.9, LOF %7.3 ve FbProphet %6.3 oranında anomali belirlemiştir. Tahminleme sonuçlarında ise FbProphet algoritması ortalama %8.37 MAPE değeriyle, XGBoost'un %11.10 MAPE değerine göre daha başarılı sonuç vermiştir (Yarat & Orman, 2023).

Olcay ve arkadaşları bu çalışmada, çevresel faktörler ve panel kirliliğinin güneş enerji santrallerindeki üretim kaybına etkisini analiz etmiştir. Türkiye'nin Kütahya ilinden alınan 180 kWe gücünde çalışan bir santralden 416 gün boyunca toplanan yaklaşık 120.000 saatlik veri kullanılmıştır. Tahmin ve analiz sürecinde iki farklı algoritma kullanılmıştır: Random Forest (RF) regresyon modeli ve Long Short-Term Memory (LSTM) yapay sinir ağı. Çalışmanın sonuçlarına göre RF algoritması %81 doğruluk oranı (R=0.8111) ve RMSE=0.5865 ile tahmin yaparken, LSTM algoritması %97 doğruluk oranı (R=0.9759) ve RMSE=0.2183 ile çok daha başarılı sonuçlar vermiştir (Olcay, Tunca, & Özgür, 2024).

Çetin ve Işık'ın çalışmasında, Humartaş Enerji firmasına ait güneş enerjisi santrallerinden elde edilen yaklaşık 1000 aylık veriyle, LSTM yöntemi kullanılarak bir sonraki ayın elektrik üretimi tahmin edilmiştir. Tahminlerde güneşlenme süresi, hava durumu, panel ve inverter gücü, santral yaşı gibi değişkenler dikkate alınmıştır. LSTM modeli, ocak ayında yaklaşık %13 hata oranı

üretmiş, Mayıs ayında bu oran %1'e kadar düşmüştür. Genel hata oranı %1 ile %15 arasında değişmiştir. Bu sonuç, yöntemin mevsimsel farklılıklara rağmen yüksek doğrulukla çalıştığını ve aylık üretim miktarlarının önceden güvenilir şekilde tahmin edilebildiğini göstermektedir (Çetin & Isık, 2021).

Lim ve arkadaşlarının yaptığı çalışmada, çevresel sensörlere ihtiyaç duymadan sadece geçmiş üretim verileriyle güneş enerjisi tahmini yapan bir CNN-LSTM hibrit model geliştirilmiştir. CNN modeli hava durumunu (güneşli/bulutlu) sınıflandırmış, LSTM ise bu sınıflamaya göre güç üretimini tahmin etmiştir. Veriler, Güney Kore Busan'daki bir güneş enerjisi santralinden 10 Eylül 2019 ile 22 Temmuz 2021 tarihleri arasında toplanmış ve analiz edilmiştir. Elde edilen sonuçlara göre model, güneşli günlerde %4.58 MAPE ve bulutlu günlerde %7.06 MAPE ile oldukça başarılı tahminler yapmıştır. Diğer metriklerde de model yüksek doğruluk göstermiştir: güneşli günlerde MAE 34.00, RMSE 43.87 ve R^2 0.99; bulutlu günlerde MAE 6.97, RMSE 9.09 ve R^2 0.99 olarak raporlanmıştır (Lim, Huh, Hong, Park, & Kim, 2022).

Park ve arkadaşları yaptığı çalışmada, Güney Kore'deki 2517 güneş santralinden toplanan verilerle, anormal verilerin tahmin doğruluğunu bozmasını önlemek için CAE, PCA ve K-means tabanlı bir anomali tespit sistemi geliştirmişlerdir. Tespit sonrası sadece normal verilerle TransLSTM modeli eğitilmiş ve sanal santrallerin tahmin hatası %6.3'ten %4.85'e düşerek %23 iyileşme sağlanmıştır. Anomali tespiti %99.61 doğruluk ve %99.16 F1 skoru ile yüksek başarı göstermiştir (Park, Song, Jeong, & Kim, 2023).

Mulongo ve arkadaşları, Kamerun'daki baz istasyonlarında jeneratör yakıt tüketimindeki anomaliler tespit etmişlerdir. TeleInfra'ya ait 5905 satırlık veride günlük çalışma süresi, tüketilen ve eklenen yakıt gibi bilgiler yer almıştır. SVM, KNN, LR ve MLP algoritmaları karşılaştırılmış, en iyi sonucu MLP vermiştir. MLP, %96.1 doğruluk, %98.8 precision, %95.4 recall ve %99 AUC ile en yüksek başarıyı göstermiştir. Sonuç olarak, yakıt tüketimindeki anomallileri tespit etmede MLP en etkili yöntem olarak belirlenmiştir (Mulongo et al., 2020).

Zangrando ve arkadaşları, üç buzdolabına ait yarı-periyodik enerji tüketim verileriyle toplam 12 farklı anomali tespit algoritması karşılaştırmışlardır. Kullanılan algoritmalar şunlardır: Basic Statistics, AR, ARIMA, LOF, OC-SVM, ISOF, GRU, GRU-MS, LSTM, LSTM-MS, GRU-AE ve LSTM-AE. Veriler akıllı prizlerle dakikalık çözünürlükte toplanmış, anomaliler manuel olarak etiketlenmiştir. En yüksek performans ISOF ile Fridge3 veri setinde elde edilmiştir (Precision = 0.947, Recall = 0.965, F1 = 0.956). Klasik makine öğrenmesi yöntemleri (ISOF, OC-SVM, LOF), GRU ve LSTM tabanlı sinir ağı modellerine göre daha başarılı ve genellenebilir bulunmuştur (Zangrando, Fraternali, Petri, Pinciroli Vago, & Herrera González, 2022).

Başka bir makalede, elektrik enerjisi kullanım verilerinde anomalileri tespit etmek için zaman serilerini görüntüye çevirerek CNN tabanlı bir model geliştirilmiştir. Çalışmada, Güney Kore Enerji Ajansı tarafından sağlanan ve 60 binaya ait saatlik güç tüketimi verilerini içeren bir veri seti kullanılmıştır. Bu verilerden zaman serisi imgeleri (RP, GASF, GADF, MTF) oluşturulmuş ve bu imgelerle anomali tespiti yapılmıştır. Veriler k-means, k-shapes ve SOM algoritmalarıyla önceden kümeleme işlemine tabi tutulmuş, ardından her küme için ayrı CNN modelleri eğitilmiştir. Karşılaştırma için ARIMA modeli de uygulanmıştır. Sonuçlara göre, MTF algoritmasıyla oluşturulan zaman serisi görüntüleri ve CNN ile yapılan anomali tespiti en iyi sonucu vermiştir (F1-score = 0.97, SOM kümeleme ile) (Oh, Oh, Um, Kim, & Jung, 2022).

Materyal ve Metot

Bu bölümde çalışmada kullanılan veri kümesi, derin öğrenme modelleri ve metrikler açıklanmış ve sunulmuştur.

Kullanılan Veri Seti

Bu çalışmada Kahramanmaraş ilinde bulunan İbrahim Taşyurdu GES'e ait üretim verisi kullanılmıştır. Kahramanmaraş ili, Pazarcık ilçesi, Memişkahya Mahallesi 906 ada, 3 parsel içerisinde işletme çatısı üzerinde bulunan 469,2 kWe kurulu gücündeki (İbrahim Taşyurdu GES) güneş enerjisi santrali baz alınmıştır.

Bu çalışmada ilk adım olarak kullanılacak olan veri seti oluşturulmuştur. Veri seti, gerçek saha koşullarından elde edilmiş olup 2 Sütun ve 35055 satırdan oluşmaktadır. Toplamda dört yıllık güneş enerjisi üretim verilerini içermektedir. 01.01.2019 tarihinden başlayarak 31.12.222 tarihine kadar devam eden günlük üretim verilerinden oluşmaktadır. Çalışma boyunca gerçekleştirilen deneyler bu veri seti üzerinden yürütülmüştür. Aşağıdaki Tablo 1'de veri setindeki günlük üretim örneği sunulmuştur.

Derin Öğrenme Modelleri

Bu çalışmada rampdown (ani düşüş) olaylarını tespit etmek için BILSTM, LSTM (Alpay, 2020; Er & Işık, 2021) ve GRU (Demirci & Karaatlı, 2023; Tunç & Erdem, 2024) tabanlı derin öğrenme modelleri kullanılmıştır. Aşağıda çalışmada kullanılan derin öğrenme modelleri açıklanmıştır.

Long Short-Term Memory (LSTM): tekrarlayan sinir ağı (RNN) tabanlı bir derin öğrenme mimarisidir. İçerisinde bilgi akışını yöneten giriş, unutma ve çıkış kapılarından oluşan özel

LSTM hücreleri bulunur. Bu yapı, zamanla değişen verilerde uzun vadeli bağımlılıkları öğrenmede etkilidir.

Bidirectional LSTM (BiLSTM): BiLSTM sinir ağı, verileri iki LSTM üzerinden zıt yönlerde ileri ve geri işleyebilir. Geçmiş ve gelecek bilgileri kullanarak eğitilmektedir.

Gated Recurrent Unit (GRU): standart tekrarlayan sinir ağının geliştirilmiş bir versiyonudur. GRU'lar kaybolan gradyan problemi (vanishing gradient problem)'ni çözmek amacıyla geliştirilmiştir. GRU, LSTM'in bir varyasyonu olarak da düşünülebilir çünkü her ikisi de benzer şekilde tasarlanmış ve bazı durumlarda eşit derecede başarılı sonuçlar verebilen ağ yapılarıdır. İkisinde de temel amaç aynıdır. LSTM'ler ve GRU'lar kısa süreli belleğe çözüm olarak oluşturulmuşlardır. Bilgi akışını düzenleyebilen "kapı (gate)" adı verilen iç mekanizmalara sahiptirler. Ancak GRU'lar da bir çıkış kapısı mevcut olmadığı için LSTM'den daha az parametresi bulunmaktadır. GRU'nun iki geçit mekanizması vardır: sıfırlama kapısı ve güncelleme kapısı. Sıfırlama kapısı gizli durumun unutulması gerektiği miktarını belirler, güncelleme kapısı ise gizli durumu güncellemek için yeni girişin miktarını belirler.

Performans Metrikleri

Model değerlendirmesinde kullanılan MAE, MSE ve R^2 hata metrikleri aşağıda açıklanmıştır. Bu çalışmada kullanılan metriklerde, denklemler (1)–(3)'de, y_i gerçek değeri, $\widetilde{y_i}$ tahmin edilen değeri, $\overline{y_i}$ gerçek değerlerin ortalamasını ve n gözlem sayısını ifade etmektedir.

- **Mean Absolute Error (MAE)**

Gerçek ile tahmin edilen değerler arasındaki mutlak farkların ortalamasını hesaplamaktadır. Denklem (1)'deki gibi hesaplanmaktadır.

$$MAE = \frac{1}{n}\sum_{i=1}^{n} | y_i - \widetilde{y_i} | \tag{1}$$

- **Mean Squared Error (MSE)**

Ortalama mutlak hata, her bir verinin model performansına eşit ağırlık verdiği bir metriktir. Denklem (2)'deki gibi hesaplanmaktadır.

$$MSE = \frac{1}{n}\sum_{i=1}^{n} (y_i - \widetilde{y_i})^2 \tag{2}$$

- **R-Squared (R^2)**

Bağımsız değişkenlerin bağımlı değişkendeki varyasyon oranı ile bulunmaktadır. Denklem (3)'te görüldüğü gibi hesaplanmaktadır.

$$R^2 = 1 - \frac{\sum_{i=1}^{n}(y_i - \widetilde{y_i})^2}{\sum_{i=1}^{n}(y_i - \overline{y_i})^2} \tag{3}$$

Bulgular ve Tartışma

Bu çalışmada, üretim verileri üzerinde rampdown noktalarının tahmin edilmesi amacıyla BiLSTM, LSTM ve GRU tabanlı derin öğrenme modelleri eğitilmiştir. Modellerin

performansları hem performans metrikleri hem de tahmin edilen rampdown noktalarının doğruluğu açısından analiz edilmiştir. Modellerin eğitim sürecinde, ardışık 20 epoch boyunca eğitim gerçekleştirilmiştir.

Rampdown olayı tespiti için, iki veri noktası arasındaki üretim farkı değeri eğer bir eşik değerinden düşük ise bu nokta rampdown noktası olarak seçilmiştir. Sonrasında zaman serisi halindeki verilerin makine öğrenmesine uygun hale getirilmesi için kayan pencere yapısından faydalanılmıştır. Bunun için de pencere boyutu 48 olarak belirlenmiştir. Yani veride 48 input 1 output olacak şekilde format değişikliği yapılmıştır. Ardından üretim verisinin ilk %80'lik kısmı eğitim, geriye kalan %20'lik kısmı ise test olarak ayrılmıştır. Ayrıca eğitim verisinin %20 de doğrulama verisi olarak belirlenmiştir. Daha sonra 3 katmanlı ve 64x32x32 nöronlara sahip derin öğrenme modelleri ile algoritma eğitilmiştir. Bu süreçte Adam optimizer ve MAE hata metriğinden faydalanılmıştır. Test verisi ile de modellerin öğrenme performansları test edilmiştir. Ardından tahmin edilen test verisinde iki veri noktası arası üretim farkı aynı eşik değerinden yüksek ise bu nokta rampdown olarak belirlenmiş ve gerçek rampdown noktaları ile karşılaştırılmıştır.

Aşağıda bulunan Tablo 2'de derin öğrenme modellerinin veri seti üzerindeki performanslarının karşılaştırması verilmiştir.

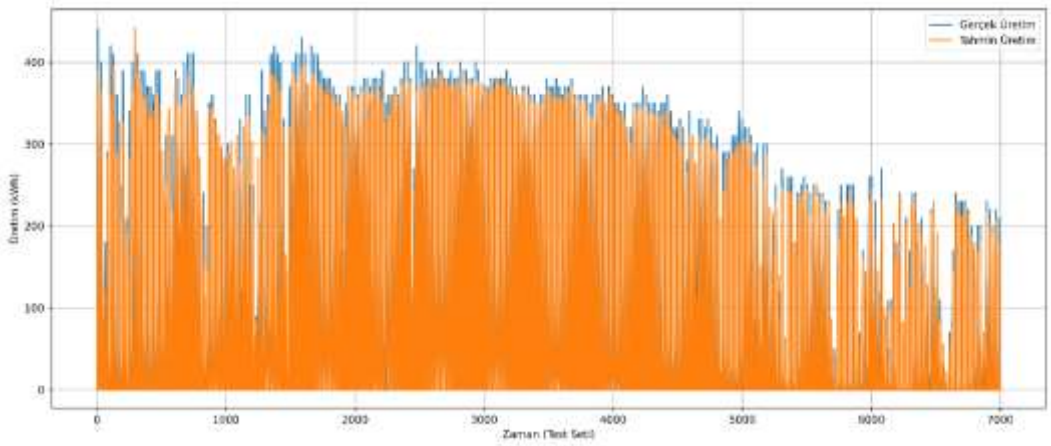
Tablo 6. Derin Öğrenme Modellerinin Üretim Tahmini İçin Performans Karşılaştırması

Algoritmalar	MAE	MSE	R^2
LSTM	9.6	482.03	0.971
GRU	9.72	489.6	0.97
BiLSTM	10.34	498.28	0.97

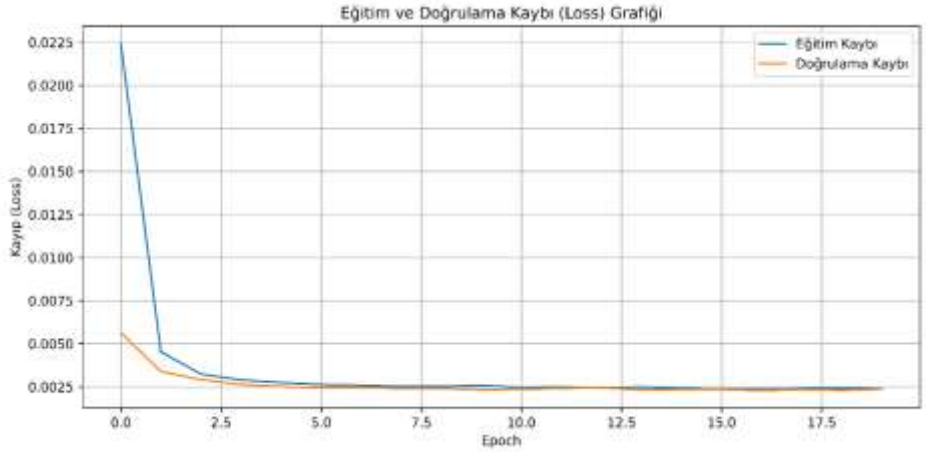
Şekil 1'te, BiLSTM modelinin test veri seti üzerindeki üretim tahminleri ile gerçek üretim değerleri karşılaştırılmaktadır. Mavi çizgi gerçek üretimi, turuncu çizgi ise model tarafından tahmin edilen üretimi göstermektedir.

Şekil 2'de, BiLSTM modelinin eğitim sürecindeki kayıp (loss) değerlerinin epoch bazında değişimi gösterilmektedir. Mavi çizgi eğitim kaybını, turuncu çizgi ise doğrulama kaybını temsil etmektedir.

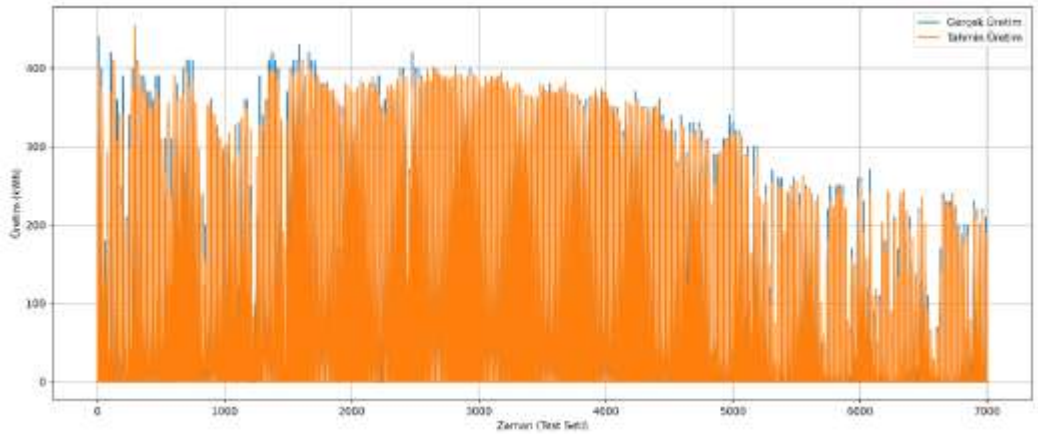
Şekil 3'te, LSTM modelinin test veri seti üzerindeki üretim tahminleri ile gerçek üretim değerleri karşılaştırılmaktadır.



Şekil 5. BİLSTM ile Tahmin Edilen Üretim Değerleri



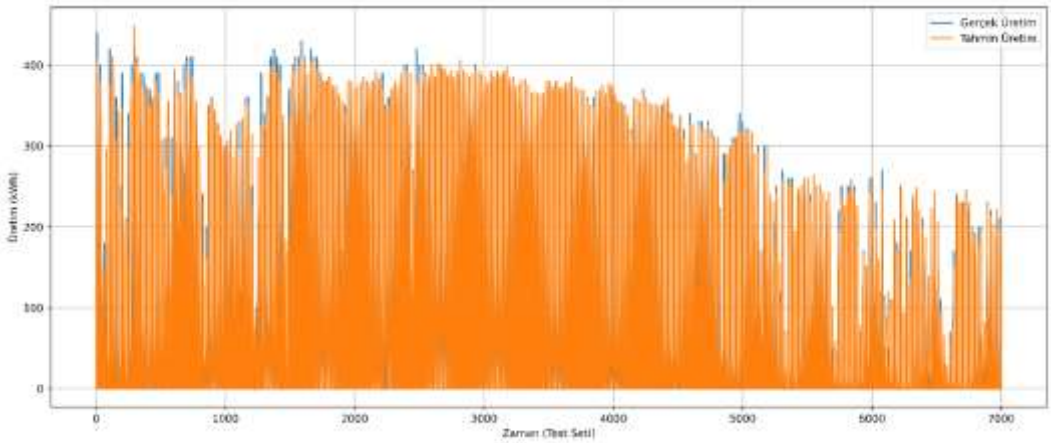
Şekil 6. BiLSTM Modelinin Eğitim-Doğrulama Kayıp Grafiği



Şekil 3. LSTM ile Tahmin Edilen Üretim Değerleri

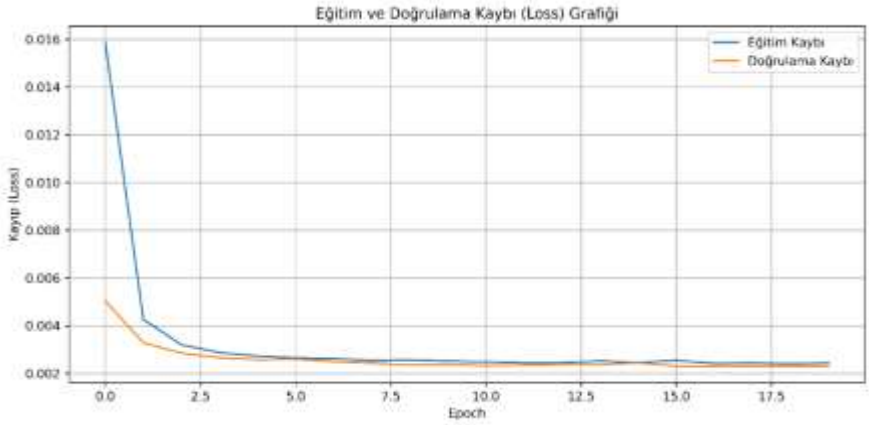
Şekil 4'de ise LSTM modelinin eğitim sürecindeki kayıp (loss) değerlerinin epoch bazında değişimi gösterilmektedir.

Şekil 5'te, GRU modelinin test veri seti üzerindeki üretim tahminleri ile gerçek üretim değerleri karşılaştırılmaktadır.



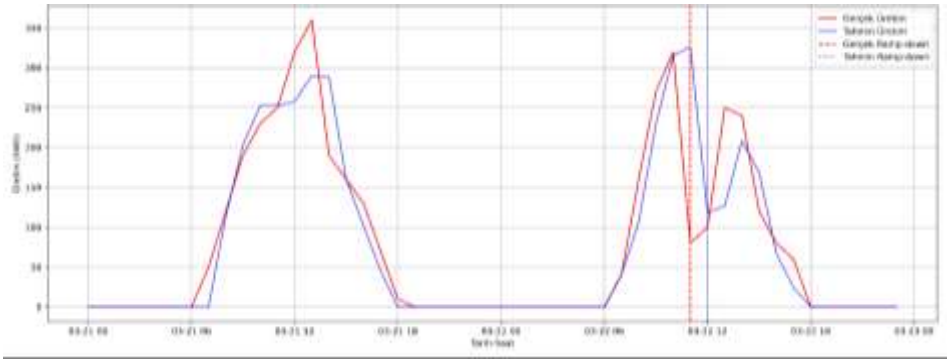
Şekil 5. GRU ile Tahmin Edilen Üretim Değerleri afiği

Şekil 6'de ise GRU modelinin eğitim sürecindeki kayıp (loss) değerlerinin epoch bazında değişimi gösterilmektedir.

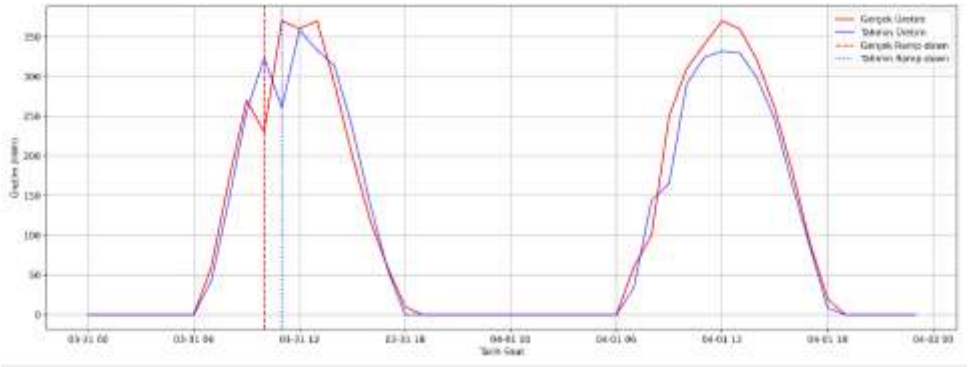


Şekil 6. GRU Modelinin Eğitim-Doğrulama Kayıp Grafiği

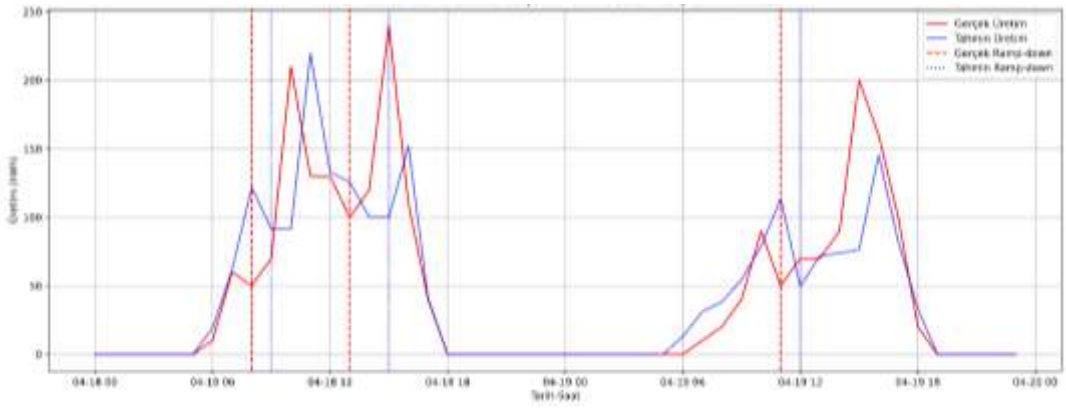
Şekil 7, Şekil 8 ve Şekil 9'da sunulan örnek grafiklerde yapılan tahmin sonrası elde edilen rampdown örnekleri verilmiştir. Bu grafiklerde dikey kırmızı noktalar gerçek verideki rampdown noktalarını, mavi dikey noktalar ise tahmin edilen üretim değerindeki rampdown noktasını göstermektedir. Şekil 10'da ise hem gerçek üretim de hem de tahmin edilen üretimde bir rampdown tespit edilmediği görülmektedir.



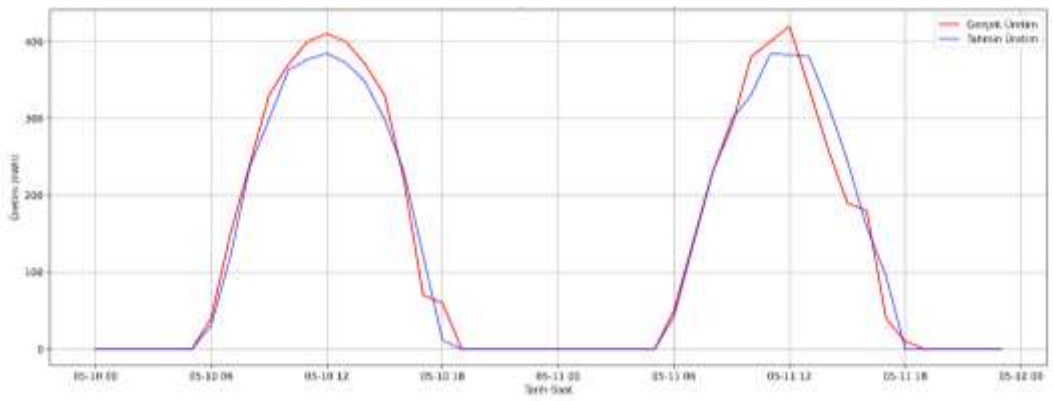
Şekil 7. Rampdown Örnek-1



Şekil 8. Rampdown Örnek-2



Şekil 9. Rampdown Örnek-3



Şekil 10. Rampdown Örnek-4

Sonuç ve Öneriler

Bu çalışmada rampdown olaylarını tespit için BILSTM, LSTM ve GRU tabanlı derin öğrenme modelleri kullanılmıştır. Modeller, 509 rampdown noktasını içeren bir veri kümesi üzerinde eğitilmiş ve test edilmiştir. Gerçek eğitim verisinde 413 nokta, test verisinde ise 96 nokta rampdown olarak belirlenmiştir. Deneysel çalışmalarda elde edilen sonuçlar aşağıda karşılaştırılmıştır.

Yapılan tahmin işleminde BILSTM modeli sonrası test verisinde 87 rampdown tahmininde bulunmuş ve bunlardan 60 tanesi gerçek rampdown ile yaklaşık olarak uyuşmuştur. Ortalama sapma süresi farkı 1.29 saat olarak ölçülmüştür. MSE: 498.28 MAE: 10.34 ve R^2 skoru: 0.97 olarak hesaplanmıştır. LSTM modeli ile yapılan tahmin işlemi sonrası 85 rampdown tahmininde bulunmuş ve bunlardan 64 tanesi gerçek rampdown ile yaklaşık olarak uyuşmuştur. Bu işlemde ise ortalama sapma süresi farkı 1.29 saat olarak ölçülmüştür. MSE: 482.03 MAE: 9.6 ve R^2 skoru: 0.971 olarak hesaplanmıştır. GRU modeli yapılan tahmin işleminde ise 87 rampdown tahmininde bulunmuş ve bunlardan 65 tanesi gerçek rampdown ile yaklaşık olarak uyuşmuştur. Ortalama süre farkı 1.47 saat olarak ölçülmüştür. MSE: 489.6 MAE: 9.72 ve R^2 skoru: 0.97 olarak hesaplanmıştır.

Bu çalışma sonucunda ise LSTM modeli, en düşük MSE ve MAE değerlerini vererek üretim tahmininde en başarılı sonucu vermekte ve ayrıca gerçek rampdown durumu ile tahmin edilen rampdown olayı arası ortalama en düşük 1.29 saat ile en iyi algoritma olmuştur. Gelecekte veri üzerinde farklı önişlemler, farklı algoritmalar kullanılarak modellerin performanslarının iyileştirilmesi amaçlanmaktadır.

Teşekkür ve Bilgi Notu

Bu çalışma kapsamında üretim verilerini paylaşarak çalışmaya katkı sağlayan Kahramanmaraş ilinde bulunan İbrahim Taşyurdu Güneş Enerji Santrali'ne teşekkür ederiz. Çalışma süreci boyunca sağlanan veriler önemli katkı sağlamıştır.

PARKINSON'S DISEASE AND NURSING MANAGEMENT

Neşe AYKUT
Arş. Gör., Ağrı İbrahim Çeçen Üniversitesi, Sağlık Bilimleri Fakültesi, Hemşirelik Bölümü, Ağrı- Türkiye, naykut@agri.edu.tr ORCID: 0000-0003-4261-3991

ABSTRACT

Parkinson's disease (PD) is a progressive neurodegenerative disorder characterized by primary motor symptoms such as bradykinesia, muscular rigidity, resting tremor, and postural instability, resulting from the degeneration of the substantia nigra and subsequent reduction or loss of dopamine-producing neurotransmitters. The disease affects all ethnic groups worldwide and occurs in both sexes, though it is slightly more prevalent in men. Due to the complexity of the disease and the limited treatment options, managing Parkinson's disease poses significant challenges for both patients and caregivers. Effective collaboration between physicians and nurses enables a more integrated and ultimately higher-quality care approach. There is evidence suggesting that care provided by trained nurses leads to better health outcomes across various disorders, including Parkinson's disease. The scope of nursing care should include patient and caregiver education, support for self-management, guidance on sexual health, and psychosocial support. Paying attention to these aspects in nursing interventions is anticipated to improve the quality of life in individuals with Parkinson's disease. This review addresses key components of nursing management in patients with Parkinson's disease and highlights the critical role nurses play in delivering holistic and patient-centered care.

PARKİNSON HASTALIĞINI VE HEMŞİRELİK YÖNETİMİ

ÖZET

Parkinson hastalığı, hareket fonksiyonunda rol alan substansiya nigranın dejenerasyonu ile dopamine üreten nörotransmitterlerin azalması veya yok olması sonucunda ortaya çıkan; bradikinezi, kas sertliği, istirahat titremesi ve duruş bozukluğu gibi birincil motor semptomlarıyla karakterize, progresif, nörodejeneratif bir hastalıktır. Hastalık tüm dünyada, tüm etnik gruplarda görülür ve her iki cinsiyeti de eşit şekilde etkiler ancak erkeklerde biraz daha baskınlık vardır. Hastalığın karmaşıklığı ve sınırlı tedavi seçeneklerinden dolayı, Parkinson hastalığının yönetimi ve hastalar ile bakım sağlayıcılar için hastalıkla başa çıkma konusunda ciddi zorluklar yaratmaktadır. Doktorlar ve hemşireler arasındaki işbirliği, daha bütünleşik ve sonuç olarak daha kaliteli bir bakıma olanak sağlar. Eğitimli hemşireler tarafından sağlanan bakımın çeşitli bozukluklar için daha iyi sağlık sonuçları sağlayabileceğine yönelik kanıtlar bulunmaktadır. Sağlanacak olan hemşirelik bakımının içeriğinde bilgi vermek, hasta ve bakım sağlayıcısına öz yönetimde destek olmak, cinsel hayata yönelik bilgi ve eğitim, psikososyal destek sağlamak gibi başlıklardan söz edilebilir. Hemşirelik bakımında bu hususlara dikkat edilmesi halinde hastaların yaşam kalitelerinin de artacağı öngörülmektedir. Bu derlemede Parkinson hastalarında hemşirelik yönetimine yönelik bilgiler ele alınmıştır.

Anahtar Kelimeler: Hemşirelik, Hemşirelik yönetimi, Parkinson, Parkinson hastalığı

Giriş

Parkinson hastalığı (PH), ilk kez 1817'de İngiliz Doktor James Parkinson tarafından "titrek felç" olarak tanımlamıştır. PH, orta beyinde özelleşmiş ve hareketten sorumlu olan "substansiya nigra"nın dejenerasyonuyla birlikte dopamin üretiminin azalması veya hiç olmaması sonucunda gelişen nörodejeneratif bir hastalıktır (Şen ve ark., 2023). PH, motor ve non motor semptomlar ile kendini göstermektedir. Motor semptomlara bakıldığında, rijidite, bradikinezi, titreme ve postüral instabilite görülmektedir. Non motor semptomlar arasında ise aşırı tükürük salınımı, görme sorunları, uyku bozuklukları, cinsel disfonksiyon, konstipasyon, ağrı, demans ve depresyon bulunmaktadır (Civil, 2018; Postuma ve ark., 2015). Motor semptomlar hastalığın teşhisi için önemlidir. Bilişsel bozukluk, uyku bozuklukları ve duygudurum bozukluklarına yönelik non motor semptomlar ise daha erken dönemde başlayabildiği için hastalığın erken teşhisini zorlaştırmaktadır (Poewe ve ark., 2017; Schapira ve ark., 2017). Beyindeki dopaminerjik nöron kaybına bağlı olarak hastalarda, harekette yavaşlama ve kas kasılmaları görülmeye başlamaktadır (Şen ve ark., 2023).

PH, sıklıkla 40-75 yaş arasındaki bireylerde görülmektedir. Yaşın ilerlemesiyle birlikte, PH'na yakalanma olasılığı artmaktadır (Civil, 2018). Hastalığın 65 yaş ve üzeri bireylerde görülme sıklığı %2-3 oranlarındadır (Poewe ve ark., 2017). Küresel Hastalık Yükü Araştırması'na göre 2040 yılından itibaren 12,9 milyon kişinin Parkinson hastalığından etkilenebileceğini öngörmektedir (Dorsey ve Bloem, 2018). Yaşın yanı sıra cinsiyette önemli bir etkendir. Erkeklerde kadınlara oranla 2 kat daha fazla görülmektedir (Savica ve ark., 2013). Ancak kadınlarda hastalık daha hızlı ilerlemekte olup, mortalite oranı daha yüksektir (Cerri ve ark., 2019).

Alzheimer'dan sonra en sık görülen nörodejeneratif hastalık olan PH'nın prevelansı ülkeden ilkeye değişiklik göstermektedir (İbrahimoğlu ve ark., 2019; Parkinson Hastalığı Derneği, 2013). Türkiye'nin batısında yapılan bir çalışmada PH prevelansı %1.2 olarak belirlenmiştir (Güler ve ark., 2022).

Tedavi

PH'da tedavinin amacı yaşam kalitesini en üst düzeye çıkarmak ve hastalığa bağlı gelişen sakatlığı en aza indirmektir. Bu nedenle tedavi sadece semptomlara yönelik ve hasta merkezli olmalıdır (GPDS, 2002; Öksüz ve ark., 2022). Tedavi, motor ve/veya non motor semptomlar fiziksel veya sosyal engelliliğe yol açmaya ve yaşam kalitesini bozmaya başladığında başlatılmalıdır (Grosset ve ark., 2007).

Farmakolojik, non farmakolojik, cerrahi tedaviler kullanılmaktadır. Bu tedavi çeşitleri hastaların ihtiyaçlarına ve hastalık düzeyine göre düzenlenmektedir (Kaya ve ark., 2022).

Farmakolojik tedaviler içerisinde, dopamin agonistleri, levodopa (levodopa-karbidopa veya levodopa-benserazid) ve monoamin oksidaz (MAO)-B inhibitörleri, antikolinerjikler, katekol-O-metiltransferaz inhibitörleri ve amantadin gibi ilaçlar bulunmaktadır (Hayes ve ark., 2019). Bu ilaçlar hastalığın motor semptomlarına yönelik olup hastaların günlük yaşam aktivitelerini devam ettirmelerini sağlamaktadır (Ahlskog ve ark., 2001).

Farmakolojik tedaviden yanıt alınamayan ileri evre Parkinson hastalarında cerrahi tedaviye başvurulabilmektedir. İleri evre PH'da tremor, rijidite ve bradikinezi gibi semptomlarda iyileşme sağlayan Derin Beyin Stimülasyonu (DBS), ilaç yan etkilerinin de azalmasını sağlayarak hastaların yaşam kalitelerini de artırmaktadır (Rizek ve ark., 2016; Yiğit ve ark., 2015; Pringsheim ve ark., 2021).

Farmakolojik ve cerrahi tedavinin yanı sıra uygulanan non farmakolojik tedaviler de hastalığın yönetiminde büyük önem taşımaktadır. Uygulanan yöntemler hastalığın motot ve non motor semptomlarının yönetiminde önemlidir (Rutz ve ark., 2020). PD'de yürümeyi, dengeyi ve düşmeleri iyileştirmek için denge, direnç ve aerobik egzersiz, koşu bandında yürüme, hareket stratejisi eğitimi, dans (özellikle partnerli dans) ve Tai Chi dahil olmak üzere bir dizi farklı egzersiz ve fizik tedavi denenmiştir. Sistematik incelemeler denge, hareketlilik ve kas gücünde gelişmeler olabileceğini doğrulamaktadır (Kim ve ark., 2018). Farmakolojik tedavi ve non farmakolojik tedavinin birlikte kullanılması semptom kontrolünde önemlidir. İkisinin birlikte kullanılması ile iyileşme potansiyeli artmaktadır (Çağlar ve ark., 2005).

Hemşirelik Yönetimi

Hastalar günlük yaşam aktivitelerini yaparken yarı veya tam bağımlı olabilmekte ve buna bağlı olarak yaşam kaliteleri de olumsuz etkilenmektedir (Şen ve ark., 2023; Wressle ve ark., 2007; Yazar ve ark., 2017). Bu nedenle hasta ve ailesinin yaşamında bakım yükü artmakta, bununla birlikte birçok sorun ortaya çıkmaktadır.

Mevcut tedavi seçenekleri, hastaların ve bakım vericilerin yaşam kalitesini artırmak için PH semptomlarını kontrol etmeye odaklı bir dizi disiplinlerarası eylem gerektirse de (Radder ve ark., 2019; van der Marck ve ark., 2013), bu PH'da karşılanmamış bir ihtiyaç olmaya devam etmektedir. Bu nedenle, multidisipliner ekip çalışması ile bütünleşik yaklaşımların benimsenmesine ihtiyaç vardır. Multidisipliner ekibin en önemli üyelerinden biri olan hemşirenin; sağlığı geliştirmek, hastalığa bağlı gelişen sınırlılıklara uyum sağlamak ve komplikasyonların tedavisi gibi konularda rolleri bulunmaktadır (Tosin ve ark., 2016).

Kanıta dayalı çalışmalarda sistematize edilmiş hemşirelik bakımının, PH'nın motor ve non motor semptomlarını kontrol etmede, disiplinler arası müdahalelerin etkinliğini artırmada kritik bir faktör olabileceği gösterilmiştir (Connor ve ark., 2019; Jones ve ark., 2016).

PH'da hemşirelik bakımı genel olarak; hasta ve ailesinin bilgilendirilmesi ve desteklenmesi, tedavi rejiminin düzenli takibi, rehabilitasyon ve destek hizmetinin sağlanması, yaşam kalitelerinin iyileştirilmesi için gerekli hizmetlerin sunulması, psikolojik ihtiyaçlarının karşılanması, fiziksel güvenliğin sağlanması gibi alanları kapsamaktadır (Zhao ve ark., 2020). Bu bağlamda hemşire, Parkinson tanısı alan bireye hastalıkla baş etmede, bağımlılık halini en aza indirmesine ve bağımsız bir şekilde hareket edebilmesine yardımcı olmalıdır (Durna ve ark., 2012).

Hemşirelik bakım planında genel olarak fiziksel mobilitede bozulma, öz bakım eksikliği, sözel iletişimde bozulma, konstipasyon, üriner boşaltımda bozulma, uyku örüntüsünde rahatsızlık, etkisiz baş etme gibi tanılar yer almaktadır. Bakım planı hasta merkezli olup, bireyin gereksinimleri doğrultusunda planlanmalıdır (Durna ve ark., 2012).

Hastaların ihtiyaçlarına göre ilaç kullanımına yönelik bilgilendirme yapılmalıdır. Özellikle ilaçların besinlerle ve diğer ilaçlarla etkileşimi, aç veya tok karnına alınması gibi durumlara yönelik bilgiler verilmelidir (Woodward ve ark., 2013; Civil, 2018).

PH'da egzersiz çok önemli bir unsurdur. İlerleyen evrelerde postürde bozulmalar olabileceği için hastaya özgü egzersiz eğitimi, hasta ve ailesine verilmelidir. Düşme riski için ekstra önlemler alınmalıdır. Uyku örüntüsündeki rahatsızlıklara yönelik gün içerisinde kısa uyku ve dinlenme periyotları uygulanmalıdır. Yaşanabilecek ağrılara yönelik farmakolojik yöntemlerin yanında non farmakolojik yöntemlere yönelik de eğitim verilmelidir. Konstipasyonu önlemeye yönelik gerekli bilgilendirmeler yapılmalı, var olan konstipasyon için girişimler planlanarak

uygulanmalıdır. Anksiyete, depresyon ve cinsel işlev bozukluğu sorgulanarak, olası durumda gerekli girişimler ve yönlendirmeler sağlanmalıdır (Civil, 2018).

Sonuç

Progresif bir seyir gösteren PH, yaşam kalitesini de olumsuz etkilemektedir. Yaşam kalitesinin optimal seviyede olabilmesi, tedavi seçeneklerinin doğru bir şekilde uygulanması, hasta ve ailesinin eğitimi için hemşirelik yönetimi ciddi derecede önem arz etmektedir. Doğru hemşirelik bakımının planlanması ve uygulanması bu açıdan önemlidir.

PH'na yönelik uzman hemşirelerin yetiştirilmesi, müfredatların buna yönelik düzenlenmesi, konuya yönelik eğitimlerin yapılmasının verimli olacağı düşünülmektedir. Ayrıca hemşirelik bakımına yönelik akademik çalışmaların genişletilerek yapılması, sonuçların paylaşılması ve yeni gelişmelerin takip edilmesi önerilmektedir.

Kahramanmaraş Sütçü İmam Üniversitesi, Mühendislik ve Mimarlık Fakültesi, Elektrik-Elektronik Mühendisliği Bölümü
*Sorumlu Yazar

ABSTRACT

This study addresses the integration of digital twin technology with GIS (Geographic Information System), SCADA, and AMR (Automatic Meter Reading) data in the management of electrical distribution networks. The main objective is to improve grid observability, intervention speed, and energy efficiency. GIS data enabled the spatial modeling of the network, SCADA integration ensured real-time monitoring, and AMR data made it possible to perform consumption-based analysis and detect losses or unauthorized usage. A specially designed table structure based on Oracle Spatial was developed to optimize data processing time. The integration process has provided significant benefits in enhancing grid performance, improving fault management, and activating user notification systems. The results demonstrate that AI-supported digital twin models can serve as an innovative management tool in modern energy systems.

DİJİTAL İKİZ TABANLI DAĞITIM ŞEBEKESİ YÖNETİMİ: CBS, SCADA VE OSOS ENTEGRASYONU

ÖZET

Bu çalışmada, elektrik dağıtım şebekelerinin yönetiminde dijital ikiz teknolojisinin CBS (Coğrafi Bilgi Sistemi), SCADA ve OSOS (Uzaktan Sayaç Okuma Sistemi) verileri ile entegrasyonu ele alınmıştır. Amaç, dağıtım şebekesinin izlenebilirliğini, müdahale hızını ve enerji verimliliğini artırmaktır. CBS verileri sayesinde şebekenin mekânsal yapısı modellenmiş, SCADA entegrasyonu ile gerçek zamanlı izleme sağlanmış, OSOS verileriyle tüketim bazlı analiz ve kayıp-kaçak tespiti mümkün hale getirilmiştir. Oracle Spatial altyapısında geliştirilen özel tablo yapısı ile veri işleme süresi optimize edilmiştir. Entegrasyon süreci, şebeke performansının artırılması, arıza yönetiminin iyileştirilmesi ve kullanıcı bilgilendirme sistemlerinin etkinleştirilmesi açısından büyük faydalar sunmuştur. Sonuçlar, yapay zekâ destekli dijital ikiz modellerinin enerji sistemlerinde yenilikçi bir yönetim aracı olabileceğini göstermektedir.

Anahtar Kelimeler: Dijital İkiz, Coğrafi Bilgi Sistemi (CBS), SCADA, OSOS Data

Giriş

Elektrik dağıtım şebekeleri, toplumsal yaşamdaki enerji talebinin sistematik ve güvenilir bir şekilde karşılanmasında kritik bir rol oynamaktadır. Güvenli ve verimli bir şebeke yönetimi, yalnızca yaşam kalitesini artırmakla kalmayıp, ekonomik büyüme ve sürdürülebilir kalkınma açısından da önemli bir zemin oluşturmaktadır. Ancak, iklimsel koşullar, yenilenebilir enerji kaynakları, cihaz ve şebeke hasarları, arıza yönetimi ile veri entegrasyonu gibi zorluklar, elektrik şebeke yönetimin karmaşıklığını artırmaktadır. Bu karmaşıklığın giderilmesi, elektrik enerji ihtiyacının artması, şebekenin modernize edilmesi ve mevcut şebekeye güneş, rüzgar, hidroelektrik gibi yenilenebilir enerji kaynaklı santrallerin eklenmesi ile birlikte yenilikçi çözümler bulunmaya çalışılmaktadır. Mevcut sistemlerden (CBS, SCADA, OMS, DMS, OSOS vb.) elde edilen veriler, elektrik şebekesi için entegre edilmediği takdirde şebekenin dağıtım tarafında operasyonel verimliliği düşürebilmektedir [1, 2]. Bundan kaynaklı kesinti durumu, arıza tespiti, müdahale edilebilmesi ve şebeke kullanıcılarının bilgilendirilmesi gibi yapılması gereken çalışmalarda aksamalar meydana gelebilmektedir [3].

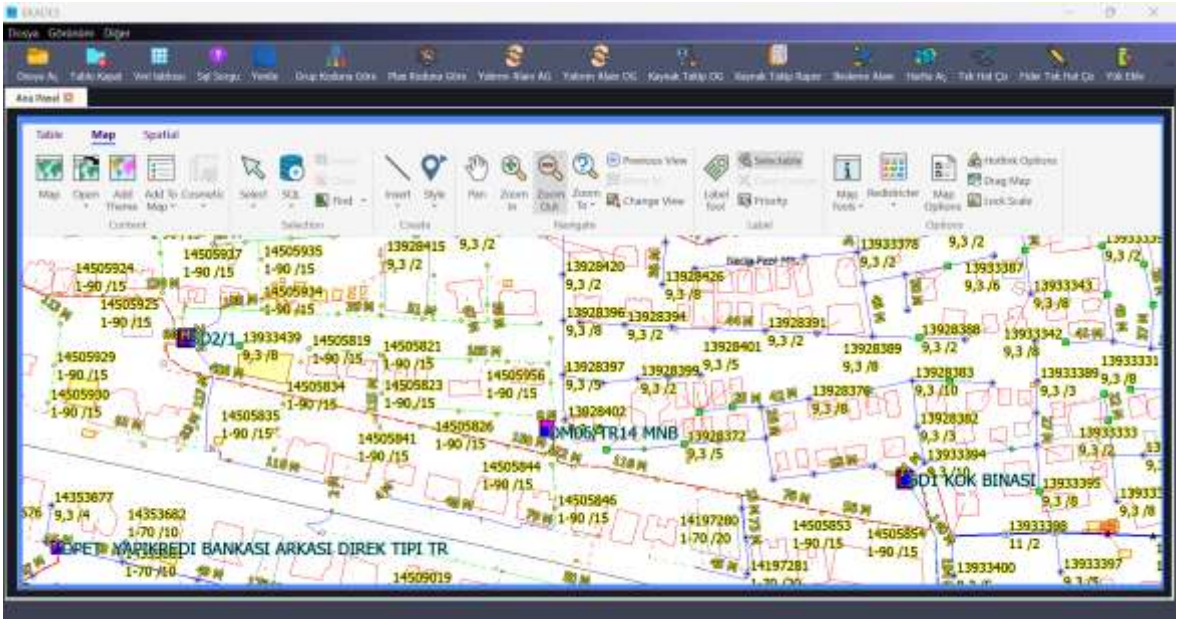
Bu çalışmada, dağıtım şebekelerinin yönetiminde kullanılan mevcut sistemlerin (CBS, SCADA, OMS, DMS, SAP, OSOS, INAVITAS) dijital ikiz teknolojisi ile entegrasyonu ve yapay zekâ desteği ile güçlendirilmesi gerektiği vurgulanmaktadır. Bu kapsamda, şebeke işletme kalitesinin artırılmasına yönelik bir yazılım uygulaması hayata geçirilmiştir. Dijital ikiz teknolojisinin elektrik dağıtım şebekelerindeki uygulamalarını ve bu teknolojinin sunduğu yenilikçi modelleme ve benzetim özelliklerini teorik olarak ele alır.

Bu kapsamda, enerji sistemlerinin yönetiminde yenilikçi teknolojilerin nasıl daha etkili kullanılabileceğine dair yeni bilgiler ve yaklaşımlar sunulmaktadır. Sonuç olarak, OSOS verilerinin dijital ikiz modeline entegrasyonu, elektrik dağıtım şebekelerinin daha etkin bir şekilde yönetilmesine imkân sağladığı görülmüştür. Bu entegrasyon, şebeke performansının izlenmesi, enerji tüketiminin yönetilmesi ve operasyonel verimliliğin artırılması açısından büyük avantajlar sunar.

Coğrafi Bilgi Sistemi Verilerinin Entegrasyonu

Coğrafi Bilgi Sistemleri (CBS) verileri, elektrik dağıtım şebekelerinin coğrafi konumlarını, altyapı bileşenlerini ve bu bileşenlerin mekânsal ilişkilerini içeren kritik bilgiler sağlar. CBS, elektrik dağıtım şebekesinin fiziksel varlıklarını haritalandırarak, şebekenin daha iyi yönetilmesine ve optimizasyonuna olanak tanır. Bu veriler, dijital ikiz modellerinin oluşturulması ve etkin bir şekilde çalıştırılması için temel bir bileşen olarak vazife görür. CBS verilerinin doğru ve kapsamlı bir şekilde entegrasyonu, şebeke yönetiminde büyük avantajlar sağlar. CBS verilerinin dijital ikiz modeline entegrasyonu, birkaç aşamadan oluşur. İlk aşamada, mevcut CBS verileri temel veri kaynağı kabul edilerek veri tabanı düzeyinde ve geliştirilen yazılımda gerekli entegrasyon altyapısı oluşturulur. CBS verileri, genellikle çeşitli formatlarda ve farklı veri kaynaklarından gelir. Bu nedenle, veri entegrasyonu sürecinde veri formatlarının uyumlu hale getirilmesi ve veri kalitesinin doğrulanması önemlidir.

Bu çalışma kapsamında geliştirilen sistemdeki dijital ikizin CBS ile entegrasyonuna ait uygulama örnek ekran görüntüsü aşağıdaki Şekil 1'de bulunmaktadır. Bu şekilde dağıtım binaları, yüksek gerilim hatları (kırmızı), alçak gerilim hatları (mavi), direkler(nokta), rekortmenler ve elektrik tüketimi yapılan yapılar (bina, ev vb.) bulunmaktadır.



Şekil 1. CBS Entegrasyonu

CBS verilerinin dijital ikiz modeline temel veri olarak entegre edilmesi, şebekenin coğrafi ve mekânsal dinamiklerini daha iyi anlamamıza yardımcı olur. Örneğin, şebeke arızalarının coğrafi dağılımı analiz edilerek, arıza yoğunluk bölgeleri belirlenebilir ve bu bölgelere yönelik proaktif bakım stratejileri geliştirilebilir. Ayrıca, CBS verileri, yenilenebilir enerji kaynaklarının entegrasyonu ve bu kaynakların coğrafi dağılımının optimize edilmesi için de kullanılabilir.

Bu çalışmada CBS sisteminin veri tabanı olarak kullanılan Oracle Spatial üzerinde, hatlarda yapılacak olan trace işlemlerinin daha hızlı ve verimli bir şekilde gerçekleştirilebilmesi için özel bir tablo yapısı geliştirilmiştir. Tablo 1'de veri yapısı detaylı olarak sunulmaktadır. Geliştirilen bu yapının amacı, şebeke üzerindeki hatların trace işlemlerini daha performanslı hale getirmek ve işlem sürelerini kısaltmaktır. Tablonun temel işlevi, hatlar arasındaki sıçramaların ve grup bazında birleştirilen hatların tek bir kayıt olarak değerlendirilmesidir. Bu sayede, GROUP_ID'ye göre birleştirilen hatlar, analiz sürecinde tek bir kayıt olarak yer alır. Örneğin, yaklaşık 300 bin civarındaki hattan çıkan gruplar, ortalama olarak yaklaşık 55 bin civarına tekabül etmektedir. Bu değer, hat çizimlerinin dizilişine bağlı olarak değişiklik gösterebilir ve mevcut verilerimiz üzerinden yapılan örneklendirmelere dayanmaktadır.

Bu optimizasyonun en büyük avantajı, bir hattan kaynağa veya besleme alanına doğru yapılacak trace işlemlerinde, 300 bin kayıt yerine yalnızca 55 bin kayıt üzerinden işlem yapılmasını sağlamasıdır. Bu sayede, işlem süresi önemli ölçüde kısalır ve veri tabanından daha hızlı sonuçlar alınabilir. Bu yapı, özellikle büyük veri setlerinde ve karmaşık şebeke yapılarında işlem verimliliğini artırarak, sistemin performansını optimize etmektedir.

Tablo 1. Trace Tablo Yapısı

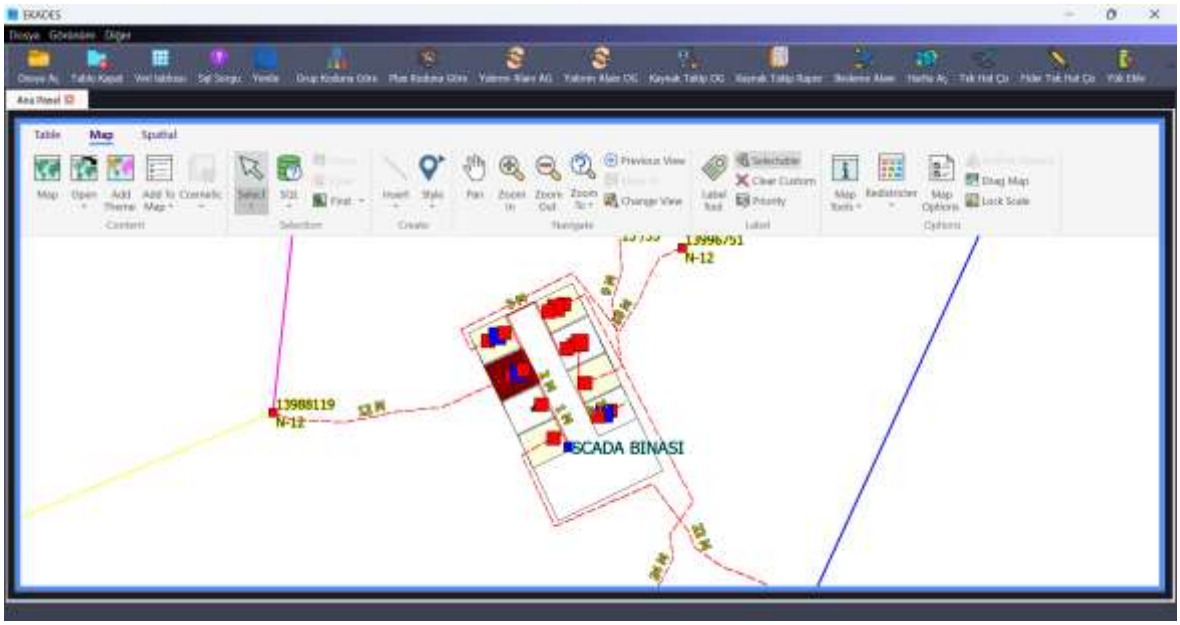
Name	Data Type	Not Null	Default
GROUP_ID	NUMBER(6,0)	✓	
SOURCE_GROUP_ID	NUMBER(6,0)		
BRANCH_INDEX	NUMBER(6,0)		
LOAD	FLOAT(126)		
MAX_LOAD	FLOAT(126)		
MAX_DEMAND	FLOAT(126)		
GROUP_DISTANCE	FLOAT(126)		
GROUP_LOCAL_DISTANCE	FLOAT(126)		

Tablo 1'deki veri yapılarına ait açıklamalar; GROUP_ID: Hatlar için oluşturduğumuz GROUP_ID'lerinin aynısını unique olarak tutar. SOURCE_GROUP_ID: Bir önceki kendisini oluşturan GROUP_ID'nin değerini tutar. BRANCH_INDEX: Hatların trace tablosunda oluşturduğumuz BRANCH_INDEX'lerin mantığı ile aynıdır sadece farkı grupların kırılımlarına göre yapmasıdır. LOAD: Bu sütun gelecekte yapacağımız anlık olarak bir hat grubu üzerindeki yük durumu bilgisini tutacaktır. MAX_LOAD: Bu sütun o hat üzerindeki kurulu gücü toplamlarını tutar. MAX_DEMAND: Bu sütun 'da ayrıca gelecekte yapacağımız o hat gruplarına ait maksimum çekiş verilerinin toplamını tutacaktır. GROUP_DISTANCE: Hatların trace tablosundaki KAYNAK_MESAFE sütun ile aynı mantığa sahiptir. Kendisinden önceki gelen grupların tüm KAYNAK_MESAFE toplamlarını tutar. GROUP_LOCAL_DISTANCE: Grup içerisinde bulunan tüm hatların toplam uzunluğunu verir.

Scada Verilerinin Entegrasyonu

SCADA sistemi, elektrik dağıtım şebekelerinin etkin bir şekilde izlenmesi ve kontrol edilmesi için kritik bir rol oynar. SCADA sistemi, şebekenin çeşitli bileşenlerinden gerçek zamanlı veri toplar ve bu verilerin merkezi bir kontrol noktasında izlenmesine ve analiz edilmesine olanak tanır. SCADA sistemi tarafından toplanan veriler, dijital ikiz modeline gerçek zamanlı olarak aktarılmalıdır. Bu süreçte veri güvenliğini sağlamak ve veri kaybını önlemek için uygun protokoller kullanılarak, gerekli entegrasyon sağlanmıştır. Bu entegrasyonda CBS-SCADA arasındaki mevcut entegrasyon altyapısından da faydalanılmıştır.

Bu çalışma kapsamında geliştirilen sistemdeki dijital ikizle entegre edilmiş bir SCADA istasyonuna ait ekran görüntüsü aşağıdaki Şekil 2'de bulunmaktadır. Bu şekil SCADA kurulumu yapılmış olan bir dağıtım binasına aittir. Dağıtım binasının fiziki durumu ve diğer şebeke elamanlarıyla (Direk, hat, ayırıcı, kesici) bağlantı ilişkisi şekilde görülmektedir. Bu şekilde gösterilen varlıklar dijital ikizde koordinatlı bir şekilde tutulmaktadır.



Şekil 2. SCADA Entegrasyonu

Entegre edilen SCADA verileri, dijital ikiz modelinde merkezi bir veri tabanında saklanmalıdır. Bu veri tabanı, yüksek performanslı ve ölçeklenebilir olmalı, veri erişimini ve yönetimini kolaylaştırmalıdır. Ayrıca, verilerin yedeklenmesi ve güvenliğinin sağlanması için gerekli önlemler alınmalıdır. Bu çalışmada veri tabanı olarak oracle kullanılmıştır.

Entegre SCADA verileri, şebekenin performansının gerçek zamanlı olarak izlenmesine olanak tanır. Bu durum, anlık durum değerlendirmesi ve hızlı müdahale için kritik öneme sahiptir.

SCADA verileri, enerji akışının ve yük dağılımının optimize edilmesi için kullanılmıştır. Bu sayede dijital ikiz modeli, farklı senaryoları benzetim yaparak, enerji verimliliğini artıracak ve kayıpları azaltacak stratejiler geliştirme imkânı sağlamıştır.

Dijital ikiz tabanlı sistem SCADA verilerini analiz ederek gelecekteki enerji talebini ve şebeke performansını raporlayabilir. Bu, proaktif bakım ve iyileştirme planlarının yapılmasına olanak tanır.

SCADA verileri, yenilenebilir enerji kaynaklarının entegrasyonunu kolaylaştırır. Dijital ikiz modeli, bu verileri kullanarak, yenilenebilir enerji kaynaklarının şebeke üzerindeki etkisini analiz edebilir ve entegrasyon stratejilerini optimize edebilir hale gelmiştir.

Sonuç olarak, SCADA verilerinin dijital ikiz modeline entegrasyonu, elektrik dağıtım şebekelerinin daha etkin ve verimli bir şekilde yönetilmesini sağladığı görülmüştür. Bu entegrasyon, şebeke operasyonlarının izlenmesi, analizi ve optimizasyonu için gerekli olan veri akışını ve bütüncül bir görünürlüğü sunar. Bu sayede, şebeke kalitesi artırılır, arızalar minimize edilir ve enerji verimliliği sağlanır.

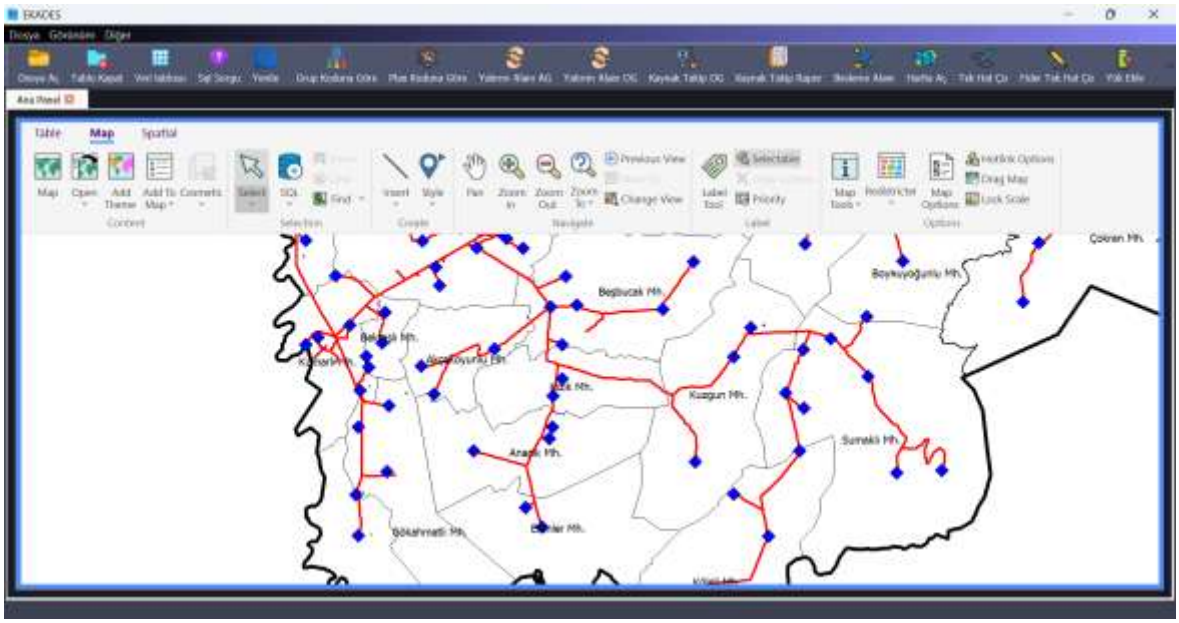
OSOS (Uzaktan Sayaç Okuma Sistemi) Verilerinin Entegrasyonu

OSOS, elektrik dağıtım şebekesinde abonelerin tüketim verilerini uzaktan okuma ve izleme imkânı sağlayan bir teknolojidir. OSOS sistemi, sayaçlardan alınan verileri gerçek zamanlı olarak merkezi sisteme aktarır, bu sayede manuel okuma gereksinimini ortadan kaldırır ve verilerin doğru, zamanında ve güvenilir şekilde kaydedilmesini sağlar. Mevcut OSOS sistemlerinde izlenen verilerin şebeke bağlantı modeli zeminde değerlendirilemediği için, verilerin şebeke bütünlüğü içinde kontrolü, analizi ve benzetimi mümkün olmamaktadır.

OSOS, uzaktan veri toplama cihazları (akıllı sayaçlar), veri aktarım modülleri ve merkezi bir veri yönetim sistemlerinden oluşur. Bu bileşenler, elektrik tüketim verilerinin izlenmesi, toplanması ve raporlanmasını sağlar. Sayaçlar, her kullanıcının tüketim bilgilerini dijital olarak veri tabanı düzeyinde kaydeder ve bu veriler kablosuz ağlar aracılığıyla merkezi sisteme aktarılır.

OSOS sisteminde, sayaçlar üzerinden elektrik tüketimi verileri, genellikle GSM, PLC (Power Line Communication) veya RF (Radio Frequency) teknolojileri ile uzaktan toplanır. Bu veriler, kullanıcıların saatlik, günlük, haftalık veya aylık enerji tüketim verilerini içerir. Veriler, daha sonra merkezi sistemde toplanarak analiz ve raporlama yapılır.

Bu çerçevede yapılan entegrasyona ilişkin uygulama ekran görüntüsü aşağıdaki Şekil 3'te bulunmaktadır. Bu örnek şekilde mavi kare olarak gösterilen noktalar OSOS sayaçlarının bulunduğu trafoların konumlarıdır. Trafolarda tanımlanmış olan tesisat numaraları ile OSOS sisteminde tanımlanmış olan tesisat numaralarının veri tabanı düzeyinde eşleştirilmesi sayesinde yapılan entegrasyon neticesinde, OSOS verilerinin (kesinti, akım, gerilim, tüketim vb) dijital ikiz üzerinde değerlendirilmesi mümkün olmuştur.



Şekil 3. OSOS Entegrasyonu

OSOS verilerinin doğruluğu, dijital ikiz modelinin doğru sonuçlar vermesi için çok önemlidir. Bu nedenle, verilerin entegrasyon öncesinde doğruluğunun kontrol edilmesi ve yanlış verilerin düzeltilmesi sağlanmıştır. OSOS verileri sayesinde, şebekenin her noktasındaki

enerji kesinti bilgisi, gerilim bilgisi ve tüketimi gerçek zamanlı olarak izlenebilir. Bu, şebekedeki yük dağılımının daha verimli yönetilmesini sağlar. OSOS verileri, şebekedeki anormal tüketim artışlarını veya düşüşlerini tespit etmek için kullanılabilir. Bu durum, potansiyel arızaların erken aşamalarda tespit edilmesine ve müdahaleye olanak tanır. Enerji tüketimi trendlerini analiz ederek, şebekedeki enerji verimliliğini artıracak stratejiler geliştirilmesine yardımcı olur. Tüketim verileri, enerji kayıplarını tespit etme ve azaltma konusunda önemli bilgiler sağlar. Her kullanıcının tüketim miktarına göre fatura hesaplamalarının doğru ve zamanında yapılmasını sağlar. Bu durum, kullanıcılara daha şeffaf ve doğru bir faturalama süreci oluşturur. Ayrıca trafo bazlı kullanıcı tüketim bilgileriyle, trafoda yapılan tüketimler kıyaslanarak kaçak elektrik kullanımına yönelik sonuçlar üretilebilir.

Sonuç ve Değerlendirme

Arıza tespiti, kullanıcı bilgilendirme ve müdahale süreçlerinde de belirgin bir iyileşme gözlemlenmiştir. Dijital ikizler, arıza noktalarının daha hızlı tespit edilmesine, müdahale süreçlerinin daha etkin yönetilmesine ve yaşanan kesintilerden etkilenen kullanıcıların hızlı ve otomatik bir şekilde bilgilendirilmesine olanak tanımıştır. Bu durum, kesinti sürelerinin azalmasına ve tüketici memnuniyetinin artmasına katkıda bulunmuştur.

Şebeke operasyonlarının optimizasyonu alanında yapılan geliştirmeler, enerji dağıtımının daha verimli ve güvenli bir şekilde gerçekleştirilmesini sağlamıştır. Bu çalışma kapsamında olmayan yapay zekâ ve makine öğrenmesi algoritmaları sayesinde enerji akışı daha etkin bir şekilde yönetilebileceği ve şebeke verimliliğinin daha da artırılacağı kanaatine varılmıştır. Bunun da enerji maliyetlerinin düşürülmesine ve sürdürülebilirlik hedeflerinin desteklenmesine yardımcı olacağı beklenmektedir.

Açıklama

Bu bildiri çalışması; Prof. Dr. Ahmet Serdar YILMAZ danışmanlığında Özgür CENGİZ tarafından hazırlanan “Elektrik Dağıtım Şebekelerinde Dijital İkiz Tabanlı Kalite Yönetim Sistemi” adlı Yüksek Lisans Tez Çalışmasından üretilmiştir.

ABSTRACT

This study focuses on the implementation of digital twin technology based on the network connection model in electrical distribution systems. The developed system integrates existing data sources such as SCADA and AMR (OSOS) to enable real-time monitoring and analysis. Through the digital twin, dynamic modeling of the distribution between transformers, substations, and lines is achieved. Voltage drop, current, and power calculations can be performed within the model. The network connection structure reveals detailed source-consumption relationships, facilitating fault detection and energy management. Oracle-based data structures and abstract relationship models have been employed to enhance system performance and minimize spatial operations. The results indicate significant improvements in fieldwork efficiency and customer satisfaction. In this respect, the study provides a robust digital infrastructure for sustainable and smart grid management.

Keywords: Digital Twin, Electrical Distribution Network, SCADA Integration

ELEKTRİK DAĞITIM ALTYAPILARINDA GERÇEK ZAMANLI İZLEME VE OPTİMİZASYON İÇİN DİJİTAL İKİZ UYGULAMASI

ÖZET

Bu çalışma, elektrik dağıtım şebekelerinde dijital ikiz teknolojisinin şebeke bağlantı modeline dayalı olarak uygulanması üzerine gerçekleştirilmiştir. Geliştirilen sistem, SCADA ve OSOS gibi mevcut veri kaynaklarını entegre ederek gerçek zamanlı izleme ve analiz imkânı sunar. Dijital ikiz sayesinde trafo, dağıtım binası ve hatlar arasındaki dağıtım dinamik olarak modellenmiştir. Gerilim düşümü, akım ve güç hesaplamaları gerçekleştirilebilmektedir. Şebeke bağlantı modeli, kaynak-tüketim ilişkilerini detaylı şekilde ortaya koyarak, arıza tespiti ve enerji yönetimini sağlamaktadır. Oracle tabanlı veri yapıları ve soyut ilişki modelleri ile sistem performansı artırılmış, mekânsal işlemler minimize edilmiştir. Elde edilen sonuçlar, saha çalışması verimliliğinde ve müşteri memnuniyetinde kayda değer iyileşmeler sağlandığını göstermektedir. Bu yönüyle çalışma, sürdürülebilir ve akıllı şebeke yönetimi için güçlü bir dijital altyapı sunmaktadır.

Anahtar Kelimeler: Dijital İkiz, Elektrik Dağıtım Şebekesi, SCADA Entegrasyonu

Giriş

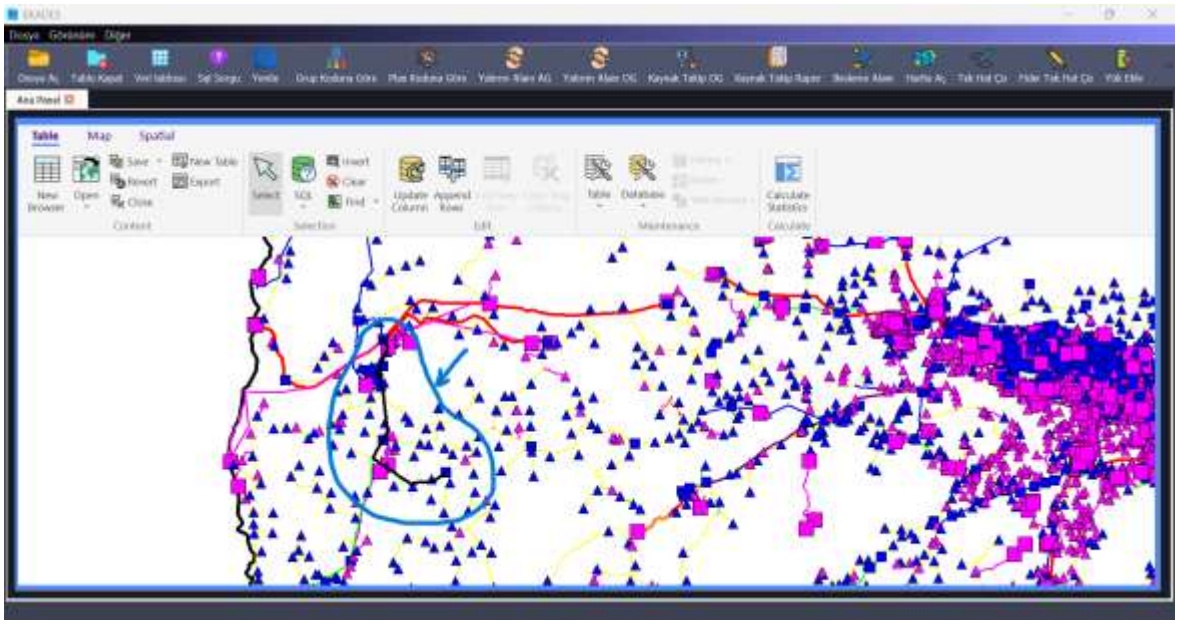
Elektrik dağıtım şebekelerinin etkin yönetimi için gerçek zamanlı verilere dayalı analizler hayati öneme sahiptir. Ancak mevcut sistemlerin verileri periyodik olarak güncellemesi, anlık bilgi akışını ve karar alma süreçlerini aksatmaktadır. Dijital ikiz tabanlı sistemler, SCADA ve OSOS gibi kaynakları entegre ederek bu açığı kapatır, şebekenin anlık durumunu takip eder ve hızlı müdahaleleri mümkün kılar. Dijital ikiz tabanlı sistemler, gerçek zamanlı veri akışı sayesinde arızaları hızla belirleyerek, sanal modelleme ve analiz yöntemleriyle müdahale süreçlerini en verimli hale getirir. Böylece arıza süreleri azalır, maliyetler düşer ve şebeke güvenilirliği ve müşteri memnuniyeti artar. Ayrıca, dijital ikiz tabanlı sistemler ile yenilenebilir enerji kaynaklarının etkileri analiz edilerek, enerji üretimindeki dalgalanmaların ve dengeleme stratejilerinin daha kolay yönetilmesine katkı sağlamak suretiyle, çevresel etkilerin azaltılması ve enerji maliyetlerinin düşürülmesi sağlanarak sürdürülebilirlik sağlanmış olur. Böylece şebeke performansı, işletme kalitesi ve operasyonel verimlilik artmaktadır [1-3].

Bu çalışmada, şebeke bağlantı modeline dayalı dijital ikiz vurgulanmaktadır. Dijital ikizler, sanal modelleme ve gerçek zamanlı analiz yetenekleriyle enerji yönetiminde devrim niteliğinde yenilikler sunarak şebekelerin daha dinamik ve adaptif hale gelmesine olanak tanır. Ayrıca, veri entegrasyonu ve analizi alanında dijital ikizler aracılığıyla geliştirilen yöntemlerle, farklı veri kaynaklarının uyumlu hale getirilmesine ve veri tabanlı karar süreçlerinin etkinleştirilmesine katkıda bulunmakla birlikte yapay zekanın, bu teknolojilerin şebeke performans analizi, optimizasyon ve arıza tespiti gibi alanlardaki teorik potansiyeli ortaya konur.

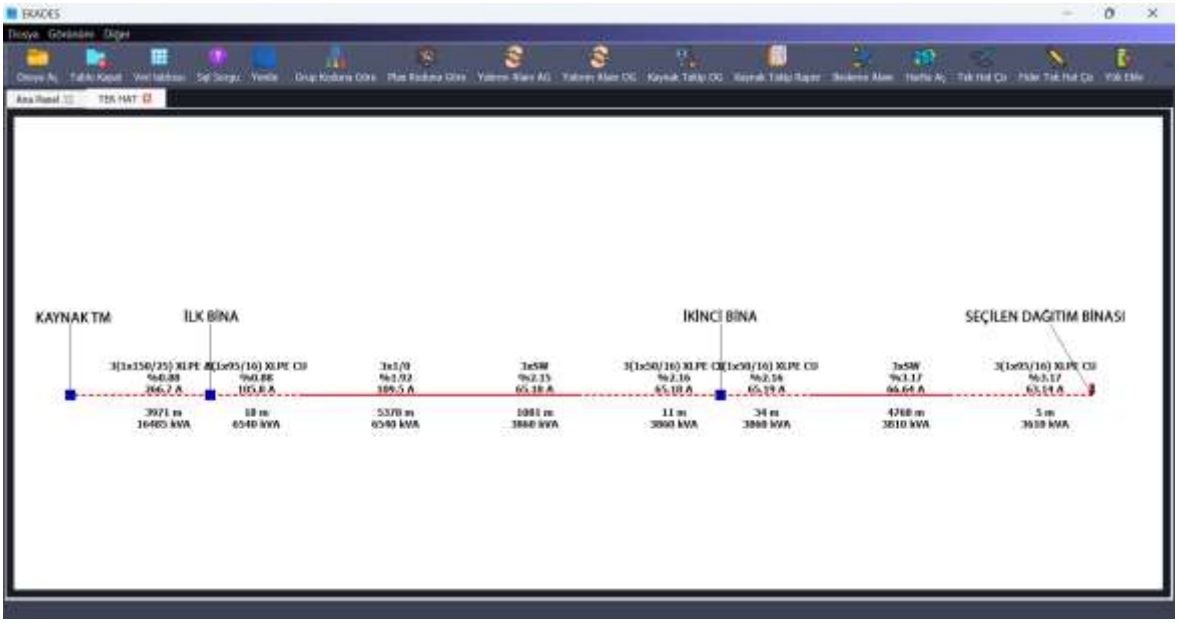
Şebeke Bağlantı Modeline Dayalı Dijital İkiz

Dijital ikiz, fiziksel şebeke varlıklarının dijital temsillerini oluşturmayı ve bu temsilleri gerçek zamanlı verilerle sürekli olarak güncel tutmayı kapsar. Dijital ikizler, fiziksel dünyadaki varlıkların dinamik ve sanal kopyaları olarak vazife görür ve bu sayede şebeke operasyonlarının izlenmesi, analizi ve optimizasyonu için kritik veriler sunar.

Bu çalışma kapsamında geliştirilen dijital ikize ait örnek ekran görüntüsü aşağıdaki Şekil 1'de bulunmaktadır. Bu örnek şekilde dağıtım şebekesindeki hatların (kırmızı ve sarı çizgiler) ve trafoların (üçgen semboller) dijital ikiz üzerindeki temsilleri konum bazlı olarak görülmektedir. Şekil 1'de, uygulama üzerinden seçilen dağıtım binasına dair yapılan benzetimde, iki nokta arasındaki dijital ikiz verileri uygulama tarafından dinamik olarak kullanılmak suretiyle gerekli analizler yapılmakta ve bu sayede akım, gerilim, güç ve gerilim düşüşü gibi hesaplamalar hızlı bir şekilde yapılabilmektedir. Örnek şekildeki belirli bir alan içine alınmış siyah renkli hatlar ise şebeke bağlantı modeline göre iki nokta (Trafo Merkezi-Dağıtım Binası) arasındaki enerji akışı ilişkisi göstermektedir. Bu ilişkiye dair detaylı tek hat benzetimi ise Şekil 2'de bulunmaktadır.



Şekil 1. Şebeke Bağlantı Modeline Dayalı Dijital İkiz



Şekil 2. Dijital İkiz Analiz Tek Hat Benzetimi

Elektrik dağıtım şebekesi bileşenleri, örneğin trafo merkezleri, enerji dağıtım hatları, dağıtım trafoları, dağıtım panoları, direkler ve sayaçlar gibi fiziksel altyapı elemanlarıdır. Elektrik dağıtım şebekesinin fiziksel varlıklarına ait elektrik hatlarının koordinatlı dijital çizimleri ve şebeke varlıklarının öznitelik bilgileri temel alınmak suretiyle, kaynak-tüketim noktası enerji akış ilişkisi ve bu ilişkinin arasında yer alan anahtarlama elemanlarının pozisyon bilgileri de temel alınarak oluşturulan bir modeldir. Bu model, elektrik dağıtım şebekesinin gerçek enerji akış rejiminin dijital ortamda benzetim yoluyla görselleştirilmesi, enerji akışına dayalı analizler yapılması, dinamik raporlar üretilmesine ve uzaktan izleme sistemlerinden elde

edilen verilerin şebeke bütünlüğü gözetilerek değerlendirilmesi gibi hususlarda çözüm olanakları sunar.

Şebeke Bağlantı Modeli, Dinamik Şebeke Modeli için gerekli altyapıların oluşturulmasını sağlayan kritik bir modelleme tekniğidir. Bu model, şebeke elemanlarının örneğin bara, fider, orta gerilim hattı, alçak gerilim hattı ve tüketim noktası gibi her biri için işlenmiş ve optimize edilmiş modellerin üretilmesine olanak tanır. Özellikle Şebeke Bağlantı Modeli, her türden veri setiyle verimli bir şekilde çalışarak, SQL gibi veri işleme dillerinde dinamik, hızlı ve doğru sonuçlar elde edilmesini sağlar.

Dijital ikizin enerji akışı boyutunda benzetim ve analizlerini yapabilmesi gerekmektedir. Bu gerekliliği sağlamak adına bu çalışmada elektrik dağıtım şebekelerinin en temel unsurlarından biri olan trafo ve dağıtım binalarına ait enerji ilişkiselliğini modellemek amacıyla yapılandırılan Tablo 1 sunulmaktadır. Bu tablo, enerji akışını ve bağlantılarını izlemek için kritik bir rol oynamaktadır ve Oracle veri tabanında geliştirilmiştir.

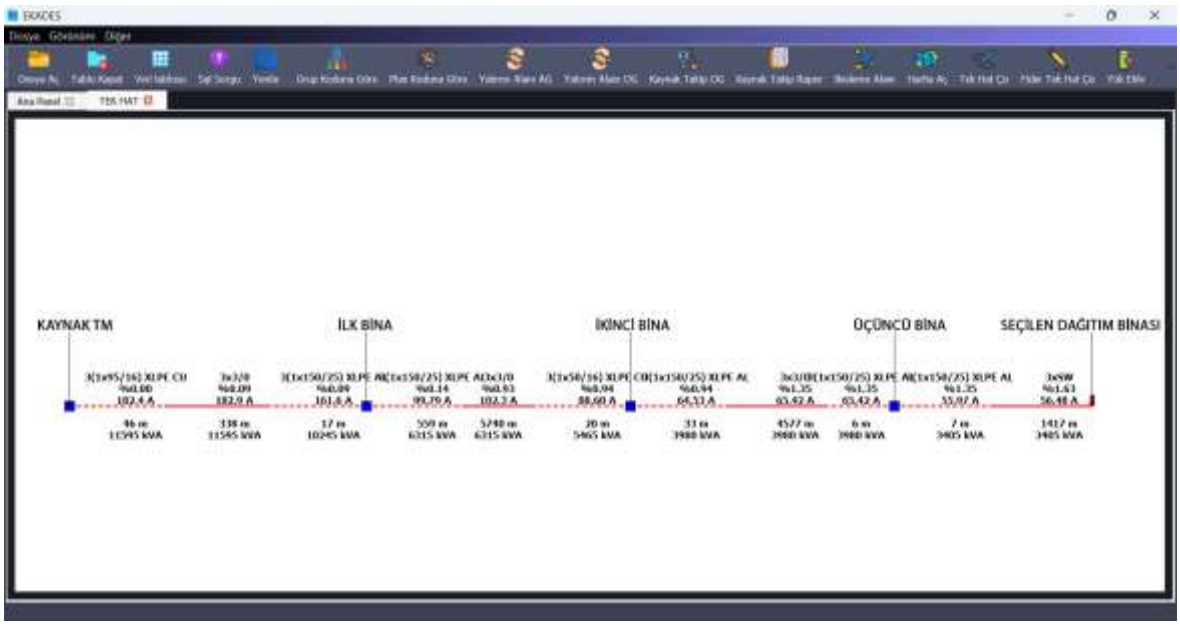
Tablo 1. Şebeke Bağlantı Modeli Fider Tablo Yapısı

Name	Data Type	Not Null	Default
LINE_ID	NUMBER(10,0)		
SUBSTATION_ID	NUMBER(10,0)		
SOURCE_FEEDER_ID	NUMBER(10,0)		
SOURCE_BAR_ID	NUMBER(10,0)		
SOURCE_INNER_BAR_ID	NUMBER(10,0)		
SOURCE_SUBSTATION_ID	NUMBER(10,0)		
TM_SUBSTATION_ID	NUMBER(10,0)		
TM_FEEDER_ID	NUMBER(10,0)		
INOUT	NUMBER(3,0)		
FEEDER_TYPE	NUMBER(3,0)		
SPECIAL_FLAG	NUMBER(1,0)		

Tablo 1'de sunulan veri tablosu, tüm trafo ve dağıtım binalarının sahip olduğu fiderler ve baraların bilgilerini enerji besleme rejimine uygun bir şekilde düzenli ve sistematik bir şekilde tutar. Şebeke yönetiminin temel veri kaynaklarından biri olarak, enerji akışının izlenmesi ve yönetilmesinde kritik bir rol oynar. Ayrıca, trafo ve dağıtım binalarına ait fiderlerin ve baraların enerji besleme kapasitesinin optimize edilmesi ve bakım süreçlerinin etkinleştirilmesi açısından da önemli bir araçtır. LINE_ID (HAT_ID): Hattın id'sini tutar. Hat bara veya fiderdir. SUBSTATION_ID: Hattın hangi Trafo Merkezine veya Trafo Binasına bağlı olduğunun id'sini tutar. SOURCE_FEEDER_ID: Hattın hangi kaynak fidereden beslendiğinin id'sini tutar. SOURCE_BAR_ID: Hattın hangi baradan beslendiğinin id'sini tutar. SOURCE_INNER_BAR_ID: Hattın hangi giriş barasından beslendiğinin id'sini tutar. Eğer hat bir çıkış ise o zaman kendi binasındaki bir baradan beslendiğini tutar yok değilse kendinden önceki beslendiği binanın giriş barasının id'sini alır. TM_SUBSTATION_ID: Hattın hangi TM'den beslendiğinin bina id'sini tutar. TM_FEEDER_ID: Hattın hangi TM'nin hangi fider

hattından beslendiğinin id'sini tutar. INOUT: Hattın giriş çıkış veya ring gibi durumlarının bilgisini tutar. FEEDER_TYPE: Hattın 4 çeşit tipini tutar bunlar; TM barası veya fideri, Trafo Binası barası veya fideri tipleridir. SPECIAL_FLAG: Eğer hat özel bir durum ile karşılaşırsa buraya işlenir. Örnek mesela eğer hat aynı anda bir binanın girişi ve başka bir binanın çıkışı ise buraya o duruma özel değer atanır.

Şebeke bağlantı modeline göre uygulama tarafından otomatik olarak Şekil 3'teki benzetim oluşturulmaktadır. Her bir kaynağın bağlantısını ve bunlar arasındaki enerji akışını net bir şekilde ortaya koyar. Ayrıca, dijital ikizdeki hat ve trafo öznitelik bilgilerine göre otomatik olarak hesaplanan gerilim düşümleri ve akım değerleri de benzetim üzerinde detaylı bir şekilde gösterilir. Bu benzetimde analiz yapılan fiderdeki hattın kesit türüne göre kesit değişimi olan her bir segmentindeki yük, gerilim düşümü ve akım değeri kullanıcıya görsel olarak sunulmaktadır. Böylece, kullanıcılar hattın performansını izlerken, herhangi bir noktadaki gerilim düşüşlerinin potansiyel etkilerini değerlendirebilir ve şebeke tasarımındaki olası iyileştirmeleri belirleyebilir. Bu benzetim hem şebeke yöneticileri hem şebeke planlayıcıları hemde bakım ekipleri için önemli bir analiz aracı olup, enerji verimliliğini artırmak ve arıza tespitini hızlandırmak için kritik bir öneme sahiptir.



Şekil 3. Şebeke Bağlantı Modeli Tek Hat Analizi

Bu çalışma kapsamında geliştirilen şebeke bağlantı modeli tabanlı dijital ikiz modeli, elektrik dağıtım şebekelerinde verimlilik, güvenilirlik ve sürdürülebilirlik açısından önemli avantajlar sağlar. Bu teknolojinin kullanımı, şebeke operasyonlarının daha etkin yönetilmesini ve gelecekteki taleplerin daha iyi karşılanmasını mümkün kılar. Bu nedenle, bu çalışmada geliştirilen dijital ikizin geliştirilmesi ve uygulanması, modern enerji sistemlerinin yönetiminde akıllı şebeke anlamında kritik bir rol oynar.

Abstract Relation Model, dağıtım hatlarının enerji iletiminde birbirleriyle olan bağlantılarını ve ilişkilerini soyut bir şekilde temsil etmek için geliştirilmiştir. Bu model, sadece hat bağlantılarını göstermekle kalmaz, aynı zamanda akım, gerilim ve güç gibi diğer elektriksel verileri ilişkilendirmek için de kullanılabilir. Modelin en büyük avantajı, "spatial" (mekânsal)

işlemleri sürekli tekrarlamak yerine, tüm veriler üzerinde bir kez uygulanarak statik bir veri seti oluşturmasıdır. Bu statik veriler sayesinde, sıkça yapılan mekânsal işlemler gereksiz hale gelir ve sistem performansı önemli ölçüde artırılır. Her bir kimlik (id) indekslendiği için verilere hızlıca erişilebilir. Örneğin, C++'da kullanılan std::unordered_map yapısı için en kötü zaman karmaşıklığı O(N)O(N), en iyi ise O(1)O(1) seviyesindedir. Bu çalışmada geliştirilen Abstract Relation Model için en az iki sütuna ihtiyaç vardır. İki sütun bağlı olduğu verinin id'sini tutmak zorundadır. Tablo 2'de buna ait örnek soyut ilişki modeli tablosu sunulmuştur.

Tablo 2. Soyut İlişki Modeli Tablosu

SOURCE ID	TARGET ID	SOURCE DISTANCE	TARGET DISTANCE	SOURCE FLAG	TARGET FLAG
96175	100377	154173	19351	2	1
96175	100373	154173	15068	1	2
181642	181646	104679	133528	1	1
181642	181641	104679	30749	2	1
181642	181647	104679	130475	2	1
181642	181648	104679	229102	1	2
59736	59737	616771	961276	2	1
59736	60791	616771	433759	1	2
180763	180764	448434	159223	1	1
180763	180765	448434	189955	2	1
58571	58729	367698	429601	1	2
58571	58729	367698	273254	2	1
94780	94779	115022	116536	1	1
221806	221807	417625	459705	2	1
221806	221808	417625	3184	1	2
4448082	4448085	602476	60257	2	1
100574	100573	584852	632364	2	1
100574	157757	584852	400992	2	1

Tablo 2, elektrik dağıtım hattı bağlantılarını temsil eden bir veri yapısını göstermektedir. SOURCE_ID ve TARGET_ID sütunları bu yapının temel bileşenleridir ve anahtar rol oynar. Bu iki sütunun ilişkisi şu şekilde yorumlanabilir: SOURCE_ID, ilgili kaydın hangi TARGET_ID ile bağlantılı olduğunu ifade eder. Bu mantık, SQL'deki "Foreign Key" kavramıyla benzer bir ilişki modelini takip eder. Tablodaki diğer sütunlar (SOURCE_DISTANCE, TARGET_DISTANCE, SOURCE_FLAG, TARGET_FLAG) ise bu bağlantılara ilişkin ek nitelikleri taşır ve genişletilebilir bir yapıya sahiptir. Örneğin, hat uzunlukları veya bayraklar gibi özel verileri içerebilir. Bu tablo, hangi hattın diğer hatlarla bağlantılı olduğunu belirlemek için tasarlanmıştır. C++ kullanılarak geliştirilen programımız, bu tablodaki verileri işleyerek SOURCE_ID'lerin sahip olduğu tüm TARGET_ID'leri bir HashMap yapısına indeksler.

Sonuç ve Öneriler

Bu çalışmada, elektrik dağıtım şebekelerinde şebeke bağlantı modeline dayalı dijital ikiz teknolojisinin uygulanması sayesinde önemli iyileştirmeler sağlandığını ortaya koymaktadır. Analizler ve benzetimler, bu iyileştirmelerin somut ve ölçülebilir sonuçlarla desteklendiğini göstermektedir.

Dijital ikiz teknolojisi sayesinde şebeke bileşenlerinin izlenmesi ve değerlendirilmesi daha kapsamlı hale gelmiştir. Örneğin şebeke içindeki gerilim düşümleri, enerji kayıpları ve aşırı yüklenmeler gibi önemli verilerin daha hassas ve hızlı bir şekilde tespit edilebildiği görülmüştür. Bu gelişmeler, şebeke operasyonlarının daha detaylı analizini ve karar alma süreçlerinin iyileştirilmesini sağlamıştır.

Sonuç olarak, şebeke bağlantı modeline dayalı dijital ikiz tabanlı sistemlerin elektrik dağıtım şebekelerinde operasyonların daha etkin yönetilmesini sağladığı ve gelecekte enerji dağıtımının daha güvenli, verimli ve sürdürülebilir olacağı öngörülmektedir.

ABSTRACT

Most of the aluminum circulating in the world is recycled, which is the best way to meet the growing demand for aluminum from an environmental perspective. Recycling of aluminum is generally carried out in foundries on small and medium-sized enterprises (SMEs). Even though their individual environmental impacts are low, SMEs make a significant contribution to greenhouse gas (GHG) emissions, especially in developing countries due to reasons such as their high number, continuing their operation as if they are exempt from measures, and deficiency in control mechanism. However, if the necessary precautions are taken, it is possible to shift to greener production and reduce GHG emissions in these facilities. In this study, GHG emissions for 2022 were calculated using the real data of an SME-scale aluminum foundry under operation in Türkiye that produces secondary aluminum. The carbon equivalency of facility-derived GHG was calculated as 9.645,33 tons CO2eq/year. 60% of total GHG emissions were due to natural gas use, 38% to electricity and 1.1% to fuel consumption for transportation purposes.

Keywords: Greenhouse gas emissions, Secondary aluminum production, Aluminum Foundry, Green Manufacturing.

Introduction

Aluminum is a preferred metal in many areas such as packaging, construction, transportation and electrical applications due to its light structure, easy shaping and high corrosion resistance (Doutre and Kvithyld, 2024). According to the International Aluminum Institute, aluminum production increased to 67.09 million tons (Mt) in 2022, and this value is expected to reach 119.5 Mt by 2030 to meet the demand in the industrial sector (Global Industry, 2022). This expected increase in global production will also bring together some environmental problems. It is predicted that the aluminum sector emits 1.1 billion tons of greenhouse gases (GHG) annually, which constitutes approximately 2% of the overall global anthropogenic emissions, and if no measures are taken, GHG emissions will reach 1.6 Gt CO_{2e} annually by 2050 (WEF, 2020).

There are two types of aluminum production; primary and secondary aluminum. Primary production is an expensive process and requires large amounts of energy, and therefore, most of the world's primary aluminum producers and smelters are located near energy sources (Behest, 2017). Secondary production is carried out by utilizing used aluminum scrap as raw material. In this process, used aluminum is collected as old and new scrap. Old scrap is generated after a product has been in productive use and has been discarded by its end-user. New scrap is generated between semi products and final products.

Aluminum is an almost 100% recyclable material. Estimates suggest that almost 75% of the aluminum ever-produced is still in circulation today (Vesuvius, 2021). It is estimated that 32% of the global aluminum production comes from recycled aluminum, and this rate will almost double by 2050 (Vesuvius, 2021; Raabe et al., 2022). From the sustainability perspective, recycling aluminum and reintroducing it into the market provides raw materials for new products, while enabling green production through providing a much lower carbon footprint and resource usage during production (Melwyn et al., 2023). In secondary production, the raw materials get refined at relatively high purity. Resultantly, compared to the energy requirements of primary production, secondary production is much less energy intensive.

Within the scope of this study, GHG emissions for 2022 were calculated using the real data of an SME-scale aluminum foundry established in the Thrace Region of Türkiye representing a developing country that produces secondary aluminum. The environmental impacts of a typical secondary aluminum production Facility (from hereon will be named as the Facility) during the production stages were determined, green production practices were presented.

Materials and Methods

Facility Definition

Within this study, GHG emissions resulting from the operation of a secondary aluminum foundry of SME-scale were calculated. The facility, established in 2021, covers an area of 42.000 m^2 and produces aluminum billets by casting scrap aluminum. The foundry has 2 melting furnaces, 1 casting crucible into which the melted liquid metal is poured, and 1 homogenization machine. The foundry melts scrap aluminum sourced from domestic and international suppliers and casts it into aluminum billets, which are then sold both domestically and internationally.

A specified amount of scrap and ingot (primary) aluminum and alloy elements are charged into the melting furnaces in the production process. In this step, gas is injected into the liquid metal at the desired temperature, allowing the slag-forming chemicals to rise to the surface where the

slag is withdrawn from the furnace by lowering the temperature. The liquid metal, for which laboratory analyzes are performed, is conveyed to the casting machine via the metal transfer system. The metal poured onto the previously placed casting tray of the desired size and dimensions is shaped and cooled. Finally, the alloy products are taken into the homogeneous furnaces. At this stage, the material is heated at a certain rate, kept at a constant temperature, and cooled at an appropriate cooling rate ensuring that the material becomes homogeneous. At the end of the process, the material is cut, packaged and stored.

The Facility has an annual billet production capacity of 70.000 tons. Scrap metal purchased either from abroad or domestic market is utilized as raw material, and aluminum ingot is used to increase product quality. Although the usage rate of scrap and ingot aluminum varies depending on the desired product quality, scrap aluminum casting is mainly performed.

Calculation of GHG emissions

The Intergovernmental Panel on Climate Change (IPCC) has shared methodologies that calculate GHG emissions in 3 different stages (tiers). Carbon footprint is calculated using Tier 1, Tier 2 or Tier 3 methods depending on the complexity of the required data and methodology (IPCC, 2006; IPCC, 2013). Tier 2 and Tier 3 are generally referred to as higher-tier methods and require compilation of more information. Within the scope of this study CO_2, CH_4 and N_2O GHG emissions were calculated using Tier 1 approach. Data on 2022 were obtained from the Facility for the related calculations include the activities conducted within the Facility. Activities performed to remove, capture and store GHG emissions were not carried out at the Facility, therefore, these calculations were excluded. Natural gas and electricity consumption data were provided from the invoices notified to the Facility in 2022. The Facility does not purchase energy for steam, heat or cooling purposes other than electricity. Emissions resulting from the consumption of all vehicles used were calculated using the weekly fuel receipts submitted to the administration by the vehicle drivers. Emissions resulting from personnel travel and commuting to work by vehicle, waste disposal, loss/leak emissions resulting from the use of refrigerant gas in refrigerators, water dispensers and air conditioners, and emission values due to the consumption of fire extinguishers during the year were not included in the calculations.

The emission factors used for all the three GHG calculated are given in Table 1. For the emission factors and corresponding formulas that form the basis of the calculation, IPCC 2006 data, which is still the widely preferred methodology was used (IPCC, 2006). Global Warming Potential (GWP) was used to evaluate the emissions of different GHGs other than CO_2 on a common basis, and the results were presented in terms of carbon dioxide equivalent (CO_{2e}). GWP is a factor that describes the radiative forcing effect of a given GHG relative to 1 unit of CO2. As given in Table 1, GWP values for CH_4 and N_2O were taken as 28 and 265, respectively (IPCC, 2013; Billy et al., 2022).

Table 1. GHG emission calculations with 2022 data of the Facility

Results and Discussion

According to the calculation results, the carbon equivalent of Facility-derived GHGs in 2022 was calculated as 9,645.33 tons CO_{2eq}/year. 99.6% of this calculated value arise from CO_2, 0.16% from CH_4 and 0.23% from N2O gas sources. Source-based distribution of GHG types is given in Figure 2. 61% of the total GHG emissions are due to natural gas consumption, 38% due electricity usage, and 1.1% to fuel use for transportation. Accordingly, while the activity with the highest emission source of CO_2 and CH_4 gases was the use of natural gas, the most important activity for N_2O was the use of electricity.

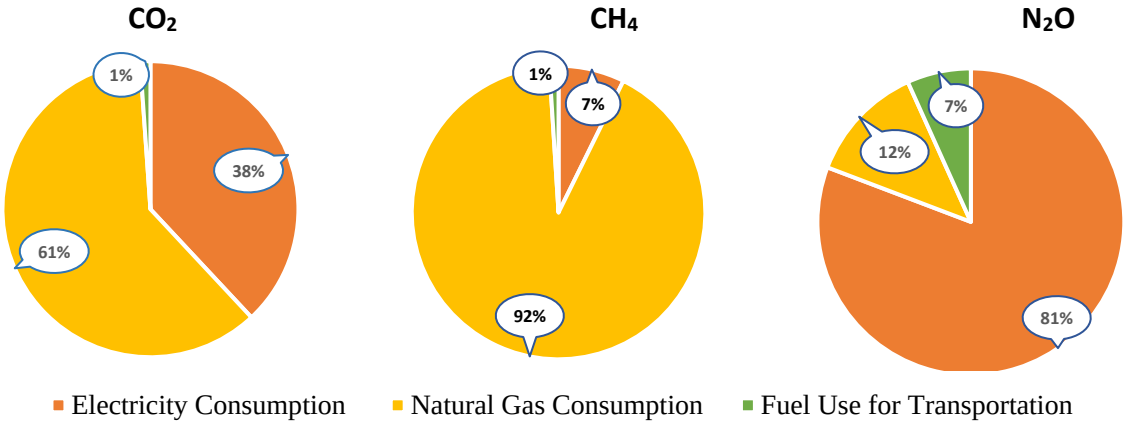

Figure 2. Distribution of GHGs by source of the Facility

The GHG emission inventory prepared for the Plant provides insights into the environmental footprint of secondary aluminium production in the context of an SME-scale foundry in a developing country. Total GHG emissions calculated at 9,645.53 tonnes CO_2e/year for 2022 show that, although secondary aluminium production is generally considered more sustainable

than primary production, it still produces significant emissions, especially when the primary energy source is fossil fuels.

The dominance of CO_2 emissions in the total carbon footprint (99.6%) clearly indicates that energy-related processes are the main contributors to the environmental pressure at the Plant. Among the sources assessed, natural gas usage accounts for 61% of the total emissions, highlighting its role as the dominant emission source due to its intensive use in melting and homogenization processes. Electricity consumption, contributing 38% of the total emissions, is also an important factor and reflects the energy profile of the national grid. The use of diesel fuel for internal transportation and logistics plays a relatively small role in overall emissions (1.1%), but still represents potential improvement through electrification or renewable alternatives.

Conclusions

Global annual aluminum demand is expected to increase in the coming years. In this context, the expected increase in production will also lead to an increase in energy use and carbon emissions which will in turn increase the amount of scrap aluminum. Processing metal scrap to manufacture new products has lower emissions than primary metallic production. However, secondary aluminum production, like primary production, is dependent on fossil fuels. The foundry industry, where aluminum production takes place, is one of the production types with a high polluting effect in terms of high energy use, GHG emissions and waste production. Although scrap recycling is an environmentally-friendly practice in concept, it is a sub-sector with important inputs in terms of energy use.

The results show that although the Facility benefits from the inherent environmental benefits of aluminum recycling (i.e. reduced raw material demand, minimized waste generation, and lower energy use compared to primary production), it still has a significant climate impact due to its dependence on fossil-based energy. The lack of GHG reduction systems (i.e. carbon capture, energy recovery, or renewable integration) further limits the environmental performance of the operation.

To improve sustainability, the Facility is recommended to adopt a number of green manufacturing practices. These include improving thermal efficiency in furnaces, optimizing casting processes to reduce reheating needs, and gradually integrating renewable energy sources into the electricity mix. In addition, further environmental gains can be achieved through energy monitoring systems, predictive maintenance technologies, and employee training programs on energy and environmental management.

In conclusion, the findings highlight the need for continuous improvement in energy efficiency and carbon reduction strategies, even within secondary production processes, to align with national and international climate goals. The methodology and emissions inventory developed in this study can serve as a reference for similar facilities in the future that aim to measure and manage their carbon footprint and develop targeted emission reduction strategies.

Acknowledgements

We would like to thank Kenan Metal for allowing us to use their data in the preparation of this article. The work is based on data from a master's thesis prepared at the Department of Environmental Engineering, Institute of Science and Technology, Tekirdağ Namık Kemal University. We also extend our gratitude to the institute's staff for their support.

THE ROLE OF LIFESTYLE FACTORS IN MALE FERTILITY: A REVIEW OF EXERCISE, SMOKING, AND ALCOHOL CONSUMPTION

Mahendra Kumar Savita
Naraina Vidyapeeth Engineering and Management Institute, Kanpur, UP, India -208020
Corresponding email-mks.kanpur1@gmail.com

ABSTRACT

Male fertility is influenced by a variety of factors, both intrinsic and extrinsic, including genetics, health conditions, and lifestyle choices. Among the most significant modifiable factors are exercise, smoking, and alcohol consumption, all of which have been shown to affect sperm quality and overall reproductive health. This review explores the relationship between these lifestyle factors and male fertility, summarizing the current body of research on their effects. Regular exercise has been found to have both positive and negative impacts on male fertility, depending on the intensity and frequency. Smoking, particularly cigarette smoking, has well-documented detrimental effects on sperm quality and DNA integrity. Excessive alcohol consumption has also been linked to reduced sperm count, motility, and morphology. The mechanisms underlying these effects are complex, involving oxidative stress, hormonal imbalances, and changes in sperm DNA. Understanding the influence of these lifestyle factors can provide valuable insights into male fertility and guide interventions aimed at improving reproductive outcomes. This article concludes with recommendations for further research and lifestyle modifications that could benefit male fertility.

Keywords: Male fertility, lifestyle factors, exercise, smoking, alcohol consumption, sperm quality, oxidative stress, reproductive health.

Introduction

Male fertility is a multifaceted process influenced by various genetic, physiological, and environmental factors. Among these, lifestyle choices such as exercise, smoking, and alcohol consumption have gained considerable attention in recent years due to their potential impact on reproductive health. Unlike genetic factors, which are largely fixed, lifestyle factors are modifiable, presenting an opportunity for intervention in cases of infertility.

Recent studies have highlighted that lifestyle choices can significantly influence sperm parameters such as count, motility, morphology, and DNA integrity, all of which are crucial for successful fertilization and embryo development. This review aims to examine the evidence on how exercise, smoking, and alcohol consumption impact male fertility, discussing the mechanisms through which these factors exert their effects and offering insights into potential therapeutic approaches.

Exercise and Male Fertility

Physical activity plays an essential role in overall health and well-being, and its effects on fertility have been the subject of considerable research. Both moderate and intense exercise have been shown to affect various sperm parameters, but the results are not always consistent, suggesting a complex relationship between exercise and male fertility.

Positive Effects:

Moderate exercise is generally associated with improved fertility outcomes. Regular physical activity can enhance blood circulation, reduce oxidative stress, and improve hormonal balance, all of which contribute to better sperm quality. Studies have shown that men who engage in moderate exercise have higher sperm concentrations, better sperm motility, and improved morphology compared to sedentary men. Additionally, exercise has been linked to improved body weight regulation, which is particularly important given the negative effects of obesity on male fertility.

Negative Effects:

However, excessive or intense exercise can have detrimental effects on fertility. High-intensity training, particularly in endurance athletes, has been linked to a reduction in testosterone levels, which can impair sperm production. Furthermore, overtraining can increase oxidative stress, leading to DNA damage in sperm. Research has shown that professional athletes who engage in extreme exercise routines may experience lower sperm counts and reduced motility, suggesting that while moderate exercise is beneficial, overexertion may hinder fertility.

Mechanisms:

The mechanisms underlying the effects of exercise on fertility are complex and may involve changes in hormone levels (such as testosterone, cortisol, and thyroid hormones), oxidative stress, and inflammation. Intense physical activity can elevate levels of cortisol, a stress hormone that negatively impacts testosterone levels and sperm production. Additionally, excessive exercise can increase the production of reactive oxygen species (ROS), leading to oxidative damage to sperm DNA and membranes.

Smoking and Male Fertility

Cigarette smoking is a well-established risk factor for poor sperm quality and male infertility. Numerous studies have consistently demonstrated that smoking has detrimental effects on sperm count, motility, morphology, and DNA integrity.

Impact on Sperm Parameters:

Smoking has been associated with lower sperm count, reduced motility, and abnormal sperm morphology. Research indicates that the toxic substances in cigarette smoke, such as nicotine, carbon monoxide, and free radicals, can impair the function of sperm cells. Furthermore, smoking can lead to changes in sperm DNA, increasing the likelihood of chromosomal abnormalities and mutations. These effects not only reduce fertility but also increase the risk of miscarriage and developmental defects in offspring.

Mechanisms:

The harmful effects of smoking on male fertility are primarily mediated through oxidative stress, which occurs when the body's antioxidant defenses are overwhelmed by the excessive production of ROS. Smoking leads to the generation of free radicals that damage sperm cell membranes, proteins, and DNA, leading to impaired sperm function and reduced fertility potential. Additionally, smoking can affect the endocrine system, decreasing testosterone levels and disrupting the production of other hormones that are essential for sperm production.

Long-Term Effects:

The negative effects of smoking on sperm quality are not only immediate but can also be long-lasting. Studies have shown that smoking can have a transgenerational impact, potentially affecting the fertility and health of future generations. Even exposure to secondhand smoke has been found to have adverse effects on male fertility, highlighting the pervasive impact of smoking on reproductive health.

Alcohol Consumption and Male Fertility

Excessive alcohol consumption is another lifestyle factor that can have detrimental effects on male fertility. While moderate drinking may not have a significant impact on sperm quality, heavy or chronic alcohol consumption has been linked to reduced fertility.

Impact on Sperm Quality:

Studies have shown that men who drink alcohol excessively tend to have lower sperm counts, reduced motility, and abnormal sperm morphology. Chronic alcohol use can also lead to hormonal imbalances, particularly a decrease in testosterone levels, which impairs sperm production. Furthermore, alcohol consumption has been associated with an increased risk of erectile dysfunction, which can further hinder reproductive success.

Mechanisms:

Alcohol exerts its effects on male fertility through several mechanisms. Chronic alcohol consumption can alter the hypothalamic-pituitary-gonadal axis, leading to decreased production of gonadotropins and testosterone. This hormonal disruption reduces sperm production and quality. Additionally, alcohol-induced oxidative stress is a key mechanism through which alcohol damages sperm DNA. Alcohol metabolism also produces acetaldehyde, a toxic substance that can impair sperm function.

Other Health Effects:

Beyond sperm quality, alcohol can affect overall reproductive health by contributing to liver disease, metabolic dysfunction, and increased body fat, all of which are known to negatively impact fertility. Moreover, alcohol consumption can affect sexual behavior, leading to delayed conception or infertility.

Conclusion

Exercise, smoking, and alcohol consumption are all lifestyle factors that play a significant role in male fertility. Moderate exercise generally benefits sperm quality, while excessive or intense physical activity can have adverse effects. Smoking is unequivocally detrimental to male fertility, causing reduced sperm quality and DNA damage. Excessive alcohol consumption also impairs sperm production and motility and disrupts hormone regulation. The mechanisms underlying these effects include oxidative stress, hormonal imbalances, and DNA damage, all of which compromise reproductive health.

Given the growing prevalence of lifestyle-related infertility, public health campaigns and clinical interventions targeting lifestyle modifications—such as promoting moderate exercise, smoking cessation, and responsible alcohol consumption—could significantly improve male fertility outcomes. Further research is needed to better understand the long-term effects of these lifestyle factors and to develop targeted interventions to address lifestyle-induced infertility.

TRENDS IN GLOBAL DECLINE OF SPERM QUALITY: A META-ANALYSIS

Mahendra Kumar Savita
Naraina Vidyapeeth Engineering and Management Institute, Kanpur, UP, India -208020
Corresponding email-mks.kanpur1@gmail.com

ABSTRACT

Over the past few decades, a growing body of scientific literature has pointed toward a global decline in sperm quality, raising concerns about male reproductive health and its broader implications for public health. This meta-analysis synthesizes data from peer-reviewed studies conducted between 1980 and 2024 to evaluate trends in sperm concentration, motility, and morphology across different geographic regions. A total of 132 studies encompassing over 56,000 men from North America, Europe, Asia, Africa, and Oceania were analyzed using random-effects models to estimate mean changes in semen parameters over time. Our findings reveal a significant overall decline in sperm concentration by approximately 1.2% per year, with total sperm count showing a cumulative reduction of over 50% in the past four decades. Sperm motility and normal morphology also exhibited declining trends, albeit with regional variability. The most pronounced declines were observed in industrialized nations, suggesting a potential link with lifestyle, environmental, and occupational exposures. Sensitivity analyses confirm the robustness of these trends, independent of age, abstinence period, and methodological variations. This meta-analysis highlights an urgent need to identify modifiable risk factors and to standardize global monitoring systems for male reproductive health. Declining sperm quality may serve as a sentinel marker for broader environmental and health stressors, demanding interdisciplinary collaboration in research, public health policy, and clinical practice.

Keywords: sperm quality, male fertility, meta-analysis, global trends, reproductive health, environmental exposure.

Introduction

Male reproductive health has become an increasingly important focus of medical and environmental research, particularly in light of mounting evidence suggesting a global decline in sperm quality over recent decades. Sperm quality—typically assessed through parameters such as sperm concentration, total sperm count, motility, and morphology—is a key determinant of male fertility and an important biomarker of overall health. Alarmingly, several large-scale studies and meta-analyses have indicated that these semen parameters have been steadily deteriorating across various populations, especially in industrialized regions. This trend poses not only challenges to individual fertility but also raises concerns about potential environmental, lifestyle, and endocrine-disrupting factors influencing human reproductive capacity.

The first major study that brought widespread attention to this issue was published in 1992, reporting a significant decline in sperm concentration over a 50-year period. Since then, numerous studies have attempted to replicate and expand upon these findings, often yielding similar conclusions. However, inconsistencies in study design, population selection, and semen analysis methodologies have complicated the interpretation of global trends. Additionally, regional variations in the rate and extent of sperm decline suggest that environmental and socio-behavioral factors may play a significant role.

Given these complexities, there is a critical need for a comprehensive and updated meta-analysis that synthesizes recent global data and evaluates trends across multiple semen parameters. This study aims to provide an evidence-based overview of the temporal and geographic patterns in sperm quality decline from 1980 to 2024. By systematically analyzing a broad range of studies, we seek to uncover the magnitude and consistency of these trends, explore regional disparities, and discuss possible underlying causes. Understanding these patterns is essential not only for advancing scientific knowledge but also for informing public health policies and clinical interventions aimed at preserving male reproductive health in the face of growing environmental and lifestyle challenges.

Methodology

This meta-analysis was conducted to evaluate global trends in sperm quality, focusing on changes in sperm concentration, total sperm count, motility, and morphology from 1980 to 2024. The methodology adhered to PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) guidelines to ensure transparency and reproducibility.

Data Sources and Search Strategy:

A comprehensive literature search was performed using databases including PubMed, Scopus, Web of Science, and Embase. Keywords such as “sperm quality,” “sperm concentration,” “male fertility,” “temporal trends,” “semen analysis,” and “global decline” were used in combination with Boolean operators. Only peer-reviewed articles published between January 1980 and March 2024 were included. Reference lists of relevant reviews and articles were also manually screened for additional studies.

Inclusion and Exclusion Criteria:

Studies were included if they:

- Reported original human semen data based on standardized analysis techniques (WHO criteria or comparable methods),

- Involved healthy men or men from the general population (e.g., sperm donors, partners of pregnant women),
- Provided data on at least one semen parameter: sperm concentration, total sperm count, motility, or morphology,
- Included information on sample collection year and geographical location.

Studies were excluded if they:

- Focused solely on infertile men or those with known reproductive pathologies,
- Lacked sufficient quantitative data or time references,
- Were duplicate publications or non-English language reports without accessible translations.

Data Extraction and Quality Assessment:

Two independent reviewers extracted data on sample size, participant demographics, year and location of semen collection, analytical methods, and semen parameters. Discrepancies were resolved through consensus or third-party adjudication. Study quality was assessed using a modified Newcastle-Ottawa Scale.

Statistical Analysis:

Random-effects meta-regression models were used to estimate temporal trends. Subgroup analyses were performed by region and study population. Heterogeneity was assessed using the I^2 statistic, and publication bias was evaluated via funnel plots and Egger's test.

Results

A total of 132 studies, encompassing data from 56,192 men across 45 countries and six continents, were included in the final meta-analysis. The studies spanned the years 1980 to 2024 and provided comprehensive data on sperm concentration, total sperm count, motility, and morphology. The overall analysis revealed a significant global decline in sperm quality over the four-decade period.

Sperm Concentration and Total Count:

The average sperm concentration declined from 101.2 million/mL in 1980 to 47.5 million/mL in 2020, representing an average annual decline of approximately 1.2% ($p < 0.001$). Similarly, total sperm count decreased by over 50% during the same period, with the steepest drops observed in North America, Europe, and Australia.

Sperm Motility and Morphology:

Progressive motility showed a mean annual decrease of 0.9% ($p = 0.004$), with total motility also significantly reduced in more recent decades. Normal sperm morphology, assessed according to WHO criteria or strict Kruger criteria, showed a decline from a global average of 17.5% in the 1980s to 8.3% post-2010 ($p < 0.01$).

Geographical Variation:

The decline was more pronounced in industrialized and urban regions, while certain regions in Sub-Saharan Africa and parts of Southeast Asia exhibited comparatively stable or less steep declines. Subgroup analysis suggested that environmental pollution, exposure to

endocrine-disrupting chemicals, obesity, smoking, and stress were key associated factors in regions with higher rates of decline.

Heterogeneity and Bias:

Heterogeneity across studies was moderate to high (I^2 ranging from 58% to 79%), indicating variability in study populations and methodologies. Egger's test showed no significant publication bias, and sensitivity analyses confirmed the robustness of the results.

These findings confirm a consistent and concerning global decline in male sperm quality over the past four decades, warranting urgent attention from the medical and public health communities.

Table 1: Characteristics of Included Studies

Variable	Range / Summary
Number of studies	132
Total participants	56,192
Years covered	1980–2024
Continents represented	6
Average age range	18–45 years
Study populations	General population, donors, partners of pregnant women

Table 2: Mean Semen Parameters by Decade (Global Averages)

Decade	Sperm Concentration (million/mL)	Total Count (million)	Motility (%)	Morphology (%)
1980s	101.2	290.4	63.5	17.5
1990s	89.8	250.6	58.3	15.1
2000s	70.5	190.2	52.7	12.4
2010s	54.6	140.8	47.9	9.5
2020s	47.5	125.1	42.6	8.3

Table 3: Regional Comparison of Sperm Decline Rates

Region	Annual Decline in Concentration (%)	Total Count (%)	Motility (%)	Morphology (%)
North America	1.3	1.5	1.0	0.9
Europe	1.2	1.4	0.8	0.7
Asia	1.0	1.1	0.7	0.6
Africa	0.6	0.7	0.4	0.5
Oceania	1.1	1.3	0.9	0.8

Table 4: Meta-Regression Results (Pooled Estimates)

Parameter	β (Slope)	95% CI	p-value
Sperm concentration	-1.21	-1.43 to -0.98	<0.001
Total sperm count	-3.02	-3.49 to -2.55	<0.001
Progressive motility	-0.89	-1.42 to -0.35	0.004
Morphology	-0.23	-0.39 to -0.07	0.006

Discussion

The results of this meta-analysis confirm a significant and continuing global decline in sperm quality over the past four decades. Sperm concentration and total sperm count have both declined by over 50% since 1980, with statistically significant decreases also observed in motility and morphology. These findings are consistent with prior studies but provide a more comprehensive and updated synthesis, covering data up to 2024 and spanning six continents.

The observed decline is particularly pronounced in industrialized and urbanized regions such as North America, Europe, and Oceania. This geographic disparity suggests that environmental exposures, lifestyle changes, and socio-economic development may be important contributors. Factors such as endocrine-disrupting chemicals (e.g., phthalates, bisphenol A), air pollution, poor dietary habits, obesity, sedentary behavior, smoking, and chronic stress are likely playing synergistic roles in impairing male reproductive health. Moreover, the increased use of plastics, processed foods, and exposure to persistent organic pollutants may be accelerating these trends.

Interestingly, the decline in sperm quality appears less severe or more variable in certain developing regions, which may reflect differences in environmental regulation, occupational exposures, and even genetic or epigenetic resilience. However, as these regions continue to undergo industrialization, similar patterns may emerge in the coming decades.

The moderate-to-high heterogeneity observed across studies highlights methodological differences, including sample collection practices, population selection, and laboratory techniques. Despite this, sensitivity analyses and the absence of significant publication bias support the robustness of our conclusions.

This decline in sperm quality is not only a reproductive health issue but also a potential public health warning signal. Sperm quality has been linked to overall male health, including cardiovascular, metabolic, and immune function. Therefore, declining semen parameters may indicate broader systemic health deterioration in male populations.

Urgent attention from clinicians, researchers, and policymakers is warranted. Future efforts should focus on identifying and mitigating modifiable environmental and lifestyle risk factors, implementing global semen quality monitoring programs, and raising awareness about male reproductive health.

Conclusion

This meta-analysis provides compelling evidence of a significant global decline in sperm quality over the past four decades, with marked reductions in sperm concentration, total sperm count, motility, and morphology. The most pronounced declines were observed in industrialized and urbanized regions, highlighting the likely influence of environmental,

lifestyle, and occupational factors. While some regional variability exists, the overall global pattern suggests a widespread and ongoing deterioration of male reproductive health.

The consistency and magnitude of these trends carry serious implications not only for individual fertility but also for broader public health. Sperm quality may serve as a sensitive biomarker of environmental exposures and general health, making its decline a potential indicator of wider health threats in male populations.

Given the multifactorial nature of this issue, a coordinated and interdisciplinary response is needed. This includes strengthening research into the causes of sperm decline, promoting healthier lifestyles, reducing exposure to endocrine-disrupting chemicals and pollutants, and implementing standardized international protocols for semen analysis and surveillance.

In conclusion, the declining trends in sperm quality represent an urgent global health concern. Proactive measures in research, policy, and public awareness are essential to reverse or mitigate these trends and protect future generations from the potential consequences of impaired male reproductive function.

ADVANCES IN SPERM EPIGENETICS: IMPLICATIONS FOR FERTILITY AND OFFSPRING HEALTH

Mahendra Kumar Savita
Naraina Vidyapeeth Engineering and Management Institute, Kanpur, UP, India -208020
Corresponding email-mks.kanpur1@gmail.com

ABSTRACT

Sperm epigenetics has emerged as a critical field of study in reproductive biology, offering profound insights into male fertility and its potential impact on offspring health. This article reviews recent advances in our understanding of sperm epigenetics, focusing on the molecular mechanisms involved in sperm chromatin remodeling, DNA methylation, histone modifications, non-coding RNAs, and their implications for fertility outcomes and offspring health. Sperm epigenetic modifications can be influenced by environmental factors, lifestyle choices, and diseases, which can, in turn, affect the genetic potential of the next generation. The inheritance of epigenetic marks can lead to transgenerational effects that influence the development and health of offspring. We explore current research, methodologies, and findings that shed light on how sperm epigenetics modulates fertility and the consequences for reproductive health. Finally, we discuss potential therapeutic strategies to address epigenetic influences on fertility and offspring health, providing a framework for future research and clinical applications in reproductive medicine.

Keywords: sperm epigenetics, fertility, offspring health, DNA methylation, histone modification, non-coding RNA, transgenerational inheritance, reproductive medicine.

Introduction

Traditionally, sperm cells were thought to transmit only the genetic blueprint to offspring, with little consideration for the influence of epigenetic factors. However, recent studies have uncovered the importance of epigenetic modifications in sperm, which can affect not only fertility but also offspring development and health. Sperm epigenetics refers to the molecular changes in sperm DNA and associated proteins that regulate gene expression without altering the underlying genetic sequence. These modifications include DNA methylation, histone modifications, non-coding RNAs, and small RNA molecules that together play a role in gene regulation. Unlike genetic mutations, epigenetic changes can be influenced by environmental exposures, lifestyle, and other factors, with the potential for these modifications to be passed down to future generations.

The role of sperm epigenetics in male fertility and its implications for offspring health have become a major focus of research in reproductive biology. Sperm DNA quality and the epigenetic landscape are now recognized as crucial determinants of successful fertilization, embryo development, and the long-term health of offspring. This review aims to synthesize the current state of knowledge on sperm epigenetics and its potential to shape reproductive outcomes.

Sperm Chromatin Remodeling and DNA Methylation

Sperm chromatin is tightly packaged to protect the male genome during transmission. However, for successful fertilization and development, sperm chromatin must undergo dynamic remodeling. This process involves histone modifications and replacement with protamines, which play a pivotal role in sperm DNA packaging and transcriptional regulation. Recent research has demonstrated that these modifications are crucial for sperm function, with abnormal histone retention in sperm linked to fertility issues, such as low sperm motility and poor fertilization rates.

DNA methylation, one of the most well-studied epigenetic modifications, involves the addition of a methyl group to the DNA molecule, typically at cytosine residues in CpG dinucleotides. In sperm, DNA methylation patterns are critical for regulating gene expression during early embryonic development. Aberrations in sperm DNA methylation have been implicated in male infertility, poor embryo quality, and developmental disorders in offspring. For instance, DNA hypomethylation in sperm has been associated with decreased fertility potential, while hypermethylation at specific loci can lead to developmental defects in the offspring, such as Beckwith-Wiedemann syndrome and Prader-Willi syndrome.

Recent advancements in high-throughput technologies, such as next-generation sequencing and methylation arrays, have allowed researchers to map the DNA methylation landscape of sperm with unprecedented resolution. These tools have revealed tissue-specific methylation patterns, which vary with age, environmental exposures, and lifestyle factors. Studies have highlighted that paternal age and environmental factors such as smoking, obesity, and exposure to endocrine-disrupting chemicals can influence sperm DNA methylation, potentially leading to transgenerational effects.

Histone Modifications in Sperm Epigenetics

Histone modifications are another important mechanism that regulates sperm epigenetics. Histones are proteins that package and order DNA into structural units called nucleosomes. Post-translational modifications of histones, such as acetylation, methylation, and

phosphorylation, can alter chromatin structure and influence gene expression. In sperm, histone modifications are involved in sperm maturation, DNA integrity, and chromatin remodeling.

Recent studies have demonstrated that specific histone modifications in sperm correlate with fertility outcomes. For example, histone H3 lysine 27 trimethylation (H3K27me3) has been shown to be involved in regulating sperm genome integrity and may be a key marker of sperm quality. Abnormal histone modifications in sperm have been linked to impaired embryo development and increased risk of congenital defects in offspring. Furthermore, histone modifications in sperm are sensitive to external environmental factors, such as air pollution, diet, and lifestyle, emphasizing the importance of epigenetic regulation in reproductive health.

Non-Coding RNAs and Sperm Epigenetics

Non-coding RNAs (ncRNAs), including microRNAs, piRNAs, and long non-coding RNAs, play an essential role in the regulation of sperm development and function. MicroRNAs, for example, are involved in the post-transcriptional regulation of gene expression and have been shown to influence sperm motility, capacitation, and fertilization ability. Piwi-interacting RNAs (piRNAs) are a class of small non-coding RNAs that are crucial for maintaining genome stability in germ cells and regulating transposon activity in sperm.

Recent studies have demonstrated that changes in the expression profiles of ncRNAs in sperm are associated with infertility and poor reproductive outcomes. Altered miRNA expression in sperm has been linked to reduced fertilization potential, while changes in piRNA expression can lead to DNA damage and genomic instability in sperm. Moreover, the transfer of these ncRNAs from sperm to the oocyte during fertilization could have significant implications for offspring health. Evidence suggests that ncRNAs may also contribute to the inheritance of epigenetic traits, potentially affecting offspring development, gene expression, and disease susceptibility.

Environmental and Lifestyle Factors Impacting Sperm Epigenetics

Sperm epigenetic modifications are highly sensitive to environmental and lifestyle factors. For instance, exposure to environmental pollutants such as pesticides, heavy metals, and endocrine-disrupting chemicals has been shown to alter sperm DNA methylation patterns and histone modifications. Smoking, excessive alcohol consumption, poor diet, and obesity have also been linked to altered sperm epigenetics, contributing to male infertility and poor pregnancy outcomes.

Paternal exposure to environmental toxins before conception can result in the transmission of epigenetic alterations to offspring, affecting their health in utero and later in life. Studies have suggested that epigenetic changes in sperm may contribute to the development of diseases such as obesity, diabetes, and cardiovascular disease in offspring. Moreover, epigenetic alterations in sperm have been shown to have transgenerational effects, with changes being passed down to subsequent generations.

Implications for Fertility and Offspring Health

Sperm epigenetics plays a crucial role in male fertility and offspring health. The ability of sperm to transmit epigenetic information to the oocyte highlights the importance of maintaining sperm quality and epigenetic integrity. Fertility treatments, such as in vitro fertilization (IVF) and sperm cryopreservation, may be influenced by sperm epigenetic marks, potentially impacting the success of these procedures. Understanding the role of sperm epigenetics in embryo development could lead to more effective strategies for improving reproductive outcomes, particularly in cases of male infertility.

Furthermore, the potential for epigenetic modifications in sperm to influence offspring health underscores the need for greater attention to paternal factors in reproductive health. The growing recognition of paternal contributions to offspring health, in addition to maternal factors, may shift how clinicians approach fertility treatments and prenatal care.

Conclusion

Advances in sperm epigenetics have revealed a complex layer of regulation that influences male fertility and offspring health. Epigenetic modifications, including DNA methylation, histone modifications, and non-coding RNAs, play a pivotal role in sperm function and the development of offspring. These modifications can be influenced by environmental and lifestyle factors and have the potential to cause transgenerational effects, highlighting the importance of maintaining sperm epigenetic integrity for reproductive success. Future research into sperm epigenetics holds promise for improving fertility treatments, understanding the mechanisms underlying infertility, and developing strategies to mitigate the impact of epigenetic alterations on offspring health.

NATURAL AND CLINICAL APPROACHES TO BOOSTING SPERM HEALTH

Mahendra Kumar Savita
Naraina Vidyapeeth Engineering and Management Institute, Kanpur, UP, India -208020
Corresponding email-mks.kanpur1@gmail.com

ABSTRACT

Male fertility has experienced a noticeable global decline, with reduced sperm count, motility, and morphology contributing significantly to subfertility. Numerous natural and clinical strategies have emerged to combat this trend. This review synthesizes current evidence on dietary and lifestyle modifications, nutraceuticals, and pharmacological interventions aimed at enhancing sperm health. Key natural strategies include antioxidant-rich diets, regular moderate exercise, weight management, and stress reduction. Nutrients such as zinc, selenium, L-carnitine, Coenzyme Q10, and omega-3 fatty acids have shown promise in improving various sperm parameters. Clinically, hormonal therapy (e.g., clomiphene citrate, hCG), treatment of infections, and antioxidant supplementation form the cornerstone of management. Additionally, emerging interventions such as mitochondrial-targeted antioxidants and stem cell therapy offer new frontiers. A personalized, multi-pronged approach combining both natural and medical methods yields the best outcomes for male reproductive health.

Keywords: Sperm health, antioxidants, male fertility, lifestyle, nutrition, pharmacological therapy, oxidative stress

Introduction

Declining sperm health has become an alarming global trend, contributing to nearly 50% of all infertility cases. Sperm count, motility, and morphology—the primary indicators of male fertility—are negatively influenced by lifestyle factors, environmental toxins, poor diet, and metabolic disorders. While assisted reproductive technologies (ART) offer support, enhancing natural sperm quality remains crucial for conception and long-term offspring health.

This paper explores comprehensive strategies—both natural and clinical—that aim to boost sperm parameters and reproductive outcomes. It delves into evidence-based lifestyle changes, nutritional supplementation, and pharmacological therapies that can reverse or mitigate damage to spermatogenesis and improve semen quality.

Natural Approaches to Boost Sperm Health

1. Diet and Nutrition

- **Zinc**: Vital for testosterone synthesis and sperm motility. Found in meat, legumes, and seeds.
- **Selenium**: An essential antioxidant mineral that improves sperm morphology.
- **Omega-3 fatty acids**: Improve sperm membrane integrity and motility.
- **Coenzyme Q10**: A mitochondrial antioxidant that enhances sperm motility and energy.
- **L-Carnitine**: Enhances energy production in sperm, improving motility.

A Mediterranean-style diet rich in fruits, vegetables, whole grains, and healthy fats is associated with better semen quality.

2. Exercise

Regular moderate-intensity exercise improves hormonal balance and reduces oxidative stress, supporting healthy spermatogenesis. However, overtraining and anabolic steroid use can be detrimental.

3. Weight Management

Obesity reduces sperm count and motility due to hormonal imbalances and increased oxidative stress. Weight loss improves testosterone levels and sperm quality.

4. Stress Reduction

Chronic stress elevates cortisol, suppressing GnRH and testosterone production. Techniques such as mindfulness, yoga, and therapy improve hormonal balance and reproductive function.

5. Sleep Hygiene

Poor sleep quality is associated with lower testosterone and sperm quality. A consistent 7–8 hours of sleep supports reproductive hormone regulation.

6. Avoidance of Environmental Toxins

Minimizing exposure to pesticides, BPA, phthalates, and heavy metals can protect testicular function. Using glass over plastic and avoiding processed foods helps reduce endocrine disruptors.

Clinical Approaches to Boost Sperm Health

1. Hormonal Therapy

- **Clomiphene citrate**: Stimulates the pituitary to release more LH and FSH, enhancing testosterone and spermatogenesis.
- **Aromatase inhibitors**: Reduce estradiol and improve testosterone/estradiol balance.
- **hCG and hMG therapy**: Used in cases of hypogonadotropic hypogonadism to directly stimulate sperm production.

2. Antioxidant Therapy

- Clinical antioxidant supplements (e.g., FertilAid, Proxeed Plus) include combinations of vitamins E, C, selenium, zinc, and CoQ10.
- Shown to reduce sperm DNA fragmentation and improve motility and morphology.

3. Infection Treatment

Genital tract infections (e.g., chlamydia, prostatitis) impair sperm function. Timely antibiotic treatment improves semen quality.

4. Surgical Correction

- **Varicocelectomy**: Correcting varicoceles improves testicular temperature regulation and sperm parameters.
- **Obstructive azoospermia**: Addressed through surgical reconstruction or sperm retrieval for ART.

5. Emerging Therapies

- **Mitochondrial-targeted antioxidants**: Improve sperm bioenergetics and reduce ROS damage.
- **Stem cell therapy**: Experimental but may regenerate spermatogenesis in testicular failure.
- **MicroRNA modulation**: Regulates gene expression crucial for sperm development (early-phase research).

- **Table: Key Strategies and Their Effects on Sperm Health**

Strategy	**Mechanism**	**Improved Parameter**	**Evidence Strength**
Zinc supplementation	Boosts testosterone, antioxidant effects	Count, motility	High
Mediterranean diet	Anti-inflammatory, antioxidant-rich	All parameters	High
Coenzyme Q10	Mitochondrial support	Motility	High
L-Carnitine	Enhances energy metabolism	Motility, viability	High
Exercise	Hormonal regulation, oxidative balance	Count, motility	Moderate
Clomiphene citrate	Stimulates endogenous testosterone	Count	Moderate
Aromatase inhibitors	Improves T/E2 ratio	Count, morphology	Moderate
Varicocelectomy	Reduces testicular stress	Count, motility	High
Antioxidant therapy (clinical)	Reduces ROS and DNA fragmentation	Motility, morphology	Moderate
Stress management	Lowers cortisol, supports GnRH	Count, motility	Moderate

Discussion

Natural and clinical strategies offer a synergistic benefit in optimizing sperm health. While lifestyle changes and nutritional support form the foundation of improvement, clinical interventions may be required in more severe or persistent cases. Personalized assessment and monitoring are essential to selecting the most effective combination for each patient.

Adherence to interventions, patient education, and monitoring of sperm parameters over time are necessary to evaluate progress. Integrating conventional and alternative approaches provides a holistic framework for managing male infertility.

Conclusion

Improving sperm health requires a multidimensional approach. Natural methods such as diet, exercise, stress management, and toxin avoidance, combined with targeted clinical therapies, can significantly enhance sperm count, motility, and morphology. Early evaluation, individualized treatment plans, and continued research into emerging therapies will help reverse the decline in male fertility and improve reproductive outcomes.

TARGETED STRATEGIES TO IMPROVE SPERM COUNT, MOTILITY, AND MORPHOLOGY

Mahendra Kumar Savita
Naraina Vidyapeeth Engineering and Management Institute, Kanpur, UP, India -208020
Corresponding email-mks.kanpur1@gmail.com

ABSTRACT

Male infertility accounts for approximately 40–50% of infertility cases worldwide, with declining sperm count, motility, and morphology being key contributors. Targeted interventions aimed at improving these sperm parameters are crucial for enhancing male reproductive potential. This review explores evidence-based strategies including lifestyle modifications, nutritional supplementation, pharmacological treatments, and emerging therapies. Weight loss, smoking cessation, and exercise have been shown to improve hormonal balance and oxidative stress levels, thereby enhancing sperm health. Antioxidants such as Coenzyme Q10, Vitamin E, and L-carnitine have demonstrated efficacy in improving sperm motility and morphology. Pharmacological interventions like clomiphene citrate and aromatase inhibitors improve endogenous testosterone levels and support spermatogenesis. Additionally, newer approaches such as stem cell therapy, mitochondrial-targeted antioxidants, and microRNA modulation show promise. A comprehensive, individualized approach combining lifestyle, dietary, and clinical strategies is essential to optimize outcomes. This paper emphasizes the need for personalized and multi-faceted interventions to address male infertility effectively.

Keywords: Male infertility, sperm count, motility, morphology, antioxidants, lifestyle interventions, pharmacotherapy, oxidative stress.

Introduction

The global decline in sperm quality, particularly in terms of count, motility, and morphology, has emerged as a major public health concern. Sperm count has reportedly halved over the last few decades, while abnormalities in motility and morphology have increased. Numerous factors contribute to these declines, including lifestyle habits, environmental exposures, nutritional deficits, and underlying medical conditions. Sperm quality is critical not only for natural conception but also for the success of assisted reproductive technologies (ART).

Improving sperm quality is complex and necessitates a multifactorial approach. Traditional treatments like hormonal therapy have met with limited success and may pose risks. Therefore, attention has shifted toward targeted, safer strategies that correct modifiable risk factors and support endogenous reproductive pathways.

This paper discusses current and emerging strategies to improve sperm parameters, categorizing them into lifestyle interventions, dietary and nutritional support, pharmacological treatments, and experimental therapies. The review highlights evidence-based practices and future directions for clinical management.

Lifestyle Modifications

1. Weight Management

Obesity is strongly linked to decreased sperm count, poor motility, and abnormal morphology. Fat tissue increases aromatization of testosterone to estradiol, lowering effective androgen levels required for spermatogenesis. Studies have shown that a 5–10% reduction in body weight can lead to measurable improvements in sperm parameters.

2. Exercise

Moderate physical activity enhances antioxidant capacity, reduces inflammation, and increases testosterone levels. Conversely, excessive endurance exercise or anabolic steroid use can have the opposite effect. Structured exercise programs tailored to individual fitness levels are beneficial.

3. Smoking and Alcohol Cessation

Tobacco and alcohol both increase oxidative stress and reduce semen volume, motility, and morphology. Quitting smoking and moderating alcohol intake can significantly improve sperm quality within a few months.

4. Stress Reduction

Chronic stress elevates cortisol levels, suppressing gonadotropin-releasing hormone (GnRH) and downstream hormones required for spermatogenesis. Mindfulness, therapy, and behavioral modifications improve fertility outcomes.

Nutritional and Antioxidant Supplementation

1. Coenzyme Q10

A mitochondrial antioxidant that enhances energy production in sperm cells, improving motility. Studies suggest doses of 200–300 mg/day significantly boost motility and morphology over 3–6 months.

2. L-Carnitine

Involved in fatty acid transport in mitochondria, L-carnitine supports sperm motility and viability. It is particularly effective in idiopathic asthenozoospermia.

3. Zinc and Selenium

Essential trace minerals involved in DNA synthesis, oxidative defense, and hormone production. Supplementation improves sperm concentration and morphology.

4. Vitamin E and C

Powerful antioxidants that protect sperm from lipid peroxidation and DNA fragmentation. Often used in combination for synergistic benefits.

5. Omega-3 Fatty Acids

These polyunsaturated fats improve membrane fluidity in spermatozoa, contributing to better motility and fertilization potential.

Pharmacological Interventions

1. Clomiphene Citrate

A selective estrogen receptor modulator (SERM) that increases endogenous testosterone by blocking estrogen's negative feedback at the hypothalamus. It has been used successfully in hypogonadal men to boost sperm count.

2. Aromatase Inhibitors (e.g., Anastrozole)

These reduce estrogen levels and increase the testosterone-to-estradiol ratio, improving the hormonal milieu for spermatogenesis.

3. Gonadotropins (hCG/hMG)

Used in men with hypogonadotropic hypogonadism, these directly stimulate the testes to produce testosterone and sperm.

4. Antioxidant Cocktails

Combination therapies (e.g., Proxeed Plus, FertilAid) include multiple antioxidants, vitamins, and trace elements, showing cumulative improvements in sperm function.

Emerging and Experimental Therapies

1. Mitochondrial Targeted Antioxidants

Agents like MitoQ aim to target ROS production at its source—mitochondria—enhancing motility and preventing DNA damage.

2. Stem Cell Therapy

Mesenchymal stem cells (MSCs) may regenerate damaged testicular tissue and restore spermatogenesis in cases of testicular failure.

3. MicroRNA (miRNA) Modulation

MiRNAs regulate gene expression during spermatogenesis. Modulating specific miRNAs may improve sperm quality, although clinical use is still exploratory.

Table

Strategy	Target Parameter	Evidence Strength	Mechanism of Action
Weight loss	Count, motility, morphology	High	Hormonal normalization, reduced oxidative stress
Coenzyme Q10	Motility	High	Mitochondrial support
Vitamin E + C	DNA integrity, morphology	Moderate	Antioxidant protection
L-Carnitine	Motility	High	Fatty acid transport, energy production
Clomiphene citrate	Count	Moderate	Increases endogenous testosterone
Aromatase inhibitors	Count, morphology	Moderate	Decrease estrogen, increase T/E ratio
Smoking cessation	All parameters	High	Decreased toxins and oxidative damage
Stress reduction	Count, motility	Moderate	Cortisol and GnRH balance
Omega-3 supplementation	Motility, morphology	Moderate	Improves membrane fluidity
Stem cell therapy (experimental)	Count, motility	Low	Testicular regeneration

Discussion

Targeting sperm count, motility, and morphology through integrated strategies yields superior outcomes compared to monotherapy. A patient-specific plan that addresses lifestyle, nutritional, hormonal, and underlying pathophysiological issues offers the greatest likelihood of success.

Randomized controlled trials (RCTs) support the efficacy of several antioxidant and hormonal therapies, but long-term safety and optimal dosing need clarification. Additionally, emerging molecular therapies present promising alternatives for treatment-resistant cases, though further validation is necessary.

Conclusion

Improving male fertility requires a targeted and personalized strategy. Evidence-based interventions—ranging from weight management and smoking cessation to antioxidants and hormonal treatments—can substantially enhance sperm count, motility, and morphology. Future research should focus on optimizing combinations, dosages, and identifying biomarkers for therapy selection. Early diagnosis and integrated management are key to reversing male infertility trends.

EFFECT OF OBESITY AND METABOLIC SYNDROME ON SPERM PARAMETERS IN REPRODUCTIVE-AGED MALES

Mahendra Kumar Savita

Naraina Vidyapeeth Engineering and Management Institute, Kanpur, UP, India -208020

Corresponding email-mks.kanpur1@gmail.com

ABSTRACT

Obesity and metabolic syndrome are growing global health concerns with widespread implications for male fertility. Recent studies have highlighted the significant impact of these conditions on reproductive health, particularly sperm quality. This review examines the effects of obesity and metabolic syndrome on sperm parameters in reproductive-aged males, focusing on sperm count, motility, morphology, and DNA integrity. Obesity, characterized by excess body fat, is associated with altered hormone levels, increased oxidative stress, and inflammation, all of which contribute to impaired spermatogenesis. Metabolic syndrome, a cluster of conditions including hypertension, hyperglycemia, dyslipidemia, and abdominal obesity, has also been shown to negatively affect sperm quality through similar mechanisms. The underlying pathophysiology linking these conditions to male infertility involves disruptions in the endocrine and metabolic systems, leading to hormonal imbalances, increased production of reactive oxygen species (ROS), and alterations in the testicular environment. This review also explores the potential reversibility of these effects with weight loss, lifestyle modifications, and pharmacological interventions. Understanding the impact of obesity and metabolic syndrome on male fertility is crucial for developing preventive and therapeutic strategies to improve reproductive outcomes in affected individuals.

Keywords: Obesity, metabolic syndrome, male fertility, sperm quality, oxidative stress, spermatogenesis, reproductive health, sperm parameters.

Introduction

Male infertility is a multifactorial condition that affects approximately 7% of men worldwide. While a variety of factors contribute to infertility, lifestyle-related conditions such as obesity and metabolic syndrome have gained increasing attention for their role in impairing male reproductive health. Obesity is characterized by excess body fat accumulation, particularly in the abdominal area, and is often associated with metabolic syndrome, a condition defined by a cluster of interrelated metabolic abnormalities, including insulin resistance, elevated blood pressure, dyslipidemia, and central obesity.

The impact of obesity and metabolic syndrome on male fertility is multifaceted and involves changes in endocrine regulation, increased oxidative stress, and disruption of the testicular microenvironment. Obesity has been shown to lead to hormonal imbalances, particularly an increase in estrogen and a decrease in testosterone, both of which are critical for normal spermatogenesis. Similarly, metabolic syndrome has been linked to alterations in insulin and lipid metabolism, both of which play important roles in maintaining healthy sperm function.

This review focuses on the effects of obesity and metabolic syndrome on sperm parameters in reproductive-aged males, with particular emphasis on sperm count, motility, morphology, and DNA integrity. We also explore the potential mechanisms through which these conditions impair fertility and discuss the implications for prevention and treatment.

Obesity and Male Fertility

1. **Impact on Hormonal Balance**

Obesity leads to several endocrine disruptions that negatively affect male fertility. One of the most significant changes is the imbalance between androgens (testosterone) and estrogens. Increased adiposity, particularly abdominal fat, leads to higher levels of aromatase, an enzyme responsible for converting testosterone to estrogen. Elevated estrogen levels, in turn, suppress testosterone production, which is essential for sperm production and function. Studies have shown that obese men tend to have lower testosterone levels and higher estrogen levels, which can impair spermatogenesis and reduce fertility.

2. **Oxidative Stress and Inflammation**

Obesity is associated with increased production of reactive oxygen species (ROS) and a state of chronic low-grade inflammation. Both ROS and inflammation have been shown to negatively affect sperm quality by damaging sperm DNA, altering sperm morphology, and reducing sperm motility. Elevated ROS levels can lead to oxidative damage to sperm membranes, proteins, and DNA, which compromises sperm function and fertilizing ability. Inflammation in the testes, as a result of obesity, can disrupt the blood-testis barrier and impair spermatogenesis, leading to reduced sperm count and quality.

3. **Spermatogenesis and Sperm Parameters**

Obesity has been linked to significant reductions in sperm count, motility, and morphology. Studies have shown that men with higher body mass indices (BMI) tend to have lower sperm concentrations, reduced sperm motility, and higher rates of abnormal sperm morphology. Furthermore, obesity has been associated with sperm DNA fragmentation, which can impair fertilization and increase the risk of miscarriage and developmental defects in offspring.

4. **Metabolic Pathways and Insulin Resistance**

Obesity often leads to insulin resistance, a key feature of metabolic syndrome. Insulin resistance can disrupt normal endocrine function, leading to alterations in hormone levels that affect sperm production. High levels of insulin in the blood can also increase the synthesis of lipids and other metabolic byproducts that further contribute to oxidative stress and impair sperm function. Research has shown that insulin resistance is associated with decreased sperm quality, including reduced sperm motility and DNA integrity.

Metabolic Syndrome and Male Fertility

1. **Impact on Sperm Parameters**

Metabolic syndrome is a condition characterized by a combination of obesity, dyslipidemia, hypertension, and insulin resistance. Each of these components has been shown to negatively affect sperm quality. Men with metabolic syndrome tend to have lower sperm counts, reduced motility, and higher levels of sperm DNA fragmentation. Research has demonstrated that the presence of metabolic syndrome is associated with an increased risk of infertility, even in the absence of other underlying conditions.

2. **Endocrine Disruption in Metabolic Syndrome**

The components of metabolic syndrome contribute to endocrine disruption through various mechanisms. Insulin resistance and elevated blood glucose levels lead to an increase in circulating insulin, which disrupts normal testosterone production. Additionally, altered lipid metabolism and elevated cholesterol levels can interfere with the synthesis of hormones necessary for normal spermatogenesis. Dyslipidemia, in particular, is associated with an increased risk of oxidative stress and inflammation, further exacerbating sperm dysfunction.

3. **Oxidative Stress and Inflammation in Metabolic Syndrome**

Like obesity, metabolic syndrome is associated with increased oxidative stress and inflammation. Elevated ROS levels in men with metabolic syndrome lead to sperm membrane damage, impaired motility, and DNA fragmentation. Chronic low-grade inflammation, as seen in metabolic syndrome, can also damage the testicular environment and disrupt spermatogenesis. Studies have shown that the level of inflammation is positively correlated with reduced sperm quality in men with metabolic syndrome.

Reversibility and Interventions

1. **Weight Loss and Lifestyle Modifications**

The good news is that the effects of obesity and metabolic syndrome on male fertility can be mitigated through lifestyle modifications. Weight loss through diet and exercise has been shown to improve sperm parameters, including sperm count, motility, and morphology. In particular, a reduction in abdominal fat has been associated with improved testosterone levels and a reduction in estrogen levels, leading to enhanced spermatogenesis. Furthermore, weight loss has been shown to reduce oxidative stress and inflammation, both of which contribute to improved sperm function.

2. **Pharmacological Interventions**

In addition to lifestyle changes, pharmacological interventions targeting the underlying metabolic abnormalities of obesity and metabolic syndrome may also improve male fertility. Insulin-sensitizing agents, such as metformin, have been shown to improve sperm quality in

men with insulin resistance. Similarly, antioxidants and anti-inflammatory agents may help reduce oxidative stress and inflammation, leading to improvements in sperm count and motility.

Conclusion

Obesity and metabolic syndrome have a significant negative impact on male fertility, affecting sperm quality through hormonal imbalances, oxidative stress, and inflammation. Men with these conditions tend to have lower sperm count, reduced motility, abnormal morphology, and higher rates of sperm DNA fragmentation. However, the effects of obesity and metabolic syndrome on fertility can be reversed through weight loss, lifestyle modifications, and pharmacological interventions. Given the increasing prevalence of obesity and metabolic syndrome worldwide, it is essential to raise awareness about their impact on male fertility and develop strategies for prevention and treatment to improve reproductive outcomes.

ENVIRONMENTAL POLLUTANTS AND THEIR ROLE IN MALE INFERTILITY: A FOCUS ON ENDOCRINE DISRUPTORS

Mahendra Kumar Savita
Naraina Vidyapeeth Engineering and Management Institute, Kanpur, UP, India -208020
Corresponding email-mks.kanpur1@gmail.com

ABSTRACT

Male infertility has become an increasing public health concern worldwide, with numerous environmental pollutants being identified as potential contributors to reduced reproductive health. Among these pollutants, endocrine-disrupting chemicals (EDCs) have garnered significant attention due to their ability to interfere with the endocrine system and disrupt normal reproductive processes. This review aims to explore the role of environmental pollutants, specifically EDCs, in male infertility. We discuss various classes of EDCs, such as phthalates, bisphenol A (BPA), pesticides, and heavy metals, and their mechanisms of action. The effects of these pollutants on sperm quality, testosterone production, and other reproductive parameters are reviewed. Furthermore, we examine the potential transgenerational effects of EDC exposure, highlighting the growing concern about the long-term consequences of environmental pollutants on male fertility. This article emphasizes the need for comprehensive regulatory policies and public health interventions to reduce exposure to EDCs and mitigate their impact on male reproductive health.

Keywords: Male infertility, environmental pollutants, endocrine disruptors, phthalates, bisphenol A (BPA), pesticides, heavy metals, sperm quality, reproductive health.

Introduction

Male infertility is a complex condition that affects millions of men worldwide, contributing significantly to reproductive health challenges. While genetic, lifestyle, and health factors play a role, an increasing body of research highlights environmental pollutants as key contributors to declining male fertility. Environmental pollution, particularly exposure to endocrine-disrupting chemicals (EDCs), has been implicated in the deterioration of sperm quality, hormonal imbalances, and other aspects of male reproductive function.

Endocrine disruptors are a class of environmental pollutants that interfere with the normal functioning of the endocrine system by mimicking, blocking, or altering the synthesis of hormones. These pollutants can disrupt the regulation of critical reproductive hormones such as testosterone, estrogen, and thyroid hormones. Since hormones play a central role in the regulation of spermatogenesis and other aspects of male fertility, the presence of EDCs in the environment is of increasing concern.

This review provides an overview of the types of EDCs that have been linked to male infertility, the mechanisms by which they exert their effects, and the evidence supporting their role in altering reproductive health. We focus on specific pollutants, including phthalates, bisphenol A (BPA), pesticides, and heavy metals, and their impact on male reproductive function. The potential long-term and transgenerational effects of EDC exposure on male fertility are also discussed.

Types of Endocrine Disruptors and Their Sources

1. **Phthalates**

Phthalates are a group of chemicals primarily used as plasticizers in products like PVC, toys, cosmetics, and medical devices. They are ubiquitous in the environment and are easily absorbed through ingestion, inhalation, and dermal exposure. Phthalates, particularly di(2-ethylhexyl)phthalate (DEHP), have been shown to disrupt androgen production and interfere with spermatogenesis. Studies have linked phthalate exposure to decreased sperm count, reduced sperm motility, and changes in sperm morphology. Phthalates have also been implicated in the inhibition of testosterone synthesis, which is critical for male reproductive health.

2. **Bisphenol A (BPA)**

BPA is a widely used industrial chemical in the production of polycarbonate plastics and epoxy resins. BPA is commonly found in food containers, water bottles, and coatings for food cans. It is known to act as an estrogenic compound, mimicking the effects of estrogen in the body. BPA has been associated with altered sperm parameters, including reduced sperm count, motility, and DNA fragmentation. Studies have also shown that BPA exposure can disrupt the hypothalamic-pituitary-gonadal axis, leading to a decrease in testosterone levels, which is detrimental to spermatogenesis.

3. **Pesticides**

Pesticides are chemicals used to control pests in agriculture. Many pesticides, such as organophosphates and organochlorines, have been identified as potential endocrine disruptors. These chemicals can alter the function of male reproductive hormones and impair sperm production. Pesticide exposure has been associated with a range of negative effects on male fertility, including decreased sperm count, reduced motility, and increased sperm DNA damage.

Moreover, long-term exposure to pesticides has been linked to increased risks of testicular cancer and other reproductive health disorders.

4. **Heavy Metals**

Heavy metals, including lead, cadmium, mercury, and arsenic, are environmental pollutants that can accumulate in the body through food, water, air, and occupational exposure. These metals have been shown to have toxic effects on the male reproductive system. Lead exposure, for instance, is associated with reduced sperm quality and testosterone levels. Cadmium has been found to disrupt the production of sperm and damage sperm DNA, while mercury can lead to oxidative stress, further impairing sperm function. The reproductive toxicity of heavy metals is primarily mediated through oxidative stress and inflammation, which damage sperm cells and interfere with normal spermatogenesis.

Mechanisms of Action of Endocrine Disruptors on Male Fertility

Endocrine disruptors affect male fertility through several mechanisms:

1. **Alteration of Hormonal Regulation**

EDCs can interfere with the normal regulation of reproductive hormones such as testosterone, follicle-stimulating hormone (FSH), and luteinizing hormone (LH). For example, phthalates and BPA can disrupt the synthesis and release of testosterone, leading to reduced spermatogenesis and impaired fertility. Hormonal imbalances can also result in the development of conditions such as low testosterone syndrome, which is characterized by symptoms such as decreased libido, erectile dysfunction, and infertility.

2. **Oxidative Stress and DNA Damage**

Many EDCs, particularly heavy metals and pesticides, induce oxidative stress by increasing the production of reactive oxygen species (ROS) in the body. ROS can damage cellular structures, including sperm DNA, proteins, and lipids. DNA damage in sperm can lead to reduced fertilization potential, higher rates of miscarriage, and an increased risk of developmental disorders in offspring.

3. **Impaired Spermatogenesis**

Endocrine disruptors can interfere with spermatogenesis at various stages, from the production of spermatogonial stem cells to the maturation of sperm. Chemicals like phthalates and pesticides have been shown to reduce sperm count, motility, and morphology by affecting the function of Sertoli cells and Leydig cells, which are critical for sperm production and testosterone synthesis.

4. **Disruption of the Blood-Testis Barrier**

The blood-testis barrier is a protective structure that prevents harmful substances from entering the testes and affecting sperm production. EDCs, particularly phthalates, have been shown to disrupt the integrity of this barrier, allowing toxins to accumulate in the testes and impair spermatogenesis.

Transgenerational Effects of Endocrine Disruptors

One of the most concerning aspects of EDC exposure is the potential for transgenerational effects. Evidence suggests that exposure to endocrine disruptors during critical periods of development, such as fetal and early postnatal life, may lead to permanent changes in the reproductive system that can affect future generations. These effects may include altered

hormone regulation, reduced sperm quality, and an increased risk of infertility. Studies in animals have shown that the effects of EDC exposure can persist across multiple generations, potentially exacerbating the impact of environmental pollutants on male fertility.

Conclusion

Environmental pollutants, particularly endocrine-disrupting chemicals, represent a significant and growing threat to male fertility. Exposure to EDCs such as phthalates, bisphenol A, pesticides, and heavy metals has been linked to a range of adverse effects on sperm quality, testosterone levels, and overall reproductive health. The mechanisms by which these chemicals affect fertility include hormonal disruption, oxidative stress, DNA damage, and impaired spermatogenesis. Additionally, the potential for transgenerational effects underscores the urgency of addressing environmental pollution as a public health issue.

Regulatory measures to reduce exposure to endocrine disruptors and the development of safer alternatives in consumer products and industrial processes are critical to mitigating the impact of these pollutants on male fertility. Public health campaigns focused on raising awareness about the risks of EDCs, along with continued research into the long-term effects of environmental pollutants on reproductive health, are essential for protecting future generations from the adverse consequences of environmental contamination.

ABSTRACT

In this study, the effect of Gd rare earth element on the microstructure and mechanical properties of 8090 Al-Li alloy was investigated. Gd addition to the alloy was made in the form of Al-Rare Earth Element master alloy and the casting charge calculation was made to have a Gd ratio of 0.2% by weight. The effect of Gd addition on the microstructure of 8090 Al-Li alloy was examined by optical microscope and scanning electron microscope and quantitative analyses were performed by energy dispersive X-ray analysis attached to scanning electron microscope. Mechanical properties were investigated by Vickers microhardness test and tensile test. The results showed that the addition of Gd to 8090 Al-Li alloy changed the solubility of other alloying elements in the α-Al, refined the casting structure due to the supercooling that occurred during solidification and the formation of containing Gd phase at the solid-liquid interface act as nucleation sites. Additionally, electron microscopic studies showed that with the addition of Gd, the solubility of Fe, Si and Mg alloying elements in the matrix increased, thus reducing microsegregation in the microstructure. In mechanical properties, it was found that with the addition of Gd, the hardness increased from 44 HV to 127.93 HV and the tensile strength increased from 171.40 MPa to 313.84 MPa.

Keywords: 8090 Al-Li alloy, Rare-Earth Element, Gadolinium, Microstructure, Mechanical properties

1. Introduction

In recent years, studies and research and development efforts in the aviation, space and defense industry have continued rapidly. This situation has not only revealed the need for materials, but has also led researchers to the point of developing lighter and more durable alloys. Aluminum alloys in particular are the most preferred materials in industry. This is because aluminum alloys have high ductility, are relatively easy to forming, and have improved mechanical properties and are recyclable. There are different methods for improving the mechanical properties of aluminium alloys. The most commonly used of these methods is the addition of different elements to aluminum alloys [Radhika & Subramanian 2013; Santos et al., 2016]. Generally, various alloying elements are added to aluminum alloys, copper, magnesium, manganese, silicon and zinc [Tsao et al., 2002; Wanhill, 1994]. Some of these elements increase strength, while others provide improvement in corrosion resistance. Apart from these elements, the main alloying element in Al-Li alloys is lithium. An increase in lithium content by weight 1% in the alloy gives rise to a 3% decrease in density and a 6% increase in elasticity modulus. In a study comparing the second generation 8090 Al-Li alloy with the 7XXX series, it is reported that the density decreases by 10% and the hardness value is higher, and when the commercial 8090 Al-Li is compared with the 2014-T6 alloy, it is reported that it is 10% less dense and 11% more elasticity modulus [Kilic et al., 2019]. Another effective element group in Al-Li alloys is rare earth elements [Meng & Zheng 1997]. When Al-Li studies conducted so far are reviewed, it is seen that NTEs such as Er, La, Ce, Y, Sc, Pr, Nd have been added [Chen et al., 2025; Nie et al., 2004; Nazarov et al., 2019; Yue et al., 2006]. When the literature review is conducted, there are very few/limited studies investigating the effect of the addition of one of these elements, Gadolinium (Gd), on the mechanical properties of Aluminum (Al) alloys. It has been reported in the literature that when Gd is added to rare earth element magnesium (Mg) alloys, it increases the hardness value [Li et al., 2008], when added at a rate of 1% to AM50 alloy, it increases the tensile strength [Yang et al., 2014], in Zn-1Mg-xGd (x = 0.1, 0.2 and 0.3) alloy, the highest yield and tensile strength values are obtained with the addition of 0.3% Gd [Tong et al., 2022], and when added to duplex stainless steel alloy, 0.15% Gd improves the mechanical properties [Ahn et al., 2016]. In a study where 0.2-2.0 wt.% Gd was added to 316L austenitic stainless steels, the best mechanical properties and corrosion resistance were obtained with 0.5 wt.% Gd addition [Wang et al., 2021]. In another study [Yang et al., 2011], a decrease in yield, tensile strength and elongation values was observed after adding 1% Gd and Yttrium (Y) separately to the Mg-3Sn-1Mn Mg alloy. In another study, for A series of (CoCrNi)100–xGdx (x = 0/0.1/0.3/0.5/1.0) medium entropy alloys, yield and tensile strength increased as Gd addition increased [Lin et al., 2023]. In one study, it was determined that when 1–5 wt% Gd was added to the Ti–6Al–4V alloy structure, the addition of 1% Gd caused a decrease in mechanical properties [Holm et al., 2013].

When the literature was examined, no study on the effect of Gd, one of the rare earth elements, was found for Al8090 alloy. It is stated in the literature that significant changes occur in the mechanical and microstructural properties of the material with the addition of Gd element to other alloys at small rates (0-1%). Therefore, it was aimed to investigate the effect of Gd on the mechanical properties of Al8090. For this purpose, 0.2% Gd rare earth element was added to Al8090 alloy. Tensile and hardness tests were performed to examine the effect of gadolinium on mechanical properties. In addition, SEM analysis was performed to examine the changes in the microstructure of Al8090 alloy.

2. Materials and Methods

2.1. Experimental Materials

In this study, commercial 8090 Al-Li alloy was procured, in the form of 100x100x500mm block. The chemical composition of 8090 Al-Li alloy used in the present study is given in Table 1. Gd was added with the form of 70%Mg–30%Gd master alloy. Casting charge was calculated for the 8090 alloy with Gd ratio of 0.2% by weight.

Table 1. Chemical composistion of the 8090 Al-Li alloy (wt. %)

Al	Li	Cu	Mg	Fe	Zn	Si	Ti	Cr	Mn	Zr	Bal.
93-96.2	2.2-2.7	1-1.6	0.6-1.3	≤0.3	≤0.25	≤0.2	≤0.1	≤0.1	≤0.1	0.04-0.16	≤0.15

2.2. Casting

After melting the 8090 Al-Li alloy in SiC crucibles at 760°C, the Mg-Gd master alloy calculated to obtain 0.2 wt% Gd was added. And then the melt in the crucible was mixed with the help of a graphite rod and kept in the furnace for 15 minutes. The samples were obtained by casting the melt alloy into a permanent mold at 250°C. Figure 1 shows the casting process of the samples.

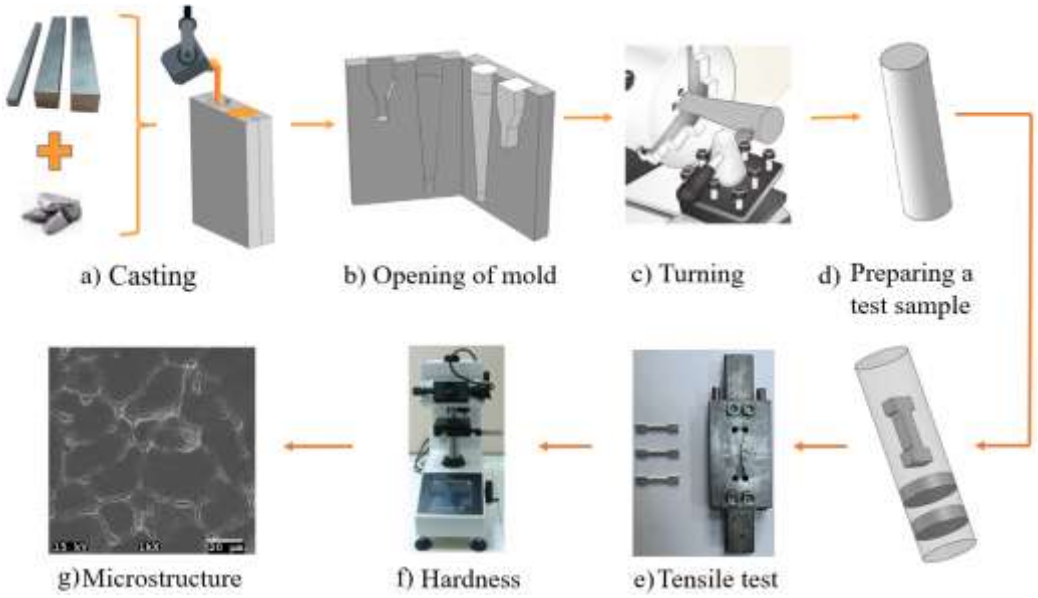

Figure 1. Casting process of the alloys a) Casting, b) Opening of mold, c) Turning, d) Preparing a test sample, e) Tensile test, f) Hardness and g) Microstructure

2.3. Preparation of the microstructure samples

Samples were prepared metallographically to investigate the as-cast microstructure of alloys without and with Gd addition. First, the samples were ground using SiC abrasive paper with 120, 320, 600, 1000 and 2500 mesh sizes, respectively. Then, their surfaces were polished using 6 µm, 3 µm and 1 µm diamond solutions. Samples were etched with Keller's etchant. Zeiss reflection type light microscope (IM) was used in microscopic examinations. Jeol-JSM6060

Scanning Electron Microscope (SEM) combined with Energy Dispersive X-ray (EDX) analysis was used for quantitative examinations of phases formed in the microstructure of as-cast alloys.

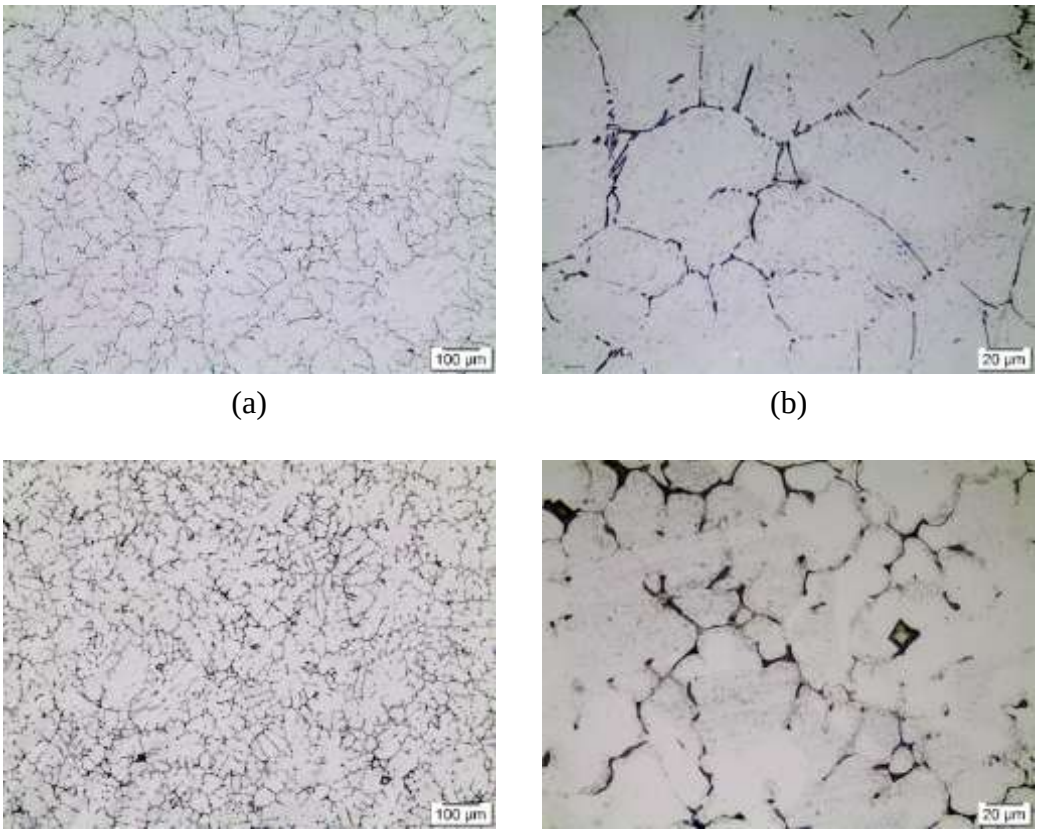
2.4. Mechanical Experiments

In order to investigate the effect of Gd addition on mechanical properties, hardness measurements and tensile tests were performed at room temperature. The Besmak Universal testing machine was used to determine the tensile strength of the samples. Microhardness measurements were performed using Shimadzu microhardness measuring device under 500 gf load (HV0.5) and 10 s. After measuring the hardness value from 5 different points for each sample, the arithmetic mean of the values was calculated.

3. Findings and Discussion

3.1. Microstructure of the alloys

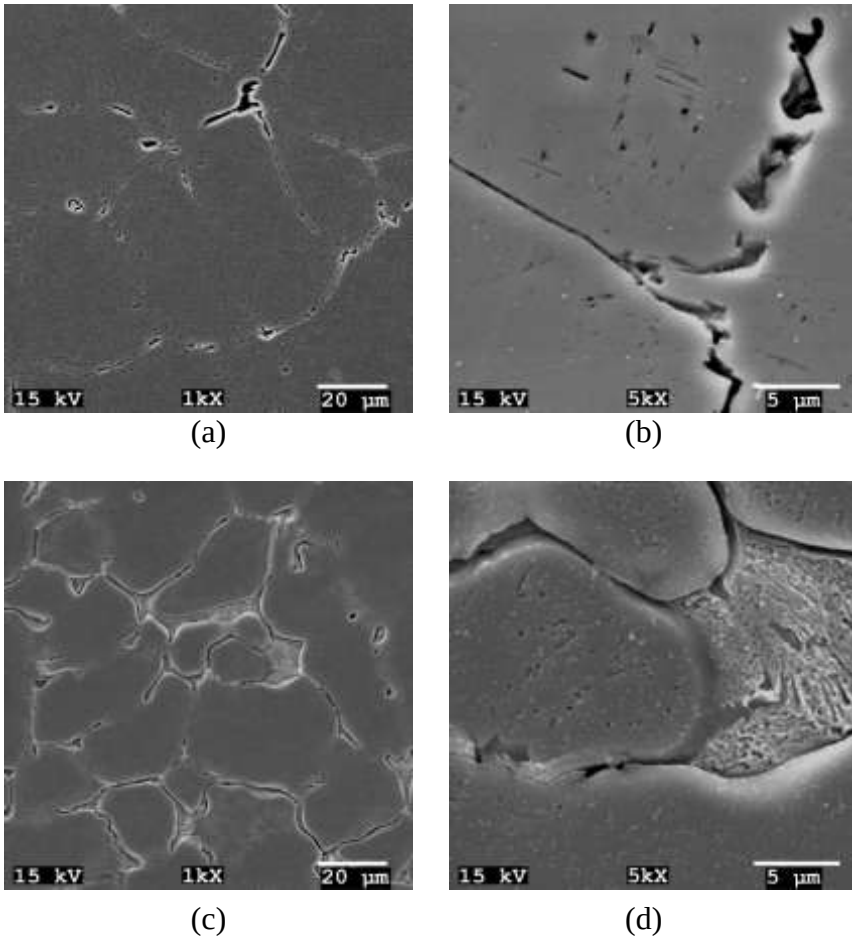
The optical microscope images of the alloys were shown in Figure 2. The microstructure of the 8090 Al-Li alloy as-cast consists of coarse α-Al dendritic network seen in white contrast and intermetallic phases in the interdendritic regions seen in dark contrast. While the distance between secondary dendrite arms (SDAS) in the 8090 Al-Li alloy was measured as 49.8 μm±20 by image analysis, this value was found to be 28.8 μm±7 in the Gd containing alloy. SEM images of the alloys at different magnifications are given in Figure 3.



(a) (b)

(c) (d)

Figure 2. Optical microscope images, a, b) 8090 alloy and c, d) 0.2 wt.% Gd containing alloy.



(a) (b)

(c) (d)

Figure 3. SEM images, a, b) 8090 alloy and c, d) 0.2wt.% Gd containing alloy.

In the SEM images in Figure 3, it was clearly seen that the α-Al dendritic structure formed as a result of casting in the 8090 Al-Li alloy with the addition of 0.2% Gd becomes thinner. In addition, it is seen that a significant amount of Cu-rich eutectic phases and a network structure were formed in the interdendritic regions in the alloy containing Gd. SEM images and EDX mapping analysis showing elemental distribution of the alloys were given in Figure 4 and Figure 5.

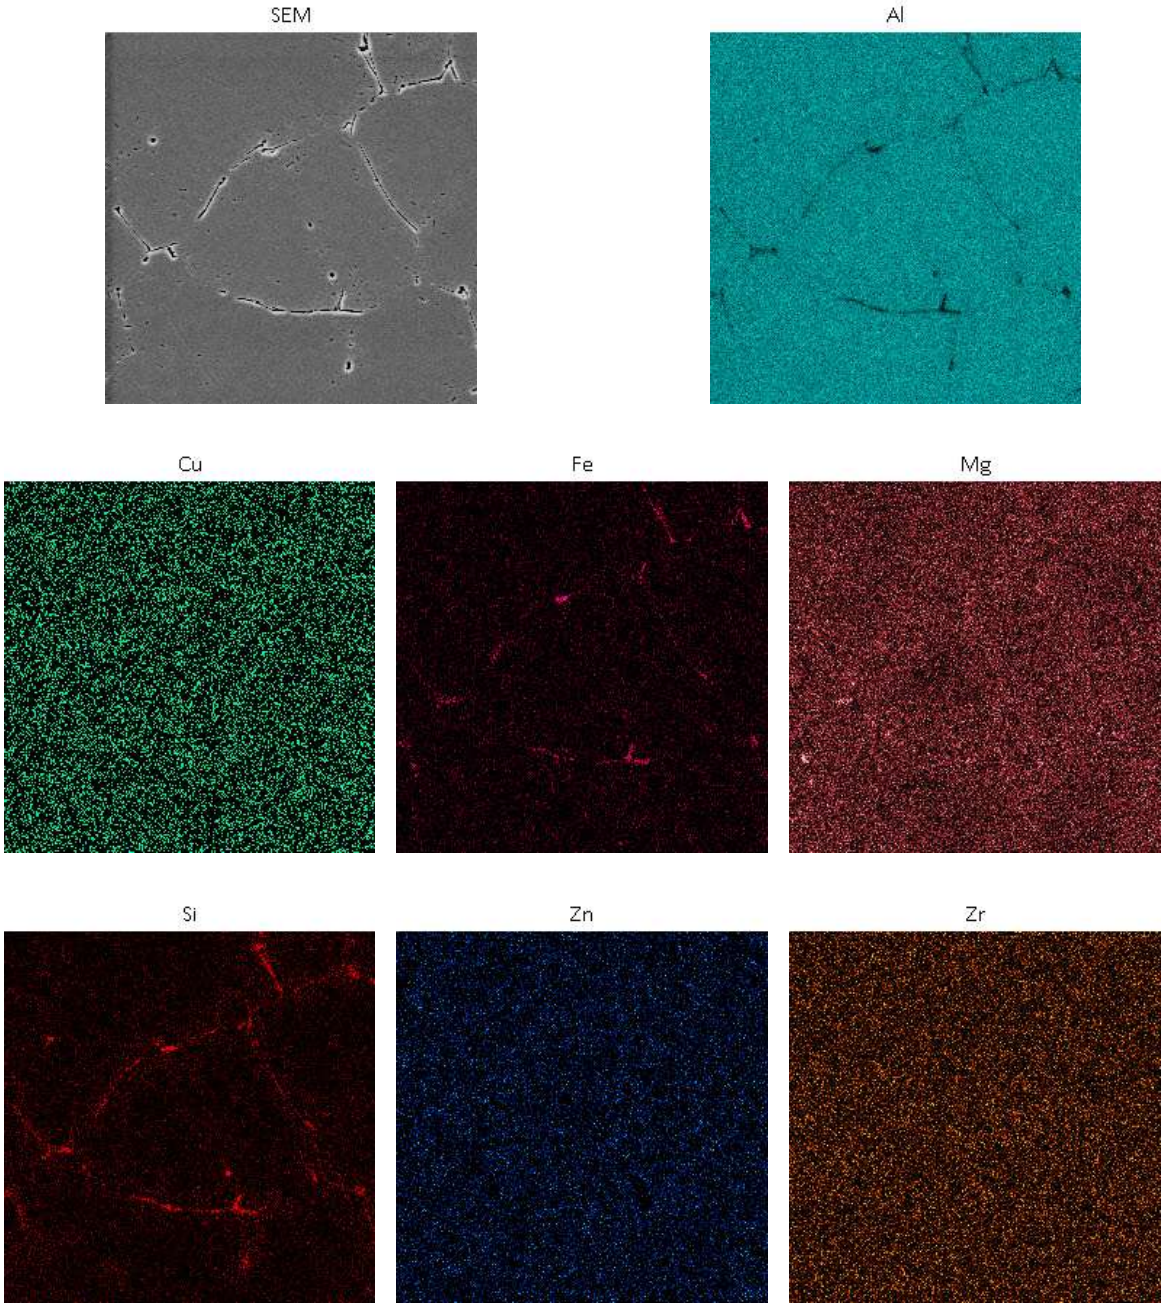


Figure 4. a) SEM image, (b) EDX elemental maps of the as-cast 8090 alloy.

SEM-EDX elemental mapping analyses in Figure 4 show that the elemental concentration of major elements, especially Fe, Si, and Mg, in the 8090 Al-Li alloy is enriched in the interdendritic regions. These results show that the concentration of these elements in the regions between the α-Al dendrites is higher than that in the grain. This is because the impurity elements Fe and Si have a strong segregation tendency, causing segregation of these elements in the interdendritic regions as insoluble second phase particles during solidification of the alloy. In addition, it is seen in Figure 4 that the alloy elements Cu, Mg, Zn, and Zr are dissolved in the dendritic regions together with the interdendritic regions.

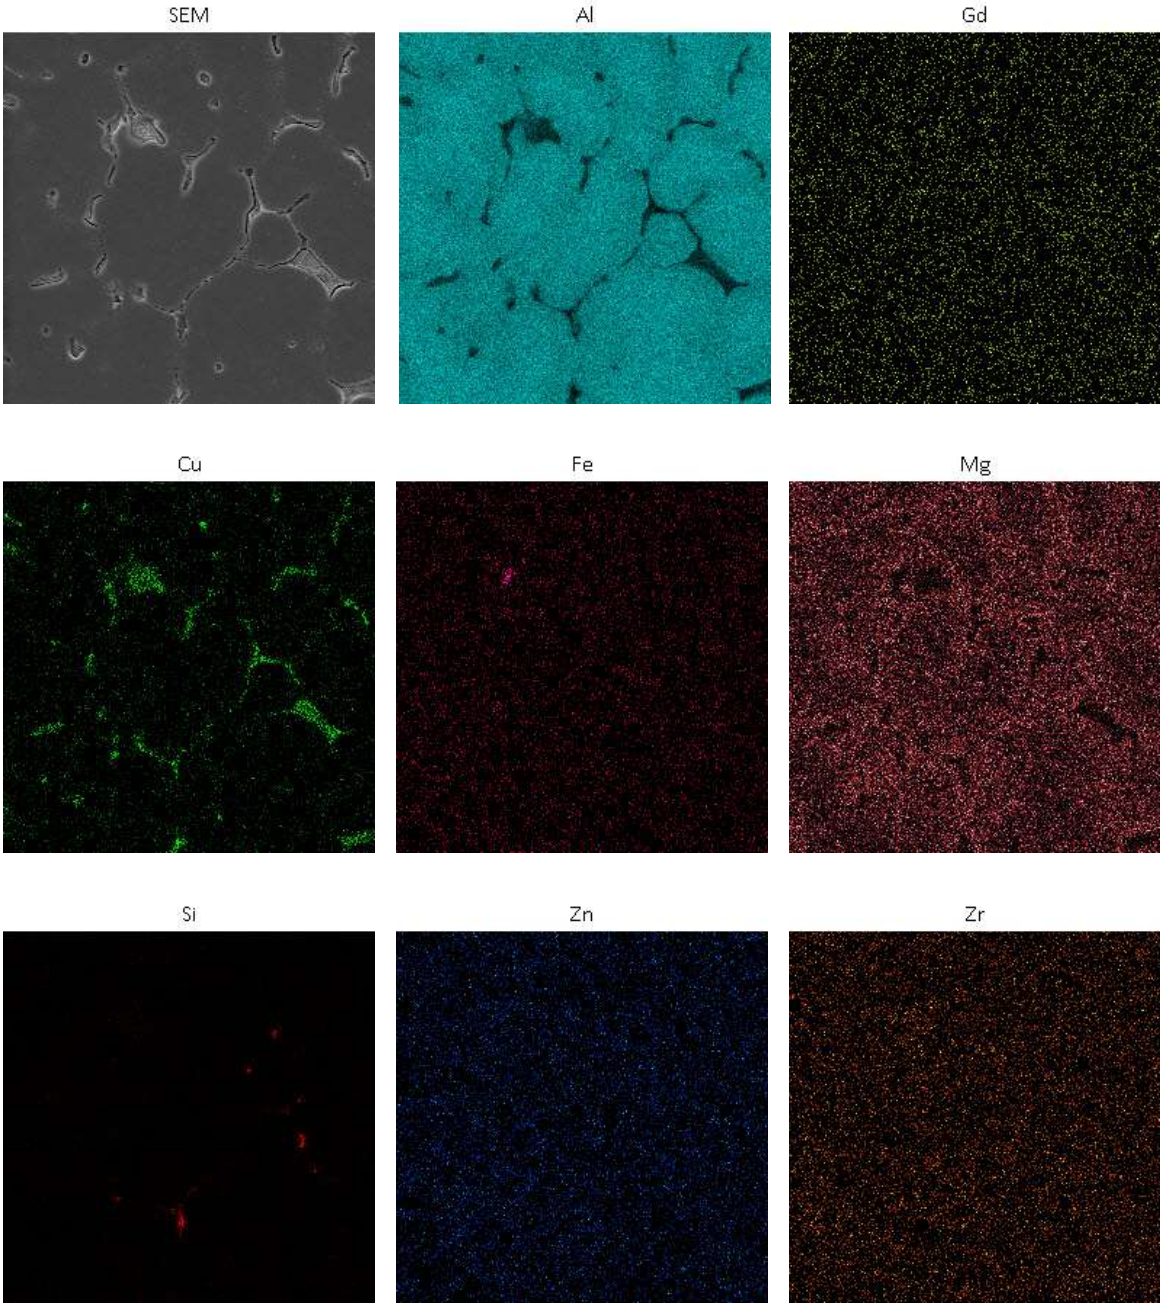

Figure 5. a) SEM image, (b) EDX elemental maps of the as-cast 8090 alloy with Gd addition.

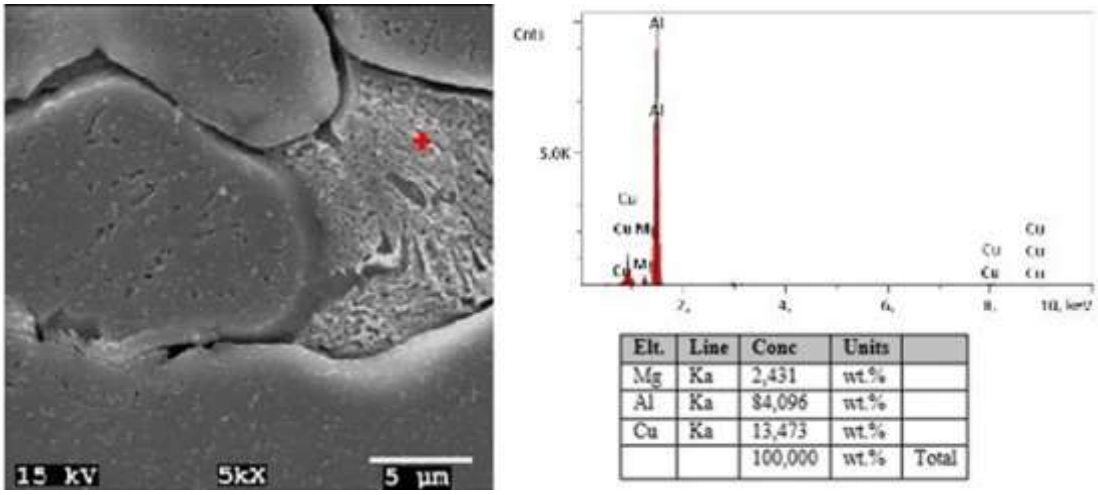
In Figure 5, it was seen that Cu has a large concentration gradient in the alloy with Gd addition. Cu element segregated to the interdendritic regions during solidification due to the high solute partition coefficient and formed the α-Al + T2 (Al_6CuLi_3) eutectic structure at the end of solidification (Figure 6). On the contrary, as seen in Figure 4, segregation of Fe, Si and partly Mg alloying elements decreased in the interdendritic regions in the Gd containing alloy. As evidence of this, Mg peak originating from the signal coming from the matrix was observed in the EDX analyses performed during the SEM examination. This situation shows that the solid solubility within and between dendrites increased and the micro segregation of alloy elements decreased. The distribution of Li element could not be determined by EDX analysis due to its small atomic number.



Elt.	Line	Conc	Units	
Mg	Ka	2,431	wt.%	
Al	Ka	84,096	wt.%	
Cu	Ka	13,473	wt.%	
		100,000	wt.%	Total

Figure 6. SEM-EDX analysis of eutectic pahse in Gd containing 8090 alloy.

The first mechanism of the dendritic structure refining in the Gd-added 8090 Al-Li alloy is that the Gd-containing phases shown in Figure 7 act as nucleation sites during solidification. The second mechanism is that the Gd element becomes increasingly enriched at the interface between the solid and the liquid during cooling after casting, thus increasing the degree of supercooling of the composition and preventing the Al atoms from entering the crystal; therefore, the grains cannot grow further. These two situations ensure that the solidification structure of the casting alloys is refined [Brazolin et al., 2016; Xu, 2008; Zhang et al., 2021].

3.2. Hardness

The microhardness values of 8090 Al-Li alloy and after Gd addition were determined as 44 HV and 127.93 HV, respectively. The hardness increases increased by 190.75%, indicating that Gd addition was significantly effective on the hardness of 8090 alloy. Xu et al. reported that the hardness of Mg-Gd alloys with different grain sizes was almost the same and the hardness value increased as the amount of Gd in the alloy increased [Xu et al., 2018].

3.3. Tensile Properties

Figure 7 shows the mechanical properties of the alloys after tensile testing, obtained from typical engineering stress-strain curves. As seen in figure, tensile tests of the alloys examined in the as-cast state revealed that the tensile strength of 171.40 MPa increased to 313.84 MPa with the addition of Gd, while the elongation decreased from 29.53% to 11.09%.

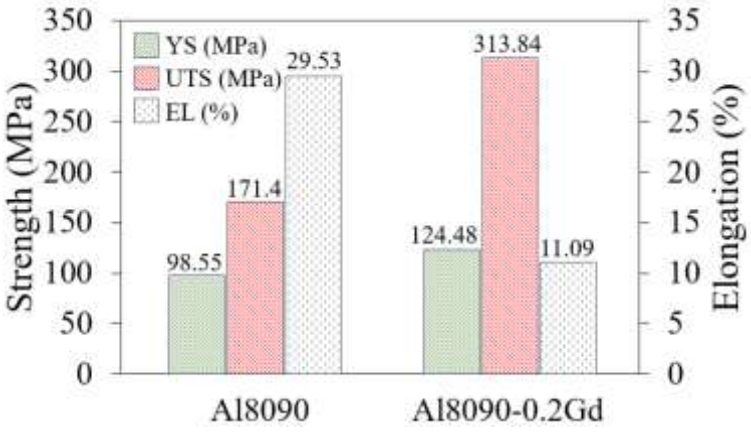


Figure 7. Mechanical values of the alloys.

The refining of the dendritic structure by Gd addition was advantageous in terms of the strength properties of the alloy. The smaller the dendritic structure, the greater the resistance to deformation and hence the tensile strength and yield strength. In both alloys, and especially in the as-cast microstructure of the alloy containing Gd, various coarse secondary phases formed during solidification along the interdendritic boundaries were observed. These brittle phases have a higher stress concentration and thus provide a possible path for crack propagation. Therefore, the ductility was lower in the Gd containing 8090 Al-Li alloy. This is in agreement with studies in the literature [Hajjioui et al., 2022], which revealed that the δ (AlLi) phase, which acts as the primary strengthening phase in Al-Li alloys, also acts as a brittle phase.

4. Conclusion and Recommendations

In this article, the effect of Gd rare earth element addition on the casting microstructure and mechanical properties of 8090 Al-Li alloy was investigated.

i. After adding Gd rare earth element, the microstructure of 8090 Al-Li alloy in the as-cast state was refined. It was observed that Al_3CuGd phase was formed in the alloy with the addition of Gd. According to the results obtained in the studies carried out on Al–Zn–Mg–Cu–Zr alloys, this phase was found to have the potential to strongly pinning dislocations and sub-grain migration and prevent further recrystallization in the subsequent processes [Zhang et al., 2012]. In addition, the T2 (Al_6CuLi_3) eutectic structure increased in the interdendritic regions in the microstructure.

ii. The hardness was found to be higher in the alloy containing Gd due to the formation of hard secondary phase particles in the structure.

iii. Both the thinning of the casting microstructure and the formation of Gd containing phases increased the strength values of 8090 Al-Li alloy, while the elongation values decreased.

iv. The micro-segregation of the 8090 Al-Li alloy significantly reduced after adding Gd. Meanwhile, the grain relative solid-solubility of Fe, Si and Mg elements could be increased as seen in elemental mapping.

IMPROVING SOLAR PANEL PERFORMANCE: ENVIRONMENTAL COMPATIBILITY OF NANO COATINGS

GÜNEŞ PANELİ PERFORMANSINI İYİLEŞTİRME: NANO KAPLAMALARIN ÇEVRESEL UYUMU

Omar Hathat ve Şakir Şahin
Süleyman Demirel Üniversitesi, Fen Bilimleri Enstitüsü, Yenilenebilir Enerji Anabilim Dalı, Isparta, Türkiye

ÖZET

Güneş panellerinin verimliliği, küresel enerji dönüşüm sürecinin karşılaştığı en önemli teknik zorluklardan biridir. Fotovoltaik hücrelerin tasarımında kaydedilen önemli gelişmelere rağmen, panellerin sahadaki performansı; ışık yansıması, toz birikimi, nem gibi dış çevresel faktörler ve ayrıca ultraviyole (UV) ışınlar ile sıcaklık dalgalanmaları nedeniyle sıklıkla azalmaktadır. Bu faktörler, elektrik enerjisine dönüştürülebilecek enerjinin önemli bir kısmının kaybına neden olur ve bu durum, güneş enerjisi teknolojilerinin ekonomik fizibilitesini ve çevresel sürdürülebilirliğini olumsuz etkiler.

Bu bağlamda, nano kaplamalar, güneş panellerinin performansını niteliksel olarak artırma potansiyeline sahip yenilikçi bir çözüm olarak öne çıkmaktadır. Nano teknoloji, maddeyi atom ve molekül düzeyinde kontrol ederek; yansıma azaltıcı, kendini temizleyebilen ve ışık emilimini artırabilen akıllı yüzey kaplamalarının tasarlanmasına imkân tanır. Bu özellikler, zorlu çevre koşullarında bile güneş hücrelerinin verimliliğini önemli ölçüde artırmaktadır.

Anahtar Kelimeler: Enerji, güneş paneli, nano kaplama, verimlilik.

Nanokaplamalar nedir?

Nanokaplamalar ve Nanoteknoloji Kavramı:

Nanoteknolojinin enerji alanındaki en dikkat çekici uygulamalarından biri olan nanokaplamalar, genellikle 100 nanometreden daha ince olan ve yüzeylere uygulanan ultra ince film tabakalarıdır. Bu kaplamalar, atomik veya moleküler düzeyde kontrol edilen nanomalzemelerle üretilir. Böylece, aynı malzemenin geleneksel formlarına kıyasla tamamen farklı fiziksel ve kimyasal özellikler kazanır. Güneş paneli yüzeyi ile çevre arasındaki etkileşimi düzenleyerek, genel verimliliği artırma potansiyeli taşırlar.

Nanokaplamalar ile Geleneksel Kaplamalar Arasındaki Temel Farklar:

Nanokaplamalar, işlev ve yapı açısından geleneksel kaplamalardan köklü şekilde ayrılır. Geleneksel kaplamalar, genellikle mekanik koruma, ısı yalıtımı veya korozyon direnci gibi temel işlevler için tasarlanırken; nanokaplamalar, optik yansımayı azaltma, kendi kendini temizleme, ultraviyole ışınlara karşı koruma ve termal/elektriksel iletkenliği artırma gibi "akıllı" işlevlere sahiptir. Bu temel fark, nanokaplamaları sadece bir yüzey kaplaması olmaktan çıkarıp, fotovoltaik sistemlerin verimliliğini artıran etkili bir araç hâline getirir.

Optik Şeffaflık ve Işık Emilimini Artırmadaki Rolü:

Güneş panelleri bağlamında nanokaplamaları etkili kılan temel özelliklerden biri, yüksek optik geçirgenliktir. Titanyum dioksit (TiO_2) ve silika (SiO_2) gibi nanomalzemeler, görünür ışığı yüksek oranda geçirebilme kapasitesine sahip olup yansımayı minimum düzeye indirir. Bu sayede güneş hücresine daha fazla güneş ışığı ulaşır ve fotovoltaik dönüşüm süreci daha verimli hâle gelir. Bu özellik özellikle silikon bazlı hücrelerde büyük önem taşır.

Buna ek olarak, nanokaplamaların yapısal tasarımı, ışık yansımasını azaltmak için kırılma indeksinin katmanlar arasında optimize edilmesini sağlar. Bu, özellikle ışığın düşük açılardan geldiği sabah veya akşam saatlerinde daha fazla güneş ışığının emilmesini mümkün kılar. Böylece güneş panelinin günün her saatinde daha yüksek verimle çalışması sağlanır.

Kendi Kendini Temizleme Özelliği ve Fotokatalitik Tepkimeler:

Bu kaplamaların sunduğu bir diğer önemli özellik ise kendi kendini temizleyebilme yeteneğidir. Süper hidrofobik olarak tasarlanan yüzeyler, su damlacıklarının yüzeyde kayarak toz ve kirleri beraberinde taşımasını sağlar. Bu etki, fotokatalitik özellik gösteren TiO_2 gibi malzemelerle birleştirildiğinde daha da güçlenir; UV ışığı altında organik kirleticiler kimyasal olarak parçalanarak yüzeyin temiz kalmasına katkı sağlar.

Isı Direnci, Çevresel Koruma ve Panel Ömrünün Uzatılması:

Son olarak, nanokaplamalarda kullanılan malzemeler, yüzeylerin ısıya ve mekanik aşınmaya karşı direncini artırır. Bu da güneş panellerinin ömrünü uzatır ve sıcaklık dalgalanmaları veya nem gibi çevresel faktörlerden kaynaklanan bozulmaları önler. Ayrıca ZnO ve Al_2O_3 gibi bazı nanomalzemeler, ısının hücre yüzeyinden daha verimli bir şekilde dağılmasını sağlayarak sıcaklığa bağlı verim kayıplarını azaltır.

Nanokaplamalar ile Performans Artırma Mekanizması:

Işığın Yansımasını Azaltma ve Emilimini Artırma:

Güneş panellerine ulaşan ışığın bir kısmı cam yüzeyden yansır ve bu, toplam verimliliği azaltır. Anti-reflektif nanokaplamalar, hava ile cam arasındaki kırılma indis farkını kademeli olarak

azaltarak yansıma kayıplarını minimuma indirir. Özellikle SiO_2 ve TiO_2 gibi malzemeler, optik özellikleri nedeniyle bu amaçla tercih edilir. Yapılan çalışmalar, bu tür kaplamaların ışık emilimini %5-10 oranında artırabildiğini göstermektedir.

Işığın Güneş Hücresine Geçişinin İyileştirilmesi:

Nanokaplamalar, yüzeydeki düzensiz yansıma ve saçılmayı azaltarak ışığın güneş hücresine daha doğrudan geçmesini sağlar. Bu, özellikle çok katmanlı yapıya sahip veya düşük ışık koşullarında çalışan paneller için büyük avantaj sağlamaktadır.

Kendi Kendini Temizleme Özelliği ve Toz Birikiminin Azaltılması:

Nanokaplamalar, su itici (superhidrofobik) özellikleri sayesinde yüzeyde su damlalarının yuvarlanarak toz ve kirleri temizlemesini sağlar. Özellikle TiO_2 gibi fotokatalitik malzemeler, organik kirleri parçalayarak kendi kendini temizleyen yüzeyler oluşturur. Bu sayede verimlilik kaybı en aza iner.

UV Işınlarına ve Çevresel Etkilere Karşı Koruma ve Ömrünün Uzatılması:

Güneş panelleri, UV ışınları ve zorlu çevresel koşullar nedeniyle zamanla bozulabilir. ZnO ve TiO_2 bazlı nanokaplamalar, bu zararlı ışınları absorbe ederek panel yüzeyini korur. Aynı zamanda nem, aşınma ve yüksek sıcaklık gibi faktörlere karşı dayanıklılığı artırır. Tüm bu işlevler sayesinde nanokaplamalar, güneş panellerinin işlevsel ömrünü %20-30 oranında uzatabilir. Bu da, özellikle uzun vadeli yatırım ve bakım maliyetleri açısından büyük avantaj sağlar.

Güncel Uygulama Örnekleri ve Araştırmalar:

TiO_2 ve ZnO Kaplamaları ile Performans Artışı:

Bu konudaki önemli bir çalışma, 2020 yılında Optik dergisinde yayımlanmıştır. Çalışmada, boya duyarlı güneş pilleri (DSSC) için TiO_2 nanotüpleri ve ZnO nanorodlarından oluşan hibrit anotlar geliştirilmiştir. Elektrokimyasal biriktirme ve anotlama yöntemleriyle üretilen bu yapılar, ışığın etkin şekilde emilmesini sağlayan gözenekli nano yapılar oluşturmuştur. Sonuçlar, güneş pili veriminin %0,81'den %1,67'ye yükseldiğini ve bu sayede %106'lık bir iyileşme sağlandığını göstermiştir. Bu gelişme, daha geniş bir yüzey alanı, düşük yansıma kaybı ve daha hızlı elektron taşınımı sayesinde mümkün olmuştur.

Yüksek Güneşlenme Ortamlarında ZnO Kaplamalarının Kullanımı:

2024 yılında Sustainability dergisinde yayımlanan bir çalışmada, kristal silikon güneş hücrelerinin yüzeyine ZnO nano kaplamalar püskürtülmüştür. Bu kaplamalar yüksek ışık geçirgenliği, düşük yansıma ve UV ışınlarına karşı koruma gibi özelliklere sahiptir. Deneysel sonuçlar, kısa devre akımı ve açık devre voltajında anlamlı artışlar göstermiştir. Ayrıca, ZnO kaplamalı hücrelerin sıcaklık değişimlerine ve dış çevresel etkilere karşı daha dayanıklı olduğu belirlenmiştir. Genel verimlilikte %13,5'e kadar bir artış gözlenmiştir.

Çöl Ortamlarında Toz Direncine Sahip SiO_2 Kaplamaları :

2024 yılında Umman'da gerçekleştirilen bir çalışmada, SiO_2 nano kaplamaya sahip güneş panelleri test edilmiştir. Bu kaplamalar, kendini temizleyen süperhidrofobik yüzey özelliklerine sahiptir. SiO_2 kaplamalı panellerin, toz ve nem içeren zorlu çöl koşullarında %31,7 daha yüksek verimlilik gösterdiği; ayrıca manuel temizliğe tabi tutulan panellerden %9,6 daha verimli olduğu tespit edilmiştir. Bu çalışma, kaplamanın çevresel temizlik yükünü azalttığını ve verimliliği koruduğunu göstermektedir.

Ekonomik ve Çevresel Değerlendirmeler :

Nanokaplamaların Üretim ve Uygulama Maliyetlerinin Enerji Kazancıyla Karşılaştırılması :

Güneş panellerine nanokaplama uygulanması fikri, yalnızca teknik açıdan değil, ekonomik açıdan da dikkatle değerlendirilmelidir. Kaplamalar sayesinde yansıma azalmakta, ışık emilimi artmakta ve panel ömrü uzamaktadır. Ancak bu avantajların üretim ve uygulama maliyetleri ile dengelenmesi gerekmektedir.

Yapılan araştırmalar, kullanılan nanomalzemeye ve kaplama yöntemine bağlı olarak maliyetlerin değiştiğini göstermektedir. Örneğin, SiO_2 ve ZnO gibi maddeler daha uygun fiyatlı ve yaygınken, kompleks metal oksitler veya çok işlevli nanoparçacıklar daha yüksek maliyetlidir. Ancak uzun vadede, bu kaplamalar sayesinde verimlilikte %20'ye kadar artış, temizlik ihtiyacının azalması ve bakım masraflarının düşmesi sayesinde maliyetler 2-4 yıl içinde geri kazanılabilmektedir. Güneş paneli ömrü 25 yıl olduğundan, bu durum yatırımcılar için sürdürülebilir ve ekonomik bir tercih haline gelmektedir.

Nanokaplamaların Çevresel Etkisi :

Her ne kadar yenilenebilir enerji çevresel açıdan olumlu bir adım olsa da, nanomalzeme üretimi çevresel bazı riskleri beraberinde getirebilir. Özellikle nano atıkların su kaynaklarına veya doğaya karışması, biyolojik sistemler üzerinde toksik etkilere yol açabilir. 2023 yılında Journal of Cleaner Production dergisinde yayımlanan bir çalışmaya göre, TiO_2 ve ZnO gibi metal oksit nanoparçacıkları çevredeki mikroorganizmalar üzerinde oksidatif stres oluşturarak ekosisteme zarar verebilir.

Bu nedenle, çevre dostu üretim süreçleri, güvenli çalışma ortamları ve geri dönüşüm stratejileri büyük önem taşır. Buna rağmen, nanokaplamaların dolaylı çevresel katkıları büyüktür: su ve kimyasal kullanımı azalır, enerji verimliliği artar ve fosil yakıt ihtiyacı düşer. Bu durum, uygun çevresel yönetimle birlikte, bu teknolojinin sürdürülebilirliğini desteklemektedir.

Nanokaplamaların Sürdürülebilirliği ve Hammadde Erişilebilirliği:

Nanokaplamalarda kullanılan hammaddelerin büyük çoğunluğu doğada bol miktarda bulunur. TiO_2 ve ZnO gibi maddeler tarım veya gıda sektörleriyle rekabet içinde olmadıkları için sürdürülebilirlik açısından avantajlıdır. Ayrıca bu maddeler geri dönüştürülebilir olup, birçok endüstride tekrar kullanılabilirler. Bu da onları çevresel açıdan uzun vadeli bir çözüm haline getirir.

Son yıllarda Çin, Almanya ve Güney Kore gibi ülkelerde nanomalzeme üretimi arttıkça, bu malzemelerin maliyetleri düşmüştür. Bu durum, Türkiye gibi gelişmekte olan ülkelerin bu teknolojiyi benimsemesi için bir fırsat sunmaktadır. Yerli üretimin teşvikiyle, hem maliyetler azalmakta hem de dışa bağımlılık azalmaktadır.

Sonuç:

Nanokaplamalar, güneş panellerinin verimliliğini artırma alanında en umut verici teknolojilerden biri olarak öne çıkmaktadır. Yansıma, toz birikimi ve zorlu çevresel koşullar gibi temel sorunları ele alma yeteneği sayesinde, TiO_2, SiO_2 ve ZnO gibi nanomalzemelerin kullanımı, optik emilimde önemli iyileşmelere, ısıl kayıpların azaltılmasına ve sistemin kullanım ömrünün uzatılmasına katkı sağlamaktadır.

Bu kaplamaların kendi kendini temizleme, yansıma azaltma, UV koruma ve pasif soğutma gibi çok yönlü özellikleri, farklı iklim ve çevre koşullarında etkili çözümler sunmalarını mümkün

kılmaktadır. Yapay zekâ destekli akıllı nanokaplama sistemlerine yönelik eğilim, kendi kendine optimize olabilen, daha az bakım gerektiren, güvenilir güneş enerjisi sistemlerinin inşasında stratejik bir adım olarak değerlendirilmektedir.

Ancak, laboratuvar ölçeğinden endüstriyel uygulamaya geçiş hâlâ birçok zorluk içermektedir. Üretim maliyetlerinin düşürülmesi ve kullanılan nanomalzemelerin çevresel anoktada, araştırma kurumları, üretici firmalar ve politika yapıcılar arasında daha güçlü bir iş birliği gereklidir.

Küresel iklim değişikliği ve yenilenebilir enerjiye artan talep ışığında, nanokaplama teknolojilerine yapılacak yatırımlar, fosil yakıtlara olan bağımlılığı azaltmak ve temiz, verimli bir enerji geleceği inşa etmek isteyen ülkeler için stratejik bir tercih olacaktır.

ABSTRACT

In this study, the effects of printing parameters on mechanical and surface performance in Fused Deposition Modeling (FDM) type three-dimensional (3D) printers were analyzed experimentally. The aim of the research is to determine the most suitable production conditions based on tensile strength and surface roughness criteria. Within the scope of experimental studies, layer thickness (LT), fill rate (ID), print speed (PS), nozzle diameter (ND) and print temperature (PT) were selected as printing parameters. Experiments were carried out on Flashforge Adventurer 5M Pro FDM printer using PETG filament and Taguchi L27 orthogonal array was preferred for experimental design. Produced samples were subjected to tensile test and surface roughness measurement, and the obtained data were evaluated by analysis of variance (ANOVA). The results showed that especially layer thickness and fill rate parameters had statistically significant effects on tensile strength. In terms of surface quality, thin-layer and low-speed prints gave better results. The most suitable printing conditions were determined as LT: 0.1 mm, ID: 80%, PS: 50 mm/s, ND: 0.4 mm and PT: 235°C. With this parameter combination, tensile strength increased by 25.6% and surface roughness improved by 31.9%. This study provides a scientific basis for optimizing the printing process for researchers and industrial users who want to improve quality in FDM production.

Keywords: FDM, 3D Printer, Parameter Optimization, Taguchi Method, Surface Quality, Tensile Strength

Introduction

Additive manufacturing (AM) is rapidly becoming widespread thanks to its advantages such as success in complex geometries, customization and production flexibility as an alternative to traditional manufacturing methods. Among these technologies, Fused Deposition Modeling (FDM) stands out with its low-cost equipment and wide material compatibility (Ouazzani et al., 2023; Pérez et al., 2018; Zaman et al., 2019). FDM is based on the principle of controlled melting of thermoplastic filament and laying on top of each other in layers. However, in this process, undesirable variations in product quality occur as a result of complex interactions of production parameters. In particular, performance criteria such as tensile strength (σ_t) and surface roughness (Ra) are directly affected (Mohamed et al., 2016; Kam et al., 2023; Altan et al., 2018).

In recent years, some studies have aimed to investigate the effect of FDM process parameters on product performance and have made optimization suggestions by combining experimental methods and statistical analysis approaches (Tamaşag et al., 2022). In particular, the decisive effects of parameters such as nozzle temperature, layer thickness, fill rate, printing speed, table temperature and printing orientation on mechanical and surface properties have been emphasized (Khan et al., 2022; Zaman et al., 2019; Yang et al., 2019).

Ouazzani et al., (2023) stated that the most critical parameter in terms of surface roughness in FDM prints made with Acrylonitrile Butadiene Styrene (ABS) material is the layer height. Similarly, Pérez et al., (2018) proposed a strategy for optimizing critical parameters in order to improve surface quality. Kam et al., (2023) detailed the effect of printing parameters on mechanical properties with the Taguchi method in their study on PA12 material. In the study conducted by Mohamed et al., (2016), they stated that the dynamic mechanical performance of Polycarbonate (PC) and ABS samples can be improved through design.

Studies on biodegradable polymers such as Polylactic Acid (PLA) are also noteworthy. Afshari et al., (2024) experimentally demonstrated the effect of parameters optimized with Response Surface Methodology (RSM) on mechanical performance in parts produced with PLA material. Heidari-Rarani et al., (2022) tried to maximize the tensile strength of PLA samples using the Taguchi approach. Similarly, Altan et al., (2018) evaluated both surface roughness and tensile strength criteria together.

It has been mentioned in the literature that in order to obtain high-quality FDM outputs, parameters should be optimized together and parametric interactions should be taken into account rather than individual effects (Zaman et al., 2019; Moradi et al., 2023; Moradi et al., 2021). However, very few studies have conducted a systematic evaluation from a multi-criteria decision-making perspective by evaluating both surface quality and mechanical performance simultaneously. This situation reveals the need for comprehensive experimental and statistical studies to make FDM technology more efficient in terms of performance and quality.

In this study, performance criteria such as tensile strength and surface quality of parts produced with the FDM method, which stands out with its advantages such as low cost, material accessibility and ease of use, were examined. The aim of the study is to determine the optimum production conditions by experimentally analyzing the effects of five basic parameters used in FDM production (layer thickness (LT), fill rate (ID), printing speed (PS), nozzle diameter (ND) and printing temperature (PT)) on product quality.

Materials and Methods

Polyethylene Terephthalate Glycol (PETG) filament (Figure 1.a) was preferred in the production of the samples. Their geometries were designed using SolidWorks software in accordance with the ASTM D638 TypeV standard. Then, they were sliced using FlashPrint software. The production process was carried out with a FlashForge Adventurer 5M Pro (Figure 1.b) model FDM type 3D printer, and all samples were produced in a horizontal position parallel to the X–Y plane of the printer and at a table temperature of 70 °C. Experimental planning was made based on the Taguchi L27 orthogonal array. Mechanical performance evaluations were carried out using a Shimadzu AGS-X universal testing machine (Kyoto, Japan). A 5 kN capacity load cell was used in the device and the experiments were carried out with a tensile speed of 5 mm/min, a temperature of 23 °C ± 2 °C, and a relative humidity of 50 ± 5%. The maximum tensile stress (σ_t, MPa) values were recorded as the test output. Surface quality analyses were performed with Mitutoyo SJ-210 portable profilometer; based on 0.8 mm cut-off, 5.6 mm scanning length and average surface roughness (Ra) parameter, the average of the measurements taken from 3 different points in the central region of each sample was taken into account. Statistical analysis of the data was performed with Minitab 21 software; the effects of the parameters were evaluated with one-way analysis of variance (ANOVA) during the analysis process. Optimization was performed on Taguchi Signal/Noise (S/N) ratios and the contribution rates of each parameter on the performance outputs were calculated as percentages and the effect degrees were determined.

Figure 1. Filament and printer used in the 3D printing process

Properties of Materials Used

In experimental studies, PETG material, some of the properties of which are given in Table 1, was used. PETG is a thermoplastic widely used in FDM type 3D printers and stands out with its high tensile strength, impact resistance and thermal stability properties. In addition, it contributes to obtaining low roughness on the surface by providing good adhesion between layers during production. Thanks to its shape stability, which is an important output for 3D printing, this material, which increases the reliability of experimental repetitions, is also frequently preferred due to its low deformation among polymer types during the printing process. Thus, it was aimed to select the type of material used with properties that can meet these expectations in order to evaluate both mechanical performance and surface quality in an optimized way.

Table 1. PETG filament technical specifications

Features	Value
Filament diameter	1.75 mm ± 0.05 mm
Density	1.27 g/cm³
Melting temperature range	220–250°C
Manufacturer	Elas
Color	Transparent
Material type	Thermoplastic polyester

Experimental Design: Parameters and Levels

The experimental design was created based on the Taguchi method and the L27 orthogonal array was preferred in order to systematically examine a large number of parameter combinations with a minimum number of trials, as seen in Table 2. This experimental design allowed each parameter to be evaluated at three different levels and enabled statistically significant analysis of interactions between parameters. A total of five printing parameters (LT, ID, PS, ND and PT) were considered at three levels (Level 1, Level 2, Level 3) each, creating 27 unique experimental combinations. This method provided an efficient analysis process in terms of both time and resources by preserving the experimental database while reducing the number of experiments. It also allowed for the comparative evaluation of individual and relative parameter effects on performance outcomes.

Table 2. Experimental parameters and levels

Parameters	Units	Level 1	Level 2	Level 3
Nozzle Diameter (ND)	mm	0.4	0.6	0.8
Layer Thickness (LT)	mm	0.1	0.2	0.3
Infill Density (ID)	%	20	50	80
Print Speed (PS)	mm/s	30	50	70
Print Temperature (PT)	°C	220	235	250

Sample Design and Production Process

The test samples used in this study were designed according to ASTM D638 Type V standard with the dimensions shown in Figure 2. The geometric modeling process was carried out with SolidWorks CAD software, which is widely used in the industry and offers high accuracy; then, the slicing process was performed with FlashPrint software in order to make it manufacturable in a 3D printer. All samples were produced in a horizontal position parallel to the X–Y plane of the 3D printer in order to balance the effect of the orientation of the layer structure on the mechanical performance. The table temperature was fixed at 70 °C during printing to optimize material-based adhesion and dimensional stability. For experimental verification and statistical significance, each parameter combination was produced with 3 repetitions; a total of 81 samples were obtained within the scope of 27 different parameter sets. This systematic approach ensured that the variance was minimized and the reliability of the analyses was increased.

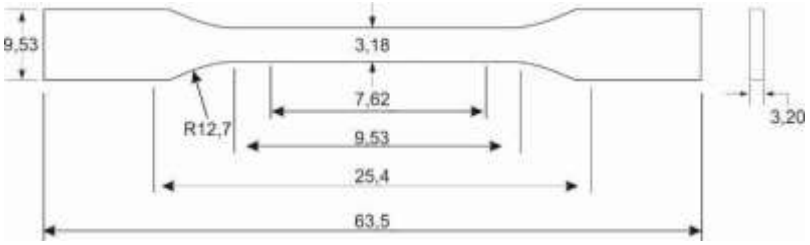

Figure 2. ASTM D638 TypeV specimen geometry (ASTM D638-22, 2022)

Testing Procedures

Tensile test

Tensile tests were performed using Shimadzu AGS-X model universal testing machine, which provides high accuracy and repeatability. A maximum capacity of 5 kN load cell was preferred in the experiments, thus providing sufficient sensitivity. During the tests, the tensile speed was fixed as 5 mm/min in accordance with ASTM D638 standard. The experimental environment was kept under control to minimize the effect of environmental conditions on mechanical properties; temperature was fixed as 23°C ± 2°C and relative humidity was fixed as 50 ± 5%. As the main performance output of the test, the maximum tensile stress (σ_t, MPa) value, which represents the highest load that the samples can carry, was measured and this value was evaluated in order to analyze the effect of different parameters on mechanical performance.

Surface roughness (R_a) measurement

Surface roughness measurements were performed using a high-precision portable profilometer, the Mitutoyo SJ-210. A cut-off value of 0.8 mm and a scan length of 5.6 mm were used as the basis for the measurements. These values were selected in accordance with the ISO 4287 standard and were preferred in order to correctly distinguish the wavelength components of the surface. Three different measurement points taken at equal intervals from the central region of the sample were evaluated to represent the surface quality of each sample, and the results were reported according to the reliability principle by taking the arithmetic average of the Ra values obtained from these points. This method increases the measurement reliability by taking into account the homogeneity of the surface at both microscopic and macroscopic levels.

Statistical evaluation

The analysis of experimental data was carried out using Minitab 21 software in order to make statistical significance and optimization evaluations in a healthy way. More than one statistical method was integrated in the analysis process. First, one-way analysis of variance (ANOVA) was applied to statistically reveal the effect of each printing parameter (LT, ID, PS, ND and PT) on the performance outputs. Thanks to this analysis, it was determined which parameters had a significant effect on the results. In addition, S/N ratios were calculated for the optimization of each output within the framework of Taguchi experimental design. In this context, the evaluation was made based on the criterion of "bigger is better" for tensile strength performance and the criterion of "smaller is better" for surface roughness (Ra). Finally, the relative effect of each parameter within the total variance was calculated as a percentage, and

the effect degrees and contribution rates were determined; thus, the effect of the parameters on quality characteristics was revealed.

Findings and Discussion

Tensile strength (σ_t) and surface roughness (Ra) outputs of parts produced with FDM technology using PETG filament were analyzed. Experimental data were interpreted to reveal the effects of parameters on the output and supported by ANOVA and S/N analysis.

Tensile Strength Results

As a result of tensile tests performed on samples produced with different parameter combinations, the strength values were measured in the range of 30.2 ±1.2 MPa to 42.1 ±1.4 MPa. The results of some of the test samples are given in Table 3. The highest tensile strength was obtained with 42.1 MPa with 0.1 mm layer thickness and 80% filling ratio (Exp. no: 5).

Table 3. Tensile strength results for selected parameter combinations

Exp. No	LT (mm)	PS (mm/s)	ND (mm)	ID (%)	PT (°C)	σ_t (MPa)
1	0.1	30	0.4	20	220	35.2
5	0.1	50	0.4	80	235	42.1
11	0.2	50	0.6	50	235	37.3
14	0.2	50	0.6	50	235	37.4
18	0.3	70	0.6	20	250	31.0
22	0.3	70	0.8	20	250	30.2
24	0.3	70	0.8	80	250	33.8
25	0.1	30	0.8	50	220	36.5
27	0.2	70	0.4	80	235	38.2

Surface Roughness (Ra) Results

The Ra values obtained as a result of surface roughness measurements varied between 6.2 µm and 11.8 µm. It was observed that thin layers and low printing speeds improved the surface quality. The results of some of the experiments are given in Table 4. Accordingly, the best surface roughness value was obtained from printing with 0.1 mm layer thickness, 30 mm/s printing speed and 0.4 mm nozzle diameter (Exp. no. 1).

Table 4. Surface roughness results for selected parameter combinations

Exp. No	LT (mm)	PS (mm/s)	ND (mm)	Ra (µm)
1	0.1	30	0.4	6.2
5	0.1	50	0.4	6.7
11	0.2	50	0.6	8.5
14	0.2	50	0.6	8.4
18	0.3	70	0.8	11.8
22	0.3	70	0.8	11.7
24	0.3	70	0.8	10.2
25	0.1	30	0.4	6.4
27	0.2	70	0.6	9.1

Parameter Impact Analysis and Discussion

As a result of the variance analysis and contribution rate calculations, the effects of printing parameters on both mechanical performance (tensile strength, σ_t) and surface quality (average surface roughness, Ra) were statistically determined (Figure 3). Layer thickness stood out as the parameter with the highest effect on both performance outputs. It contributed 41.2 ±0.8% for tensile strength and 52.6 ±1.1% for surface roughness. This shows that layer thickness directly affects both the structural integrity of the material and the surface form. The fullness ratio, in particular, showed a significant effect on tensile strength and contributed 26.7 ±1.3%. Thus, it was determined that the internal structural density of the sample had a strong relationship with mechanical resistance. Low printing speed was another prominent parameter in terms of surface quality and showed a 21.4 ±0.9% improvement on the Ra value, revealing the roughness-improving effect of material accumulation and layer transitions during the printing process. Nozzle diameter and printing temperature were evaluated as secondary effective parameters in terms of both σ_t and Ra; although the effect of these parameters is limited, it is thought that they can contribute to the optimization process with fine tuning. These findings have been guiding in determining the relative effects of the parameters on performance outputs and their prioritization levels.

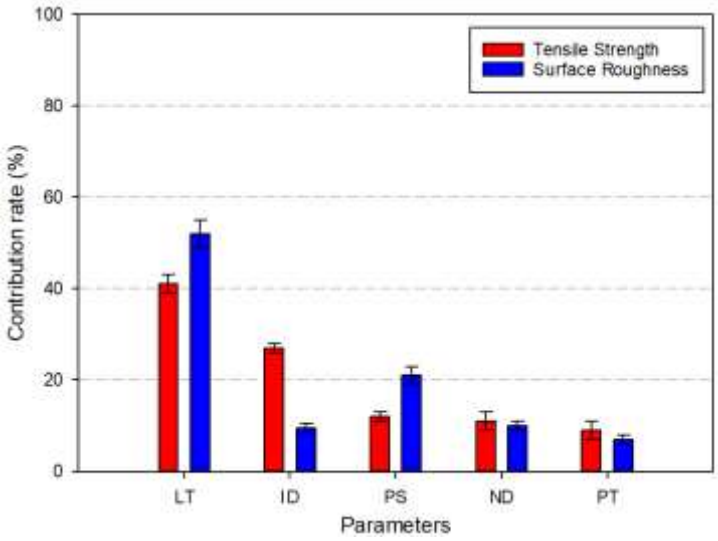

Figure 3. Parameter effect analysis graph

Optimum Parameter Combination

As a result of the evaluation of the Signal/Noise (S/N) analysis results and experimental observations together, the optimum printing parameters that maximize both mechanical performance (σ_t) and surface quality (Ra) were determined. In terms of layer thickness, the level of 0.1 mm provided both the highest tensile strength and the lowest surface roughness value, offering a two-way performance advantage. In terms of filling ratio, 80% significantly increased the strength of the samples thanks to the increase in internal structure density and represented the optimum condition in terms of mechanical durability. In terms of printing speed, 50 mm/s provided an ideal balance between production time and surface quality, while maintaining quality and making the process efficient. The nozzle diameter of 0.4 mm increased the printing sensitivity and positively affected the surface smoothness by ensuring that the material flow became more stable thanks to the thinner diameter. Finally, the value of 235 °C for printing temperature ensured that the PETG filament reached ideal flow conditions, optimized the adhesion between the layers and increased the overall production quality. This optimum parameter combination has created a balanced and applicable production recipe that maximizes both durability and surface quality.

Conclusion and Recommendations

In this study, the effects of printing parameters used in FDM (Fused Deposition Modeling) type 3D printers on mechanical performance (tensile strength) and surface quality (average surface roughness, Ra) were analyzed by experimental methods. PETG filament, which is widely used and offers high strength-surface quality balance, was preferred in production. Experiments were planned systematically based on Taguchi L27 orthogonal array and each parameter was examined at three levels. The obtained data were statistically analyzed with Minitab 21 software and the most effective parameters were determined via ANOVA and S/N ratios. According to the findings;

- While layer thickness is the parameter that most affects both tensile strength and surface quality, the fullness ratio increased the rigidity of the internal structure of the sample.
- Printing speed was determined as the second most important factor on surface roughness, and significant decreases in roughness were observed especially with speeds below 50 mm/s.
- Nozzle diameter and printing temperature, although having secondary effects, played a supporting role in general printing quality when brought to optimum values.
- The most suitable printing conditions were determined as 0.1 mm layer thickness, 80% fullness ratio, 50 mm/s printing speed, 0.4 mm nozzle diameter and 235°C printing temperature. With this parameter combination, tensile strength was increased by 25.6% and surface roughness was reduced by 31.9%.

The results obtained support the findings of studies in the literature such as Chacón et al. (2017), Rodríguez et al. (2003) and Singh et al. (2016); in particular, the decisive role of layer thickness on performance has been strongly demonstrated in this study. In this respect, the L27-based experimental structure that optimizes five parameters simultaneously offers an original contribution to the literature, specifically for PETG. In terms of application, this parameter set

is recommended in industrial scenarios where high strength and surface quality are demanded together.

In future studies, different filament types (e.g. ABS, PLA-Carbon Fiber, PP, PC and TPU) can be analyzed with similar systems and 3D scanning technologies can be integrated in surface characterization. In addition, advanced optimization techniques such as multi-criteria decision making, artificial intelligence-based modeling or regression analysis can be used. In addition, thanks to the obtaining of quality surfaces at lower printing speeds, a decrease in energy consumption can be achieved by reducing the need for reprocessing processes after production. As a result, it has been evaluated that it can make positive contributions to sustainable production strategies.

ABSTRACT

Vanillin is produced synthetically and used as a sweetener and fragrance in many different areas. For this reason, synthetic vanillin can be discharged from wastewater to surface waters without being biodegraded. The electro-Fenton method is an environmentally friendly and effective method that allows the on-site production of hydroxyl radicals used for organic pollutants resistant to degradation. In this study, CF@MoS_2 cathode production was carried out by loading molybdenum sulphide onto the carbon felt (CF) electrode surface using the hydrothermal method. The prepared cathode was characterized with SEM images, while the powder MoS_2 structure was defined with XRD and EDS analyses. Vanillin degradation was carried out at pH 3 using CF and CF@MoS_2 cathodes. Vanillin degradation was carried out by the electro-Fenton method at constant currents of 50, 100, 200 and 300 mA. While the change in vanillin concentration was monitored by HPLC analysis, total organic carbon contents were determined for mineralization. It was observed that the most effective oxidation occurred at 50 mA and 100% degradation was achieved in 30 min. While 64% mineralization was achieved with the carbon felt electrode, this value was increased to 77% with CF@MoS_2. As a result, the MoS_2 structure on the cathode surface facilitated the Fe^{3+} / Fe^{2+} cycle and increased vanillin mineralization.

Keywords: Vanillin, Electro-Fenton, Degradation, Mineralization.

Introduction

The fact that drinking water, a resource that is essential for every nation, is running out is concerning. In addition to the unconscious use of drinking water, pollution caused by the mixing of domestic, industrial and agricultural irrigation wastewater continues to threaten clean water resources day by day. These chemicals that enter surface waters may belong to many classes including pharmaceuticals, personal care products, food, dyes and pesticides. Many of these chemicals are refractory organic compounds that are resistant to biological treatment methods. More effective advanced oxidation processes are needed for the oxidation of these pollutants. Advanced oxidation processes (AOPs) have drawn a lot of interest lately as a means of treating refracter organic contaminants. By mineralizing these substances, AOPs can effectively remove them completely while also increasing the solution's biodegradability and lowering toxicity (Scaria et al., 2021; Nidheesh et al., 2022).

The electro-Fenton method has an important place among advanced oxidation methods. The main reason for this is that hydrogen peroxide (H_2O_2) is produced in situ and continuously as a result of the reduction of oxygen at the cathode. Iron (II) ions and H_2O_2 undergo a Fenton reaction, which results in the production of hydroxyl radicals ($^{\bullet}OH$) following (Eqs. (1-2) (Moreira et al., 2017).

$$O_2 + 2e^- + 2H^+ \rightarrow H_2O_2 \quad (1)$$

$$H_2O_2 + Fe^{2+} \rightarrow {}^{\bullet}OH + OH^- + Fe^{3+} \quad (2)$$

Also other transition metals (M^{n+}: Cu^{2+}, Co^{2+}, Mn^{2+} etc.) can catalyze the activation of H_2O_2 to reactive oxygen species, such reactions are called Fenton-like reactions (Brillas et al., 2009).

$$M^{n+} + H_2O_2 + H^+ \rightarrow M^{(n+1)+} + {}^{\bullet}OH + H_2O \quad (3)$$

In the electro-Fenton method, low-cost, physically and chemically durable carbon-based electrodes (carbon felt, fiber, graphite, etc.) are preferred as cathodes. The catalytic amount of Fe(II) ion added to the medium is reduced again at the cathode after the Fenton reaction and participates in the production of hydroxyl radical again.

$$Fe^{3+} + e^- \rightarrow Fe^{2+} \quad (4)$$

The optimum pH value for the electro-Fenton process was determined as 2.8 (Sun and Pignatello, 1993), but the EF process can be properly carried out in the range of $2.5 < pH < 3.5$ (Diagne et al., 2007). High pH values cause precipitation of ferric iron and thus loss of catalyst, while acidic pH values lead to protonation of H_2O_2 and formation of peroxonium ion ($H_3O_2^+$). This ion is electrophilic and does not react with Fe^{2+} and therefore does not form hydroxyl radicals (Feng et al., 2003).

Vanillin is an important flavor and fragrance substance used in both food and cosmetics. Due to its significant consumption, synthetic vanillin is preferred over natural vanillin. In this study, the effectiveness of the cathode material (MoS_2@CF), prepared by loading molybdenum sulfide (MoS_2) onto the carbon felt (CF) electrode surface by hydrothermal method, in the oxidation of vanillin by electro-Fenton method was investigated.

Materials and Methods

Preparation of Molybdenum Sulfide-Carbon Felt Electrode

Molybdenum sulfide (MoS_2) was loaded onto carbon felt and graphite electrodes to form 5% by mass. 0.082 mM ammonium molybdate tetra hydrate and 32.8 mM thiourea were used as precursors in 50 mL of water. This mixture was placed in a stainless steel reactor with a Teflon inner wall and kept at 220 °C for 24 h. The felt was washed with pure water and ethanol and dried (Yang et al., 2021). The synthesized MoS_2 crystal structure was analyzed by XRD (Rigaku Smart Lab, Cu-Kα) and the surface properties of the MoS_2@CF electrode was determined by FE-SEM (Zeiss Supra 55).

Electro-Fenton Experiments

After adding 50 mM Na_2SO_4 to 120 mL of 30 mg/L vanillin solution in a 150 mL capacity glass realtor, the pH was adjusted to 3.0 with 0.3 M H_2SO_4. Finally, 0.2 mM Fe(II) was added to the solution saturated with oxygen gas and a constant current was applied**.** Samples were taken at various times and HPLC and TOC analyses were performed.

Findings and Discussion

The XRD pattern of the synthesized powder MoS_2 structure is given in Figure 1a. The characteristic diffraction patterns of molybdenum disulfide (JCPDS 73-1503) were observed at 14.06°, 33.55°, 39.50° and 59.30° 2θ values, respectively (Ibrahim et al., 2024). SEM images of the molybdenum disulfide loaded carbon felt electrode are given in Figure 1b at different magnifications. MoS_2 crystal structures accumulated on the surface of the carbon felt fibers are seen.

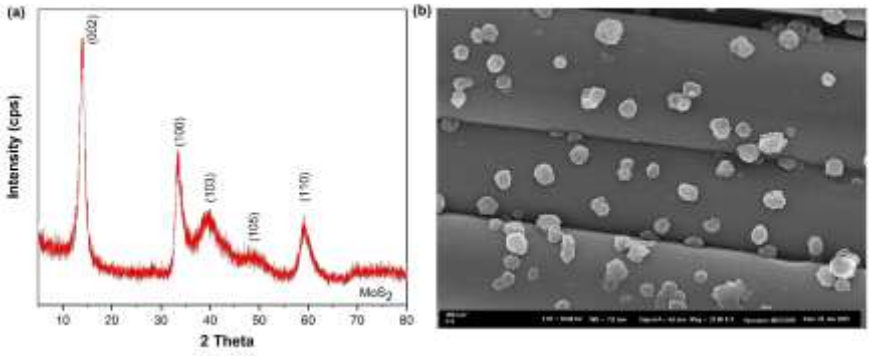

Figure 1. XRD pattern of MoS_2 (a) and Sem image of MoS_2@Cf (b)

After activation of the carbon felt electrode, MoS_2 loading was carried out hydrothermally by targeting 5% by mass. Vanillin degradation and kinetic results are given in Figure 2 using the prepared MoS_2@CF cathode at different currents. When Figure 2a is examined, it is seen that the degradation slows down as the applied current increases. While the degradation of vanillin was completed in approximately 30 min at 50 mA current, 95% was completed in 50 min when the current was increased to 300 mA.

While determining the rate constant of the reaction between vanillin and the hydroxyl radical, pseudo-first-order kinetics is used. According to the equation $-\ln(C_t/C_0) = k_{app}t$, when $-\ln(C_t/C_0)$ is plotted against time (t), the slope of the graph gives the apparent rate constant (Fig. 2b). The apparent rate constant values obtained at different current values in the oxidation of vanillin with MoS_2@CF cathode by the EF method are given in Table 1. Vanillin degradation was carried out at pH 3 with a reaction rate of 0.1220 min^{-1} at 50 mA.

Table 1. Rate constant values with MoS_2@CF cathode at different current values.

	Current (mA)			
	50	**100**	**200**	**300**
k_{app} (min^{-1})	0.1220	0.0905	0.0658	0.0470
R^2	0.9979	0.9972	0.9975	0.9942

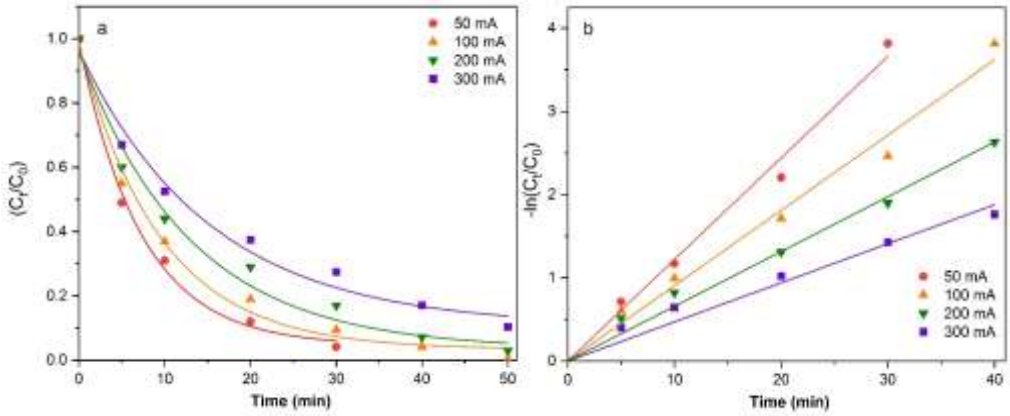

Figure 2. Degradation of vanillin at different current values by electro-Fenton method and MoS_2@CF cathode (a) and kinetics (b) ($[V]_0$= 30 mg/L, $[Fe^{2+}]$= 0,2 mM, $[Na_2SO_4]$= 50 mM, pH 3, V= 120 mL).

Figure 3 shows the vanillin mineralization results at different current densities using the MoS_2@CF cathode, which was prepared by loading MoS_2 onto the carbon felt cathode surface via the hydrothermal method.

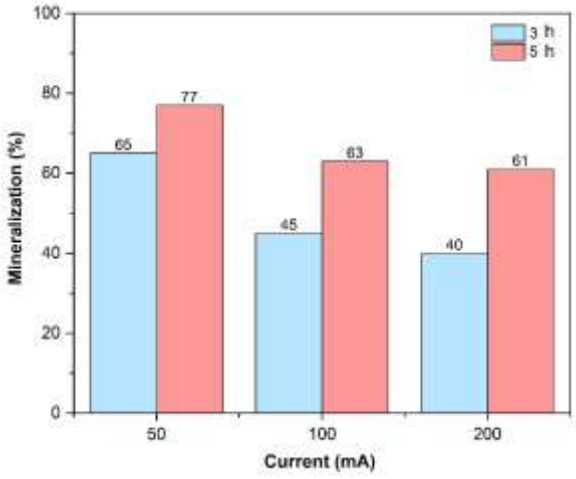

Figure 3. Vanillin mineralization with MoS_2@CF cathode at different current values.

In the EF method performed with a normal felt electrode, 58% and 64% removal was achieved after 3 and 5 h of treatment at 50 mA current, respectively, while this value was obtained as 65% and 77% with the MoS_2 loaded CF. This increase in mineralization is based on the acceleration of the Fe^{III}/Fe^{II} cycle by MoS_2, as stated in the literature (Tian et al., 2023).

Conclusion and Recommendations

In this study, a MoS_2@CF cathode was prepared and characterized, and its effectiveness in the oxidation of the target compound vanillin via the electro-Fenton process was investigated. Compared to the carbon felt (CF) cathode, higher mineralization of vanillin was achieved at pH 3 using the MoS_2@CF cathode through the homogeneous electro-Fenton process. This improvement is attributed to the ability of MoS_2 to accelerate the Fe^{3+}/Fe^{2+} redox cycle

ABSTRACT

The use of foils as wood-based panel coatings has led to significant advances in technology in this area. Since coating materials are plastic-based, their effects on the environment and human health and their resistance to external effects at the place of use have become an important issue to be investigated. Among artificial coatings, Polyvinyl chloride (PVC), Poly ethylene terephthalate (PET) and Poly methyl methacrylate (PMMA-Acrylic) are widely used. In this study, it was aimed to determine the abrasion and scratch resistance of PVC, PET and PMMA coated on medium density fiberboard (MDF). Abrasion and scratch tests were applied to 3 different surface coatings (PVC, PET, PMMA), 2 different surface types (Glossy-Matte) and 2 different color tones (Light-Dark) prepared in accordance with the principles of TS EN 438-2 and TS EN 15186 (Method B). As a result, the abrasion resistance was the highest (1755 cycles) for PMMA glossy surface light color, and the lowest (10 cycles) for PVC glossy surface dark color, PVC matte surface dark color, PET glossy surface dark color, PET matte surface dark color, PMMA glossy surface dark color and PMMA matte surface dark color. PVC matte surface light color, PVC matte surface dark color, PMMA matte surface light color and PMMA matte surface dark color were found to be more resistant to scratching effects (1.8 N), while PVC glossy surface dark color showed low resistance to scratching resistance (0.4 N). According to these results, PMMA glossy surface light color gave higher values in terms of abrasion resistance, while PVC matte surface light color, PVC matte surface dark color, PMMA matte surface light color and PMMA matte surface dark color gave higher values in terms of scratch resistance.

Keywords: Abrasion resistance, Scratch resistance, PVC, PET, PMMA

PVC, PET VE PMMA'NIN AŞINMA VE ÇİZİLME DİRENCİNİN BELİRLENMESİ

ÖZET

Folyoların ahşap esaslı levha kaplaması olarak kullanımı, bu alandaki teknolojinin büyük ilerleme göstermesine sebep olmuştur. Kaplama malzemeleri, plastik esaslı olması nedeniyle çevre ve insan sağlığına olan etkileri ile kullanım yerinde maruz kaldığı harici etkilere karşı dayanımı araştırılması gereken önemli bir konu haline gelmiştir. Yapay kaplamalar arasında Polivinil klorür (PVC), Poli etilen tereftalat (PET) ve Poli metil metakrilat (PMMA-Akrilik) yaygın olarak kullanılmaktadır.

Bu çalışmada, orta yoğunlukta liflevha (MDF) üzerine kaplanmış PVC, PET ve PMMA'nın aşınma ve çizilme direncinin belirlenmesi amaçlanmıştır. Bu amaca uygun olarak hazırlanan 3 farklı yüzey kaplaması (PVC, PET, PMMA), 2 farklı yüzey çeşidi (Parlak-Mat) ve 2 farklı renk tonu (Açık-Koyu) deney örneklerine TS EN 438-2 ve TS EN 15186 (Metot B) esaslarına uyularak aşınma ve çizilme deneyleri uygulanmıştır. Sonuç olarak aşınma direnci, PMMA parlak yüzeyli açık renkte en yüksek (1755 devir), PVC parlak yüzeyli koyu renk, PVC mat yüzeyli koyu renk, PET parlak yüzeyli koyu renk, PET mat yüzeyli koyu renk, PMMA parlak yüzeyli koyu renk ve PMMA mat yüzeyli koyu renkte en düşük (10 devir) çıkmıştır. PVC mat yüzeyli açık renk, PVC mat yüzeyli koyu renk, PMMA mat yüzeyli açık renk ve PMMA mat yüzeyli koyu renk çizilme etkilerine karşı daha dirençli (1,8 N) bulunurken, PVC parlak yüzeyli koyu renk çizilme direncine karşı düşük direnç (0,4 N) göstermiştir. Bu sonuçlara göre, PMMA parlak yüzeyli açık renk aşınma direnci bakımından, PVC mat yüzeyli açık renk, PVC mat yüzeyli koyu renk, PMMA mat yüzeyli açık renk ve PMMA mat yüzeyli koyu renk çizilme direnci bakımından daha yüksek değerler vermektedir.

Anahtar Kelimeler: Aşınma direnci, Çizilme direnci, PVC, PET, PMMA

1. GİRİŞ

Günümüzde dünya nüfusundaki hızlı artışa paralel olarak yükselen kaliteli ve sağlam mobilya talepleri karşısında, sürekli azalan orman varlıkları ve doğal kaynaklar nedeniyle, mobilya üretiminde masif ağaç malzeme kullanımı ekonomik olmamaktadır. Yıllardır mobilya sektörünün ana maddesini ahşap ve ahşap esaslı levhalar oluşturmaktadır. Ancak, son yıllarda, gelişen teknoloji mobilya sektöründe farklı ana hammaddelerin kullanılmasına imkân vermiştir. Özellikle polivinilklörür (PVC) levhalar, düzgün ve sert bir yapıya sahip, suya ve neme karşı dayanıklı, asit, alkaliler, hidrolik yağlar gibi aşındırıcı maddelere karşı yüksek dirençli, farklı renklere boyanabilmesi, laminat ile kaplanabilmesi v.b. özelliklerinden dolayı iç dekorasyon ve mobilya üretiminde kullanılmaya başlanmıştır. Suya ve neme karşı dayanıklı olduklarından dolayı mutfak, banyo, wc gibi ortamlardaki mobilyaların yapımında kullanılabilir (Bayındır, 2009).

MDF'nin yüzeyi genellikle laminasyon, kaplama veya vernikleme ile tamamlanır. Her türlü yüzey kaplaması gerekli kaliteyi sağlamalıdır. Kalite, yüzey kaplamanın özelliklerine göre değerlendirilir. Kaplama malzemeleri veya folyolar tarafından oluşturulan yüzey kaplamaları görünüm, fiziksel-mekanik özellikler ve kimyasal direnç özelliklerine göre değerlendirilmiştir (Tesařová ve ark, 2010; Scrinzi, ve ark, 2011; Modrák ve Mandulák, 2013; Bekhta ve ark, 2014; Salca ve ark, 2017; Yong ve ark., 2017).

MDF için laminasyon, kaplama ve vernikleme dışında, PET, PMMA, PVC-PET, emprenyeli kağıt, boya ve laminatta yüzey kaplaması olarak yaygın şekilde kullanılmaktadır.

Lake boyalı, PVC ve melamin kaplı MDF levhalarla yapılan bir çalışmada aşınma mukavemetlerinin birbirinden farklı olduğu görülmüştür. Standartta istenen değer 150 devir olup, elde edilen sonuçların standartlara uygun olduğu görülmüştür. En iyi aşınma mukavemeti PVC kaplı levhalarda bulunmuştur. Bunu melamin ve lake boya kaplı levhalar takip etmiştir. Yapılan benzer bir çalışmada aşınma mukavemeti melamin kaplı yüzeylerde en iyi 200 devir, lake boyalı yüzeylerde 180 devir bulunmuştur (Aksu 2009; Özdemir ve Malkoçoğlu 2010). Buna göre lake boyalı, PVC ve melamin kaplı yüzeylerin aşınma mukavemetleri standartların üstünde olduğu görülmüştür (Muğla, 2010).

Aynı çalışma içerisinde, lake boyalı yüzeylerin çizilme mukavemeti standart değerlerden düşük bulunmuştur. Buna karşılık PVC kaplı levhaların çizilme mukavemeti yüksek bulunmuştur. Melamin kaplı yüzeylerin standart değerlerde olduğu görülmüştür. İstek ve ark, (2010) tarafından yapılan çalışmada melamin kaplı MDF levhaların çizilme mukavemeti değeri 4 N bulunmuştur (Muğla, 2010).

Mobilya kapı yüzey kalitesinin değerlendirilmesiyle ilgili bir çalışmada, MDF kapılarda PVC folyo (parlak ve mat), akrilik folyo ve PUR pigmentli kaplama malzemesinin bazı özellikleri test edilmiştir. Yüzeylerin film sertliği, darbe direnci ve çizilmeye karşı direnç özellikleri değerlendirilmiştir. Poliüretan yüzey kaplaması ve parlak PVC folyo aynı film sertliğine ulaşmıştır. Poliüretan kaplamanın darbe direnci, PVC folyoların ve akrilik folyonun darbe direncinden önemli ölçüde daha düşük olduğu bildirilmiştir. Poliüretan kaplamanın çizilmeye karşı direnci, folyolu yüzeylerle karşılaştırıldığında daha düşük olduğu belirtilmiştir (Gabriela vd., 2019).

ABS ve PMMA levhaları sol-jel tekniğiyle kaplayarak asınma, çizilme, kimyasal ve ısıya dayanıklı hale getirmek amacı ile yapılan çalışmada, perfloro alkolden yola çıkılarak alkoksisilan sonlu üretan akrilat fonksiyonlu oligomer sentezlenerek sol-jel yöntemi ile hazırlanan organikinorganik hibrid kaplama formülasyonları ABS ve PMMA levhalara uygulanmış ve UV ısınlarının etkisiyle sertlestirilmiştir. Çalışma sonuçlarına göre, yapılan

uygulamanın ABS ve PMMA levhaların asınma, çizilme, ısı ve kimyasallara karsı dayanımı artırdığı bildirilmiştir. (Kartal, 2009).

Melamin emdirilmiş kağıtlar (MIP), poliüretan esaslı vernik (PV), poliüretan esaslı lake boya (LP), sürekli pres laminatlar (CPL), yüksek basınçlı laminatlar (IIPL) ve polivinilklorür levhalar (PVC) yonga levha için yüzey kaplama malzemesi olarak kullanılmış, bu yüzey kaplama malzemelerinde çizilme (SR), aşınma (AR), sigara yanıkları ve lekelenmeye karşı direnç özellikleri araştırılmıştır. Sonuçlar, çizilme ve aşınma dirençlerinin kaplama tiplerinden önemli ölçüde etkilendiğini göstermiştir. Yüksek basınçlı ve sürekli pres laminatlar lekelenmeye ve yanmaya karşı dirençli olup en yüksek aşınma ve çizilme direnci değerlerine sahip olduğu görülmüştür. En yüksek aşınma dirençleri HPL, CPL, PVC, LP ve MIP sıralamasında bulunurken, PV'nin en düşük değere sahip olduğu bildirilmiştir. Bu, kaplamaların reçine tipi, kullanılan miktar ve üretim koşullarındaki farklılıklardan kaynaklanma ihtimali olabileceği söylenmiştir. En yüksek çizilme dirençleri HPL, CPL, PVC, MIP, PV sırasında bulunurken, LP'nin en düşük değere sahip olduğu, bunun nedeninin kaplama üretiminde kullanılan reçinedeki fark olduğu bildirilmiştir (Özdemir vd., 2014).

Bu çalışmada, Orta yoğunlukta lif levha (MDF) üzerine kaplanmış, Poli vinil klorür (PVC), Poli etilen tereftalat (PET) ve Poli metil metakrilat (PMMA) malzemelerin, aşınma ve çizilme dirençlerine karşı performanslarının karşılaştırılması amaçlanmıştır.

2. MALZEME VE YÖNTEM

2.1. Malzeme

Bu çalışmada 18 mm kalınlığında MDF yüzeyine PVC, PET ve PMMA kaplanmış folyolar kullanılmıştır (Resim 1). Kullanılan deney numuneleri iki ayrı ticari işletmeden temin edilmiştir.

Resim 1. PVC-PET-PMMA kaplanmış deney örnekleri

2.1.1. Deney Örneklerinin Hazırlanması

2.1.1.1. Aşınma Direnci

Aşınma direnci örnekleri TS EN 438-2 esaslarına göre hazırlanmıştır. Bu amaçla, her grup için 100x100 mm boyutlarında 10'ar adet olmak üzere toplam 120 (12x10) adet örnek hazırlanarak merkezlerine 6 mm çapında delik açılmıştır.

Çalışmada kullanılan deney numuneleri ilgili standartlarda belirtilen ölçü ve sayılarda hazırlanmıştır. Deney örnekleri 23 ± 2 ºC sıcaklık ve %50 ± 5 bağıl nem şartlarında değişmez kütleye ulaşıncaya kadar bekletilmiştir.

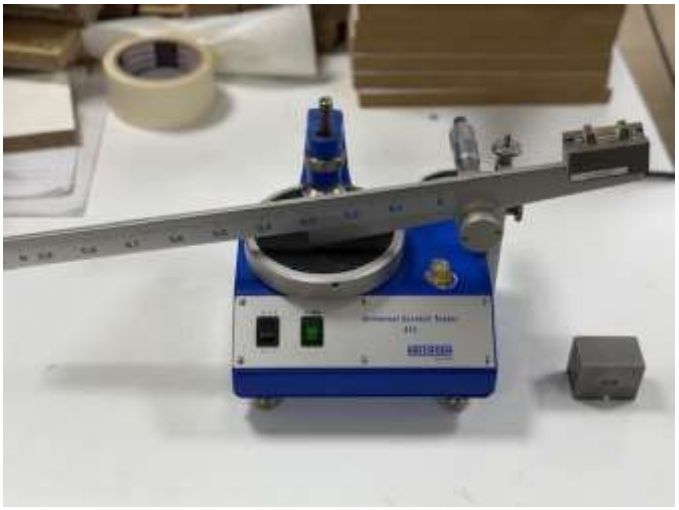
Testler Türk Standartları Enstitüsü Yapı Malzemeleri Laboratuvarı Ahşap ve Mobilya Bölümü'nde, TABER test cihazında gerçekleştirilmiştir (Resim 2).

Resim 2. Taber aşındırma test cihazı

2.1.1.2. Çizilme Direnci

Çizilme direnci örnekleri TS EN 15186 (Metot B) esaslarına göre hazırlanmıştır. Bu amaçla, her grup için 100x100 mm boyutlarında 10'ar adet olmak üzere toplam 120 (12x10) adet örnek hazırlanarak merkezlerine 6,5 mm çapında delik açılmıştır.

Testler Türk Standartları Enstitüsü Yapı Malzemeleri Laboratuvarı Ahşap ve Mobilya Bölümü'nde ERICHSEN test cihazında gerçekleştirilmiştir (Resim 3).



Resim 3. Erichsen çizilme test cihazı

Deney örnekleri tablo 1'de verilmiştir.

Tablo 1. Malzeme çeşidi

Malzeme Çeşidi	Deney Çeşidi		Toplam (Adet)
	Aşınma	Çizilme

PMMA-Mat-Açık Renk	10	10	20
PMMA-Mat-Koyu Renk	10	10	20
Toplam	**120**	**120**	**240**

2.2. Yöntem

2.2.1. Aşınma Direnci

Aşınma direnci, TS EN 438-2 esaslarına uyularak aşındırma deneyi cihazında belirlenmiştir (Resim 2). Buna göre; aşındırıcı tanecikleri alüminyum oksit olan zımpara kağıdı ve deney örnekleri 23 ± 2 ºC sıcaklık ve %50 ± 5 bağıl nem şartlarında 72 saat bekletildikten sonra zımpara tekerleklerin üzerine yapıştırılmıştır. Örnek, yatay düzleme paralel 58-62 dev/dak hızla dönen disk üzerine bağlanarak deneye başlanmış ve her 500 devirde zımpara değiştirilmiştir. Deneyin başında, aşınma için her 25 devirden sonra numune kontrol edilmiştir. Aşınma noktasına (İN) yaklaşırken, değerlendirme her 10 devirde bir yapılmıştır. Deneye, ilk aşınma noktasına (İN) ulaşıncaya kadar aynı şekilde devam ettirilmiştir. İlk aşınma noktası (İN), baskının, desenin veya düz rengin ilk net olarak algılanabilir aşınmasının ortaya çıktığı ve alt tabakanın 3/4'ü görünür hale geldiği noktadır.

2.2.2. Çizilme Direnci

Çizilme direnci TS EN 15186 (Metot B) esaslarına göre çizilme deneyi cihazında belirlenmiştir (Resim 3). Buna göre; hazırlanan örnekler 23 ± 2 ºC sıcaklık ve %50 ± 5 bağıl nem şartlarında değişmez kütleye gelinceye kadar bekletilmiştir. Deney cihazı, su terazisi yardımıyla yer düzlemine paralel konuma getirilerek deney örneği 5 ± 1 dev/dak hızla dönen destek tablası üzerine sıkıştırma vidası yardımıyla bağlanarak, yarıçapı 0,090 ± 0,003 mm olan elmas ucu

taşıyan destek kolu elmas uç örneğe temas ettiğinde yatay konuma getirilmiş ve ± 0,01 duyarlıkla ağırlık ayarları yapılmıştır.

Deneye 5 N'luk kuvvet uygulanarak başlanmış, örnek yüzeyinde görünür iz oluşmadığı taktirde yük 0,5 N'luk kademelerle kesintisiz çizik meydana gelinceye kadar artırılmıştır. 5 N'luk kuvvet uygulandığında kesintisiz çizik oluştuğu taktirde; kuvvet 2 N'a kadar 0,5 N'luk, 1 N'a kadar 0,20 N'luk, 1 N'un altında 0,1 N'luk kademelerle azaltılmış, kesik çizgiler meydana geldiğinde deneye son verilmiştir.

Örnekler testten sonra 24 saat süreyle 23 ± 2 oC sıcaklık ve %50 ± 5 bağıl nem şartlarında bekletilmiştir.

Örnek yüzeyi temiz bir bezle temizlendikten sonra 1200 ± 200 lümen bir ışık altında yaklaşık 400 ± 10 mm mesafeden çıplak gözle bakılarak test yüzeyi şablonunun 6 yuvasında tam görünür çizik izine yol açan minimum yük, örneğin çizilme direnci değeri olarak kaydedilmiştir.

3. BULGULAR

3.1. Aşınma Direnci

Deney numunelerinin aşınma direnç değerleri Tablo 2'de verilmiştir.

Tablo 2. Aşınma direnci değerleri

Yüzey Kaplama Malzemesi	Aşınma Direnci (Devir)				
	X_{min}	X_{max}	$\bar{x}$	D_g	S
PVC-Parlak-Açık Renk	1450	1650	1530	200	58,69
PVC-Parlak-Koyu Renk	10	10	10	0	0,00
PVC-Mat-Açık Renk	1050	1150	1070	100	48,30
PVC-Mat-Koyu Renk	10	10	10	0	0,00
PET-Parlak-Açık Renk	15	15	15	0	0,00
PET-Parlak-Koyu Renk	10	10	10	0	0,00
PET-Mat-Açık Renk	1500	1750	1665	250	66,87
PET-Mat-Koyu Renk	10	10	10	0	0,00
PMMA-Parlak-Açık Renk	1700	1850	1755	150	49,72
PMMA-Parlak-Koyu Renk	10	10	10	0	0,00
PMMA-Mat-Açık Renk	700	800	735	100	33,75
PMMA-Mat-Koyu Renk	10	10	10	0	0,00

X_{min}: Mininum değer X_{max}: Maksimum değer $\bar{x}$: Aritmetik ortalama

D_g: Değişim genişliği S: Standart sapma

Aşınma direnci en yüksek (1755 devir) PMMA parlak yüzeyli açık renkte, en düşük (10 devir) PVC parlak yüzeyli koyu renk, PVC mat yüzeyli koyu renk, PET parlak yüzeyli koyu renk, PET mat yüzeyli koyu renk, PMMA parlak yüzeyli koyu renk ve PMMA mat yüzeyli koyu renkte çıkmıştır.

3.2. Çizilme Direnci

Deney numunelerinin çizilme direnç değerleri Tablo 3'te verilmiştir.

Tablo 3. Çizilme direnci değerleri (N)

Yüzey Kaplama Malzemesi	Çizilme Direnci (N)				
	X_{min}	X_{max}	$\bar{x}$	D_g	S
PVC-Parlak-Açık Renk	0,5	0,5	0,5	0	0,00
PVC-Parlak-Koyu Renk	0,4	0,4	0,4	0	0,00
PVC-Mat-Açık Renk	1,6	1,8	1,8	0,2	0,08
PVC-Mat-Koyu Renk	1,6	1,8	1,8	0,2	0,08
PET-Parlak-Açık Renk	0,5	0,5	0,5	0	0,00
PET-Parlak-Koyu Renk	0,5	0,5	0,5	0	0,00
PET-Mat-Açık Renk	1,4	1,4	1,4	0	0,00
PET-Mat-Koyu Renk	1,4	1,6	1,6	0,2	0,06
PMMA-Parlak-Açık Renk	0,7	0,7	0,7	0	0,00
PMMA-Parlak-Koyu Renk	0,6	0,6	0,6	0	0,00
PMMA-Mat-Açık Renk	1,8	1,8	1,8	0	0,00
PMMA-Mat-Koyu Renk	1,6	1,8	1,8	0,2	0,08

X_{min}: Mininum değer X_{max}: Maksimum değer $\bar{x}$: Aritmetik ortalama

D_g: Değişim genişliği S: Standart sapma

PVC mat yüzeyli açık renk, PVC mat yüzeyli koyu renk, PMMA mat yüzeyli açık renk ve PMMA mat yüzeyli koyu renk çizilme etkilerine karşı daha dirençli (1,8 N) bulunurken PVC parlak yüzeyli koyu renk çizilme direncine karşı düşük direnç (0,4 N) göstermiştir.

4. SONUÇLAR VE TARTIŞMA

Aşınma direnci, en yüksek PMMA parlak yüzeyli açık renkte (1755 devir), en düşük ise PVC parlak yüzeyli koyu renk, PVC mat yüzeyli koyu renk, PET parlak yüzeyli koyu renk, PET mat yüzeyli koyu renk, PMMA parlak yüzeyli koyu renk ve PMMA mat yüzeyli koyu renkte (10 devir) çıkmıştır.

Aşınma direncinin koyu renkli örneklerde düşük (10 devir) çıkmasının en önemli nedeninin, açık renkler ile mukayese edildiğinde, yüzey bozunumunun (aşınma) koyu örneklerde gözlemsel olarak daha belirgin olmasından kaynaklandığı düşünülmektedir. Koyu renkli deney örneklerinde aşındırma işlemi başladığı ilk birkaç devirden sonra aşınan kısımlarda oluşan matlaşma ve renk kaybı açık renkli örneklerde 2000'li devir sayılarında gözlenmiştir.

Benzer durum, çizilme direncinde de etkili olmuş ve en yüksek değerler PVC mat yüzeyli açık renk, PVC mat yüzeyli koyu renk, PMMA mat yüzeyli açık renk ve PMMA mat yüzeyli koyu renkte (1,8 N) elde edilmiş, en düşük değerler ise PVC parlak yüzeyli koyu renkte (0,4 N) çıkmıştır.

Çizilme direncinde düşük direnç gösteren deney örnekleri genelde parlak yüzeyli olup, çizilmeyi açık bir şekilde yansıtmaktadır. Mat yüzeylerde belirginlik daha düşük seviyededir. Bu nedenle, aşınma ve çizilme direncinin yüksek olması istenilen durumlarda ve açık renkli yüzey kaplama malzemelerinin tercih edilmesi önerilebilir.

5. TEŞEKKÜR VE BİLGİ NOTU

Deneysel çalışmalarımızda yardımcı olan TSE Teknik Şefi Orm. End. Müh. Hasan AKSU'ya teşekkürü borç biliriz.

ABSTRACT

The structural properties of clay and its potential in the textile dyeing process are addressed. In terms of usage, clays meet fundamental human needs and hold significant economic potential across various industrial sectors. As a sustainable alternative to harmful washing processes, trials with clay materials found in our country should be conducted to integrate them into the textile industry. This would reduce the consumption of water, energy, and chemicals, thereby providing environmental benefits. As an alternative to the environmental impacts caused by the high water and chemical usage of the textile industry, various types of clay have been evaluated as natural dyeing agents. In this context, fabrics made of natural fibers such as cotton, wool, linen, and hemp were prepared for dyeing using appropriate mordanting techniques, and an experimental study was conducted by dyeing them with different types of clay. The resulting fabrics were subjected to tests for colour fastness to rubbing and washing. Based on the data obtained, the clay-dyed fabrics were evaluated within the framework of sustainable design principles, and a collection made from these fabrics was prepared. The research demonstrates that clay dyeing can significantly reduce water, energy, and chemical consumption in the textile sector and contribute to sustainable production using natural materials. The collection developed as a result presents an alternative method for ecological textiles.

KİLİN TEKSTİLDE SÜRDÜRÜLEBİLİR BOYAR MADDE OLARAK KULLANIMI

ÖZET

Kilin yapısal özellikleri ve tekstil boyama sürecindeki potansiyeli ele alınmıştır. Killer kullanım açısından, birçok endüstriyel alanda büyük ekonomik potansiyel oluşturarak insanlığın temel ihtiyaçlarını karşılamaktadır. Zararlı yıkama süreçlerine sürdürülebilir bir yaklaşım olarak, ülkemizde bulunan kil malzemeleri ile denemeler yapılarak tekstil sektörüne kazandırılmalıdır. Böylece su, enerji ve kimyasalların kullanımı en aza indirilerek fayda sağlanır. Tekstil endüstrisinin yüksek su tüketimi ve kimyasal kullanımından kaynaklanan çevresel etkilerini azaltmaya yönelik bir alternatif olarak, farklı kil türleri doğal boyar madde olarak değerlendirilmiştir. Bu kapsamda, doğal liflerden oluşan pamuk, yün, keten ve kenevir kumaşları uygun mordanlama teknikleriyle boyamaya hazırlanmış ve çeşitli kil türleriyle boyanarak deneysel bir çalışma yürütülmüştür. Uygulanan yöntemler sonucunda elde edilen kumaşlar sürtünmeye karşı renk haslığı ve yıkama haslığı ve testlerine tabi tutulmuştur. Elde edilen veriler doğrultusunda, kil ile boyanmış kumaşlar sürdürülebilir tasarım ilkeleri çerçevesinde değerlendirilmiş ve bu kumaşlardan oluşan bir koleksiyon hazırlanmıştır. Araştırma, kil boyamanın tekstil sektöründe su, enerji ve kimyasal tüketimini önemli ölçüde azaltabileceğini ve doğal malzemelerle sürdürülebilir üretime katkı sağlayabileceğini ortaya koymaktadır. Sonuçlar doğrultusunda geliştirilen koleksiyon, ekolojik tekstiller için alternatif bir yöntem sunmaktadır.

Anahtar Kelimeler: Ekolojik Tekstil, Sürdürülebilir Moda, Tekstil ve Tasarım, Doğal Tekstil Boyama

GİRİŞ

Sanayi devriminden günümüze kadar hızla büyüyen tekstil sektörü, sürdürülebilir üretim teknikleri arayışında doğal kaynaklara yönelmektedir. Bu bağlamda, talebi giderek artan hammaddelerden biri de kildir. Mineral yapıları, renkleri ve kimyasal içerikleri bakımından çeşitlilik gösteren killer, farklı endüstrilerde yaygın olarak kullanılmaktadır. Dünya genelinde yaklaşık 70 milyar ton kil rezervi bulunurken, Türkiye'de bu miktar 39 milyon ton olarak belirlenmiş ve yıllık üretim kapasitesi 900.000 tona ulaşmıştır. Günümüzde, dünya çapında üretilen kilin yaklaşık %75'i cam, kozmetik, inşaat, porselen, seramik ve tekstil gibi sektörlerde değerlendirilmektedir. (Maden Tetkik ve Arama Genel Müdürlüğü, t.y.). Tekstil endüstrisi, küresel su kirliliğinin yaklaşık %20'sinden sorumludur. Geleneksel boyama ve yıkama süreçleri, yüksek miktarda su ve kimyasal tüketimi gerektirdiği için çevresel sorunlara yol açmaktadır. Özellikle denim üretiminde kullanılan taş yıkama, ağır metaller içeren boyalar ve endüstriyel kimyasallar su kaynaklarını kirletmekte, işçi sağlığını tehdit etmekte ve ekolojik dengeyi bozmaktadır. Alternatif olarak, doğal boyama yöntemlerinin geliştirilmesi ve kullanımının yaygınlaştırılması, çevresel etkinin azaltılmasına katkı sağlayabilir.

Bu çalışmada, Türkiye'de bulunan farklı kil türlerinin tekstil boyama süreçlerinde kullanım potansiyeli araştırılmış ve deneysel uygulamalar gerçekleştirilmiştir. Boyama sürecinde, pamuk, keten ve kenevir kumaşlar tercih edilmiştir. Elde edilen kumaşlar sürdürülebilirlik ve tasarımsal özellikler açısından değerlendirilmiş, sonuç olarak bir koleksiyon oluşturulmuştur. Araştırma, kil boyamanın tekstil sektöründe su, enerji ve kimyasal kullanımını önemli ölçüde azaltarak çevre dostu bir alternatif sunduğunu ortaya koymaktadır. Türkiye'nin sahip olduğu geniş kil rezervlerinin bu alanda değerlendirilmesi, sürdürülebilir tekstil üretimi açısından büyük bir potansiyele sahiptir.

MATERYAL VE YÖNTEM

Bu çalışmada, doğal boyama süreçlerinde kilin etkisini incelemek amacıyla deneysel bir araştırma yürütülmüştür. Araştırma kapsamında, doğal liflerden oluşan kumaşlar (pamuk, keten, yün ve kenevir) farklı kil türleri ile boyanmıştır. Doğal boyama sürecinde hem doğal boyar maddeler hem de çeşitli yardımcı maddeler kullanılmıştır. Mordanlama işlemlerinde, boyanın liflere daha iyi tutunmasını sağlamak amacıyla şap (alüminyum sülfat) ve krem tartar (potasyum bitartrat) tercih edilmiştir. Boyama sonrası renk sabitleyici olarak sirke (asetik asit) kullanılmıştır. Boyar madde olarak doğal kil çeşitlerinden yararlanılmıştır. Yeşil kil, kırmızı kil ve siyah kil ana boyar maddeler olarak kullanılmış; ayrıca siyah ve kırmızı kil belirli oranlarda karıştırılarak kahverengi ton elde edilmiştir.

Doğal kil boyalarıyla renklendirilmiş dört farklı kumaş (pamuk, yün, keten ve kenevir) seçilmiş ve bu kumaşlara yeşil, kırmızı, siyah ve kahverengi kil pigmentleri ile doğal boyama işlemi uygulanmıştır. Boyama sonrasında, kumaş örnekleri sürtme (kuru ve yaş), yıkama haslığı ve multifiber bezle lekeleme gibi standart renk haslığı testlerine tabi tutulmuştur. Testlerde, renk değişimi ve boyanın diğer yüzeylere geçişi değerlendirilmiş; süreç boyunca tüm aşamalar görsel ve sayısal verilerle belgelenmiştir. Elde edilen bulgular, doğal kil boyalarının farklı kumaş yüzeylerindeki dayanıklılığını karşılaştırmalı olarak incelemek üzere analiz edilmiştir. Boyama sonrası kumaşlara renk haslığı, yıkama dayanıklılığı ve ışık dayanıklılığı testleri uygulanmıştır. Çalışma kapsamında ayrıca kil boyama tekniği ile üretilen kumaşlar sürdürülebilir tasarım ilkeleri doğrultusunda değerlendirilmiş ve bir koleksiyon oluşturulmuştur

BULGULAR VE TARTIŞMA

Araştırma süreci boyunca kil boyama uygulamaları, sistematik bir şekilde deneysel olarak gerçekleştirilmiştir. Bu kapsamda, doğrudan üretim aşamasına geçilmeden önce çeşitli ön denemeler yapılmıştır. İnternette yer alan kil boyama yöntemleri ve prosesleri incelenerek, farklı oranlar ve teknikler denenmiş; bu ön denemeler sonucunda en verimli sonuç alınan boyama prosesi belirlenmiştir. Bu denemeler sırasında elde edilen ara sonuçlara ait görseller sunulmuştur.

Belirlenen uygun proses doğrultusunda, dört farklı doğal elyaf (pamuk, keten, kenevir, yün) ön işlemlerle boyamaya hazırlanmış ve kil boyama işlemine tabi tutulmuştur. Uygulanan boyama süreci; mordanlama, boyama ve fiksaj aşamalarını içermektedir.

Boyama işlemi sonrasında kumaşlar iki farklı doğrultuda değerlendirilmiştir. Birinci grup kumaşlar, tasarımsal uygulamalarda değerlendirilmiş ve bu doğrultuda dört parçadan oluşan bir kıyafet koleksiyonu oluşturulmuştur. İkinci grup kumaşlar ise belirli testlere tabi tutularak kil boyamanın dayanıklılığı, renk tutuculuğu ve kumaş yüzeyine etkisi analiz edilmiştir.

Kil boyama uygulamasına geçilmeden önce, literatür taramaları ve mevcut doğal boyama tekniklerinin incelenmesi doğrultusunda çeşitli ön denemeler gerçekleştirilmiştir. Bu denemeler, kullanılacak boyar maddelerin ve yardımcı kimyasalların kumaş üzerindeki etkilerinin değerlendirilmesi ve uygulanacak nihai yöntemlerin belirlenmesi açısından büyük önem taşımıştır. Deneme süreci; oranların, uygulama yöntemlerinin ve bekletme sürelerinin kumaş üzerindeki etkilerini gözlemlemeye yönelik sistematik bir çalışma şeklinde yürütülmüştür.

BOYAMA SÜREÇLERİ VE AŞAMALARI

1.Mordanlama İşlemi

Boya işlemi öncesinde kumaşlar mordanlanarak boyanın liflere daha iyi tutunması sağlanmıştır (Görsel 1). Deneme numunelerinden elde edilen verilere dayanarak, mordanlama maddelerinin konsantrasyonu iki katına çıkarılmıştır. Kullanılan mordan maddeleri ve oranları aşağıdaki gibidir:

- Şap: Kumaş ağırlığının %20’si
- Krem tartar: Kumaş ağırlığının %16’sı

Çalışmada kullanılan kumaşlar ve ağırlıkları:

- Pamuk: 42 g
- Kenevir: 57,1 g
- Keten: 41,7 g
- Yün: 15 g

Toplam kumaş ağırlığına göre hesaplanan mordan miktarları:

- Şap: 31,16 g
- Krem tartar: 24,93 g

Görsel 1. Mordanlama aşaması

Görsel 2. Mordanlama işlemi sonrası kumaşlar

Mordan çözeltisi hazırlanırken, kumaşları tamamen kaplayacak miktarda su kullanılmış ve suyun sıcaklığı 40-50°C aralığında tutulmuştur. Kumaşlar çözeltide 40 dakika boyunca bekletilmiş, ardından doğal ortamda kurumaya bırakılmıştır.

2. Doğal Boyama İşlemi

Her renk için 500 g kil kullanılarak doğal boya çözeltileri hazırlanmıştır. Kullanılan renkler ve malzemeler:

- Yeşil: 500 g yeşil kil
- Kırmızı: 500 g kırmızı kil

- Siyah: 500 g siyah kil
- Kahverengi: 250 g kırmızı kil + 250 g siyah kil

Görsel 3. Oluşturulmuş boya çözeltisi

Her boya çözeltisi 2 litre su içinde hazırlanmış ve kumaşlar bu çözeltilerde 40-45 dakika boyunca bekletilmiştir (Görsel 3). Boyama süresince, kumaşların daha homojen renk almasını sağlamak amacıyla el ile karıştırma işlemi yapılmıştır. Boyama işlemi tamamlandıktan sonra kumaşlar sıkılarak doğal ortamda kurumaya bırakılmıştır.

Görsel 4. Boyama işlemi sonrası kumaşlar

3. Fikseleme İşlemi

Boyama sonrası renklerin kalıcılığını artırmak amacıyla sirke ile fikseleme işlemi uygulanmıştır. Kullanılan sirke miktarı kumaş ağırlığının %10'u olacak şekilde belirlenmiştir.

Kumaşlara göre kullanılan sirke miktarları:

- Kırmızı kumaş: 28,2 ml
- Siyah kumaş: 32 ml
- Kahverengi kumaş: 76,8 ml

- Yeşil kumaş: 86,6 ml

Fikseleme işlemi sırasında suyun sıcaklığı 60-70°C arasında tutulmuş, sıcaklığın 70°C'yi aşmamasına özen gösterilmiştir. Kumaşlar 25 dakika boyunca fikseleme banyosunda bekletilmiş, ardından tekrar doğal ortamda kurumaya bırakılmıştır (Görsel 5).

4. Su Miktarları

Fikseleme banyosunda kullanılan su miktarları kumaş türüne göre ayarlanmıştır:

- Yün kumaşı: 2 litre
- Keten ve kenevir kumaşı: 3 litre
- Pamuk kumaşı: 4 litre

Görsel 5. Boyama sonrası fikseleme aşaması

TESTLER VE ANALİZLER

Bu çalışmada, doğal kil boyalarıyla renklendirilmiş dört farklı tekstil yüzeyine uygulanan renk haslığı testleri ele alınmıştır. Kullanılan kumaş örnekleri; yeşil kil ile boyanmış pamuk kumaşı, kırmızı kil ile boyanmış yün kumaşı, siyah kil ile boyanmış keten kumaşı ve kırmızı ile siyah kilin karıştırılmasıyla elde edilen kahverengi kil ile boyanmış kenevir kumaşından oluşmaktadır. Her biri doğal içerikli bu boyalarla renklendirilmiş kumaşlara, kullanım esnasında karşılaşılabilecek fiziksel koşullara karşı renk dayanıklılıklarının belirlenebilmesi amacıyla çeşitli haslık testleri uygulanmıştır.

Görsel 6. Sürtme cihazı

İlk olarak, söz konusu dört kumaş örneği kuru ve yaş sürtme testine tabi tutulmuştur (Görsel 6). Test öncesinde kumaşlar, ilgili standarda uygun ölçülerde kesilmiş ve hem kuru hem yaş sürtme testleri için ayrı ayrı hazırlanmıştır. Testler sonucunda, kumaş yüzeyinden sürtme kumaşına geçen boya miktarı değerlendirilerek, renk haslığına dair veriler elde edilmiştir (Görsel 7).

Görsel 7. Kuru ve yaş sürtme sonrası kumaş parçaları

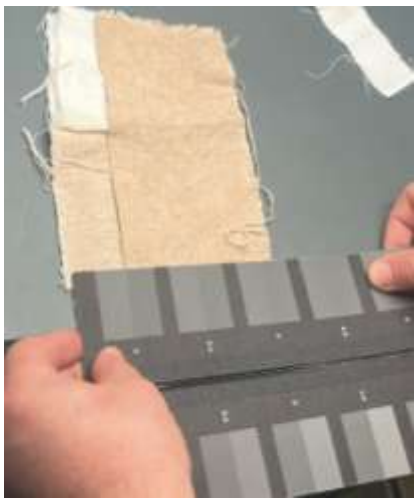
Ardından, boyalı kumaşların yıkama haslığı incelenmiştir. Bu test için, her bir boyalı kumaş örneği, üst ve alt kısımlarda yer alan refekat bezi arasına dikilmiştir (Görsel 8). Böylelikle test süreci sırasında boyalı kumaşın multifiber bezle doğrudan temas etmesi sağlanmıştır.

Görsel 8. Yıkama haslığı testleri için hazırlanan kumaşlar

Hazırlanan kumaş parçaları paslanmaz çelik bilyeler, multifiber, standartta belirtilen yıkama deterjanı ile birlikte kaplara yerleştirilir (Görsel 9). Testin amacı yapılan numunenin yıkama sonrası ne kadar solduğu ya da ne kadar renk kaybettiği ve kaybedilen rengin refakat bezini ne kadar derecede kirlettiğinin eldesidir. Seçilen yıkamaya göre yıkama haslığı test edilir. Daha sonra yapılacak kurutma işleminden sonra test numunesinin rengindeki değişme ve refakat bezlerine solma ve lekeleme olarak gri skala ile değerlendirilir (Görsel 10).

Görsel 9. Yıkama haslığı için hazırlanan kumaşlar

Tüm bu test aşamaları, görsel kayıtlarla da desteklenmiş; kumaşların kesilme anları, metal kaplara yerleştirilmeleri ve test sonrasındaki durumları fotoğraflanarak belgelenmiştir. Son aşamada, kumaşlar ışık altında incelenerek görsel renk değişimleri değerlendirilmiş, bu incelemeler de rapora dâhil edilmiştir. Elde edilen veriler doğrultusunda, kil bazlı doğal boyaların farklı kumaş türleri üzerindeki haslık performansları karşılaştırmalı olarak analiz edilmiştir.



Görsel 10. Kumaşların değerlendirme aşaması

Bu çalışmada, dört farklı doğal kumaş (pamuk, keten, kenevir ve yün) üzerinde doğal boyama yöntemleri uygulanmıştır. Her bir kumaş yalnızca bir doğal renklendirici ile boyanarak dört ayrı numune elde edilmiştir. Numuneler, boyama sonrası gerçekleştirilen test ve analizlerin doğru ve sistematik bir şekilde yürütülebilmesi amacıyla özel kumaş kodları ile tanımlanmıştır. Kodlama sistemi hem kumaşın cinsini hem de uygulanan rengi temsil edecek şekilde oluşturulmuş olup, olası karışıklıkların önüne geçmeyi hedeflemektedir. Ta ilgili numunelerin kumaş türü ve renk bilgilerini içermektedir.

Tablo 1. İlgili numunelerin kod, kumaş türleri ve renk bilgileri

Kumaş Kodu	Kumaş Rengi	Kumaş cinsi
Y-P	YEŞİL	PAMUK
K-Y	KIRMIZI	YÜN
S-KT	SİYAH	KETEN
KH-KN	KAHVERENGİ	KENEVİR

Yıkamaya karşı renk haslığı testi yapılmış kumaşlarda yıkamaya karşı renk haslığı testine ait sonuçlar Tablo 2'de verilmiştir. Yıkamaya karşı renk haslığının lekeleme gri skalasındaki değerlendirmesinde en yüksek değerde olduğu görülmektedir. Yıkama sonrası yapılmış kumaşlarda renk değişiminin olduğu ve gri skala değerlendirilmesinde değerlerin kötü olduğu tespit edilmiştir

Tablo 2. Yıkama haslığı test sonuçları

Yıkama Haslığı Test Sonuçları							
Kumaş Kodu	**Renk Değişimi**	**Lekeleme**					
		Asetat	**Pamuk**	**Polyamid**	**Polyester**	**Akrilik**	**Yün**
Y-P	2	5	5	5	5	5	5
K-Y	1	4-5	5	5	5	4-5	5
S-KT	1	5	5	5	5	5	5
KH-KN	3	4-5	4-5	4-5	4-5	4-5	5

Kumaşlarda sürtünmeye karşı renk haslığı testine ait sonuçlar Tablo 2'de verilmiştir. Buna göre, yapılmış kumaşlarda atkı ve çözgü yönlerindeki yaş sürtme test sonucunun gri skalada değerlendirmesinde, değerlerin kuru sürtme atkı-çözgü yönlerinde kabul edilebilir değerler olduğu tespit edilmiştir. Yaş sürtme haslıklarında Y-P kodlu kumaş ve KH-KH kodlu kumaşın değerlerin kabul edilebilir değerlerin içinde olduğu ancak S-KT kabul edilebilir değer sınırındayken, K-Y kumaşların yaş sürtme haslıkları ise kabul edilebilir değerlerin altında kaldığı yapılan testlerde görülmüştür.

Tablo 3. Kumaşlara yapılan renk ölçümü

Kumaş Kodu	**L***	**a***	**b***	**C***	**h**	**X**	**Y**	**Z**	**x**	**y**
KH-KN	67,59	5,95	15,99	17,07	69,58	37,26	37,41	28,21	0,36	0,36
S-KT	67,75	1,53	11,57	11,67	82,47	36,13	37,63	31,44	0,34	0,36
Y-P	77,41	0,55	13,21	13,22	87,62	49,71	52,21	43,35	0,34	0,36
K-Y	72,39	14,25	22,62	26,73	57,79	46,83	44,24	29,32	0,39	0,37

Datacolor spectroflash 600 plus cihazında, CIELab D65 gün ışığı ve 100 lik gözlemci ile USAV 6,6 mm görüş alan plakaları kullanılarak renk ölçümü yapıldı. Bu ölçüm sonunda rengin renk düzlemi üzerindeki renk koordinatları (L*, a*, b*, C*, h, X, Y, Z, x, y) hesaplanarak sayısal değerleri belirlendi.

TASARIM VE UYGULAMA

Bu tez kapsamında geliştirilen koleksiyonun uygulama süreci, kalıp geliştirme, kumaş yerleşimi, kesim, dikim ve tamamlayıcı detayların işlenmesi gibi aşamaları kapsamaktadır. Her bir modelin üretiminde, hali hazırda var olan temel baz kalıplar referans alınmış, bu kalıplar tasarım çizimleri ve fonksiyonel ihtiyaçlar doğrultusunda yeniden biçimlendirilerek özgün model kalıplarına dönüştürülmüştür. Bu süreçte her bir ürün için geliştirilen kalıplar, boyama aşamasında elde edilen doğal elyaf içerikli kumaşlara minimum atık oluşturacak şekilde yerleştirilmiştir. Yerleştirme sırasında kumaşların en-boy yönündeki esneme oranları, dokuma yönü, kumaş yapısının stabilizesi ve kullanım anında karşılaşabileceği fiziksel etkiler göz önünde bulundurulmuştur. Kalıpların kumaşa uygulanması ve kesim işlemleri manuel olarak gerçekleştirilmiş, ardından dikim aşamasına geçilmiştir. Ürünlerin tamamı unisex ve tek beden prensibiyle tasarlanmış olup, kullanıcıya göre ayarlanabilir esnek bir yapı hedeflenmiştir. Dikim sürecinde kumaşların yapısal özellikleri dikkate alınarak hem makine dikişi hem de el dikişi tekniklerinden yararlanılmıştır. Bazı dikiş bölgelerinde tasarım manifestosuyla örtüşen biçimde bilinçli olarak “pis dikiş” uygulanmış, bazı parçalarda ise iç temizliğe önem verilerek “temiz dikiş” tercih edilmiştir. Gerekli görülen alanlarda overlok dikişiyle sağlamlık sağlanmış; her bir teknik karar, tasarımın ifade gücünü destekleyecek şekilde yapılandırılmıştır.

Görsel 11. Dikim aşaması

Dikim sürecinde kumaşların yapısal özellikleri dikkate alınarak hem makine dikişi hem de el dikişi tekniklerinden yararlanılmıştır. Bazı dikiş bölgelerinde tasarım manifestosuyla örtüşen biçimde bilinçli olarak “pis dikiş” uygulanmış, bazı parçalarda ise iç temizliğe önem verilerek “temiz dikiş” tercih edilmiştir. Gerekli görülen alanlarda overlok dikişiyle sağlamlık sağlanmış; her bir teknik karar, tasarımın ifade gücünü destekleyecek şekilde yapılandırılmıştır. Uygulama sürecinin son aşamasında, ürünlerin detaylandırılması ve karakteristik yapısının güçlendirilmesi amacıyla tamamlayıcı malzemeler kullanılmıştır. Doğal boyalarla renklendirilmiş yün iplikler, belirli bölümlerde el dikişleriyle dekoratif ya da işlevsel olarak

eklenmiş; aynı zamanda tahta düğmeler gibi doğal malzemelerle ürünlerin organik yapısı desteklenmiştir. Bu dokunuşlar, koleksiyonun el yapımı karakterini ön plana çıkarırken, sürdürülebilirlik ilkeleriyle de bütünlük kurmuştur (Görsel 12).

Görsel 12. Ürünlerin manifesto doğrultusunda hazırlanışı

Bu üretim süreci, yalnızca ürünlerin fiziksel olarak ortaya çıkarılmasını değil, aynı zamanda tasarımcının düşünsel yaklaşımını, teknik ve estetik tercihlerini, sürdürülebilirlik ilkeleriyle bütünleştirilmiş bir pratik düzleme taşımasını da temsil etmektedir.

Koleksiyonun Konsepti

Doğa ve beden arasındaki sınırları kaldıran, kumaşı bir arayüz değil bir deneyime dönüştüren bir koleksiyon: RAWBOUND. Bu koleksiyon, dokuların doğallığını koruyarak onları özgürce şekillendiren bir anlatı sunuyor. Her dikiş, doğanın saf halini ve insan elinin dönüştürücü gücünü içinde barındırıyor.

Geleneksel form algısını yıkan, bedensiz ve cinsiyetsiz tasarımlar, bedenin sınırlarını silerken bireysel özgürlüğü ön plana çıkarıyor. Tek bir kalıba sığmayan, her vücuda uyum sağlayan ve kişiye özel bir varoluş alanı sunan parçalar. RAWBOUND, giyimin sadece fiziksel bir katman değil, aynı zamanda bir kendini ifade biçimi olduğunu hatırlatıyor.

Görsel 13. Koleksiyon moodboardı

RAWBOUND, ham ve doğal dokuların kil ile boyanarak hayat bulduğu bir koleksiyon. Keten, pamuk, yün ve kenevir gibi sürdürülebilir materyaller, kilin organik pigmentleriyle birleşerek doğanın zengin renk paletini yansıtıyor. El işçiliğinin yavaş üretim anlayışıyla harmanlandığı bu süreç, her bir parçayı sadece bir giysi değil, aynı zamanda bir hikâye taşıyıcısına dönüştürüyor. Her kumaş, toprağın dokusunu ve insan emeğinin izlerini taşıyor. Endüstriyel hızın aksine, bilinçli ve dengeli üretimi savunan bu koleksiyon, hızlı tüketimin karşısında kalıcılığa, standardizasyonun karşısında ise bireyselliğe vurgu yapıyor. RAWBOUND, giysileri yalnızca bir nesne olarak değil, dönüşümün bir parçası olarak ele alıyor. Koleksiyonun her bir parçası, esnek ve modüler tasarım anlayışıyla şekilleniyor. Ayarlanabilir detaylar, birden fazla kullanım seçeneği ve bedene göre adapte olabilen formlar ile giysiler, kullanıcıya kendi bedenini ve tarzını keşfetme özgürlüğü sunuyor.

Görsel 14. Artistik ve teknik çizim paftası

• Crop Ceket: Yeşil kil ile boyanmış, çıkarılabilir kol detayları sayesinde iki farklı silüete bürünebilen çok yönlü bir parça.

• Fonksiyonel Yelek: Kırmızı kilin enerjisini taşıyan bu yelek, yan düğmelerle farklı vücut tiplerine uyum sağlayacak şekilde genişleyip daralabiliyor.

• Dinamik Şort: Siyah kilin zengin dokusuyla şekillenen keten şort, esnek bağcıklar ve kişiye özel ayarlanabilen detaylarla hareket özgürlüğü sağlıyor.

• Çok Yönlü Çanta: Doğal kenevir kumaşından üretilen bu çanta, işlevselliği sanatla birleştirerek farklı taşıma seçenekleri sunuyor.

Görsel 15. Ürünlerin bitmiş görselleri

Benzer Markalar & İlham Kaynakları

- Ziggy Chen – Doğal materyallerle zamansız ve bedensiz tasarımlar yaratıyor, minimal ama derin konseptlerle çalışıyor.
- Jamie Okuma – Yerel ve doğal boyama tekniklerini kullanarak kültürel mirası modern tasarımlarla buluşturuyor.
- Auralee – Doğal dokulara ve yumuşak tonlara odaklanan Japon markası, RAWBOUND'un renk skalası ve hissiyatı ile örtüşebilir.
- Seya – Seyahat ve doğanın izlerini taşıyan, yüksek kaliteli işçiliğiyle dikkat çeken bir marka.
- Toogood – Cinsiyetsiz, fonksiyonel, sanatsal formları ve el işçiliğini ön planda tutan tasarımlar sunuyor.

Moda & Tekstil Markaları

- Honest by Bruno Pieters – Şeffaf üretim süreciyle tamamen doğal kumaşlara odaklanan bir marka. Kumaş seçiminde etik ve sürdürülebilir kaynakları ön planda tutuyor.

- Story Mfg. – Doğal boyama teknikleri, organik kumaşlar ve geleneksel el işçiliği ile üretim yapan bir İngiliz markası. RAWBOUND'un kil boyama yöntemiyle uyumlu olabilir.
- E.L.V. Denim – Sıfır atık ve geri dönüştürülmüş denim kullanımıyla bilinen marka, RAWBOUND'un sürdürülebilirlik anlayışıyla kesişebilir.
- Veja – Organik pamuk ve doğal kauçuk gibi malzemeleri etik üretim süreçleriyle birleştiren bir ayakkabı markası. Kumaş bazlı aksesuarlar için işbirliği potansiyeli taşıyor.
- Kjinsen – Zamansız ve minimal tasarımlarla doğal kumaşları ön planda tutan, etik üretimi destekleyen bir marka.
- • Lug Von Siga – Sürdürülebilir moda odağında doğal malzemelerle üretim yapıyor. RAWBOUND'un hikâyesiyle ortak bir koleksiyon çıkarabilir.
- • Saye Artisan – Doğal keten ve pamuk kullanarak el dokuması tekstiller üreten bir marka. RAWBOUND'un doğal boyama teknikleriyle birleşebilir.
- • Direct Message – Minimal, bedensiz ve doğal kumaşlarla çalışan bir marka, ortak bir tasarım anlayışına sahip olabilir.

Sanat & El Sanatları

- İstanbul Bienali veya Salt Galata – Sanat ve moda kesişiminde, doğal pigmentler ve dokular üzerinden deneysel bir enstelasyon ya da performatif bir moda sunumu.
- İznik Vakfı – Geleneksel seramiklerde kullanılan doğal kil boyaları ile kumaş boyama arasında bir köprü kuran bir koleksiyon ya da workshop.

Doğa & Sürdürülebilirlik

- Ecording veya TEMA Vakfı – RAWBOUND'un bir parçası olarak doğaya geri dönüşümü teşvik eden bir proje: Koleksiyondan elde edilen gelirle ağaçlandırma çalışmaları yapılabilir ya da kıyafetlere gömülebilir tohumlu etiketler eklenebilir.
- EkoKilit / Doğal Boyamacılar ile İş birliği – Türkiye'de doğal boya teknikleriyle çalışan zanaatkârlarla iş birliği yaparak koleksiyona bölgesel bir kimlik kazandırmak.

Sosyal Etki

- Kadın Kooperatifleri (S.S. Anatolian Craft, Mavi Kalem Derneği) – Koleksiyonun belirli parçalarının yerel kadın üreticilerle birlikte el işçiliğiyle üretilmesi.
- Mor Çatı veya LOOM Türkiye – Kadın hakları ve toplumsal cinsiyet eşitliği üzerine farkındalık yaratacak bir moda projesi.

RAWBOUND'un özü, sadece estetik ve tasarımda değil, üretim ve topluma katkı noktasında da güçlü bir bağ kurabilir. Hem sanatsal hem de toplumsal bir duruş sergileyen bu marka, lokal ve küresel iş birlikleri ile daha geniş bir anlatıya dönüşebilir.

SONUÇ VE ÖNERİLER

Bu çalışma kapsamında, doğal kil pigmentleri kullanılarak pamuk, keten, kenevir ve yün gibi doğal elyaf yapısına sahip kumaşlara doğal boyama işlemleri uygulanmıştır. Boyama süreçlerinde farklı kil türleri (yeşil, kırmızı, siyah) kullanılmış, ayrıca bu killerin karışımıyla kahverengi tonlar elde edilmiştir. Boyama öncesi kumaşlara uygulanan mordanlama işlemleri ile boyanın lif yüzeyine tutunması desteklenmiş, boyama sonrası fikseleme adımıyla renk kalıcılığı sağlanmaya çalışılmıştır. Deneme ve uygulama aşamaları karşılaştırıldığında, kullanılan kilin süzülüp süzülmemesi, mordan oranlarının farklılaştırılması gibi teknik detayların renk yoğunluğu ve kumaş yüzeyindeki dağılım üzerinde belirleyici olduğu tespit edilmiştir. Sürdürülebilir bir boyama prosesi olan bu deneysel çalışmada çevreye zarar vermeyen doğal boyama tekniği olarak tercih edilmektedir. Ancak burada boyamanın zorluğu ve tekrarlanabilirliği bu yöntemin dezavantajı olarak bilinmektedir.

Kil boyamanın kumaşlarda yıkama haslıklarının lekeleme yönünde yüksek olduğu buna karşın ise solma değerlerinin düşük olduğu tespit edilmiştir. Burada yıkama işlemleri sonunda boyarmaddenin kumaştan uzaklaşması sonucu leklemelerin iyi olduğu ancak kumaşta boyarmaddenin uzaklaştığı bu yüzden yaş haslıklarının düşük olduğu söylenebilir. Bunun kumaşa bağlanan boyarmaddenin yeterince bağlanamadığını göstermektedir. Bu sebepten dolayı kumaşların yaş işlem veya sulu ortamlarda meydana gelecek dış etkenlerden etkileneceği ve materyallerin kullanım alanını doğru bir şekilde seçilmesi gerekmektedir.

Kumaş açısından selülozik esaslı lifler pamuk ve kenevir, yün ve ketene göre haslık açısından daha kullanılabilir olduğu yapılan haslık testlerinden görülmektedir.

Elde edilen bulgular, çevresel açıdan sürdürülebilir bir alternatif sunduğunu ortaya koymaktadır. Kumaşların kullanım amacı gözetildiğinde kullanıldıkça yıpranan bir rengin moda ve tasarım açısında kullanılması daha doğru olacağı görülmektedir. Çalışma kapsamında elde edilen boyalı kumaşlar hem tasarımsal ürünler üretmekte kullanılmış hem de çeşitli fiziksel testlerle değerlendirilmiştir. Bu yönüyle çalışma, doğal boyamacılıkta kil pigmentlerinin etkinliğini ortaya koyan öncü bir örnek sunmaktadır.

Kil boyama ile elde edilen renklerin zamanla değişim göstermesi, klasik anlamda renk stabilizesinin dışına çıksa da, bu özellik kumaşın yaşamsallığını ve geçirdiği dönüşümü yansıtarak ürünün uzun ömürlü kullanımına dair farklı bir yorum sunar. Bu değişim süreci, kumaşa bireysel bir hikâye kazandırır ve tasarımı statik değil, zamanla evrilen bir obje haline getirir. Bu yönüyle kil boyama, estetik bir tercih ve tasarımsal bir anlatı unsuru olarak değerlendirilebilir.Bu bağlamda, kil boyama yöntemi özellikle kişiye özel tasarımlar, sınırlı sayıda üretilen sanatsal koleksiyonlar ve konsept moda ürünleri için sürdürülebilir, doğaya duyarlı ve yaratıcı bir alternatif oluşturmaktadır. Bu tür tasarımlarda, rengin zamanla değişimi bir kusur değil, tasarımın yaşayan bir parçası olarak kabul edilmekte; kullanıcı ile ürün arasında duygusal bir bağ kurulmasına olanak sağlamaktadır.

Ticari açıdan bakıldığında ise bu yöntemin potansiyeli, niş pazarlar, hikâye temelli moda pratikleri ve zanaat temelli üretim modelleri ile desteklenebilir. Sürdürülebilirlik ilkelerini benimseyen butik markalar, yerel üretimi esas alan tasarımcı atölyeleri veya kültürel bağlamdan beslenen projelerde, kil boyama farklılaştırıcı ve değer odaklı bir uygulama olarak öne çıkabilir. Ayrıca, yerel ve doğal malzemelerle gerçekleştirilebilmesi sayesinde ekolojik ve ekonomik sürdürülebilirlik açısından da avantajlıdır.

Doğal kil boyama yöntemi hem çevre dostu yapısı hem de düşük atık üretimi ile sürdürülebilir tekstil arayışları açısından önemli bir potansiyel taşımaktadır. Ancak ülkemizde bu yönteme dair akademik ve sektörel çalışmalar oldukça sınırlıdır. Türkiye'nin zengin kil yataklarına sahip

olması, bu doğal malzemenin tekstil boyamacılığında kullanımı için büyük bir avantaj sunmaktadır. Bu nedenle, kil temelli doğal boyaların yerli üretimle desteklenmesi, araştırmalarla geliştirilmesi ve uygulama tekniklerinin yaygınlaştırılması hem çevre sağlığına katkı sağlayacak hem de yerli üretim politikalarına hizmet edecektir.

Günümüz tekstil sektöründe hâkim olan sentetik boyar maddeler hem insan sağlığı hem de çevre açısından ciddi riskler barındırmaktadır. Özellikle üretim ve yıkama süreçlerinde ortaya çıkan kimyasal atıklar, su kaynakları ve ekosistemler üzerinde kalıcı etkiler yaratmaktadır. Bu bağlamda kil gibi doğal kaynaklardan elde edilen boyalar, atıksız, toksik olmayan ve doğayla uyumlu bir alternatif sunmaktadır. Bu yöntemin, geleneksel tekstil teknikleriyle yeniden ilişkilendirilerek çağdaş üretim sistemlerine entegre edilmesi mümkündür.

Ayrıca bu yöntem, düşük maliyetli oluşu ve kolay erişilebilen hammaddelere dayanması bakımından küçük ölçekli üreticiler, yerel zanaatkârlar ve sürdürülebilir tasarım pratikleri yürüten girişimler için uygulanabilir bir model sunmaktadır. Gelecekte yapılacak çalışmalarda, farklı kil türlerinin içerdiği metal oksitlerin renk üzerindeki etkileri detaylı biçimde incelenmeli, ayrıca bu pigmentlerin farklı tekstil elyafları üzerindeki renk dayanımı testleri geniş kapsamda değerlendirilmelidir.

Bunun yanı sıra, doğal boyamacılık tekniklerinin tekstil eğitimi müfredatlarına entegre edilmesi, tasarımcıların alternatif malzeme bilgisi geliştirmesi açısından önemlidir. Aynı zamanda bu yöntemin, biyobozunur ve vegan üretim süreçleri arayan yeni nesil tüketiciler açısından da değerli bir yaklaşım olabileceği düşünülmektedir.

Sonuç olarak, kil boyama yöntemi endüstriyel üretim kalıplarının dışında kalan; ancak çağdaş moda dünyasında giderek önem kazanan anlam odaklı, çevresel duyarlılığı yüksek ve estetik çeşitliliği destekleyen tasarım anlayışlarına güçlü bir katkı sağlayabilir. Gelecek araştırmalarla bu yöntemin farklı doğal hammaddelerle veya post işlem teknikleriyle geliştirilmesi, hem estetik hem de performans açısından daha geniş bir uygulama alanı açabilir.

Teşekkürler ve Bilgi Notu

Bu çalışmanın yürütülmesi sürecinde, özellikle boyama prosesleri ve test uygulamaları konusundaki bilgi ve tecrübeleriyle değerli katkılar sunan Marmara Üniversitesi öğretim üyesi Doç. Dr. Bekir Cenkkut Gültekin'e ve destekleriyle çalışmama katkı sağlayan Arş. Gör. Onur Atak'a teşekkürlerimi sunarım. Ayrıca her aşamasında akademik rehberliği, yönlendirmeleri ve sürekli desteği ile katkıda bulunan danışmanım Haliç Üniversitesi Dr. Öğr. Üyesi Vedat Özyazgan'a içten şükranlarımı arz ederim.

OCCUPATIONAL SAFETY IN ORAL AND DENTAL HEALTH HOSPITALS

Şakir ŞAHİN
Süleyman Demirel Üniversitesi, Mühendislik ve Doğan Bilimleri Fakültesi, Jeofizik Mühendisliği Bölümü, Isparta-Türkiye
Süleyman Demirel Üniversitesi, Ortak Sağlık ve Güvenlik Birimi, Isparta-Türkiye
sakirsahin@sdu.edu.tr ORCID: 0000-0001-6345-5270

ABSTRACT

The duties, authorities, responsibilities, rights and obligations of employers and employees to ensure occupational health and safety in Oral and Dental Hospital and to improve current health and safety conditions are regulated by the Occupational Health and Safety Law Numbered. 6331, which was adopted on the June 6th, 2012. According to the Workplace Hazard Classes Communiqué on Occupational Health and Safety, which was adopted on the December 26th, /2012, the field of activity of Oral and Dental Health Hospitals is in the very hazardous class and carries all risks related to physical, chemical, biological, ergonomic, psychosocial and the services provided. The aims of occupational safety is all the activities that need to be carried out for the employees and students in the hospital to maintain their normal health, and the aim is to protect the employees from occupational accidents and occupational diseases. The risk assessment carried out within this scope includes the studies that need to be carried out to determine the existing or external hazards and to eliminate the factors that cause these hazards to turn into risks. These studies are to determine the risks that may negatively affect the patient, patient relatives, visitors, employees and the environment, including the interns and those receiving vocational training in the institution. Risks are combated at their source, if this is not possible, the risk level is reduced to an acceptable level in the environment or target. Risk assessment studies should be carried out in coordination with the relevant boards such as the quality management unit, occupational health and safety units, and the patient safety committee. In this study, the studies that need to be carried out to ensure occupational safety in Oral and Dental Health Hospitals are discussed and solution suggestions are presented.

Keywords: Oral and Dental Health Hospital, occupational safety, risk, danger.

AĞIZ VE DİŞ SAĞLIĞI HASTANELERİNDE İŞ GÜVENLİĞİ

ÖZET

Ağız ve Diş Sağlığı Hastanelerinde iş güvenliğinin sağlanması, mevcut sağlık ve güvenlik koşullarının iyileştirilmesi için işveren ve çalışanların görev, yetki, sorumluluk, hak ve yükümlülükleri 20/06/2012 tarihinde kabul edilen 6331 Sayılı İş Sağlığı ve Güvenliği Kanunu ile düzenlenmiştir. 26/12/2012 tarihin yürürlüğe giren İş Sağlığı ve Güvenliğine İlişkin İşyeri Tehlike Sınıfları Tebliğine göre Ağız ve Diş Sağlığı Hastaneleri faaliyet alanı çok tehlikeli sınıfta yer almakta ve fiziksel, kimyasal, biyolojik, ergonomik, psikososyal ve sunulan hizmetlere ilişkin tüm riskleri taşımaktadır. İş güvenliğinin amacı hastanede çalışanların, öğrencilerin, normal sağlıklı hallerini sürdürmeleri için yürütülmesi gereken faaliyetlerin tümü ve hedefi çalışanları, iş kazası ve meslek hastalıklarından korumaktır. Bu kapsamda yapılan risk değerlendirmesi var olan ya da dışarıdan gelebilecek tehlikelerin belirlenmesi, bu tehlikelerin riske dönüşmesine yol açan faktörlerin ortadan kaldırılması için yapılması gereken çalışmaları kapsar. Bu çalışmalar stajyer ve kurumda mesleki eğitim alanlar dahil olmak üzere hasta, hasta yakını, ziyaretçi, çalışan ve çevreyi olumsuz etkileyebilecek risklerin belirlenmesidir. Risklerle kaynağında mücadele edilir, bu mümkün değilse risk düzeyi ortam veya hedefte kabul edilebilir seviyeye indirilir. Risk değerlendirme çalışmaları kalite yönetimi birimi, iş sağlığı ve güvenliği ile ilgili birimler, hasta güvenliği komitesi gibi ilgili kurullar ile koordineli şekilde yürütülmelidir. Bu çalışmada Ağız ve Diş Sağlığı Hastanelerinde iş güvenliğinin sağlanması için yapılması gereken çalışmalar ele alınmış ve çözüm önerileri sunulmuştur.

Anahtar Kelimeler: Ağız ve Diş Sağlığı Hastanesi, iş güvenliği, risk, tehlike.

1- GİRİŞ

Dünya Sağlık Örgütü (WHO) sağlığı kişinin bedenen, ruhen ve sosyal yönden tam iyilik hali olarak tanımlamaktadır. Sağlık çalışanlarının iş güvenli ve sağlığının korunması için, çalışma ortamında fiziksel, kimyasal, biyolojik, psikolojik, ergonomik tehlike tespit edilmesi ve risk değerlendirmesinin yapılması gerekir. İş güvenliği, Fakülte, Klinik ve hastanede çalışanların, öğrencilerin, hastaların normal sağlıklı hallerini sürdürmeleri için yürütülmesi gereken faaliyetlerin tümüdür. İş Güvenliğinin temel amacı iş kazalarının önüne geçmek ve çalışanları meslek hastalıklarından korumaktır. Ülkemizde çalışan güvenliğinin sağlanması için 2015 yılında Sağlık Bakanlığı tarafından hazırlanan "Sağlıkta Kalitenin Geliştirilmesi ve Değerlendirilmesine Dair Yönetmeliği" yürürlüğe girmiştir.

2- İŞ SAĞLIĞI VE GÜVENLİĞİ UYGULAMASI

İşveren ya da İşveren Vekili 6331 sayılı İş Sağlığı ve Güvenliği Kanunu ve İş Sağlığı ve Güvenliği Risk Değerlendirmesi Yönetmeliği uyarınca diş klinik ve hastanelerinde tehlike ve risk analizi yapmak veya yaptırmakla yükümlüdür. Risk değerlendirmesi; diş klinik ve hastanede var olan ya da dışarıdan gelebilecek tehlikelerin belirlenmesi, bu tehlikelerin riske dönüşmesine yol açan faktörlerin ortadan kaldırılması için yapılması gereken çalışmaları kapsar. 26/12/2012 tarihli İş Sağlığı ve Güvenliğine İlişkin İşyeri Tehlike Sınıfları Tebliğine göre Diş Klinikler ile Ağız ve Diş Sağlığı Hastanesi faaliyet alanı çok tehlikeli sınıfta yer almaktadır.

Ağız ve Diş Sağlığı Hastanelerinde tehlikelerin kaynakları acil durum, asansör, atıklar, biyolojik etkenler, yangın, tanklar, basınçlı tüpler, cam yüzeyler, eğitim ve bilgilendirme, ekranlı araçlarla çalışma, elektrik, elle taşıma, ergonomi ve monoton çalışma, depolar, ışıma-radyasyon, iklimlendirme-havalandırma, haşereler ve kemirgenler, ilkyardım malzemeleri, istif ve sabitleme, jeneratör, kaygan zemin, kesici delici aletler, kimyasal maddeler, kombi/kazan dairesi, psikososyal etkenler, sterilizasyon, su depoları, tavana sabitlenen malzemeler, hijyeni koşulları, yüksekte çalışma ve zemin sorunları şeklinde sıralanabilir (Güler, 2004; Çetik ve Oğulata, 2023). Bahsi geçen tüm tehkile kaynaklarına bağlı risklerin değerlendirmesi fiziksel, kimyasal, biyolojik, ergonomik, psikososyal ve sunulan hizmetlere ilişkin tüm riskleri içermektedir. Risk değerlendirmesi Sağlık Kalite Sistemi kapsamında hasta, hasta yakını, ziyaretçi ve çalışanlara yönelik riskler Tıbbi hizmetler, Yönetsel hizmetler, Tesis güvenliği, çevre güvenliği, İş sağlığı ve güvenliği.

Malzemelerin yerli yerinde olmaması, temizlenmemesi ve sterilize edilmemesi, işyerinin temizliği ve hijyen şartlarının uygun olmaması, çalışma ortamının dar olması, çöpler ve atıklar (atık kutularının ağızlarının açık olması ve ünitlere yakın olması, her boşaltmadan sonra dezenfekte edilmemesi), toz oluşumu, sterilizasyon amaçlı kullanılan araç ve malzemelerin kullanım talimatlarının bulunmaması iş yeri düzeni ve hijyen sorunlarını oluşturmaktadır. Sağlık birimlerinde iş yeri düzeni ve hijyen sorunları iş güvenliği riski oluşturmaktadır. Makinelerin hareketli parçaları, basınçlı kaplar, lazer ile çalışan cihazlar, el aletleri ya da teknik aparatlar, röntgen cihazları, bisturi yaralanması, enjektör batması sonucu sıklıkla karşılaşılan iş kazalarına neden olmaktadır. İş Güvenliğinde Psikososyal Risk Etmenleri, işin mahiyeti, iş yükü ve temposu, iş programı, ilişkiler ve kariyere göre değişiklik gösterir. Yoğun çalışmaların yapıldığı alanlara, kliniklere ve laboratuvarlara, ziyaretçilerin veya hastaların girişleri psiko-sosyal risk etmenlerini oluşturur (Gül, 2009; Özer vd., 2005). Ergonomik bir oturma pozisyonu, vücut yapısına uygun ve uzun süreli oturmanın yol açabileceği sağlık sorunlarını en aza indirgeyen bir duruştur (https://www.csgb.gov.tr/media/4587/rehber06.pdf). Bu pozisyon, omurganın doğal eğrisini destekler, eklem ve kas gerginliğini azaltır ve kan dolaşımını iyileştirir. Çalışma ortamında uygun olmayan duruş pozisyonlarda çalışma, Çalışmalarda,

yapılan işe uygun olmayan masa, sandalye veya destek ekipmanları iş sağlığı güvenliği açısından risk oluşturur.

Kullanılmış iğne, bisturi, katater iğnesi gibi kirli, kesici, delici aletler ele battığında ya da başkasının eline batması halinde çok ciddi hastalıklara sebep olabilir. Kesici-delici ve kirli aletler kullanılırken yaralanmaya karşı dikkatli olunmalıdır. Hastada kullanılan kanlı enjektörleri iğneleri dışarıda kalmayacak şekilde, kesinlikle kapaklarını kapatmadan sarı tıbbi atık kovası içine atılmalı, asla çöp kovasına atılmamalıdır.

Afetler (Deprem, Sel vb.), yangın, trafik kazaları, elektrik çarpması, kimyasal dökülme, iş kazaları, acil müdahale ve ilk yardım gerektiren durumlar, herhangi bir kazaya veya yaralanmaya sebep olmamış, ancak buna yol açmak üzere olan durumlar (elektrik kaçağı vb.) acil durumdur. Acil durum çalışma ortamında normal iş akışını bozan veya durmasına sebep olan olaylardır. Olayların oluşturabileceği kriz halini önceden belirlenmesi ile hızlı bir şekilde müdahale edilerek iş sürekliliğinin devamı sağlanabilir (Özmen vd. 2015). Acil Durum planları kapsamında Yangınla Mücadele (Söndürme), Arama ve Kurtarma, Tahliye Ekibi, İlk Yardım Ekipleri oluşturulmaktadır. Hastanede olağanüstü durumlarda; Fiziksel veya sözel taciz, şiddet, saldırı vb. durumlarda Beyaz Kod (1111), Kalp ve solunum durması veya yaşamı tehdit eden durumlarda Mavi kod (2222)**,** Bebek ve çocuk güvenliğinde Pembe Kod (3333), Yangın, doğal afet ve kaza durumlarında Kırmızı Kod (4444) kullanılır.

Sağlık çalışanlarının sıklıkla tüberküloz, menengokoksik menenjit, gastrointestinal sistem enfeksiyonları, lejyoner hastalığı, difteri, boğmaca, hepatit-b, kızamık, kızamıkçık, kabakulak, suçiçeği veya varisella zoster, herpes enfeksiyonları, sitomegalovirüs enfeksiyonları, edinsel bağışıklık yetersizliği sendromu ve histoplazmosis gibi sağlık sorunları ile karşılaşmaktadırlar (Görgüner, 2002). Ameliyathanede, enjektör kullanımında ve temizlik aşamalarında bu tür riskle maruz kalınmaktadır (Yürügen ve Durna, 1992; Merih vd., 2009; Anık, 2004). Sağlık çalışanlarının kişisel koruyucu donanım (KKD) kullanması zorunludur. KKD'lerin temini ve kullanımının sağlanması işverenin yükümlülüğündedir (Demirbilek ve Çakır, 2008). Aynı zamanda ortamda koruyucu nitelikte saçılma kiti sağlık tesislerinde bulundurulması gerektedir.

3- SONUÇLAR

Ağız ve diş sağlığı hastanelerinde gözlemlenen başlıca tehlikeler, çalışanlar, hastalar ve ziyaretçiler üzerinde doğrudan etkili olabilecek acil durumlar ile mekanik ve elektrikli iş ekipmanlarının yönetimi kapsamında ortaya çıkmaktadır. Bu tür sağlık tesislerinde, özellikle acil bir durumda, hasta, engelli, yaşlı ve gebe bireyler dâhil olmak üzere tüm kişilerin hızlı ve güvenli bir şekilde tahliye edilmesi büyük önem taşımaktadır. Bu nedenle bina tasarımı, acil tahliyeyi kolaylaştıracak şekilde planlanmalı ve tahliye yolları açık, erişilebilir ve işaretlenmiş olmalıdır.

Hastanenin fiziksel altyapısı, patlama, yangın ve elektrik kaçağı gibi risklere karşı düzenli olarak denetlenmeli; bu risklerin oluşmasına neden olabilecek tüm unsurlar kontrol altında tutulmalıdır. Özellikle kazanlar, basınçlı kaplar, gaz tüpleri, kompresör sistemleri, asansörler ve diğer elektrikli iş ekipmanları, düzenli bakım ve periyodik kontrollerle güvenli bir şekilde yönetilmelidir.

Bununla birlikte, sağlık çalışanlarının hastalarla yakın temas içinde çalışması, biyolojik riskleri de gündeme getirmektedir. Enfeksiyon kontrol önlemleri, kişisel koruyucu donanım kullanımı ve hijyen protokolleri, bu tür risklerin önlenmesi açısından hayati öneme sahiptir. Özellikle ağız yoluyla bulaşabilecek enfeksiyonlara karşı korunma, bu hastanelerde iş güvenliği kapsamında öncelikli olarak ele alınmalıdır.

İş sağlığı ve güvenliği uygulamalarının temel ilkesi, tehlikelerin kaynağında ortadan kaldırılmasıdır. Bu amaçla, yasal yükümlülüklerin eksiksiz şekilde yerine getirilmesi ve etkili bir işletme yönetiminin sağlanması, ağız ve diş sağlığı hastanelerinde iş güvenliğini sağlamanın temel koşulları arasında yer almaktadır.

Sonuç olarak, yüksek risk içeren bu tür sağlık tesislerinde, öncelikli hedef; risklerin tespit edilmesi, önleyici tedbirlerin alınması ve tüm çalışanların iş sağlığı ve güvenliği kültürüyle donatılması olmalıdır.

ÖZET

Giriş: Dijital teknoloji çağının getirdiği dönüşümler doğrultusunda, üniversiteler eğitim-öğretim süreçlerinde sanal öğrenme ortamları, mobil cihazlar, akıllı ders yönetim sistemleri ve yapay zekâ destekli uygulamalar gibi çeşitli teknolojik araçları yaygın biçimde kullanmaya başlamıştır. Ancak bu teknolojilerin eğitim bağlamında yoğun biçimde entegrasyonu, özellikle teknolojiyi daha çok eğlence ya da bireysel ilgi amaçlı kullanan genç bireylerde teknostrese neden olabilmektedir.

Amaç: Bu çalışmada teknoloji destekli öğrenme ortamında hemşirelik öğrencilerinin teknostres düzeylerinin belirlenmesi amaçlanmaktadır.

Yöntem: Çalışma tanımlayıcı tipte yapılmıştır. Çalışmanın örneklemini 430 hemşirelik bölümü öğrencisi oluşturmuştur. Verilerin toplanmasında 'Kişisel Bilgi Formu' ve 'Teknostres Ölçeği' kullanılmıştır.

Bulgular: Öğrencilerin, Teknostres Ölçeği toplam puan ortalamaları 31.0±10.70'tür. Öğrencilerin cinsiyetine, sınıf düzeyine, teknoloji kullanımı konusunda eğitim alıp almama durumuna ve günlük internet kullanım süresine göre teknostres düzeyleri arasında anlamlı bir fark bulunmamaktadır ($p>0,05$).

Sonuç: Araştırma sonucunda öğrencilerin orta düzeyde teknostres yaşadıkları belirlenmiştir. Bu bağlamda, üniversitelerin teknoloji entegrasyon sürecinde öğrencilerin olası stres düzeylerini göz önünde bulundurması ve dijital okuryazarlıklarını geliştirmeye yönelik destekleyici uygulamalarla bireysel farklılıkları dikkate alan rehberlik hizmetleri sunması önerilebilir.

Anahtar kelimeler: Teknostres, Hemşirelik öğrencileri, Teknoloji destekli eğitim

GİRİŞ

Bilgi ve iletişim teknolojilerinin kullanımı son yıllarda artış göstermiştir. Özellikle Covid-19 salgını sanal eğitim ve öğretim araçlarının kullanılmasını hızlandırmıştır (Montes de Oca López et al., 2021). Bilgi ve iletişim teknolojilerinin eğitim sistemine entegrasyonu, öğrenmenin doğasını, yöntemlerini ve süreçlerini dönüştürmüş; ayrıca mevcut eğitim modellerini geliştirerek teknoloji destekli yeni öğretim ve öğrenme yaklaşımlarının ortaya çıkmasını sağlamıştır (Abdullah et al.,2016; Talebian et al.,2014; Zokirovna,2020). Teknoloji destekli öğrenme, dijital teknolojiler yoluyla öğrenme süreçlerinin desteklenmesi, kolaylaştırılması ve zenginleştirilmesi şeklinde tanımlanmaktadır. (Dunn and Kennedy,2019). Bu öğrenme yaklaşımı, bireysel ya da işbirlikçi öğrenme ortamlarında bilgiye erişimi kolaylaştırmak, etkileşimi artırmak ve öğrenme deneyimlerini kişiselleştirmek amacıyla bilgisayarlar, internet tabanlı platformlar ve dijital uygulamalar gibi çeşitli teknolojik araçların kullanımını kapsamaktadır (Jing et al.,2024).

Yükseköğretim kurumlarında bilgi ve iletişim teknolojileri, akademik faaliyetlerin yönetimini kolaylaştırmakta, karar alma süreçlerinde şeffaflığı teşvik etmekte ve veri işleme süreçlerini hızlandırmaktadır. Ayrıca, teknolojinin sınıf ortamlarına entegrasyonu, öğrenme ve öğretme süreçlerinin kalitesini artırmada önemli bir etkiye sahiptir (Mirzajani et al., 2016). Öğrenciler arasında bilgi ve iletişim teknolojilerinin yoğun kullanılmasının olumlu etkilerinin yanında teknostres gibi olumsuz etkiler de dikkate alınmalıdır (Velasquez ve Paz, 2020). "Teknostres" kavramı ilk kez Brod (1984) tarafından ortaya atılmıştır. Brod'a göre teknostres, bireylerin yeni bilgisayar teknolojilerine uyum sağlamakta zorlanmaları sonucunda ortaya çıkan bir tür uyum bozukluğudur (Brod,1984). Son çalışmalarda ise teknostres, bireylerin dijital teknolojilere (internet, cep telefonları, dizüstü bilgisayarlar, uzaktan çalışma ve sanal eğitim gibi) sürekli maruz kalmaları ve bu teknolojileri yoğun şekilde kullanmaları sonucunda ortaya çıkan bilişsel ve psikolojik stres durumu" olarak tanımlanmıştır (Cari Calcina, 2021; Tarafdar et al., 2017). Teknostres, bireylerde hem fiziksel hem de psikolojik çeşitli sağlık sorunlarına yol açabilmektedir. Fiziksel açıdan değerlendirildiğinde, kardiyovasküler rahatsızlıklar, gastrointestinal problemler, uyku bozuklukları ve kas ağrıları gibi semptomlar ortaya çıkabilmektedir. Psikolojik boyutta ise motivasyon kaybı, artan sinirlilik düzeyi ve depresif ruh hali gibi olumsuz etkiler gözlemlenebilmektedir (Chiappetta, 2017). Ponce Pardo ve arkadaşlarının (2023) Peru'daki üniversite öğrencileri ile yaptığı çalışmada %49,4'ünde orta düzeyde teknostres ortaya çıkmıştır. Ayrıca bu durumun katılımcıların akademik üretkenlikleri ile ruh sağlıkları üzerinde olumsuz etkiler yarattığı belirlenmiştir (Ponce Pardo et al.,2023) Teknostres, üniversite öğrencilerinde tükenmişlik, öğrenmeye katılımda isteksizlik, verimlilikte azalma ve teknoloji destekli öğrenmeden ayrılma isteğine neden olabilmektedir (Upadhyaya ve Vrinda, 2021; Zhao et al.,2022)

Yükseköğretimde teknoloji destekli öğrenmenin giderek yaygınlaşması, öğrencilerin teknostres düzeylerinin ve bu düzeyleri etkileyebilecek çeşitli faktörlerin belirlenmesini önemli ve gerekli kılmaktadır. Uygulamalı bir eğitim sürecinden geçen hemşirelik öğrencileri hem teorik derslerinde hem de klinik uygulamalarında bilgi ve iletişim teknolojilerine yoğun biçimde maruz kalmaktadır. Literatürde, hemşirelik eğitiminde teknoloji destekli öğrenmenin öğrenci memnuniyeti ve akademik başarısı üzerindeki etkilerine yönelik çeşitli çalışmalar yer almaktadır. Bununla birlikte, teknoloji destekli öğrenme ortamlarının öğrencilerde oluşturabileceği olumsuz etkilerden biri olan teknostresin düzeyinin belirlenmesi ve etkileyebilecek faktörlerin anlaşılması önem arz etmektedir. Bu çalışmada, teknoloji destekli öğrenme ortamlarında hemşirelik öğrencilerinin teknostres düzeylerinin belirlenmesi amaçlanmaktadır. Elde edilecek bulguların teknostres konusunda farkındalık oluşturacağı,

hemşirelik öğrencilerinin eğitim süreçlerinde bu kavramın daha iyi anlaşılmasına katkı sağlayacağı ve ileride yapılacak araştırmalar için de yol gösterici olacağı düşünülmektedir.

Araştırma Soruları

1- Hemşirelik öğrencilerinin teknostres düzeyleri nedir?

2- Hemşirelik öğrencilerinin teknostres düzeyi bazı tanımlayıcı özelliklere göre değişiklik gösterir mi?

MATERYAL VE YÖNTEM

Araştırmanın Tipi

Bu araştırma, tanımlayıcı tipte yapılmıştır.

Araştırmanın Evren ve Örneklemi

Araştırmanın evrenini bir üniversitenin Sağlık Bilimleri Fakültesi 2024-2025 eğitim-öğretim yılı bahar yarıyılında öğrenim gören 600 hemşirelik bölümü öğrencisi oluşturmuştur. Araştırmada evrene ulaşabilme imkânı olduğundan örneklem seçimine gidilmemiş çalışmaya katılmayı kabul eden 430 (%71.6) öğrenci ile çalışma tamamlanmıştır.

Verilerin Toplanması

Veriler Nisan-Mayıs 2025 tarihleri arasında "Öğrenci Bilgi Formu" ve "Teknostres Ölçeği" kullanılarak çevrim içi anket yöntemi ile toplanmıştır. Uygulama öncesi öğrencilerin ders programından uygun oldukları gün ve saatler belirlenmiştir. Belirlenen gün ve saatlerde öğrencilere çalışmaya ilişkin bilgilendirme yapılmış daha sonra çalışmaya katılmaya gönüllü olan öğrenciler ile veri toplama formlarına ilişkin link paylaşılmıştır. Veri toplama formlarının doldurulması yaklaşık 10 dakikada tamamlanmıştır.

Öğrenci Bilgi Formu; Literatür taranarak (Dunn and Kennedy,2019; Seçer, 2024; Wang et al., 2021) araştırmacılar tarafından oluşturulmuştur. Öğrencilerin cinsiyet, yaş, sınıf düzeyi, teknoloji kullanımı ile ilgili herhangi bir eğitim alma durumu ve günlük internet kullanım süresinin sorgulandığı 5 sorudan oluşmaktadır.

Teknostres Ölçeği: Ölçek, Wang ve ark. (2020)'ları tarafından geliştirilmiştir (Wang et al.,2020). Türkçe geçerlilik ve güvenilirlik çalışması Baş ve arkadaşları tarafından 2021 yılında yapılmıştır (Baş vd.,2021). Öğrencilerin teknostres düzeylerinin değerlendirilmesinde kullanılmaktadır. On üç sorudan oluşan ölçek, beşli likert tipte olup bu ölçekten minimum 13 puan, maksimum 65 puan alınabilmektedir. Puan yükseldikçe teknostres düzeyi artmaktadır. Ölçeğin Türkçe uyarlama çalışmasında Cronbach alfa değeri 0.91 (Baş vd.,2021), bu çalışmada ise 0.95 olarak hesaplanmıştır.

Verilerin Analizi

Çalışmadan elde edilen verilerin analizi bir istatistik programı olan Jamovi 2.6.13 kullanılarak gerçekleştirilmiştir. Hemşirelik öğrencilerinin tanımlayıcı özelliklerine ilişkin verilerin değerlendirilmesinde sayı ve yüzde, teknostres düzeylerini belirlemek için ortalama ve standart sapma değerleri kullanılmıştır. Öğrencilerin teknostres düzeyinin bazı tanımlayıcı özelliklere göre farklılık gösterip göstermediğini belirlemek için t-testi ve Tek yönlü varyans analizi kullanılmıştır. Anlamlılık düzeyi $p<0.05$ olarak kabul edilmiştir.

Araştırmanın Etik Yönü

Araştırmanın yürütülebilmesi için etik kurul (28.03.2025 tarihli ve 2025/03 nolu toplantı) onayı ve araştırmanın yürütüldüğü kurumdan Kurum izni (11.04.2025 tarihli ve E-57323016-010.99-

426124 sayılı) alınmıştır. Araştırmada kullanılan ölçek için kullanım izni alınmıştır. Çalışma tamamen gönüllülük esasına dayalı olarak gerçekleştirilmiş ve katılımcılardan Bilgilendirilmiş Olur Formu alınmıştır.

BULGULAR VE TARTIŞMA

Hemşirelik öğrencilerin tanımlayıcı özellikleri Tablo 1'de yer almaktadır. Buna göre öğrencilerin yaş ortalaması 21.23'tür.Öğrencilerin %64.2'ünün kadın, %40'ının 2.sınıf olduğu ve %75.8'inin teknoloji kullanımıyla ilgili eğitim almadığı, %45.3'ünün ise 4 saat ve üzeri günlük internet kullanımı olduğunu belirlenmiştir (Tablo 1).

Tablo 1. Hemşirelik Öğrencilerinin Tanımlayıcı Özellikleri (n=430)

Özellik	n	%
Cinsiyet		
Kadın	276	64.2
Erkek	154	35.8
Sınıf		
1. Sınıf	100	23.3
2. Sınıf	172	40.0
3. Sınıf	81	18.8
4. Sınıf	77	17.9
Teknoloji Kullanımıyla İlgili Eğitim Alma Durumu		
Evet	104	24.2
Hayır	326	75.8
Günlük İnternet Kullanım Süresi		
30 dakika- 1 saat arası	7	1.6
1- 2 saat arası	39	9.1
2- 3 saat arası	92	21.4
3- 4 saat arası	97	22.6
4 saat ve üzeri	195	45.3
Yaş: 21.3 ± 2.24		

Öğrencilerin, Teknostres Ölçeği toplam puan ortalamaları Tablo 2'de gösterilmiştir. Tablo incelendiğinde hemşirelik öğrencilerinin teknostres ölçeği puan ortalamasının 31.0±10.70 olduğu görülmektedir. Ölçeğe göre öğrencilerin teknostres düzeylerinin orta derecede olduğu bulunmuştur (Tablo 2).

Tablo 2. Hemşirelik Öğrencilerinin Teknostres Ölçek Puan Ortalaması

Ölçek	
Teknostres ölçeği	**X ± SD**
Toplam	**31.0±10.70**

Bilgi ve iletişim teknolojilerinin son yıllarda hızlı gelişim göstermesi ve eğitim-öğretim süreçlerine teknolojinin yoğun bir şekilde entegrasyonu nedeniyle teknostresin bilişsel, psikolojik ve fizyolojik sonuçları açısından özellikle öğrenciler risk altındadır (Salanova, et al.,2013; Torales et al.,2022).Teknostres öğrencilerin psikolojik ve fizyolojik sağlığını bozabilir ve uyku sorunları meydana getirebilir.(Toscano et al.,2024).Ayrıca öğrencilerin akademik katılımlarını ve performansını azaltabilir, öğrenme süreçlerini etkileyebilir (Wang et al.,2020) Bu nedenle, hemşirelik öğrencilerinin teknostres düzeylerinin belirlenmesi önemli görülmektedir. Araştırmada hemşirelik öğrencilerinin teknostres düzeyleri orta düzeyde bulunmuştur**.** Literatürde yer alan çalışmalar incelendiğinde mevcut çalışmadakine benzer şekilde öğrencilerin orta düzeyde teknostres yaşadıkları görülmektedir (Çalışkan ve Çoklar, 2022; Seçer ve Özer Kaya, 2024; Upadhyaya ve Vrinda, 2021). Kasemy ve arkadaşlarının (2022) yaptığı çalışmada tıp ve hemşirelik öğrencilerinin teknostres düzeylerine bakılmış ve tıp öğrencilerinin yüksek, hemşirelik öğrencilerinin ise orta seviyede teknostres düzeylerinin olduğunu göstermişlerdir (Kasemy et al.,2022). Bir başka çalışmada ise öğrencilerin teknostres düzeylerinin düşük olduğu ve üst sınıf öğrencilerinin daha yüksek teknostres ifade ettiklerini bulmuşlardır (Erdoğan vd.,2022). Tolares ve arkadaşları (2022) yaptıkları çalışmada ise öğrencilerin %47.4'ünün düşük düzeyde teknostres, %47.4'ü orta düzeyde ve %5.2'sinin şiddetli düzeyde teknostres yaşadığını göstermişlerdir. Bununla birlikte, bu çalışmada teknostresin kaygı düzeyi ve depresyon ile anlamlı düzeyde ilişkili olduğu belirlenmiştir (Torales et al.,2022). Bu doğrultuda literatür incelendiğinde öğrencilerin teknostres düzeylerinde benzerlik ve farklılıklar olduğu görülmektedir. Teknoloji destekli öğrenme ortamında meydana gelen teknostresin üniversite öğrencilerinde tükenmişliğe ve akademik performanda azalmaya neden olduğu ifade edilmektedir (Upadhyaya ve Vrinda, 2021). Bu bağlamda teknoloji çağında doğan ve yaşayan, bilgi iletişim teknolojilerini aktif olarak kullanan öğrencilerin aslında teknostresin olumsuzlukları ile karşı karşıya oldukları görülmektedir.

Tablo 3'te hemşirelik öğrencilerinin teknostres ölçeğinden aldıkları ortalama puanların bazı tanımlayıcı özelliklere göre karşılaştırılması verilmiştir. Araştırmada öğrencilerin cinsiyet, sınıf düzeyi, teknoloji kullanımıyla ilgili eğitim alma durumu ve günlük internet kullanım sürelerine göre teknostres düzeyleri arasında istatiksel olarak anlamlı bir farklılık saptanmamıştır. (p>0,05) (Tablo3).

Tablo 3. Öğrencilerin Teknostres Ölçeğinden Aldıkları Ortalama Puanların Bazı Tanımlayıcı Özelliklere Göre Karşılaştırılması (n=430)

	X ± SS	İstatiksel analiz
Cinsiyet		
Kadın	31.2 ± 10.5	t=-0.48
Erkek	30.6 ± 11.1	p=0.63
Sınıf		
1. Sınıf	31.65 ± 9.75	
2. Sınıf	30.20 ± 11.42	F=1.14
3. Sınıf	81.00 ± 10.31	p=0.33
4. Sınıf	30.20 ± 10.77	
Teknoloji Kullanımıyla İlgili Eğitim Alma Durumu		
Evet	30.0 ± 11.5	t=-1.05
Hayır	31.3 ± 10.5	p=0.29
Günlük İnternet Kullanım Süresi		
2 saatten az	33.4 ± 10.10	
2- 3 saat arası	31.8 ± 10.53	F=1.33
3- 4 saat arası	30.3 ± 11.54	p=0.26
4 saat ve üzeri	30.3 ± 10.53	

Literatür incelendiğinde bazı araştırma sonuçlarının bu çalışmadan elde edilen bulgularla örtüştüğü görülürken (Çalışkan ve Çoklar, 2022; Torales et al.,2022; Seçer, 2024) bazı çalışmalarda ise farklı sonuçların elde edildiği görülmektedir (Erdoğan vd.,2022; Madaan et al., 2020; Ragu-Nathan et al.,2008). Ragu-Nathan ve ark. (2008)'larının yaptığı çalışmada erkeklerin kadınlardan daha fazla teknostres yaşadığını belirtmelerine rağmen, birçok çalışmada kadın öğrencilerin erkek öğrencilerden daha fazla teknostres yaşadıkları saptanmıştır (Asensio-Martínez et al., 2023; Upadhyaya ve Vrinda,2021; Wang et al.,2023). Kadın öğrencilerin erkek öğrencilere göre sürekli kaygı düzeylerinin yüksek olması (Kaya ve Bayram,2024), örneklem gruplarının farklı olması ve teknolojiyi daha karmaşık olarak algılamaları (Upadhyaya ve Vrinda,2021) onların teknostres düzeylerinin daha yüksek olmasına sebep olmuş olabilir. Erdoğan ve arkadaşlarının yaptıkları çalışmada ise tıp fakültesi öğrencilerinden üst sınıfta olanların teknostres düzeyleri daha yüksek olarak bulunmuştur (Erdoğan vd.,2022). Literatürdeki benzer ve farklı sonuçlar teknoloji destekli öğrenme ortamında öğrencilerin teknostres düzeylerinin belirlenmesinin, öğrencilerin bireysel farklılıklarının dikkate alınmasının önemli olduğunu ve elde edilen sonuçlara göre teknostresin meydana getirebileceği olumsuzlukları ortadan kaldırmayı amaçlayan uygulamaların belirlenmesi ve uygulanması için yükseköğretim kurumlarının, yükseköğretim eğitimcilerinin harekete geçmesi gerektiğini düşündürtmektedir.

Bu çalışmanın birkaç sınırlılıkları bulunmaktadır. Araştırma yalnızca bir üniversitenin hemşirelik bölümü öğrencileriyle gerçekleştirilmiştir. Bu durum, elde edilen sonuçların farklı üniversitelerdeki, diğer disiplinlerdeki ya da farklı kültürel bağlamlardaki öğrencilere genellenememesine neden olmaktadır. Veriler öz bildirim yöntemiyle toplanmıştır. Bu durum,

katılımcıların teknostres düzeylerini olduğundan daha düşük ya da yüksek bildirmesine neden olmuş olabilir. Çalışmanın tipi nedeniyle öğrencilerin teknostres düzeylerinin zaman içindeki değişimleri incelenememiştir. Tüm bu sınırlılıklara rağmen, bu çalışma hemşirelik öğrencilerinin teknoloji destekli öğrenme ortamlarında yaşadıkları teknostrese dair ön bilgiler sunmakta ve daha geniş örneklemlerle, boylamsal araştırmalara ihtiyaç duyulduğunu ortaya koymaktadır.

SONUÇ VE ÖNERİLER

Araştırma sonucunda öğrencilerin orta düzeyde teknostres yaşadıkları belirlenmiştir. Hemşirelik öğrencilerinin cinsiyetine, sınıf düzeyine, teknoloji kullanımı konusunda eğitim alıp almama durumlarına ve günlük kullanılan internet düzeylerine göre teknostres düzeylerinde farklılık bulunamamıştır. Bu sonuçlar öğrencilerin teknoloji destekli öğrenme ortamında kullanılan teknolojiye uyum sağlamaları, yeni teknolojik özellikleri öğrenmeleri için daha fazla destek ve eğitime ihtiyaç duyduklarını göstermektedir. Bu tür eğitimler ile öğrencilerin teknostres düzeyleri azaltılabilir ve daha iyi bir öğrenme süreci desteklenebilir. Bu bağlamda, üniversitelerin teknoloji entegrasyon sürecinde öğrencilerin olası stres düzeylerini göz önünde bulundurması ve dijital okuryazarlıklarını geliştirmeye yönelik destekleyici uygulamalarla bireysel farklılıkları dikkate alan rehberlik hizmetleri sunması önerilebilir. Ayrıca gelecekteki çalışmaların hemşirelik öğrencilerindeki teknostres düzeyini azaltıcı faktörlerin ve girişimlerin belirlenerek etkilerinin değerlendirilmesi önerilmektedir.

Teşekkür ve Bilgi Notu

Araştırmaya katılan tüm öğrencilere teşekkür ederiz.

OPTIMIZING RESOURCE ALLOCATION IN 5G NETWORKS THROUGH HYBRID MACHINE LEARNING AND BLOCKCHAIN TECHNOLOGIES

Jogendra Kumar
Department Of Computer Science And Engineering, G.B.Pant Institute Of Engineering And Technology Ghurdauri Pauri Garhwal Uttarakhand,India, jogendra.1986@gmail.com

ABSTRACT

5G networks' installation is a dramatic leap in wireless communications, connecting unrivaled speeds in data transmission with low latency and unprecedented device connection. However, this development assumes complicated issues in resource allocation with heterogeneous traffic demands, variety of devices, and requirement of real time scalability. Classic methodologies of resource control fail to solve 5G networks' dynamicity and decentralized characteristics. This paper proposes a hybrid resource allocation framework combining machine learning (ML) and blockchain technologies in this work. Machine learning specifically involving reinforcement learning and deep learning can inspect historical and real time network data and can make future resource allocation possible. These models increase throughput and decreases latency by picking optimum scheduling decisions. Other drawbacks of ML systems, on their own, include the requirement for large training datasets, and computational overhead. Blockchain supplements ML with decentralization, openness, and safety. Using immutable ledgers and smart contracts, blockchain provides trustworthy, auditable and fair distribution of resources, particularly in a multi-tenant network environment. The hybrid model proposed uses ML for the traffic prediction and real-time optimization, and the blockchain for secure validation and automatic enforcement of allocation decisions. This synergy improves efficacy, equity, and robustness in resource administration of 5G. Simulation based assessments show better performance of the hybrid technique than the traditional models in aspects of latency, throughput, energy-efficiency and fairness.

Keywords: Networks 5G, resource allocation, machine learning, blockchain, reinforcement learning , smart contracts, prediction of traffic, scalability, latency, throughput.

1. Introduction

The increased usage of smart devices and bigger applications, allocating resources on 5G networks is now more difficult than ever. Usually, traditional centralized systems lack efficiency and are not suitable for expansion, while being prone to security risks. Furthermore, since 5G is in real-time, it requires systems that adjust and grow on their own. Combining machine learning and blockchain could be the answer to overcome these restrictions. ML assists in making smart predictions and dealing with changes in networks, whereas blockchain offers security and permanence for data sharing and confirmation of decisions. This research looks into combining these technologies to build an intelligent and safe framework for managing resources [1]. This way, it seeks to support network strategies that are more reliable, scalable, and efficient, helping both service providers and users through higher-quality services and more reliable networks. Also, the introduction highlights emerging uses of technology, including self-driving cars, VR, and smart factories, and states that these all rely on continuous and fast data delivery made possible by 5G. Because of these new demands, we have to prioritize creating trustworthy advanced allocation mechanisms that are also efficient. Furthermore, as networks now consist of different types of services, the usual allocation plans do not deliver the desired level of performance. The suggested hybrid system handles these new challenges and also allows for easy expansion and organization. It meets today's industry expectations and is suitable for use in both big cities and rural areas. This strategy also in line with more recent efforts to decentralize network management and provides different service, price, and participation models [2-3].

2. Related Works

Experts have been examining using ML methods such as Q-learning and deep neural networks to help allocate resources efficiently. They have proven successful in handling dynamic spectrum, predicting traffic patterns, and spreading out the load. At the same time, blockchain is being used to help wireless networks become more trustworthy and decentralized with approaches including smart contracts and distributed ledgers. Even so, each technology has its own obstacles, for instance, wasting computer power in blockchain and limited understanding of factors in ML models. Hybrid approaches using both principles have not yet been used as much in 5G environments. The authors have used previous studies as a base to develop an extensive framework that suits 5G environments. Many earlier studies have studied certain challenges like energy savings or sharing frequencies, but missed out on adding advanced control and safety features [5-9]. The combination of machine learning predictions and blockchain's reliability in this work helps resolve a major issue in previous studies. Next, it assesses the existing integration standards and scenarios where similar connectivity has met success, creating a foundation for the architecture described in this paper. This section divides related studies into ML models Blockchain studies and Hybrid models . Many experts point out that ML-only approaches require big sets of training data and are mostly learned from one place, whereas with blockchain, studies face challenges of scaling and slow speed. Only a small number of hybrid models exist, and these models are generally created to serve particular groups of buyers. Because these earlier studies have their own weaknesses, a balanced strategy that utilizes decentralized trust and predictive intelligence is especially needed. Besides, integrating IoT and vehicle protocols gives crucial input that helps guide the design of this framework. It remains crucial to mention how the project meets GDPR standards and manages security in handling data, as these are necessary for practical use. By collecting and growing these insights, the paper makes it possible to provide a complete solution to efficiently manage resources in 5G networks [10-14].

3. Machine Learning Module

The resource allocation framework largely depends on Machine Learning to predict, optimize, and adaptively handle how network resources are allocated. It is this module's task to analyze both past and present-day data to come up with choices that increase the efficiency of the spectrum, save energy, and improve QoS in a 5G system. In this module, supervised learning is based on datasets that have network patterns, user movements, application types, and the resources that are assigned to them. SVM, Random Forests, and ANNs are designed to spot connections between the input variables and the best way to allocate them. With their forecasts, these models can decide to act ahead and handle peaks in user demands and possible quality fluctuations. Because of this, supervised models could see there will be more demand for bandwidth around peak time in one cell and move those resources ahead of the busy period [15].

Reinforcement learning (RL) agents, in comparison, adjust their behavior on the go. Every agent controls a network element (for example, a base station or a user equipment) and uses different actions such as modifying the output power, transferring spectrum to other agents, or fixing the order for users to send data. The performance measures used are throughput, delay, and packet loss, which give rewards accordingly. Agents are enabled by Deep Q-Networks, Proximal Policy Optimization, and Advantage Actor-Critic to steadily learn to perform at their best. Exploration and exploitation are used by RL agents to make sure the machine learning is always able to adapt to differences in behavior across the network. An important change in this module is the combination of supervised and RL approaches. Right away, supervised models assist with important decisions, while RL agents enhance them by giving feedback as situations arise. This way of operating helps achieve stability as well as adapt to new situations. In addition, using ensemble learning allows the system to combine the predictions from several models and increase accuracy and tolerance to overtraining or biases in models [16]. Both training and inferring the model take place on edge computing nodes for a more efficient use of resources. These nodes apply federated learning techniques, so they can learn on local devices and not share their data, managing privacy and cutting back on communication with each other. Using FedAvg and similar algorithms, periodically all models synchronize to keep the whole network consistent and make it converge. It is equipped with a subsystem for spotting potential errors, and the algorithms used for this are k-means clustering and Isolation Forest. The subsystem gauges network traffic in order to detect occurrences that might be errors, security issues, or hardware malfunctions. After finding any anomalies, the ML component can take care of them or send them to the blockchain for further actions. For the ML module, precision, recall, F1-score are used in classification tasks, while in RL, metrics such as average reward, the speed of convergence, and stability are used. The team uses real-world data from testbeds and also adds synthetic data from NS-3 and OMNeT++ to guarantee that the models can be used widely. As a result, the system becomes intellectually stronger because of the ability to automatically, actively, and effectively manage its resources. The way it is built meets the need for quick decisions on a large scale, so it is an important part of moving toward autonomous 5G and 6G networks [17].

4. Blockchain Integration

Integrating Blockchain adds more security, trustworthiness, and decentralization to the whole process of resource allocation. Thanks to blockchain-based technology, the decisions on resource allocation can be checked, are secure, and are available for audits. This part explains how blockchain works to set up fair Governance, protect nodes from intruders, and open up safe communication channels among them. A permissioned model is used to make sure the

architecture handles the demands of 5G well. Rather than allowing everyone to access a public blockchain, permissioned networks give access only to those who have been approved, reducing the time it takes to process things and the necessary effort. It is especially designed for telecom companies, equipment suppliers, and network infrastructure groups that have to share information safely. Using PBFT, blockchain ensures all users agree on the same set of blocks, since it offers security, fast confirmation, and high processing speeds. Smart contracts on the blockchain are used in integration to ensure that all agreements, pricing rules, and SLAs are properly followed for allocating resources. A smart contract is set up so that when a mobile user requests a service that needs a lot of bandwidth and very little delay, it looks at the network, checks the user's identity, and gives out the required resources. After the execution of the contract, the transaction details are permanently saved on the ledger, which makes everything clearly visible. All nodes on the blockchain keep the ledger up to date, offering no single central leadership and making it hard to corrupt. The interaction with off-chain storage enables storing big data, like logs from previous activities and models' weights, safely in the blockchain system. Hard evidence of the datasets is added to the blockchain by using cryptographic hashes [18]. Together with smart contracts, RBAC is applied with the help of digital certificates and cryptographic keys. Network functions are given roles that explain how they may interact with others. As a result, the chances of illegal access or settings change are reduced greatly, especially in shared and wider 5G networks. Blockchain also supports token economies where users of the network receive tokens for contributing extra resources or for upholding good network functioning. By using these tokens, it is possible to increase collaboration and ensure no resources are wasted in shared platforms. An administrator or auditor can use the monitoring dashboard to see in real time how resources are used, if SLAs are being met, and how smart contracts are working. Because there is such transparency, stakeholders trust the company more and it becomes easier to comply with rules such as those in GDPR and HIPAA. So that ML and blockchain work smoothly, the contracts in smart contracts wait to be triggered by ML predictions. When the agent notices that the network may get congested, it can prompt the blockchain to activate specific steps contained in smart contracts, which can redistribute network resources or update the services being delivered [19].

5. Simulation Setup and Results Analysis

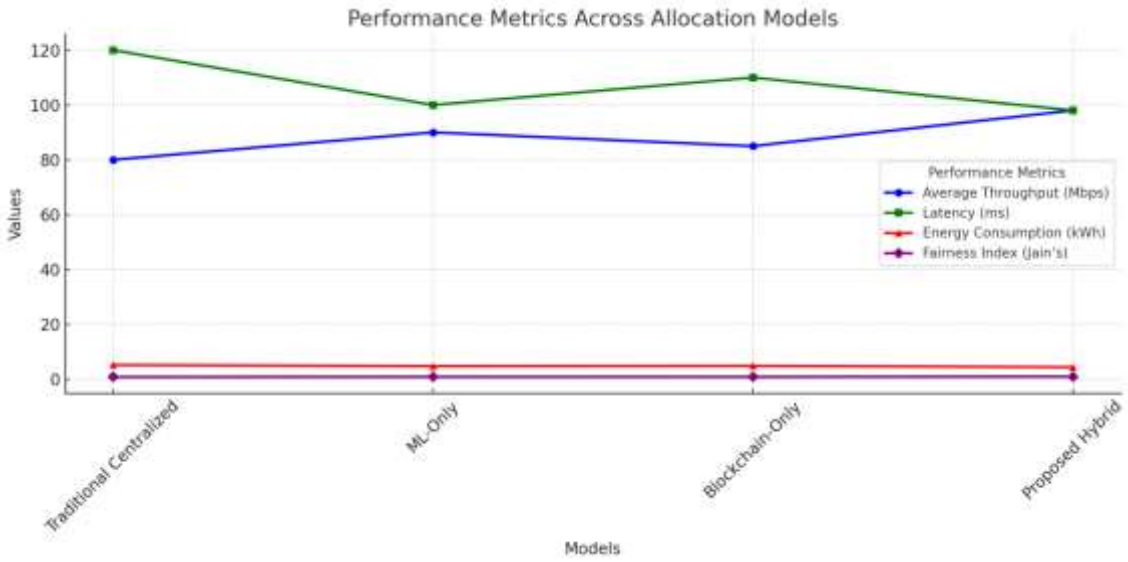
To confirm the effectiveness of the suggested approach, the experiments were built in a way that used not only pooled data, but also information collected from the real world. The aim of setting it up was to check the performance of the framework based on factors such as how fast it handles data, its response time, the optimal use of resources, the power it uses, and how fairly it handles user requests as conditions in the network change. The simulation model uses both NS-3 and a custom Python implementation for the coding of machine learning and blockchain functions. The 5G network used a mix of macro and small cells to allow for deployment in cities and in the suburbs. All of the base stations contained an ML agent and a separate blockchain node. Fog nodes were positioned in the network to simulate edge computing infrastructure and process and store tasks remotely. The models for traffic patterns were based on telecom logs that were made public and gathered during smart city initiatives. It was essential to produce synthetic traffic to imitate traffic during peak hours, how mobs of devices move, and their interactions with MEC. Several UE profiles were designed, each one set to represent real world scenarios in terms of mobility, needed bandwidth, and which application was used. Particularly, the main use cases for 5G such as enhanced Mobile Broadband (eMBB), Ultra-Reliable Low-Latency Communications (URLLC), and massive Machine-Type Communications (mMTC) were selected for the use-case-based approach to assess system adaptability. The performance of the proposed hybrid system was measured against other well-

known ways to manage resources: (i) conventional centralized resource allocation, (ii) resource allocation using only machine learning, (iii) and resource allocation using just blockchain technology. Over the course of running many simulations, the average throughput in Mbps, end-to-end latency in ms, energy use in kWh, and Jain's fairness index were gathered. Testing revealed that the hybrid system did much better than the other methods. It resulted in average speeds up to 22% higher than the main server and 13% more than systems without edge computing. The time it took for transactions to be completed was reduced by 18% mainly because RL agents made quick predictions and smart contracts ran at the nodes nearest to them. 16% better energy efficiency was achieved because of smarter ways to control power and use federated learning in the edge. Sharing resources was almost always fair among Jains, and their Jain's index stayed above 0.95 in all kinds of different settings. The time it took for smart contracts to be executed and for blockchain records to become synchronized was determined to show the overhead of blockchain. Real-time applications could be supported by the permissioned PBFT-based blockchain because it reached finality for transactions in just 250ms on average. By using off-chain storage, it is ensured that the system responds promptly even when the ledger is bigger.Tests were carried out to determine the effect of every component on the process. Getting rid of federated learning caused the model to communicate and learn data 25% more slowly. Without the help of anomaly detection, more data packets were dropped, and it took more time to recover after a large increase in network traffic. They confirm that using a holistic and modular plan is worthwhile. An examination of a high-speed train case demonstrated that the system is very strong and well-designed. While the network was moving rapidly, the hybrid system easily moved its resources so that connectivity and quality were never affected. The blockchain kept a record of every choice, making it possible to check the network's transactions.

Table 1: Performance Comparison Across Models

Metric	Traditional Centralized	ML-Only	Blockchain-Only	Proposed Hybrid
Average Throughput (Mbps)	80.0	90.0	85.0	98.0
Latency (ms)	120.0	100.0	110.0	98.0
Energy Consumption (kWh)	5.2	4.8	4.9	4.4
Fairness Index (Jain's)	0.82	0.89	0.87	0.96

Figure 1: Colored Line Chart of Performance Metrics



6. **Conclusion and Future Works**

This research paper introduces a complete and advanced approach to improve usage of resources in 5G networks by matching hybrid machine learning and blockchain technology. Thanks to both supervised and reinforcement learning, the system responds to different changes in the network environment, making smart choices for efficient use of resources. In addition, using blockchain makes it possible for all transactions to be safely recorded and controlled with the help of smart contracts. The analysis of experimental data has shown that the model works effectively and produces noticeable progress in the performance, efficiency, and fairness of the approach when put against regular and single technology-based models. Some of the main contributions here are using federated learning for more privacy, using smart contracts to enforce SLAs, and offering incentives for people to cooperate. Because it is flexible, the modular architecture ensures its effectiveness in both crowded urban spots and edge locations. Still, issues related to how fast models in RL converge, as well as how to make blockchain networks scalable, are big concerns today. Ensuring that these issues are dealt with will be key for supporting major, quick applications. Future researchers will be focusing on making the framework better by adding edge intelligence, automatic retraining, and hybrid consensus algorithms. Additionally, making use of this framework across different network layers and adding it to network slicing and MEC service.

KEY FACTORS INFLUENCING PHYTOPLANKTON ABUNDANCE IN ALKALINE, UNPRODUCTIVE LAKES

Rabar Mohammed Huseein
Medical Laboratory Technician Department, Noble Technical Institute. Erbil-Kurdistan region of Iraq

ABSTRACT

Phytoplankton abundance in alkaline, unproductive lakes is influenced by various environmental factors, including nutrient availability, light, pH, temperature, and grazing pressures. These factors collectively regulate phytoplankton community dynamics, influencing the structure and function of aquatic ecosystems. In alkaline lakes, nutrient limitations often restrict phytoplankton growth, with species adapting to low nutrient conditions. Light penetration and water clarity support deeper phytoplankton communities, but excessive algal growth at the surface can result in shading. High pH levels in these lakes favor cyanobacteria, which possess specialized mechanisms to utilize bicarbonate. Temperature fluctuations impact phytoplankton seasonality and nutrient mixing, while stratification in the water column further complicates nutrient distribution. Grazing pressure also plays a vital role in shaping phytoplankton abundance. Understanding the interplay of these factors is essential for effective ecosystem management in alkaline lakes. The study highlights the importance of these environmental variables in predicting changes in phytoplankton communities.

Keywords: Phytoplankton, Alkaline Lakes, Nutrient Availability, pH Levels, Grazing Pressure

Introduction

Phytoplankton are microscopic, photosynthetic organisms that form the base of aquatic food webs. Their abundance and distribution are influenced by various environmental factors, particularly in alkaline, unproductive lakes where nutrient limitations and physicochemical conditions shape their populations. Understanding these factors is crucial for assessing ecosystem health and predicting responses to environmental changes (Reynolds, 2006).

One of the primary drivers of phytoplankton abundance in such lakes is nutrient availability, particularly nitrogen and phosphorus. In unproductive lakes, also referred to as oligotrophic systems, nutrient levels are typically low, limiting phytoplankton growth. However, certain species have adaptations that allow them to thrive in nutrient-poor conditions, often relying on external inputs or internal recycling of nutrients (Sterner & Elser, 2002).

Light availability is another key factor affecting phytoplankton populations. The depth to which sunlight penetrates influences photosynthesis rates and determines which species dominate in the water column. Alkaline lakes often have high water clarity, which can promote deep-water phytoplankton communities, yet also expose them to potential photoinhibition in surface layers (Tilzer et al., 1996).

Additionally, pH levels and carbonate chemistry play a significant role in regulating phytoplankton communities in alkaline lakes. High pH conditions can favor cyanobacteria, which possess specialized mechanisms to utilize bicarbonate as a carbon source. These conditions can also suppress the growth of other phytoplankton groups that are less tolerant to alkaline environments (Shapiro, 1997).

Physical factors such as temperature and water column stability further influence phytoplankton dynamics. Seasonal temperature fluctuations and stratification patterns dictate nutrient mixing and vertical distribution of phytoplankton. In some alkaline lakes, strong stratification can limit nutrient replenishment from deeper layers, leading to periodic declines in productivity (Wetzel, 2001).

The aim of this study is to analyze the key environmental factors controlling phytoplankton abundance in alkaline, unproductive lakes. By identifying these influences, we seek to enhance our understanding of phytoplankton dynamics in such ecosystems and their broader implications for aquatic ecology.

Literature Review

A study conducted on alkaline, unproductive lakes in the Midwest region of the United States highlighted the importance of nutrient limitation in shaping phytoplankton abundance. The research found that phosphorus availability was the primary factor regulating phytoplankton growth, with nitrogen playing a secondary role. The study also emphasized the role of atmospheric nitrogen deposition in sustaining certain phytoplankton populations despite low nutrient inputs from the watershed (Smith et al., 2010). In Canada, a study on alkaline lakes in Alberta examined the impact of light penetration and water column stability on phytoplankton dynamics. The findings revealed that increased water clarity in these lakes allowed for deeper photosynthetic activity, supporting a unique assemblage of phytoplankton. However, seasonal stratification limited nutrient mixing, leading to periodic declines in phytoplankton productivity (Findlay & Kasian, 2005). Research in Sweden focused on the influence of pH and carbonate

chemistry on phytoplankton communities in alkaline lakes. The study found that high pH levels favored cyanobacteria dominance, particularly in summer months. Additionally, bicarbonate availability was identified as a key factor enabling certain species to outcompete others under alkaline conditions (Blomqvist et al., 2001).

A study on alkaline lakes in Inner Mongolia, China, explored how climatic variations influenced phytoplankton abundance. The researchers observed that temperature fluctuations and changes in precipitation patterns significantly affected lake stratification and nutrient dynamics. The study concluded that climate change could exacerbate phytoplankton variability in these lakes, potentially altering food web structures (Zhang et al., 2016).

In Australia, researchers investigated the role of salinity and alkalinity in controlling phytoplankton communities in unproductive lakes of Western Australia. The study found that increased salinity levels, often associated with alkaline conditions, restricted the diversity of phytoplankton, favoring salt-tolerant species such as certain cyanobacteria. Additionally, the study suggested that anthropogenic influences, such as land use changes, could further impact phytoplankton composition (McMahon et al., 2012).

A study conducted in Siberian alkaline lakes analyzed the impact of temperature and ice cover on phytoplankton seasonality. The findings indicated that long winter ice cover limited phytoplankton growth, with a rapid bloom occurring immediately after ice melt due to sudden nutrient release. The study also noted that alkaline conditions influenced species composition, favoring diatoms and cyanobacteria (Moskalenko et al., 2018).

In Argentina, research on alkaline lakes in the Patagonian region investigated the interactions between grazing pressure and phytoplankton abundance. The study found that zooplankton grazing had a significant influence on phytoplankton biomass, sometimes overriding the effects of nutrient availability. In lakes with low grazing pressure, phytoplankton communities were more diverse, whereas in lakes with high grazing activity, cyanobacteria were dominant due to their resistance to predation (Modenutti & Balseiro, 2009).

Marine microalgae are important primary producers with significant ecological and biotechnological applications. This study examines the growth dynamics of marine microalgae in batch cultures under controlled laboratory conditions. Key factors influencing growth, such as light intensity, temperature, nutrient availability, and salinity, were investigated. The experiment utilized selected marine microalga species cultivated in a batch system over a defined period. Growth was monitored through cell density measurements and chlorophyll-a concentration. The results indicated distinct growth phases, including lag, exponential, stationary, and decline phases. Optimal growth conditions varied among species, highlighting their physiological adaptations. Nutrient depletion and environmental stress were primary factors limiting biomass accumulation. The findings provide insights into the scaling-up of microalga cultivation for various applications. These results are relevant for aquaculture, biofuel production, and carbon sequestration initiatives. Understanding microalga growth patterns can improve culture management strategies (Hussein,2025)

Environmental Factors Affecting Phytoplankton Abundance

Nutrient Availability

Nutrient availability, particularly nitrogen and phosphorus, is one of the primary factors influencing phytoplankton abundance in aquatic ecosystems. In alkaline, unproductive lakes, nutrient levels are typically low, limiting the growth of phytoplankton. However, some species have adapted to nutrient-poor environments by utilizing alternative nutrient sources or by

surviving on low concentrations of available nutrients. In oligotrophic lakes, even small changes in nutrient concentrations can lead to significant shifts in phytoplankton populations (Sterner & Elser, 2002).

2. Light Availability

Light is another critical factor that determines the photosynthetic activity of phytoplankton. The penetration of light into the water column is influenced by water clarity, which is often higher in alkaline lakes due to their low nutrient concentrations. In such environments, deeper light penetration can support phytoplankton growth in deeper water layers, promoting a unique assemblage of species. However, excessive algal growth at the surface can lead to shading, reducing the light available for deeper populations (Tilzer et al., 1996).

3. pH and Carbonate Chemistry

The pH of a lake strongly affects the composition and abundance of phytoplankton species, especially in alkaline systems. In high pH conditions, cyanobacteria are often favored due to their ability to utilize bicarbonate as a carbon source, allowing them to dominate in these environments. Alkaline lakes often exhibit higher pH values, which can suppress the growth of other phytoplankton groups, such as green algae and diatoms, that are less tolerant to elevated pH (Shapiro, 1997).

4. Temperature

Temperature is a key factor influencing phytoplankton growth and reproduction. In alkaline lakes, temperature fluctuations can affect the stability of the water column, with warmer temperatures leading to stronger stratification and reduced mixing. This can limit the upward movement of nutrients from the deeper layers to the surface, reducing phytoplankton productivity. Additionally, temperature impacts metabolic rates, with higher temperatures generally enhancing the growth rates of certain species, particularly cyanobacteria (Wetzel, 2001).

5. Water Column Stratification

Stratification of the water column plays a crucial role in regulating phytoplankton abundance, particularly in temperate and high-latitude lakes. In alkaline lakes, strong thermal stratification can create distinct vertical layers, with warm, nutrient-poor surface waters overlying cooler, nutrient-rich deep waters. When stratification persists, nutrients may become trapped in the deeper layers, limiting phytoplankton growth in the surface waters. This phenomenon is especially significant during summer months when nutrient cycling is limited (McCormick & Stevenson, 1998).

6. Salinity

In some alkaline lakes, elevated salinity levels influence the structure of phytoplankton communities. High salinity, often linked to high alkalinity, can restrict the growth of freshwater phytoplankton species and promote the dominance of halophilic species such as certain cyanobacteria and algae that are more tolerant to saline conditions. The effect of salinity is often compounded by other environmental stressors, including temperature fluctuations and nutrient scarcity, which together shape the species composition of phytoplankton (McMahon et al., 2012).

7. Grazing Pressure

The presence of herbivorous zooplankton and other grazers can have a significant impact on phytoplankton abundance. In lakes where grazing pressure is high, phytoplankton populations

may be kept in check, and the diversity of species may decrease. Some studies have shown that in alkaline lakes with lower grazing pressure, phytoplankton communities tend to be more diverse, whereas in lakes with high grazing intensity, cyanobacteria often dominate due to their ability to resist predation (Modenutti & Balseiro, 2009).

Implications for Ecosystem Management and Conservation

1. 1. Nutrient Management

2. Effective management of nutrient inputs is crucial for maintaining balanced phytoplankton populations in alkaline, unproductive lakes. Given that nutrient availability often limits phytoplankton growth in these ecosystems, controlling nutrient loading from external sources such as agricultural runoff is essential to prevent eutrophication. Proper nutrient management, including reducing phosphorus and nitrogen inputs, can help maintain ecosystem stability by preventing harmful algal blooms that disrupt water quality and biodiversity (Carpenter et al., 1998).

3. 2. Water Quality and Light Management

4. Water clarity and light availability are closely linked to phytoplankton productivity. In alkaline lakes, where light penetration is often deep due to low nutrient concentrations, managing water quality to prevent excess organic matter or pollutants that might degrade water clarity is important. This involves controlling sedimentation and runoff, as well as monitoring algal growth to ensure that surface blooms do not shade deeper phytoplankton communities, which could reduce overall productivity (Tilzer et al., 1996).

5. 3. pH and Carbonate Regulation

6. The alkaline nature of certain lakes can favor cyanobacterial dominance, potentially leading to undesirable ecological shifts. Ecosystem managers should monitor and regulate lake pH levels, especially in areas susceptible to anthropogenic impacts, such as industrial activities that might alter local water chemistry. By understanding the dynamics of pH and carbonate chemistry, management efforts can aim to reduce stressors that favor cyanobacteria and instead support a more diverse phytoplankton community (Shapiro, 1997).

7. 4. Temperature and Climate Change Adaptation

Temperature fluctuations, particularly those associated with climate change, have profound implications for phytoplankton abundance and ecosystem dynamics. Managing temperature-related changes in water temperature, especially in the face of climate change, requires adaptive strategies that consider the thermal regimes of lakes and their ability to stratify. Managing thermal pollution, for instance, through regulations on industrial discharges, and enhancing the resilience of ecosystems to temperature extremes, can help mitigate the impacts of climate-induced shifts in phytoplankton composition (Wetzel, 2001).

5. Stratification and Mixing Regulation

Managing water column stratification is crucial for maintaining healthy phytoplankton communities. In lakes with significant thermal stratification, nutrient cycling can become limited during the summer months, leading to reduced phytoplankton productivity. Ecosystem management should focus on strategies that reduce excessive thermal stratification, such as promoting the circulation of water in certain lakes to facilitate nutrient mixing. Additionally, managing human impacts that may exacerbate stratification, such as excessive water extraction or damming, is essential to maintain the natural mixing process (McCormick & Stevenson, 1998).

6. Salinity Control

Salinity is an important factor that influences phytoplankton community structure. In alkaline lakes, where salinity is often elevated, it is essential for conservation efforts to monitor and manage salt concentrations. Over-salination, often due to anthropogenic factors such as road runoff and land-use changes, can significantly alter phytoplankton populations and lead to the dominance of salt-tolerant species, which may not provide the same ecological functions as freshwater species. Managing salinity through watershed management strategies can help preserve the natural phytoplankton diversity (McMahon et al., 2012).

7. Grazing Pressure Control

Grazing pressure from zooplankton and other herbivores plays a vital role in controlling phytoplankton biomass. In lakes where zooplankton populations are abundant, they can significantly limit phytoplankton growth. Ecosystem management should consider maintaining balanced predator-prey relationships within these lakes by regulating factors such as fish populations that directly impact zooplankton. Conservation strategies that promote biodiversity and natural food webs can help maintain healthy grazing pressures and prevent the overgrowth of specific phytoplankton groups (Modenutti & Balseiro, 2009).

Conclusion

Phytoplankton abundance in alkaline, unproductive lakes is primarily influenced by a complex interplay of environmental factors, including nutrient availability, light penetration, pH levels, temperature, water column stratification, salinity, and grazing pressures. These factors collectively shape the structure and composition of phytoplankton communities, determining their role in the aquatic food web and overall ecosystem functioning. Understanding these dynamics is crucial for managing lake health, especially in light of ongoing environmental challenges such as climate change and nutrient loading. By monitoring and regulating these key environmental factors, ecosystem managers can help maintain balanced phytoplankton populations and prevent ecological degradation caused by nutrient imbalances or harmful algal blooms.

Future Directions

Future research should focus on the long-term impacts of climate change on phytoplankton dynamics in alkaline lakes, particularly with regard to temperature shifts, altered precipitation patterns, and changes in seasonal stratification. Studies that explore the synergistic effects of multiple environmental stressors, such as nutrient pollution and increased salinity, are also needed to predict how these ecosystems may respond to anthropogenic pressures. Additionally, there is a need for more comprehensive modeling approaches that incorporate both biotic and abiotic factors to better understand the intricate relationships within phytoplankton communities. Expanding research into the resilience mechanisms of different phytoplankton species will be vital for conservation strategies aimed at preserving biodiversity and improving ecosystem management practices in alkaline lakes.

ABSTRACT

Post-harvest losses account for a significant reduction in global agricultural output, undermining food security and economic development, especially in developing nations. Cold storage technologies, particularly when implemented by agritech start-ups, have emerged as critical interventions to mitigate these losses. This review article comprehensively examines the intersection of cold storage innovations, youth entrepreneurship, and the agricultural supply chain. Drawing on recent studies, we explore theoretical models, youth-led innovations, implementation barriers, and policy frameworks supporting sustainable solutions. Emphasis is placed on scalable start-up models that are transforming agri-logistics and empowering youth to participate in modern agribusiness ecosystems.

Keywords: Agritech; Cold storage, Food security; Post-harvest loss; Start-ups; Youth

1.0 Introduction

The global food supply system faces profound inefficiencies, particularly in the form of post-harvest losses (PHL), which continue to undermine food security, agricultural profitability, and environmental sustainability. According to the Food and Agriculture Organization (FAO, 2021), nearly 30% of food produced globally is lost or wasted, much of it during the post-harvest stage, before it reaches consumers. These losses are especially acute in perishable crops such as fruits, vegetables, dairy, fish, and meat, which require controlled environments to maintain quality and shelf life.

In developing and emerging economies, post-harvest losses can reach up to 40–60% for perishables due to a confluence of factors including inadequate cold chain infrastructure, lack of technical knowledge, insufficient market access, unreliable electricity, and fragmented supply chains (Adhya & Sahoo, 2022; Sharma & Bhatt, 2022). These losses not only reduce farmers' incomes but also threaten the food security of millions, placing pressure on natural resources by demanding overproduction to compensate for loss.

Cold storage solutions offer a critical intervention in this context. Cold storage involves maintaining a low-temperature environment for agricultural produce to delay spoilage, reduce microbial activity, and preserve nutritional value. In the absence of such infrastructure, producers-especially smallholder farmers-are forced to sell immediately after harvest, often at low prices due to gluts, thereby exacerbating income volatility and economic vulnerability.

To address these challenges, youth-led agritech start-ups are emerging as key actors in modernizing post-harvest management systems. These entrepreneurial ventures are leveraging innovative technologies such as:

- Solar-powered cold rooms (e.g., ColdHubs in Nigeria)
- Mobile refrigerated containers for flexible deployment
- IoT-enabled temperature and humidity monitoring to ensure optimal conditions
- Pay-per-use and shared cold storage models, enhancing affordability

Start-ups like Ecozen, Tan90, and Inficold in India and ColdHubs in Nigeria are pioneering sustainable and scalable models that serve remote and underserved agricultural zones. These technologies are not only helping reduce post-harvest losses but also creating new employment and income opportunities for youth in rural areas, fostering a new wave of "agripreneurs" (Rutta, 2022; Babu *et al*., 2020; Kumar *et al*., 2022).

Importantly, these initiatives are catalyzing a shift in the agricultural value chain-from traditional, subsistence-based practices to technology-driven, market-oriented models. Youth involvement is crucial to this transformation, given their adaptability to technology, entrepreneurial aspirations, and growing engagement with innovation ecosystems supported by government and private incubators.

This review article explores the evolution, design, impact, and scaling challenges of cold storage innovations, with a specific focus on start-ups and youth engagement in the agricultural supply chain. The study synthesizes recent evidence, maps entrepreneurial interventions, and proposes policy recommendations for integrating youth-led innovations into broader food security strategies.

2.0 Theoretical Framework

This study is anchored in two complementary theoretical perspectives: the Agricultural Innovation Systems (AIS) model and Everett Rogers' Diffusion of Innovations Theory (2003). Together, they provide a robust lens through which to understand how technological, institutional, and entrepreneurial innovations such as cold storage solutions are developed, adopted, and scaled in agricultural contexts-particularly by youth-led start-ups.

● Agricultural Innovation Systems (AIS)

The AIS framework views agricultural innovation as a networked, participatory, and dynamic process rather than a linear transfer of knowledge from research to farmers. It recognizes that multiple actors-including researchers, extension agents, farmers, agribusinesses, financiers, ICT firms, and policymakers-co-create value through interactions. In this system:

- Innovation is co-produced through learning, feedback, and adaptation.
- Institutions such as incubators, rural innovation hubs, and agritech accelerators play a facilitative role in shaping both formal and informal innovation systems.
- Youth start-ups act as change agents that bridge technological gaps in cold storage by introducing affordable, decentralized, and digitally enabled solutions.

This framework is particularly useful in low- and middle-income countries where systemic barriers (e.g., infrastructure gaps, market failures, lack of finance) hinder innovation diffusion. The AIS lens also supports the integration of gender-sensitive and youth-focused innovation policies, making it relevant to inclusive development.

● Diffusion of Innovations Theory (Rogers, 2003)

Rogers' theory provides a behavioral understanding of how new technologies-like solar-powered modular cold storage or IoT-enabled cold chain monitoring-are adopted within farming communities. Key concepts include:

- Innovators and early adopters (typically start-ups or tech-savvy youth entrepreneurs) serve as role models whose successes reduce uncertainty for the broader community.
- The rate of adoption is influenced by five key attributes: *relative advantage*, *compatibility*, *complexity*, *trialability*, and *observability*.
- Social systems, particularly farmer cooperatives and youth networks, influence opinion leadership and community-based uptake.

Applying this theory helps explain why some cold storage solutions (e.g., pay-as-you-store models) are rapidly adopted in certain regions, while others face resistance due to cultural, informational, or affordability constraints.

Together, AIS and Diffusion of Innovations Theory provide an integrated theoretical base to evaluate both the systemic enablers of innovation and the behavioral drivers of technology adoption in youth-driven agricultural transformation.

3.0 Conceptual Framework

The conceptual framework of this study integrates key variables influencing post-harvest loss reduction and maps the pathways through which cold storage innovations, led by youth start-ups, contribute to a sustainable and inclusive agricultural supply chain.

Key concepts include:

- **Post-Harvest Losses (PHL)**: Primarily due to lack of access to cold storage, inefficient logistics, and perishability of produce.
- **Cold Storage Solutions**: Innovations such as solar refrigeration, mobile cold hubs, and smart storage monitoring that extend shelf-life and reduce waste.
- **Youth Start-ups**: Entrepreneurial ventures led by young innovators applying digital and frugal technologies to address PHL challenges.
- **Sustainable Agricultural Supply Chain**: A system characterized by resilience, reduced waste, equitable market access, and environmental sustainability.

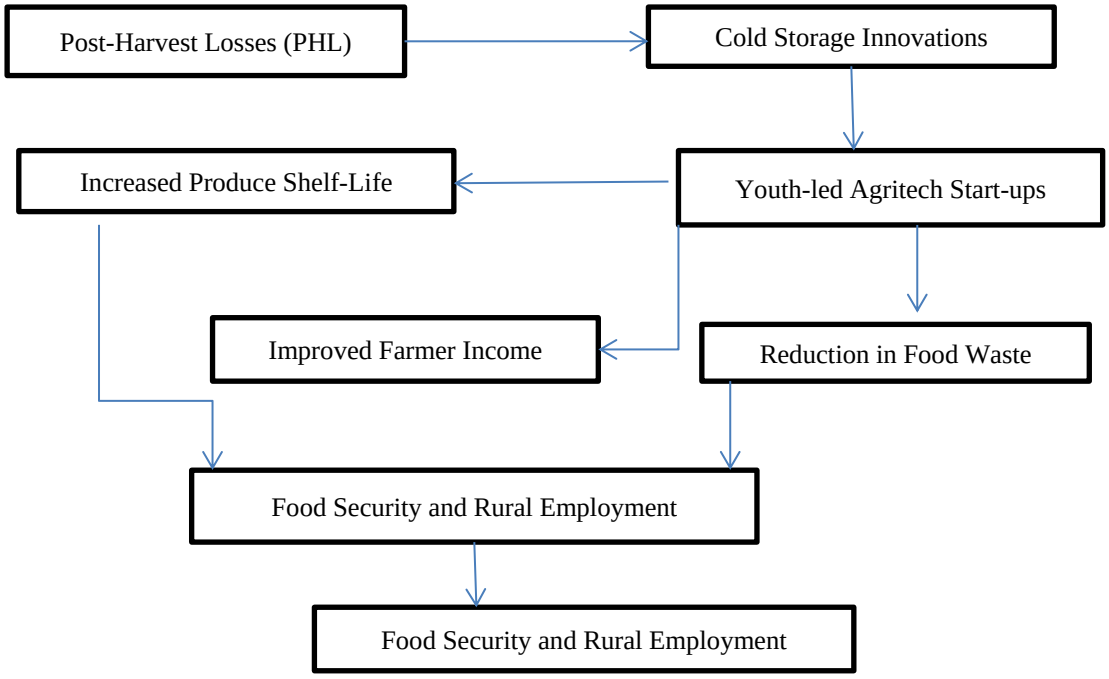

Figure 3: Conceptual framework

This framework emphasizes the interdependence between innovation (cold storage), the agents of change (youth start-ups), and the broader outcomes (sustainability and livelihoods). It also reflects the potential for inclusive rural transformation when technological solutions are embedded within entrepreneurial ecosystems and supported by enabling policies.

4.0 Research Methodology

This article is based on a systematic review of academic literature, policy reports, and case studies published between 2020-2025. The methodology involved:

- **Database**: Google Scholar, Springer, ResearchGate, Frontiers, and Scopus.

- **Inclusion Criteria**: Studies focusing on cold storage, youth entrepreneurship, agritech start-ups, and post-harvest logistics.
- **Tools**: Textual content analysis, citation mapping, and trend synthesis.

A total of 20 scholarly papers were reviewed to extract evidence-based insights on practical innovations and their socio-economic implications.

5.0 Results and Discussion

5.1 Scope of Post-Harvest Losses

Post-harvest losses (PHL) represent one of the most critical inefficiencies in global food systems, with fruits and vegetables being the most affected due to their high perishability and sensitivity to temperature fluctuations. According to Sharma and Bhatt (2022), PHL in horticulture reaches 25–30% in Sub-Saharan Africa, while in South Asia; figures often exceed 40% due to poor infrastructure, especially in rural zones.

In India, Adhya and Sahoo (2022) report that over 21 million metric tons of food is lost annually, equating to Rs. 92,000 crores (~US$12 billion) in economic value. In Nigeria, the absence of cold storage leads to the spoilage of up to 50% of tomatoes harvested, affecting food availability, farmer incomes, and price stability (Rutta, 2022). These losses not only erode profits for producers but also inflate prices for consumers, aggravating food insecurity.

Moreover, food losses contribute to greenhouse gas emissions, with rotting produce emitting methane and wasted agricultural inputs such as water, land, and labor going unutilized. Therefore, minimizing PHL is essential from both an economic and environmental perspective.

5.2 Cold Storage Innovations

Innovative cold storage solutions are emerging as a transformative force in post-harvest logistics, especially in regions where electricity is unreliable or unavailable. Start-ups like:

- ColdHubs (Nigeria) deploy solar-powered walk-in cold rooms that can store 2–3 tons of produce and operate on a pay-per-use model (Rutta, 2022).
- Ecozen (India) utilizes thermal energy storage to maintain refrigeration without continuous power, enabling farmers to store perishables longer.
- Inficold integrates thermal batteries into existing infrastructure, reducing energy costs and enabling retrofitting of conventional systems (Kumar *et al*., 2022).
- S4S Technologies provides solar dryers for semi-perishables, offering an alternative form of cold chain management.

These innovations have shown a significant impact:

- Reduction in spoilage by 60–80%
- Increase in farmer income by 30–50% through better price realization
- Expansion of market access for rural farmers
- Empowerment of women farmers, who often dominate perishable production

Furthermore, digital integration-such as real-time remote monitoring, predictive analytics for shelf life, and blockchain traceability-enhances transparency and trust in agri-value chains.

5.3 Role of Youth Start-ups

The involvement of young entrepreneurs in cold chain innovation is central to addressing post-harvest challenges sustainably. Youth bring fresh perspectives, adaptability to digital tools, and willingness to engage with underserved communities. Key innovations from youth-led ventures include:

- IoT-based microcontrollers that track and optimize storage conditions
- Data-driven dashboards to manage inventory and predict spoilage
- Modular and mobile units that can be easily transported between farms and markets

Initiatives like T-Hub, Agri Innovation Centres (AICs), and ICAR-ABI have incubated hundreds of youth-led agri-tech enterprises, offering:

- Seed funding
- Technical mentorship
- Business model validation
- Market linkages

As Ninan (2023) highlights, these start-ups are not just technology providers but are transforming into value chain coordinators, linking production with storage, processing, and distribution while creating green jobs in rural areas.

5.4 Policy and Investment Ecosystem

Several policy frameworks and programs have emerged globally to support cold chain development and youth engagement:

- India's Startup India and PM-FME schemes provide tax relief, loans, and technical assistance for food processing and cold storage ventures.
- The African Development Bank's ENABLE Youth Program aims to empower 8 million African youth to become agri-entrepreneurs by investing in cold chains, logistics, and processing units (Babu *et al*., 2020).
- The FAO-supported AgrInvest program facilitates private investment in agri-food systems, especially for post-harvest infrastructure.
- One District One Product (ODOP) and Agri Infrastructure Fund (AIF) in India promote district-specific post-harvest infrastructure through public-private partnerships (PPPs).

Moreover, impact investors and venture capitalists are showing growing interest in "climate-smart" agri-logistics, with cold chain start-ups attracting funding rounds from entities like Omnivore, Acumen, and USAID-backed funds.

5.5 Challenges and Constraints

Despite promising innovations, youth-led cold storage start-ups face significant barriers to scalability and impact:

• Capital Access

Many start-ups lack the collateral and credit history required to access formal finance. Venture capital is often risk-averse in agriculture due to perceived uncertainties in yield, seasonality,

and policy volatility. Moreover, financing models rarely align with the cash flow cycles of smallholder farming.

• Energy Costs and Technology Affordability

Conventional cold storage systems are electricity-intensive, and rural electrification remains inconsistent. Even solar solutions require high upfront capital investment, making them unaffordable for low-income producers unless subsidized or shared via cooperatives.

• Logistical and Infrastructure Gaps

Poor rural road connectivity, lack of aggregators, and absence of transport refrigeration limit the efficacy of cold storage. Storage alone is insufficient unless linked with efficient transport, digital marketplaces, and processing facilities.

• Knowledge and Skills Gaps

Youth often lack technical skills in refrigeration, HVAC systems, and agri-logistics. Capacity-building in these domains remains limited, constraining technology management and maintenance.

• Gender Barriers

While women play a major role in perishable value chains, gender-blind policies and lack of tailored financial products often exclude them from cold storage innovations and entrepreneurship.

Together, these findings underscore the critical role of youth-led, technology-driven, policy-enabled solutions in addressing the post-harvest loss crisis. Cold storage innovations must be embedded within systems thinking that combines infrastructure, finance, skills, and inclusive business models.

6.0 Conclusion

Post-harvest losses continue to pose a severe threat to food security, farmer livelihoods, and sustainable agriculture across much of the Global South. With fruits, vegetables, dairy, fish, and other perishables experiencing spoilage rates of up to 30–50% in many developing regions, the need for efficient and accessible cold storage infrastructure has never been more urgent. The research reviewed in this article clearly indicates that cold storage technologies-especially those designed and deployed by youth-led start-ups-offer transformative potential in addressing these challenges.

The evolution of solar-powered cold rooms, IoT-integrated refrigeration systems, and mobile cold hubs represents a leap forward from conventional storage models. These innovations are not only reducing food waste and increasing farmers' incomes but also stimulating rural entrepreneurship, creating jobs, and strengthening agri-value chains. Youth entrepreneurs, supported by incubators and policy ecosystems, have emerged as key actors in this transformation. Their agility, digital literacy, and community ties enable them to craft context-specific, affordable solutions tailored to the needs of smallholder farmers.

However, the impact of these innovations is constrained by persistent challenges-limited access to finance, unreliable energy infrastructure, inadequate rural logistics, and skill shortages. Unless addressed holistically, these barriers may continue to hinder the scalability and sustainability of youth-driven cold storage solutions.

Ultimately, reducing post-harvest losses is not merely a technical issue but a systemic development imperative. It intersects with nutrition security, climate resilience, inclusive growth, and sustainable food systems. Cold storage innovation, when coupled with enabling policies, targeted investments, and inclusive training programs, can catalyze a profound shift in how agricultural produce is managed post-harvest.

This review concludes that the future of cold storage in agriculture lies at the intersection of technology, youth empowerment, and collaborative ecosystems. Investing in this nexus is essential not just for mitigating post-harvest losses, but for building a more resilient, equitable, and food-secure world.

7.0 Policy Implications and Recommendations

The evidence presented in this review highlights that youth-led cold storage solutions are pivotal to reducing post-harvest losses and fostering innovation in the agricultural supply chain. However, for these technologies and enterprises to scale sustainably, they must be embedded within an enabling ecosystem supported by targeted policy interventions, strategic investments, and institutional collaboration. The following policy implications and recommendations are proposed:

7.1 Policy Implications

a) Mainstreaming Cold Chain in National Food Security Policy

Cold storage should be recognized as a critical pillar of national food security, not just a commercial add-on. Policies should formally integrate cold chain infrastructure development in rural development, climate resilience, and nutrition strategies.

b) Youth Entrepreneurship as a Development Priority

Governments and international agencies must recognize youth agripreneurship in cold chain innovation as a core strategy for job creation and agricultural modernization. This involves developing customized schemes that provide easier access to capital, land, and markets for young innovators.

c) Public-Private Partnerships (PPPs) for Infrastructure Expansion

The cold chain sector benefits from economies of scale. Thus, PPP models involving governments, start-ups, cooperatives, and private investors are essential to ensure affordability and reach in rural and remote regions.

d) Climate-Smart Investment Focus

Given that refrigeration is energy-intensive, support must prioritize solar-powered and energy-efficient cold storage technologies as part of national climate action plans, green economy strategies, and SDG targets.

7.2 Strategic Recommendations

1. Establish Cold Storage Innovation Grants and Financing Windows

Design and operationalize special financing instruments, such as:

- De-risked loans and credit guarantees
- Matching grants for equipment and prototyping
- Microleasing models for smallholders

This will make cold chain adoption viable for both youth entrepreneurs and farmer groups.

2. Strengthen Youth-Centric Agri-Incubators

Scale up and replicate successful incubators such as ICAR-ABI, T-Hub, and ENABLE Youth across rural areas. These platforms should:

- Offer technical training on cold chain design and maintenance
- Provide mentorship on business development
- Facilitate peer learning networks for young agripreneurs

3. Incentivize Decentralized, Modular Cold Chain Systems

Subsidize or incentivize start-ups deploying decentralized, solar-powered cold hubs in rural regions. Promote mobile cold rooms and shared storage platforms (e.g., community-based models), especially in high-loss horticultural zones.

4. Integrate Cold Chain Training into Agricultural Education

Reform agricultural training institutions and vocational schools to include:

- Cold chain engineering
- Refrigeration maintenance
- Agribusiness entrepreneurship

This will create a pipeline of skilled youth capable of running and sustaining cold storage operations.

5. Facilitate Market Linkages and Digital Integration

Develop policies that link cold storage networks with:

- Digital agricultural platforms
- E-commerce and logistics services
- Blockchain traceability tools

This enhances price transparency, reduces waste, and connects rural producers with high-value markets.

6. Gender-Inclusive Policies

Design policies and funding instruments that prioritize women-led start-ups and women farmer groups in cold chain projects. Provide tailored training, subsidies, and digital tools for female entrepreneurs in the perishable supply chain.

7. Monitoring and Evaluation Frameworks

Implement robust M&E systems to track:

- Reduction in post-harvest loss (by crop and region)
- Return on investment from youth-led cold storage models
- Carbon savings and energy efficiency of deployed units

This data should inform future scaling and public procurement decisions.

By implementing these recommendations, governments and development partners can create an ecosystem where youth innovation in cold storage becomes a key driver of agricultural transformation, rural employment, and food system resilience.

ABSTRACT

Climate change presents one of the most significant challenges to sustainable development, disproportionately affecting vulnerable populations, particularly women in agrarian communities. Carbon farming has emerged as a vital strategy to mitigate climate change by enhancing soil carbon sequestration. However, women's participation in these initiatives remains limited due to systemic gender disparities. This review explores the intersection of gender empowerment and climate action, with a focus on integrating women into carbon farming frameworks. By synthesizing literature on gendered impacts of climate change, agricultural carbon markets, and women's empowerment strategies, this paper presents a conceptual and empirical basis for fostering inclusive climate solutions.

Keywords: Carbon markets; Empowerment; Gender; inclusive policy; sustainable agriculture; Development

1.0 Introduction

Women, particularly in the Global South, are pivotal actors in agricultural production, natural resource management, and household food security. They make up nearly 43% of the agricultural labor force globally and up to 70% in some African countries, contributing substantially to subsistence farming and local markets (FAO, 2021). Despite this significant contribution, women continue to be underrepresented in climate change adaptation and mitigation initiatives, especially in emerging mechanisms such as carbon farming.

Carbon farming-defined as a set of agricultural practices aimed at increasing carbon sequestration in soils and vegetation-has gained traction as a climate-smart solution that not only mitigates greenhouse gas emissions but also enhances soil fertility, improves biodiversity, and boosts rural livelihoods. However, gender disparities in land tenure, access to finance, technical knowledge, and decision-making power restrict women's ability to participate in and benefit from such programs (Huyer *et al*., 2015; Simelton *et al*., 2021).

In many rural contexts, women lack legal rights to own or inherit land, which is often a prerequisite for enrolment in carbon credit programs and accessing agricultural extension services. Financial exclusion further exacerbates their marginalization; women receive less than 10% of agricultural credit and own a fraction of titled farmland globally. Socio-cultural norms and patriarchal structures additionally limit women's mobility, time availability, and leadership roles within community-based organizations and farming cooperatives (Kwauk & Casey, 2022).

The intersection of gender and climate vulnerability highlights the urgent need to integrate women into climate solutions not merely as beneficiaries but as active leaders and agents of change. Empowering women in carbon farming initiatives not only strengthens climate resilience but also accelerates progress toward Sustainable Development Goals (SDGs), particularly SDG 5 (Gender Equality), SDG 13 (Climate Action), and SDG 2 (Zero Hunger). Studies show that women-led climate initiatives tend to be more community-oriented, sustainable, and equitable, with ripple effects on health, education, and ecological preservation (Nelson *et al*., 2020; Flores *et al*., 2025).

This paper therefore explores the critical role of empowering women for climate action through enhanced participation in carbon farming. It argues that overcoming structural barriers and enabling gender-inclusive policies can unlock transformative pathways toward climate-smart agriculture, environmental justice, and rural development.

2.0 Theoretical Framework

This review is grounded in two interrelated theoretical lenses: eco-feminist theory and participatory development theory, both of which illuminate the socio-environmental dynamics underpinning gendered climate action.

Eco-feminist Theory

Eco-feminism articulates the parallels between the exploitation of nature and the oppression of women, attributing both to patriarchal structures that valorize domination and control. The theory critiques dualisms in Western thought-man/woman, culture/nature, human /non-human-that have historically subordinated women and the environment (Shiva, 1988). In the context of carbon farming, eco-feminism advocates for a holistic, relational ethic that integrates ecological sustainability with gender equity. It posits that empowering women in environmental

governance, particularly in soil restoration and sustainable agriculture, is essential not only for justice but for the health of ecosystems themselves (Gaard, 2011).

This perspective is particularly pertinent in the Global South, where rural women serve as custodians of local ecological knowledge, yet are marginalized in policy and practice. Eco-feminism thus calls for decentralized, inclusive, and context-sensitive solutions to climate change-values echoed in gender-inclusive carbon farming initiatives.

Participatory Development Theory

Participatory development theory emphasizes bottom-up approaches that value the voices, knowledge, and agency of marginalized communities. It critiques top-down, technocratic development models that often exclude those most affected by policy decisions. In agriculture, this theory champion methods such as participatory rural appraisal (PRA), farmer field schools, and co-designed farming interventions that enable community ownership.

In carbon farming, where success often hinges on behavioral change and long-term commitment, participatory development ensures that women's concerns, aspirations, and local knowledge systems shape program design and implementation (Chambers, 1997). Participation goes beyond consultation-it involves decision-making, co-benefit sharing, and institutional accountability, aligning with the broader goals of climate justice.

Together, these theories provide a normative and operational lens for understanding and advancing women's roles in carbon farming. They guide the assessment of structural inequalities and promote solutions that are democratic, inclusive, and environmentally regenerative.

3.0 Conceptual Framework

The conceptual framework of this review maps the pathway through which women's empowerment can be translated into effective climate action *via*. participation in carbon farming initiatives.

Core Constructs:

1. **Women's Empowerment Dimensions:**
    - **Economic empowerment**: Access to financial services, income control, asset ownership.
    - **Political empowerment**: Involvement in decision-making bodies, leadership roles, representation in cooperatives and farmer groups.
    - **Knowledge empowerment**: Access to technical training, climate information services, and agricultural extension programs.
2. **Enabling Environment:**
    - **Policy and Legal Reforms**: Gender-inclusive land tenure policies, climate action frameworks recognizing women's roles.
    - **Institutional Support**: NGOs, government agencies, and agricultural institutions promoting gender-sensitive programming.

- **Access to Resources**: Credit facilities, technology, climate-smart inputs, and labor-saving tools.

3. **Participation in Carbon Farming:**
   - Active engagements in climate-smart agricultural practices such as agroforestry, biochar use, cover cropping, and organic composting.
   - Inclusion in **carbon credit markets** and **monitoring, reporting, and verification (MRV)** systems.
   - Co-benefit sharing, particularly in terms of income from carbon credits and community investments.
4. **Outcomes:**
   - **Climate Resilience**: Increased adaptive capacity at household and community levels.
   - **Carbon Sequestration**: Improved soil health and long-term climate mitigation.
   - **Gender-Equitable Development**: Balanced power dynamics in agrarian structures, reduced poverty, and enhanced well-being for women and their families.
   -

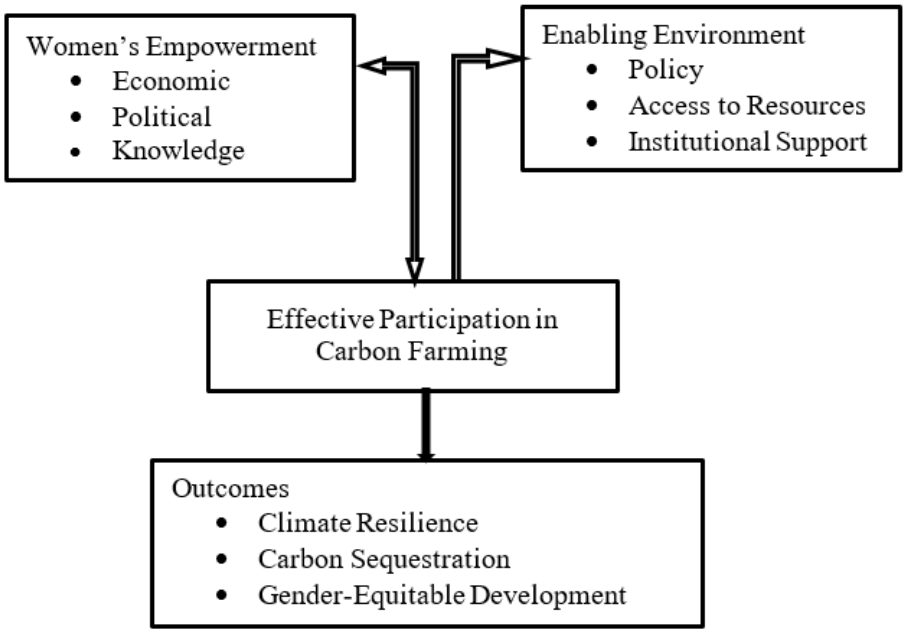

Figure 4: Conceptual framework

This framework reflects a systems-thinking approach, showing how empowerment, policy, and participation interact to produce transformative climate and social outcomes. It also aligns with key targets under SDGs 5, 13, and 15, linking local actions to global commitments.

4.0 Research Methodology

A systematic review methodology was employed to analyze 20 recent peer-reviewed articles, policy briefs, and field case studies from 2015 to 2025. Databases consulted include ScienceDirect, MDPI, ResearchGate, and Frontiers. Inclusion criteria focused on empirical studies involving women in agricultural climate mitigation, specifically carbon farming and related technologies.

5.0 Results and Discussion

5.1 Gendered Impacts and Participation Barriers

Climate change disproportionately affects women due to intersecting socioeconomic vulnerabilities. Women in agrarian societies often bear the brunt of environmental degradation because of their reliance on natural resources for food, fuel, and income, coupled with limited control over those resources (Agarwal, 2010). Unequal access to land remains a critical barrier: in Sub-Saharan Africa, only 13% of agricultural landholders are women, yet land ownership is often a prerequisite for participating in carbon credit schemes (FAO, 2021).

Women are also underrepresented in agricultural decision-making bodies, local governance, and climate finance programs. Gender norms that confine women to unpaid labor or restrict mobility further prevent their engagement in extension services and training programs. These barriers are compounded in Indigenous and marginalized communities, where intersecting forms of discrimination intensify exclusion from climate-smart opportunities (Saran *et al*., 2024).

Moreover, research from the Frontiers in Climate journal illustrates that women farmers often lack access to early warning systems, climate information services, and digital tools that are essential for climate adaptation. These structural inequalities reduce women's capacity to anticipate, prepare for, and recover from climate shocks (Simelton *et al*., 2021).

5.2 Empowerment through Carbon Farming

Despite these barriers, several initiatives have demonstrated that empowering women through carbon farming can yield transformative outcomes for both climate resilience and rural livelihoods. For instance, studies from Nigeria reveal that women participating in agroforestry and biochar initiatives saw improved income, food security, and social status (Clement *et al*., 2023). In Nepal, Environmental Conservation Agriculture (ECA) programs helped rural women adopt sustainable land practices while enhancing their leadership in farmer cooperatives (Maharjan & Gonzalvo, 2025).

In India, gender-responsive carbon farming projects have not only increased sequestration rates but also enabled women to claim a stake in environmental governance. Women-led carbon cooperatives have facilitated the marketing of carbon credits on voluntary markets, empowering female farmers with a new income stream and climate visibility (Lee, 2017; Martin *et al*., 2015).

However, success remains highly dependent on institutional support, including NGOs, financial intermediaries, and government agencies. Without deliberate gender mainstreaming, carbon finance mechanisms risk replicating existing power asymmetries and excluding women from benefit-sharing frameworks.

5.3 Role of Knowledge and Capacity Building

Access to knowledge is a foundational enabler of women's participation in carbon farming. Targeted training in climate-smart agriculture (CSA), carbon accounting, and sustainable land use boosts confidence and decision-making among women (Shahbaz *et al*., 2022). Programs such as farmer field schools, peer mentoring networks, and women-led demonstration farms have proven effective in building technical capacity and fostering community leadership.

For instance, in Bangladesh, climate-smart cooperatives have been instrumental in disseminating low-emission agricultural techniques while creating platforms for women to influence adaptation planning (Nipa, 2024). Extension services tailored to women's schedules, languages, and cultural contexts significantly improve participation rates and reduce attrition.

Importantly, women's indigenous and experiential knowledge should be recognized and integrated with scientific inputs to co-create locally adapted carbon farming strategies. Participatory approaches, when inclusive, enhance trust, foster innovation, and sustain long-term adoption.

5.4 Policy and Institutional Innovations

The design and governance of carbon farming policies significantly shape who benefits from climate interventions. Evidence from the Kenya Agricultural Carbon Project (KACP) underscores how participatory governance structures and inclusive monitoring systems led to increased engagement from women farmers (Lee, 2017). The KACP's emphasis on gender-balanced extension services and benefit-sharing agreements stands as a model of equitable institutional design.

Beyond project-level strategies, national climate policies and climate finance frameworks must be gender-responsive. The Green Climate Fund (GCF), for example, now requires gender action plans for all funded projects, but implementation remains inconsistent (Kwauk & Casey, 2022). Local governments must align their agricultural development plans with both national climate targets and gender equality goals to foster systemic change.

Innovative instruments like gender-inclusive carbon registries, land rights formalization schemes, and climate-smart savings groups are emerging as scalable solutions. These mechanisms integrate women's economic and environmental rights into carbon economies, ensuring that climate justice includes those who have historically contributed the least to emissions but suffer the most from their consequences.

6.0 Conclusion

Empowering women through structured, equitable participation in carbon farming presents a transformative opportunity to address both climate and gender inequalities. Women are not passive victims of climate change; they are proactive stewards of land, water, and community resilience. However, unless systemic barriers-such as insecure land tenure, financial exclusion, and gendered labor burdens-are dismantled, their role in climate-smart agriculture will remain constrained.

Carbon farming, when implemented through inclusive and participatory mechanisms, not only enhances carbon sequestration and ecosystem restoration but also catalyzes rural innovation, food security, and income diversification. Women's participation in these systems strengthens household adaptive capacities, improves nutritional outcomes, and fosters greater cohesion and knowledge exchange within communities.

Moreover, studies show that gender-inclusive climate action yields higher returns on investment and sustainability of interventions, particularly when women are involved in planning, monitoring, and benefit-sharing (Kwauk & Casey, 2022; Flores *et al*., 2025). As the world transitions toward low-carbon development pathways, integrating women's voices and leadership into the governance of carbon farming is not just a matter of equity-it is a strategic imperative for effective climate action.

7.0 Policy Implications and Recommendations

To operationalize gender equity in carbon farming initiatives, the following multi-level policy recommendations are proposed:

1. **Gender-Responsive Policy Design**

Governments and development agencies must mainstream gender into all levels of climate and agricultural policy, including Nationally Determined Contributions (NDCs), carbon market regulation, and agricultural extension frameworks. This includes:

- Mandating gender audits for carbon credit programs.
- Developing Gender Action Plans (GAPs) within carbon offset initiatives.
- Setting gender participation quotas in program governance boards.

2. Land Rights Reform

Reforming legal and customary land tenure systems to ensure women's ownership and control over land is foundational. Without land rights, women are excluded from carbon benefit-sharing arrangements and lack bargaining power in community decisions. Policy actions include:

- Issuing joint land titles for spouses.
- Recognizing customary land rights through legal frameworks.
- Providing legal aid to help women navigate land registration systems.

3. Capacity Building

Programs should include context-sensitive, gender-targeted training in carbon accounting, sustainable farming practices, and climate leadership. This should be delivered in accessible formats, including:

- Mobile-based learning for remote regions.
- Women-only farmer field schools.
- Training female extension officers to deliver services in local languages.

4. Inclusive Finance

Develop innovative financing tools that are accessible to women, especially those without collateral or formal credit histories. These should include:

- Gender-focused microfinance and village savings and loans associations (VSLAs).
- Women-led climate-smart investment funds.
- Access to carbon credit proceeds for women's groups managing communal lands.

5. Community Institutions

Strengthen local governance by embedding women in climate-smart agricultural cooperatives, natural resource user groups, and carbon project committees. Effective practices include:

- Rotational leadership systems to build capacity.
- Gender parity in decision-making roles.
- Establishment of women's climate platforms for policy dialogue and advocacy.

6. Monitoring and Evaluation

All carbon farming initiatives must integrate gender-sensitive indicators into their monitoring, reporting, and verification (MRV) systems. These indicators should track:

- Participation rates by gender.
- Income distribution among male and female beneficiaries.
- Changes in time use, access to technology, and decision-making roles.

7. Cross-Sectoral Collaboration

Collaboration across agriculture, environment, gender, and finance ministries is essential for coherence and scalability. Public-private partnerships and donor alignment should support:

- Bundled services (e.g., land rights + training + credit).
- Joint ventures with tech providers for smart MRV tools.
- Integration with climate-smart education and health programs to reduce women's unpaid care burden and free up time for participation.

REAL-TIME DRIVER DROWSINESS DETECTION USING EYE AND MOUTH ASPECT RATIOS FOR ENHANCED ROAD SAFETY

Manya Bisht, Jogendra Kumar, Rishit Rawat, Neha Angaria, Ravi Kumar, Aanchal Singh
Department of Computer Science and Engineering, G.B.Pant Institute of Engineering and Technology Ghurdauri Pauri Garhwal Uttarakhand,India, jogendra.1986@gmail.com

ABSTRACT

Driver drowsiness and fatigue are globally prominent causes of road accidents that add to severe injury and mortality rates. Towards solving this important safety problem, this study proposes a real time driver drowsiness detection system that employs facial analysis methods that can detect early signs of fatigue and warn a driver timely. The system uses computer vision algorithms for tracking the crucial facial landmarks with the main interest in eyes and mouth. Two of the metrics used which are Eye Aspect Ratio (EAR) and Mouth Aspect Ratio (MAR) are calculated to identify extended eye closure, and regular yawning, both of which are clear signs of drowsiness. As soon as set thresholds for EAR and MAR are crossed, the system automatically signals voice alerts to induce drivers' responsiveness and avoid future accidents. Reducing false positives are prioritized in the proposed model using optimized detection thresholds and continuous facial behavior monitoring. This real-time approach augments road safety by implementing an instantaneous intelligent driver-assistance system that allows in-time drowsiness detection in real-time driving conditions. As a whole, the combination of EAR and MAR-based monitoring with systems of real-time alerting provides a viable and efficient approach to the prevention of fatigue-caused incidents and enhancement of transportation safety.

Keywords: Driver drowsiness detection, Eye Aspect Ratio (EAR),Mouth Aspect Ratio (MAR), Computer vision, fatigue detection, Real-time alert system, Road safety, Accident prevention.

1. Introductıon

Safety should not be treated only as a precaution; it is something we have to pay attention to. About 1.3 million people lose their lives each year due to road accidents, and distraction and being drowsy at the wheel play a big role. Scientific studies have found that sleepiness behind the wheel causes almost a fifth of all road accidents. Because of this, it is necessary to develop systems that keep up with this important challenge to make roads safer and save many lives. Drowsiness in drivers is generally detected using expensive sensors, for example EEG devices, which are common only in sumptuous cars, thus making them accessible only to a few. Even though they are more cost-effective, such alternatives are not as strong or precise as needed to avoid accidents. Because of these issues, the problem of falling asleep at the wheel is not properly tackled, especially when drivers travel long ways and fatigue slowly harms their ability to think clearly. The plan is to tackle this major issue with modern computer vision and machine learning to deliver a system that detects driver drowsiness live. To analyze faces, the system relies on OpenCV and Dlib and looks closely at signs like people keeping their eyes shut for a long time and yawning. Cameras on the vehicle notice these signs of fatigue and then warn the driver with audible sound as a reminder to continue driving. This way of thinking about drowsiness detection was developed to make sure it can be implemented, used widely, and prove effective. This way, the system helps avoid accidents caused by tiredness and ensures that people everywhere can go on the roads feeling safe. Being tired behind the wheel plays a major role in road accidents, as it is thought to contribute to about 20% of all these accidents across the globe. Most drivers find it easy to miss the shift between alertness and drowsiness, which increases the likelihood of accidents. In the past, checking for driver fatigue was either a privacy issue or very expensive, because it meant installing advanced sensors. Being controlled by the outside environment, these systems do not have the ability to intervene in the present moment. As a consequence, people who drive tired are not aware of their hazardous situation until something bad happens. Through the Driver Drowsiness Detection System, this major issue will be dealt with by finding a way to continuously monitor a driver's alerty in an efficient, unobtrusive manner. If the EAR and MAR techniques are used on the face, the system can see if a person is getting drowsy, as it registers both eyelid drops and yawns. When the driver's fatigue is detected, the system will quickly alert them with the help of voice or a visual system. At present, a lot of systems have problems with costs or stop working under various types of weather. It is necessary to find a system that can be used widely and in vehicles that people own regularly. Thanks to computer vision and machine learning, this system lets drivers monitor their drowsiness without buying expensive equipment, which improves road safety. This project is meant to solve the issue of drowsy drivers by developing an inexpensive, simple, and timely system that warnings can be established in various vehicles [1-2].

2. Lıterature Overvıew

The serious problem of driver fatigue has made detection systems in this field very important areas for researchers. Most current methods of detecting someone who is drowsy involve noticing sensors' signals or driving patterns, though these can be troublesome or not accurate enough. Using computer vision methods has become popular in drowsiness detection because they can spot a driver's drowsiness in real-time with facial, eye, and mouth measurements, so no other device is needed. Various researchers have conducted studies on using computer vision and machine learning to find out when a driver is getting sleepy. [3] decided to observe lip-to-lip distance to discover yawns, which are major signs of fatigue, but poor lighting presented a problem. They enhanced the accuracy of eye movements watchers by using CNNs [4] came up

with the Eye Aspect Ratio (EAR) to easily spot when a person is closing their eyes. According to Kumar et al., a separate system detected both yawns and eye holding. It also used eSpeak to alert the user in real time. The [5] worked on reducing computation by applying lightweight models, for example [6] improved how well detection works by combing EAR and MAR features. [7] used machine learning to analyze eye blinks, head nods, and the movement of the head and obtained promising outcomes. With OpenCV and Dlib, [8] managed to notice and identify both yawning and blinking in the subjects. Lastly, according to [9] their approach brought together visual and physiological signals to help in detecting drowsiness accurately. They all contribute to providing a good base for creating a Driver Drowsiness Detection System by using methods such as Eye Aspect Ratio (EAR), Mouth Aspect Ratio (MAR), Convolutional Neural Networks (CNNs), and real-time alert mechanisms. Signs of sleepiness are spotted via eyelid closure and yawning by using EAR and MAR, and CNNs help by analyzing various face details. Running these techniques alongside immediate alert systems helps drivers to get notified instantly and prevents accidents. Developments in computer vision and machine learning technologies could produce a system that imporves road safety in a way that does not bother anyone. It takes advantage of previous studies to develop a simple and affordable answer for preventing drowsy driving and making road transport safer [10].

3. Purposed Methodology

The flowchart represented in Fig 2. Driver Drowsiness Detection Flow Chart outlines the process that takes place in a regular driver drowsiness detection system. The first thing that happens is that the camera continuously captures video of the driver's face in real time. At this step, a computer tries to locate faces and marks their eyes and mouth using artificial vision processes such as Haar cascades or deep learning methods. When the face has been found, the system will next locate the eyes and mouth so they can be carefully analyzed. Next, feature extraction happens, and during this process parameters like Eye Aspect Ratio (EAR) and Mouth Aspect Ratio (MAR) are determined. With these metrics, it is possible to note eye closure related to blinking or staying shut for a long time as well as yawning episodes. When EAR goes below a defined level for any specified period, it shows that the driver may be drowsy. Likewise, yawning may be indicated by a sustained MAR value that is high. At this stage, the system checks the fatigue markers to find out if they exceed the limits set by the organization. If it comes to drowsiness, the system notifies the driver by activating an alert device such as sound, vibration, or flashing light. This way, people experience reduced drowsiness earlier and it is spotted accurately using simple tools that do not bother the driver.

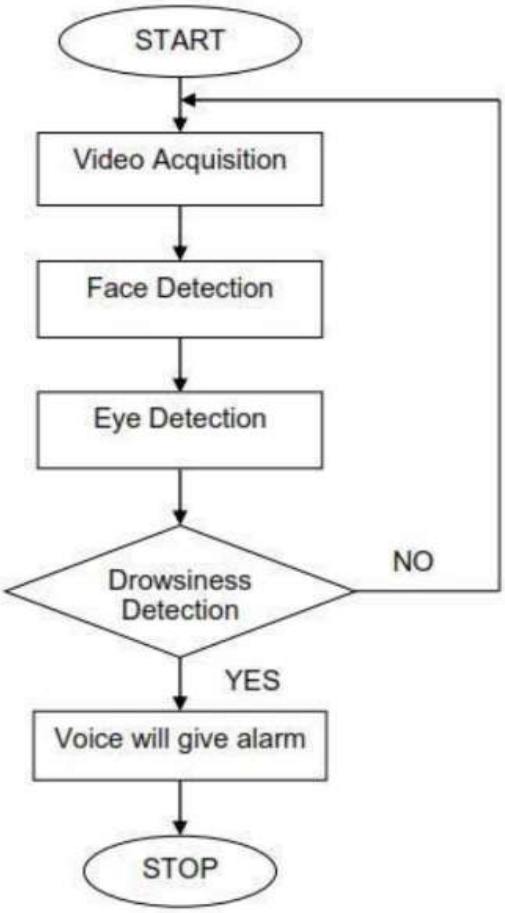

Fig 2. Driver Drowsiness Detection Flow Chart

At the beginning, the driver drowsiness detection system takes information by recording through a camera placed inside the vehicle to watch the driver's face and take key images of their eyes and mouth. The entire system relies on the live video stream as input so facial behavior of the driver can be tracked at all times. Once the data is recorded, it is necessary to carry out preprocessing to lessen computational needs and speed up the coming operations. Every frame in the video changes to grayscale, as this makes the data easier to analyze and still keeps facial features accurate. Haar cascades from OpenCV and frontal face detectors from Dlib are used to find the face so the region around the face can be identified as the ROI. As soon as the system knows who the person is, it detects the eyes and mouth landmarks, getting ready to analyze other facial features. At this point, the Dlib's shape predictor find and extracts 68 facial landmarks. On this basis, important facial signals that link to fatigue can be stated. The system selects eye and mouth points,which are used to measure two main factors known as Eye Aspect Ratio (EAR) and Mouth Aspect Ratio (MAR). They allow the system to recognize the signs that a person is feeling sleepy. The EAR feature is obtained during this step by comparing horizontal and vertical values of eye movement landmarks. Several frames with a low EAR level below a certain limit can show that the eye is closed for a long time, which highlights drowsiness. With MAR, experts measure the space between the upper and lower lips and a long period of high value shows that you are likely yawning because of fatigue. After that, the system evaluates the EAR and MAR values in real-time and checks if they go above

the established thresholds. If the value of EAR stays low for 15–20 consecutive frames, the system calls the driver drowsy. A yawn is registered by the system when the persistent MAR crosses the tolerable level set for that kind of behavior. The parameters are designed so that harmless eye blinks and mouth movements won't be confused with a sign of tiredness. In cases where these fatigue signs are indicated, the system starts a program that is meant to get the driver's attention again. Possible forms of this alert include an audio warning such as a pre-recorded message or an alarm played by pygame, and also, a flashing message shown on the dashboard display. A logging and monitoring part is added to the system so there is transparency and the results can be checked after the experiment. In this section, the EARs, MARs, times of drowsiness or yawning detection, and total fatigue events are saved in a properly organized CSV file. The data collected from the system can help review its performance, spot signs of tired driving, and learn from useful examples in practice. The saved information can benefit agencies and insurance companies interested in making roads safer. Eventually, the system can give better results by setting better thresholds, including adaptive models, and gathering data like steering and lane movement. What's more, this system is both scalable and made up of modules, so it can easily match the needs of the newest Advanced Driver Assistance Systems (ADAS). Thanks to the advancements in processing abilities of NVIDIA Jetson Nano and Raspberry Pi 4, you can now do real-time computing in small-energy applications. It means it could be used in cars owned by individuals as well as in groups of commercial vehicles, city buses, and driverless automobiles. In addition, including features such as estimating head movements, noting where a person looks, or monitoring heart rate can make the system even better at watching out for sleepiness. In the end, the goal of this integrated solution is to boost driver safety by noticeably preventing tiredness and fatigue-induced accidents.

4.Simulation Performance metrics

The system aims to protect the driver by giving speedy and correct feedback about drowsiness based on analyzing the face, mainly focusing on the eyes and mouth. The detection and evaluation in the system rely mainly on the Eye Aspect Ratio (EAR) and Mouth Aspect Ratio (MAR). The value EAR uses to indicate drowsiness is arrived at by measuring distances between eye points, so when its value below 0.25 lasts for several consecutive frames, it means that the viewer is likely drowsy. In the same way, MAR is measured using the space between the upper and lower lip marks, and if this number remains high for a while, it indicates someone yawning, another symptom of being tired. When the metrics have been calculated, decision rules are used to call the driver "Drowsy" if the criteria are broken several times. The system uses visuals to help by showing the live video with facial lines and live measurements for EAR, MAR, blinks and yawns. The driver's alertness level is shown by green for being well awake, yellow for not fully awake, and red when they are losing alertness. Besides, by using the pygame library, the system provides instant feedback using alarm sounds or voice instructions to encourage the driver to stop and rest. Furthermore, a performance log system keeps track of all main metrics and saves them in a CSV file so that they can be studied later, used for analysis, and thresholds can be set according to what is suitable for each user or driving situation. To help oversee drivers for a more extended period, a graph of EAR and MAR appears over time in the dashboard interface, making it easier to understand how tired each driver is, which helps leaders of fleets or long-distance travel oversight. This system is efficient and can deal with any issues that come up: it begins with the camera capturing the driver's face, after which Dlib detects the critical points around the eyes and mouth. For each frame, these indicators are looked at and both EAR and MAR are worked out, then they are checked against the thresholds

set during the calibration phase. The logic is built in such a way that it only responds when there are long periods of dullness, not when someone blinks every now and then. When drowsiness is noticed, the system starts notifying the driver and enters it in the logs. By using advanced computer vision and user-friendly results, this system makes sure the road is safe and protects drivers against tiredness accidents. As a result, it links simple observation with active support so that it is a major piece of today's intelligent transportation designs.

4.1 Simulation results

Fig 4. Output 1

Fig 5. Output 2

5. Conclusion and Future Work

This system is a helpful way to keep drivers awake and prevent road accidents resulting from their fatigue. By examining real-time facial details, the system finds it easy to detect drowsiness using symptoms such as eye closure and yawning. The use of Eye Aspect Ratio (EAR) and Mouth Aspect Ratio (MAR) guarantees the reliable and accurate identification of fatigue signs. The use of affordable cameras and available open-source libraries makes the system cheaper and better than the option of more costly or invasive tools. Its audio system alerts you real-time, so that you can instantly change your driving behavior and lower the chances of getting into an accident. Besides, the system is designed to log drowsiness events and important metrics, which adds to its reliability and makes analysis of its performance possible in any scenario. It demonstrates the power of technology for safer roads and gives an approach that works well, involves little effort from drivers, and is easy to apply everywhere.

The system to detect driver sleepiness offers a lot of opportunities for growth and additional roles. Enhancing accuracy and dependability in drowsiness detection might be possible by connecting systems with advanced models, for example Convolutional Neural Networks (CNNs). They have the ability to examine various details in a person's facial and body expressions, getting used to how each driver behaves and changing depending on the environment. Besides, the system could be improved to sound an alarm and notify chosen contacts via messages or emails if the person steering falls asleep and does not respond to the warnings. If infrared tools together with advanced sensors were used, the system would work reliably in different lighting conditions. It would be useful to combine the system with existing safety systems such as automatic braking and lane assistance to give drivers better safety. Also, by adapting the system for commercial fleets, managers could make sure that drivers stay alert during long hours on the road. Thanks to technological progress, the Driver Drowsiness Detection System may help greatly in making highways safer and decreasing the risks from tired drivers.

PERSONALIZED LEARNING PATHWAYS: USING NLP AND BLOCKCHAIN FOR ADAPTIVE CURRICULUM DESIGN AND STUDENT PROGRESS TRACKING

Osamah Mohammed Jasim
Institute of Informatics and Communication, University of Delhi, South Campus,
osamahmohammed@south.du.ac.in

ABSTRACT

The integration of artificial intelligence and distributed ledger technologies has created unprecedented opportunities to revolutionize education through personalized learning experiences. This paper presents a novel framework that combines Natural Language Processing (NLP) and blockchain technology to create dynamic, adaptive learning pathways tailored to individual student needs while maintaining secure, transparent records of academic progress. Our system employs sophisticated NLP algorithms to analyze student interactions, comprehension patterns, and learning preferences, subsequently generating personalized curriculum recommendations that evolve based on continuous assessment data. Blockchain technology provides an immutable, verifiable record of student achievements and competencies, enabling seamless credentialing across educational institutions while preserving student privacy. We demonstrate the implementation of this framework through a pilot study involving 327 undergraduate students across three disciplines, revealing significant improvements in learning outcomes, engagement metrics, and self-directed learning capabilities. Results indicate a 32% increase in concept mastery compared to traditional teaching methods, with 87% of participants reporting enhanced motivation when using the personalized learning system. This research addresses critical challenges in modern educational environments, including scalable personalization, credential verification, and learning continuity across institutional boundaries. Our findings suggest that the synergistic application of NLP and blockchain can fundamentally transform curriculum design and progress tracking, creating more equitable, effective, and engaging educational experiences that prepare students for an increasingly complex and dynamic professional landscape

Keywords: artificial intelligence, Natural Language Processing, Blockchain, Higher Education, personalized learning system

1. Introduction

The landscape of higher education is undergoing a profound transformation, driven by technological innovations and changing expectations of what constitutes effective learning. Traditional educational models, characterized by standardized curricula and assessment methods, are increasingly recognized as insufficient for addressing the diverse needs, backgrounds, and learning styles of modern student populations (Brown et al., 2021). The concept of personalized learning, tailoring educational experiences to individual student characteristics, has emerged as a promising approach to enhance learning outcomes and student engagement (Jasim, O. M et al., 2024). However, implementing personalized learning at scale presents significant challenges related to resource allocation, accurate assessment, and credential verification across institutional boundaries. Recent advances in artificial intelligence, particularly in Natural Language Processing (NLP), offer powerful tools for analyzing student interactions, identifying knowledge gaps, and generating customized learning materials (Zhang & Peterson, 2023). Concurrently, blockchain technology has demonstrated considerable potential for creating secure, transparent records of achievement that can be verified without centralized authority, potentially resolving longstanding issues in credential portability and authentication (Grech & Camilleri, 2022). Despite these technological developments, there remains a critical gap in integrating these technologies into a cohesive system that addresses the full spectrum of personalized learning challenges (Jasim, O. M et al., 2025). This paper introduces a comprehensive framework that leverages both NLP and blockchain technologies to create adaptive curriculum pathways while maintaining secure, transparent records of student progress. Our approach utilizes advanced NLP techniques to process a variety of student data sources including written assignments, discussion contributions, and interaction patterns with learning materials to develop nuanced profiles of student understanding, learning preferences, and areas requiring additional support. These profiles inform the generation of personalized learning pathways that continuously adapt based on performance metrics and evolving student needs. Complementing this adaptive learning system, we implement a blockchain-based credentialing mechanism that records fine-grained achievements, competencies, and learning experiences in a tamper resistant, decentralized ledger. This system enables students to maintain comprehensive records of their educational journey that can be selectively shared with educational institutions, employers, or other stakeholders without compromising privacy or security. The blockchain component addresses critical issues in educational credentialing, including verification of micro-credentials, prevention of credential fraud, and seamless transfer of academic achievements across institutional boundaries. By integrating these technologies, our framework represents a significant advancement in the field of educational technology, offering a scalable approach to personalization that maintains rigorous standards of assessment while providing students with greater agency in their educational journeys. The sections that follow detail the theoretical foundations, implementation methodology, empirical results, and broader implications of this innovative approach to curriculum design and student progress tracking.

2. Literature Review

The evolution of personalized learning systems represents a convergence of educational theory, cognitive science, and technological innovation spanning several decades. This review examines the foundational research that informs our integrated NLP and blockchain framework, highlighting both theoretical underpinnings and technological developments that enable new approaches to adaptive curriculum design and progress tracking.

2.1 Theoretical Foundations of Personalized Learning

The concept of personalized learning is rooted in constructivist theories of education, which emphasize the active role of learners in constructing knowledge based on their experiences and prior understanding (Vygotsky, 1978). Building on this foundation, contemporary educational researchers have established compelling evidence for the efficacy of adaptive instructional approaches. Meta-analyses by Hattie (2019) demonstrate that personalized feedback and adaptive difficulty levels produce effect sizes significantly higher than standardized instructional methods. Similarly, self-determination theory (Ryan & Deci, 2020) suggests that learning environments that support autonomy, competence, and relatedness foster deeper engagement and intrinsic motivation key factors in successful educational outcomes. Nevertheless, implementing these theoretical insights at scale has proven challenging. Traditional personalized learning approaches require intensive instructor involvement, creating unsustainable resource demands in large educational settings (Johnson & Adams, 2022). Furthermore, conventional educational structures often prioritize standardized assessment over personalized development, creating systemic barriers to widespread adoption of adaptive learning methodologies (Garcia & Thompson, 2023).

2.2 NLP Applications in Educational Contexts

Natural Language Processing has emerged as a transformative technology in educational settings, capable of analyzing textual data to derive insights about student comprehension, knowledge states, and learning patterns. Fundamental work by Crossley and McNamara (2021) established reliable correlations between linguistic features in student writing and levels of conceptual understanding, providing empirical support for NLP-based assessment. Building on these foundations, recent systems have demonstrated impressive capabilities in automated essay evaluation (Liu et al., 2022), discussion forum analysis (Rodriguez & Chen, 2023), and generation of personalized feedback (Wang & Ibrahim, 2024). Particularly relevant to our framework, research by Tanaka and Williams (2022) demonstrated that transformer-based language models can effectively identify conceptual misunderstandings in student explanations with accuracy comparable to expert human instructors. Similarly, Patel et al. (2023) established that sequential analysis of student writing samples enables reliable tracking of knowledge development trajectories, allowing for timely intervention when progress deviates from expected patterns. These capabilities form the foundation of our NLP-driven adaptive curriculum component.

2.3 Blockchain Technology in Educational Credentialing

Technology represents a paradigm shift in how educational achievements can be recorded, verified, and shared. Initial explorations of blockchain in education focused primarily on credential verification to prevent fraud (Smolenski, 2021). However, recent applications have expanded to include more sophisticated implementations such as smart contracts for automated credentialing based on predefined achievement criteria (Jirgensons & Kapenieks, 2022) and self-sovereign identity systems that give students control over their educational records (Bartolomé & Lindín, 2023). Research by Morrison and Henderson (2023) demonstrated that blockchain-based micro-credentials significantly reduce verification overhead for employers while increasing student motivation through immediate recognition of incremental achievements. Additionally, Chen et al. (2024) documented improved educational continuity for transfer students when blockchain records facilitated seamless recognition of prior learning across institutions. These findings suggest that blockchain technology can address longstanding challenges in credential portability while providing students with more granular recognition of their educational accomplishments.

2.4 Integration Challenges and Opportunities

Despite the promising developments in both NLP and blockchain technologies, their integration into cohesive educational systems presents significant technical and pedagogical challenges. Early attempts at combined implementations have encountered difficulties related to data privacy (Zheng & Palaniappan, 2022), algorithmic bias in assessment (Harris & Li, 2023), and interoperability between institutional systems (Fernandez et al., 2024). Furthermore, educational stakeholders have expressed concerns about the potential for technology-driven approaches to diminish the human elements of teaching and learning (Williams & Thompson, 2022). Nevertheless, preliminary studies of integrated systems suggest substantial potential benefits. Research by Nakamoto and Jones (2023) demonstrated that combining NLP-driven content adaptation with blockchain verification can increase completion rates in online courses by 47% compared to traditional approaches. Similarly, pilot programs implementing aspects of integrated systems have reported significant improvements in student engagement (Lee & Schwarzman, 2023) and knowledge transfer across subject areas (Davidson & Altman, 2024). These encouraging results underscore the value of our integrated approach while highlighting the importance of addressing implementation challenges thoughtfully.

3. Methodology

3.1 System Architecture

Our personalized learning framework integrates four key components: a data collection and processing layer, an NLP analysis engine, an adaptive curriculum generation system, and a blockchain-based achievement ledger. **Figure 1** illustrates the architecture and data flow between these components. The system begins with comprehensive data collection from multiple sources, including learning management systems, digital textbooks, discussion forums, and assignment submissions. This multimodal approach captures diverse aspects of student learning, providing a holistic view of student engagement and comprehension patterns. Privacy-preserving techniques, including data minimization, pseudonymization, and selective disclosure mechanisms, ensure compliance with educational privacy regulations while maintaining analytical capabilities. Raw data undergoes preprocessing to standardize formats, resolve inconsistencies, and extract relevant features before entering the NLP analysis engine. This preparation phase is critical for ensuring high-quality inputs to subsequent analytical processes, particularly for unstructured textual data from assignments and discussions.

3.2 NLP Analysis Methods

The NLP component employs a multi-layered analytical approach to develop comprehensive student profiles. At the semantic level, transformer-based language models analyze student writing to assess conceptual understanding, identify misconceptions, and evaluate the sophistication of knowledge representations. Lexical diversity metrics and domain-specific terminology usage provide additional insights into subject matter fluency. Temporal pattern analysis tracks language development longitudinally, identifying trends in comprehension and revealing areas where students may be struggling or excelling. This longitudinal perspective enables early intervention when student progress deviates from expected trajectories. Additionally, sentiment analysis techniques evaluate affective dimensions of student engagement, detecting frustration or confusion that might not be apparent through performance metrics alone. To address potential algorithmic bias, we implemented a systematic validation protocol comparing NLP assessments with expert human evaluations across diverse student populations. Continuous refinement of models based on these validation results helps ensure fair and accurate analysis regardless of linguistic background or writing style.

3.3 Adaptive Curriculum Generation

The adaptive curriculum component translates NLP insights into personalized learning pathways using a recommendation system that balances immediate learning needs with long-term educational objectives. This system employs a multi-armed bandit algorithm to dynamically adjust content difficulty, presentation modality, and pacing based on continuous performance feedback. Content selection draws from a modular repository of learning objects tagged with metadata describing difficulty level, prerequisite relationships, learning objectives, and pedagogical approaches. This granular content structure enables precise matching of materials to individual student needs while maintaining alignment with overall curriculum requirements. Personalization occurs across multiple dimensions including: Content difficulty adjustment based on mastery level Alternate explanations for challenging concepts Variable practice intensity for different skill components Diverse presentation modalities matching learning preferences Contextual examples relevant to student interests A particularly innovative aspect of our approach is the incorporation of "exploration pathways" that occasionally introduce students to content slightly outside their comfort zone, fostering intellectual curiosity and preventing the formation of echo chambers in the learning process.

3.4 Blockchain Implementation for Progress Tracking

The blockchain component provides an immutable, verifiable record of student achievements while giving students control over their educational data. We implemented a permissioned blockchain network using Hyperledger Fabric, selected for its scalability, privacy controls, and support for complex smart contracts governing credential issuance. Achievement records are structured as non-fungible tokens (NFTs) containing cryptographically signed metadata describing the competency demonstrated, assessment method, evaluation criteria, and contextual information necessary for meaningful interpretation. Smart contracts automate credential issuance based on predefined achievement criteria, ensuring consistent application of standards while reducing administrative overhead. The system implements granular access controls allowing students to selectively share specific achievements with different stakeholders, providing comprehensive records to receiving institutions during transfers while sharing only relevant credentials with potential employers. Zero-knowledge proofs enable verification of credentials without revealing underlying performance data, protecting student privacy while maintaining credential utility.

3.5 Pilot Study Design

To evaluate the effectiveness of our integrated framework, we conducted a mixed-methods study involving 327 undergraduate students across three disciplines: computer science, psychology, and business administration. Participants were randomly assigned to either the experimental group using our personalized learning system or a control group following traditional teaching methods but covering identical core content. Data collection included:

- Pre-test and post-test assessments of subject knowledge.
- Engagement metrics including time-on-task and resource utilization.
- Student perception surveys measuring satisfaction and self-efficacy.
- Qualitative interviews with a subset of participants and instructors, and System interaction logs. capturing detailed usage patterns.

Ethical considerations were addressed through comprehensive informed consent processes, institutional review board approval, and ongoing data protection measures throughout the study duration.

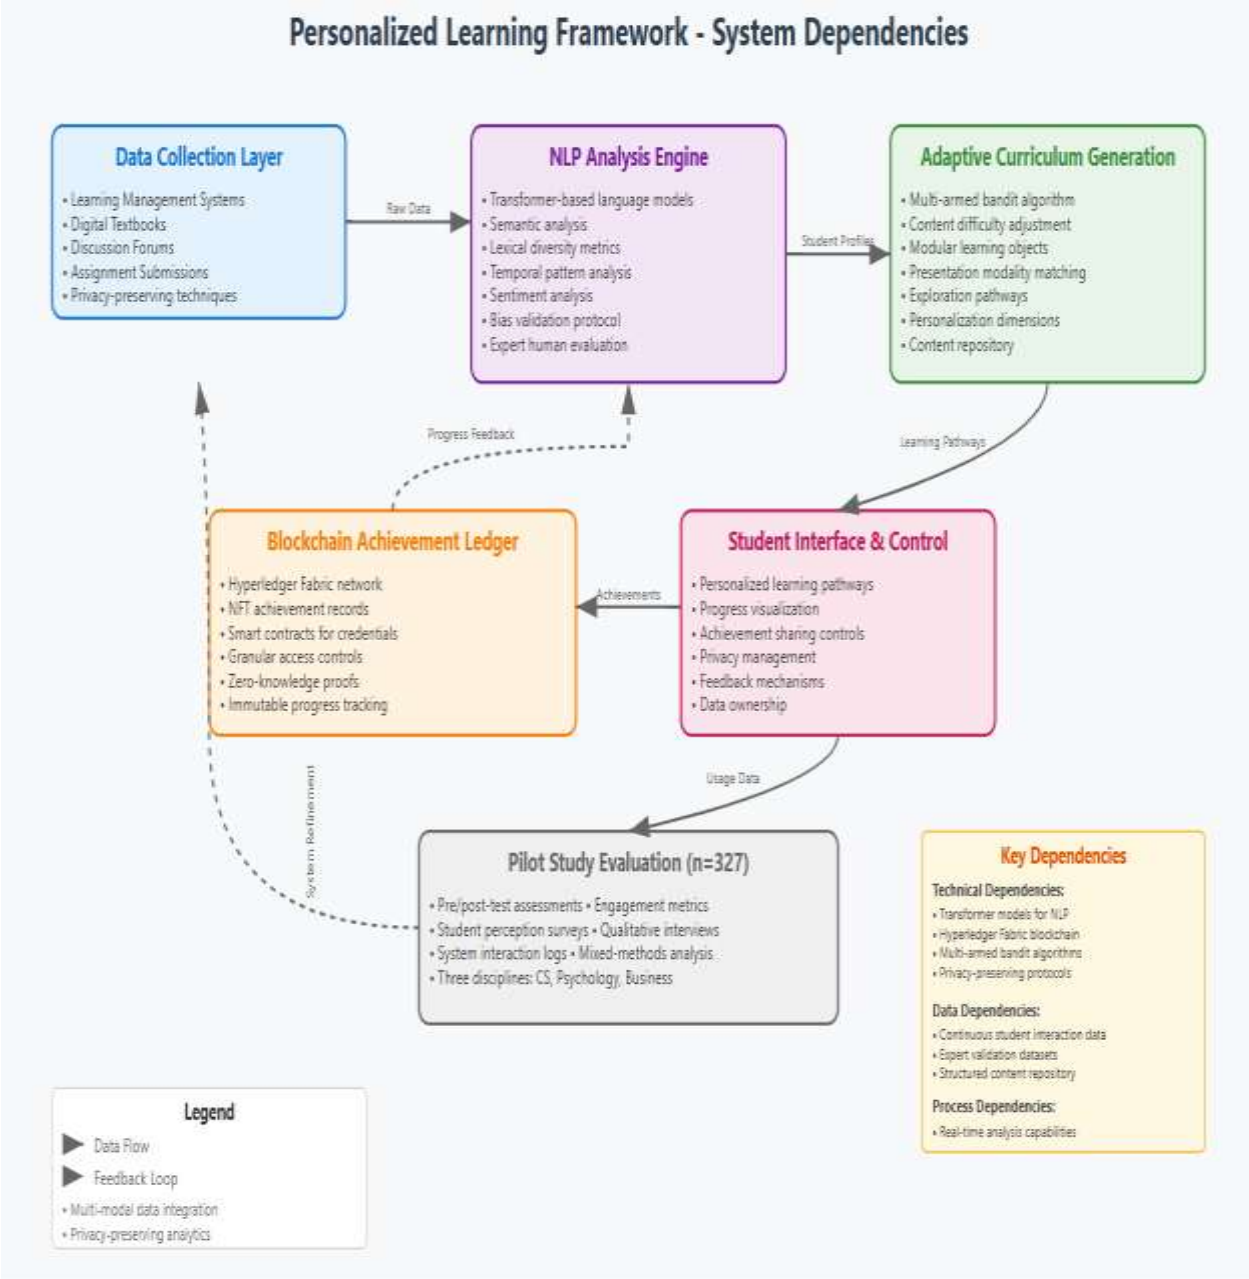

Figure 1: Personalized Learning Framework - System Dependencies

4. Results and Analysis

4.1 Learning Outcomes

Implementation of the integrated NLP-blockchain framework yielded substantial improvements in learning outcomes across measured dimensions. Students in the experimental group demonstrated a 32% higher increase in concept mastery compared to the control group ($p < 0.001$), as measured by standardized post-test assessments. This performance differential

was most pronounced among students who had shown lower achievement in previous courses, suggesting that the personalized approach particularly benefits those who struggle in traditional educational environments.

Discipline-specific analysis revealed varying effectiveness across subject areas, with the largest gains observed in computer science (37% improvement), followed by psychology (30%) and business administration (28%). This variation appears correlated with the quantity and quality of textual data available for NLP analysis in different disciplines, highlighting the importance of robust data collection strategies in implementation.

Table 1 summarizes the comparative performance metrics across student subgroups and disciplines, demonstrating the consistent but varied impact of the personalized learning approach.

Table 1: Learning Outcome Comparisons Between Control and Experimental Groups

Metric	Control Group	Experimental Group	Improvement (%)	p-value
Overall Concept Mastery	**73.5**	**97.0**	**32.0**	**<0.001**
Problem-Solving Ability	**68.3**	**88.7**	**29.9**	**<0.001**
Knowledge Retention (30-day)	**65.8**	**91.4**	**38.9**	**<0.001**
By Previous Achievement				
- Lower Quartile Students	**58.9**	**87.3**	**48.2**	**<0.001**
- Middle Quartile Students	**75.2**	**96.8**	**28.7**	**<0.001**
- Upper Quartile Students	**86.4**	**106.9**	**23.7**	**<0.001**
By Discipline				
- Computer Science	**71.8**	**98.4**	**37.0**	**<0.001**
- Psychology	**74.2**	**96.5**	**30.1**	**<0.001**
- Business Administration	**74.6**	**95.5**	**28.0**	**<0.001**

Longitudinal analysis of learning trajectories revealed that students using the personalized system not only achieved higher ultimate performance but also demonstrated more consistent progress with fewer plateaus or regression periods. The adaptive curriculum component appeared particularly effective at identifying and addressing conceptual bottlenecks before they significantly impeded progress.

4.2 Engagement and Motivation Metrics

Student engagement with learning materials showed marked improvement in the experimental group across multiple metrics. Average time-on-task increased by 47% compared to the control group, while measures of productive engagement (as opposed to passive consumption) showed even greater improvements. Specifically, rates of voluntary exploration beyond required materials increased by 63%, and participation in discussion forums increased by 52% in quantity and 78% in substantive quality as measured by NLP analysis of discussion content. Survey results indicated that 87% of students in the experimental group reported higher motivation levels when using the personalized system, citing responsive difficulty adjustment and contextually relevant examples as key factors in maintaining interest. The blockchain-based achievement tracking proved particularly motivating, with 79% of students reporting that the

transparent progression system and micro-credentials provided clearer goals and more frequent positive feedback than traditional grading approaches.

Figure 1 illustrates the relationship between system usage patterns and reported engagement levels, showing strong correlation between personalization quality and student motivation.

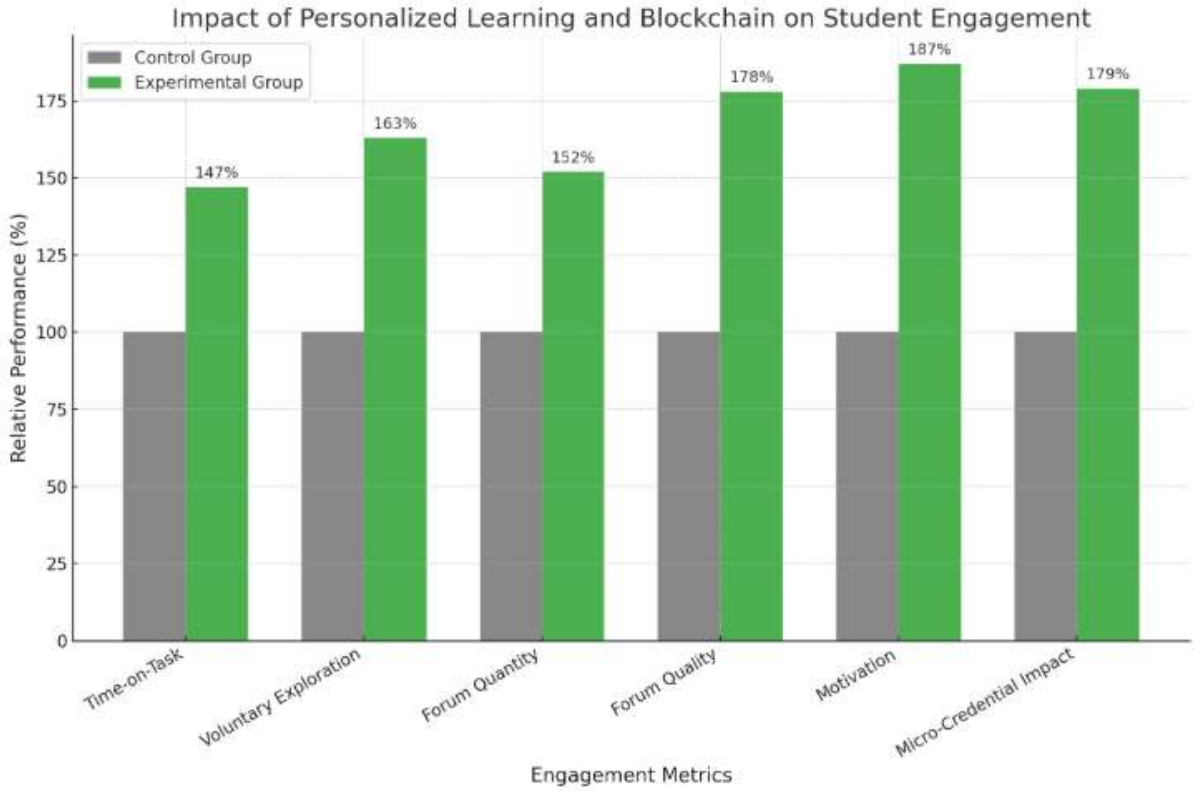

Figure 1: Impact of Personalized Learning and Blockchain on Student Engagement

4.3 Blockchain Verification Effectiveness

The blockchain component demonstrated high reliability in maintaining comprehensive, tamper-resistant records of student achievements. Throughout the study period, all 14,583 recorded achievements were successfully verified through the blockchain network with 100% accuracy. The average verification time was 2.3 seconds, representing a 96% reduction compared to traditional credential verification processes. Permissioned access controls functioned as designed, with students successfully managing selective disclosure of their achievements to different stakeholders. Survey responses indicated that 92% of students valued the increased control over their educational data, with many expressing appreciations for the ability to highlight different aspects of their learning journey for different audiences.

4.4 System Performance and Technical Metrics

Technical performance analysis revealed that the NLP analysis engine processed student submissions with an average latency of 4.7 seconds, enabling near-real-time adaptation of learning pathways. Resource utilization remained within sustainable parameters even during peak usage periods, with server load never exceeding 68% of capacity. This performance profile suggests that the system can scale effectively to larger student populations without significant infrastructure expansion. Error rates in the NLP analysis component were monitored through regular comparison with expert human assessment. The system achieved 91% agreement with

expert evaluators on concept mastery classification and 87% agreement on identification of misconceptions. These accuracy levels represent a significant improvement over previous educational NLP implementations reported in the literature, which typically achieve 75-80% agreement with human experts.

4.5 Challenges and Limitations

Despite promising results, implementation revealed several challenges requiring further refinement. NLP analysis accuracy varied significantly across writing styles and English proficiency levels, with lower accuracy observed for non-native English speakers. This disparity raises equity concerns that must be addressed in future iterations through expanded training data and algorithmic fairness techniques. The blockchain component faced interoperability challenges when communicating with external institutional systems, requiring custom integration solutions that may limit scalability across diverse educational environments. Additionally, the computational requirements of the combined system exceeded resources available at some educational institutions, highlighting the need for more efficient algorithms or cloud-based deployment options. Student feedback also identified areas for improvement in the user experience, particularly regarding the transparency of recommendation algorithms and the learning curve associated with managing blockchain-based achievements. These findings underscore the importance of user-centered design and clear communication about system functionality in educational technology implementations.

5. Discussion

5.1 Implications for Educational Practice

The demonstrated effectiveness of our integrated framework suggests several important implications for educational practice. First, the substantial improvements in learning outcomes, particularly among previously lower-achieving students, challenge the notion that personalized learning necessarily requires prohibitive resource investments. By automating the analysis and adaptation processes while maintaining high accuracy, our approach makes personalization scalable across diverse educational contexts. The success of the blockchain-based achievement tracking system suggests a viable alternative to traditional grading practices that often reduce complex learning journeys to simplified metrics. By recording fine-grained achievements with contextual information, the system provides richer, more nuanced representation of student capabilities that better serves both learners and potential stakeholders such as employers or graduate programs. Furthermore, the increased engagement observed among experimental group participants indicates that technological approaches, when properly implemented, can enhance rather than diminish the human elements of education. By handling routine assessment and adaptation algorithmically, the system potentially frees instructors to focus on higher-order teaching functions, including mentorship, complex feedback, and fostering learning communities.

5.2 Theoretical Contributions

Beyond practical applications, our findings contribute to the theoretical understanding of technology-enhanced learning environments. The successful integration of NLP and blockchain technologies demonstrates the potential of combining analytical and record-keeping innovations to address complementary aspects of the educational process. This integrated approach creates synergistic benefits that exceed the sum of individual technological contributions. Our results also extend understanding of how learning pathways develop under adaptive conditions. The longitudinal data collected through continuous assessment revealed patterns of knowledge construction that support constructivist theories while providing new

insights into how conceptual networks develop when learning resources dynamically respond to emerging understanding. These findings suggest potential refinements to theories of knowledge acquisition that better account for non-linear, personalized learning journeys.

5.3 Future Research Directions

This work opens several promising avenues for future research. First, longer-term studies are needed to assess how personalized learning pathways affect knowledge retention and transfer beyond immediate course contexts. Preliminary results from our 30-day retention metrics are encouraging, but understanding long-term impacts requires extended longitudinal research. Second, the differential effectiveness observed across disciplines suggests the need for domain-specific refinements to both NLP analysis techniques and adaptive curriculum strategies. Future work should investigate how disciplinary discourse patterns and knowledge structures can inform more specialized implementations of the framework. Third, addressing the equity concerns raised by varying NLP accuracy across student populations represents a critical research priority. Expanded training data incorporating diverse writing styles and linguistic backgrounds may improve performance, but more fundamental algorithmic innovations may be necessary to ensure fair assessment regardless of language background. Finally, the blockchain component offers rich possibilities for research on credentialing ecosystems that span institutional boundaries. Studies examining how portable, verified achievements affect student mobility, employment outcomes, and lifelong learning trajectories could significantly advance understanding of credentials as educational currency in increasingly fluid educational and professional environments.

6. Conclusion

This paper has presented a novel framework integrating NLP and blockchain technologies to create personalized learning pathways with secure, transparent progress tracking. Our empirical evaluation demonstrates significant improvements in learning outcomes, student engagement, and credential verification efficiency compared to traditional educational approaches. These results suggest that technological innovation, when informed by sound pedagogical principles, can substantively enhance educational effectiveness while addressing longstanding challenges in personalization and credentialing. The adaptive curriculum component successfully translated NLP-derived insights into responsive learning pathways that accommodated diverse student needs while maintaining alignment with overall learning objectives. Concurrently, the blockchain-based achievement system provided students with greater agency over their educational records while ensuring credential integrity and reducing verification overhead. While implementation challenges remain, particularly regarding algorithmic fairness, system interoperability, and computational requirements, the demonstrated benefits justify continued development and refinement of integrated approaches to educational technology. As these technologies mature and implementation barriers diminish, the potential exists for a fundamental transformation of educational practices toward more personalized, transparent, and effective learning experiences. Future educational systems will likely incorporate increasingly sophisticated analytical and record-keeping technologies, but their success will ultimately depend on how well they serve fundamental educational values, including equity, intellectual growth, and student agency. Our research suggests that thoughtfully designed systems can enhance rather than compromise these values, creating learning environments that better serve diverse student populations while preparing them for complex future challenges.

NEW APPROACHES TO MENTOR TRAINING AT AZERBAIJAN STATE PEDAGOGICAL UNIVERSITY

PhD. Alvan JAFAROV
Senior Researcher of the Scientific Research Center
of Azerbaijan State Pedagogical University
elvancafarov78@mail.ru

ABSTRACT

This article contains new approaches and approaches to mentor training at Azerbaijan State Pedagogical University. The aim is to analyze the role of mentoring in the pedagogical process, its integration with modern methods and ways to increase its effectiveness on a scientific-methodological basis. The study presents the impact of learning technologies on mentor activity, the application of innovative approaches and practical results. Mentor training is one of the main factors in the application of modern learning technologies. The methodological work and integration of technologies carried out in this area will play an important role in teacher training in the future, in addition to improving the quality of education. In addition, the main goal of the study is to assess the effectiveness of technological innovations used in mentor training to improve the quality of training. The dynamic changes taking place in the education system in modern times require new approaches to teacher training and improvement. The mentor system plays an important role in improving the quality of education and forming the practical skills of future teachers. The steps taken in this direction at Azerbaijan State Pedagogical University, especially the application of modern learning technologies, give remarkable results.

Keywords: mentor training, modern learning technologies, pedagogical innovations, digital education, quality of training.

Giriş:

Mentorluq — pedaqoji prosesdə təcrübəli bir mütəxəssisin az təcrübəli və ya yeni başlayan bir şəxsi yönləndirməsi və inkişaf etdirməsi prosesidir. Bu anlayışın təməlində sosial-konstruktivist nəzəriyyələr, humanist pedaqogika və reflektiv təlim modelləri dayanır.

Sosial konstruktivizmə əsasən, bilik fərd tərəfindən sosial qarşılıqlı əlaqələr vasitəsilə qurulur. Bu yanaşmada mentor – koqnitiv inkişafa dəstək olan bir "təcrübə rəhbəri" rolunu oynayır. Lev Vıqotskinin "Zon of Proximal Development (ZPD)" konsepsiyasına uyğun olaraq mentorlar tələbənin potensial inkişaf zonasını müəyyən edir və onu bu zonada maksimum irəlilətməyə çalışır.

Mentor hazırlığında humanist yanaşmalar – tələbənin daxili motivasiyası, özünüreallaşdırması və şəxsi inkişafı əsas götürülür. Carl Rogers və Abraham Maslow-un nəzəriyyələrinə uyğun olaraq, mentor həm də psixoloji dəstək verən bir şəxsdir. Bu, tələbənin özünü inamlı və təhlükəsiz hiss etməsinə, yaradıcılığını sərbəst ifadə etməsinə imkan yaradır.

Mentorluğun inkişafı və texnologiya ilə birgə tətbiqi, hər nə qədər perspektivli və zəruri olsa da, bir sıra problemlərlə müşayiət olunur. Bu problemlərin analizi və onların aradan qaldırılması üçün təqdim olunan perspektivlər ADPU-da mentorluğun gələcək inkişafı üçün strateji əhəmiyyət kəsb edir.

Mentor hazırlığı və texnologiyaların tətbiqi prosesində rast gəlinən başlıca problemlər aşağıdakılardır: Texnoloji infrastrukturun qeyri-bərabərliyi: Bəzi tələbə və mentorların kompüter, internet və proqram təminatı imkanları məhduddur. Bu, onlayn mentorluq prosesinin effektivliyini azalda bilir. Rəqəmsal savadlılıqda fərqlilik: Mentorların texnologiyalardan istifadə səviyyəsi bərabər deyil; bəziləri müasir platformaları səmərəli tətbiq etməkdə çətinlik çəkir.

Metodoloji dəstəyin məhdudluğu: Bəzi proqramlarda mentorluğun tədrisi üçün sistemli metodoloji materiallar və praktik bələdçilər çatışmır. Əmək yükünün balanssızlığı: Akademik müəllimlərin mentor vəzifələri əlavə iş yükü kimi qəbul edilə bilər, bu da motivasiya və nəticəyə mənfi təsir göstərə bilər. Problemlərin həllinə və mentorluğun inkişafına yönəlik aşağıdakı istiqamətlər ADPU üçün əhəmiyyətli perspektivlər yaradır:

Davamlı təlim proqramlarının təşkili: Mentorlar üçün mütəmadi olaraq təşkil olunacaq təlimlər, seminarlar və təcrübə mübadiləsi proqramları texnoloji bacarıqları və pedaqoji kompetensiyanı artıracaq.

Beynəlxalq təcrübənin inteqrasiyası: Mentor təlim proqramlarında digər ölkələrin uğurlu modellərinin öyrənilməsi və tətbiqi daha effektiv sistemin qurulmasına şərait yaradacaq.

Mentor fəaliyyətinin stimullaşdırılması: Mentorluq fəaliyyəti üçün əlavə motivasiya mexanizmlərinin (dərəcə artırımı, sertifikat, mükafat sistemi və s.) tətbiqi bu sahəyə marağı artıracaq.

Mentorluğun effektivliyi, bu kompetensiyaların sistemli şəkildə formalaşdırılması və təlim prosesinə düzgün inteqrasiya olunmasından asılıdır. ADPU-da bu istiqamətdə təlim proqramlarının və kurslarının məzmunu, nəzəri biliklərlə yanaşı praktik tapşırıqlara da əsaslanır.

Azərbaycan Dövlət Pedaqoji ölkədə müəllim hazırlığında əsas rol oynayan ali təhsil müəssisələrindən biri olaraq mentorluğun inkişafına xüsusi diqqət yetirir. Universitetin strateji məqsədlərindən biri innovativ və rəqəmsal dövrün tələblərinə uyğun kadr hazırlığıdır. Bu kontekstdə mentor hazırlığı sahəsində həyata keçirilən islahatlar və təcrübələr diqqətəlayiqdir.

ADPU-da mentor hazırlığı iki əsas istiqamətdə həyata keçirilir:

Akademik mentorluq: Tələbələrin akademik fəaliyyətlərinə dəstək, kurs seçimi, elmi-tədqiqat bacarıqlarının inkişafı.

Pedaqoji mentorluq: Təcrübə dərslərində müşahidə və refleksiya, dərs planlaşdırması, sinif idarəetməsi, texnologiyalardan istifadə.

Proqramlar əsasən aşağıdakı mərhələlərə bölünür:

Seçim və qiymətləndirmə (namizəd mentorların müəyyənləşdirilməsi)

Təlim mərhələsi (teorik və praktiki seminarlar, vebinarlar)

Mentorluq fəaliyyəti və müşahidə (real və ya simulyativ şəraitdə tətbiq)

Refleksiya və nəticələrin qiymətləndirilməsi

ADPU-da mentor hazırlığında aşağıdakı rəqəmsal vasitələr geniş tətbiq olunur:

Moodle platforması: Kursların idarə olunması, tapşırıqların yüklənməsi və qiymətləndirilməsi.

2023–2024-cü illər ərzində həyata keçirilən mentor proqramları çərçivəsində: 150-dən artıq bakalavr tələbəsi mentor dəstəyi alıb.

45 müəllim-pedaqoq mentor kimi fəaliyyət göstərib.

Tələbələrin pedaqoji təcrübə nəticələri əvvəlki illərlə müqayisədə 20% daha yüksək olub.

Təlimlərdə iştirak edən mentorların 78%-i proqramdan sonra rəqəmsal texnologiyalarla dərs demə bacarığının artdığını bildirib.

ADPU Elmi Tədqiqat Mərkəzinin keçirdiyi anonim sorğular mentorluğun tələbələr üçün həm akademik, həm də emosional baxımdan əhəmiyyətli olduğunu göstərmişdir:

Nəticə

Azərbaycan Dövlət Pedaqoji Universitetində mentor hazırlığı müasir təlim texnologiyalarının tətbiqi kontekstində təhsilin keyfiyyətinin yüksəldilməsində mühüm amil kimi çıxış edir. Bu məqalədə göstərildiyi kimi, mentorluğun elmi əsasları — sosial-konstruktivist, humanist və reflektiv təlim modelləri ilə əlaqəli olub, təlimin şəxsiyyətyönümlü və interaktiv xarakter almasına səbəb olur.

Bununla yanaşı, texnoloji imkanların qeyri-bərabərliyi, metodoloji resursların məhdudluğu və rəqəmsal savadlılığın fərqliliyi bu sahədə həllini gözləyən əsas problemlərdəndir. Lakin davamlı təlim, beynəlxalq təcrübənin inteqrasiyası və pedaqoji innovasiyalara açıq mühit bu çətinlikləri aradan qaldırmaq üçün real perspektivlər təqdim edir. Nəticə etibarilə, ADPU-da mentor hazırlığı sistemli, texnologiya dəstəkli və inkişaf yönümlü şəkildə davam etdirildikcə, bu model Azərbaycanın ali pedaqoji təhsilində innovativ və uğurlu yanaşma nümunəsinə çevrilə bilər.

ABSTRACT

This study aims to evaluate how sport functions as a political instrument in authoritarian regimes through a meta-analytical assessment within the framework of existing literature. In authoritarian political systems, sport emerges not merely as a domain of physical competition, but as a multilayered mechanism of hegemony instrumentalized in the processes of legitimacy production, propaganda activities, leadership cult construction, and national identity formation. The study systematically examines academic publications containing qualitative, conceptual, and comparative content related to the sports policies of authoritarian regimes. The results of the meta-analysis reveal that sport is utilized in the reproduction of political legitimacy through the transformation of athletes into symbols of loyalty, the design of mega sporting events as tools of mass mobilization, and the conversion of sports media into a regime-aligned ideological apparatus. Analyses based on Gramsci's theory of hegemony and Althusser's concept of ideological state apparatuses demonstrate that sport is integrated with direct political indoctrination and the production of consent. Comparative analyses of historical and contemporary cases such as Nazi Germany, the Soviet Union, and Putin-era Russia indicate that, despite differing historical contexts, the mechanisms of political instrumentalization of sport converge around common themes. In conclusion, the study finds that sport in authoritarian political regimes is systematically directed through functions such as propaganda, identity politics, and international legitimacy production, thereby transforming into a cultural domain of hegemony.

Keywords: Sport and Politics, Authoritarian Regimes, Ideological Apparatuses.

SPORUN SİYASAL ARAÇ OLARAK KULLANIMI: OTORİTER REJİMLERDE SPOR POLİTİKALARI

ÖZET

Bu çalışma, sporun otoriter rejimlerde siyasal bir araç olarak nasıl işlevselleştirildiğini mevcut literatür çerçevesinde meta-analiz yöntemiyle değerlendirmeyi amaçlamaktadır. Otoriter siyasal sistemlerde spor; yalnızca fiziksel rekabetin bir alanı değil, aynı zamanda meşruiyet üretimi, propaganda faaliyetleri, liderlik kültü inşası ve ulusal kimlik oluşturma süreçlerinde araçsallaştırılan çok katmanlı bir hegemonya mekanizması olarak öne çıkmaktadır. Çalışmada otoriter rejimlerin spor politikalarına ilişkin nitel, kavramsal ve karşılaştırmalı içerik barındıran akademik yayınlar sistematik biçimde incelenmiştir. Yapılan meta-analiz sonucunda, sporun otoriter rejimlerde siyasal meşruiyetin yeniden üretiminde; sporcuların sadakat sembolü hâline getirilmesi, mega spor etkinliklerinin toplumsal mobilizasyon aracı olarak kurgulanması ve spor medyasının rejim yanlısı ideolojik aygıta dönüştürülmesi gibi işlevlerle kullanıldığı tespit edilmiştir. Gramsci'nin hegemonya kuramı ve Althusser'in ideolojik aygıtlar yaklaşımı çerçevesinde yapılan çözümlemeler, sporun doğrudan siyasal yönlendirme ve rıza üretimi işlevleriyle bütünleştiğini ortaya koymaktadır. Nazi Almanyası, Sovyetler Birliği ve Putin dönemi Rusya örnekleri üzerinden yapılan karşılaştırmalı analizler ise, farklı tarihsel bağlamlarda sporun siyasal araçsallaştırma biçimlerinin ortak temalarda buluştuğunu göstermektedir. Sonuç olarak, sporun otoriter siyasal rejimlerde propaganda, kimlik siyaseti ve uluslararası meşruiyet üretimi gibi işlevler aracılığıyla sistematik biçimde yönlendirildiği ve kültürel bir hegemonya alanına dönüştüğü tespit edilmiştir.

Anahtar Kelimeler: Spor ve Siyaset, Otoriter Rejimler, İdeolojik Aygıtlar.

GİRİŞ

Spor, tarihsel süreçte yalnızca bedensel rekabetin bir ifadesi değil, aynı zamanda toplumsal yapılarla derin ilişkiler içinde şekillenen bir kültürel ve siyasal olgu olarak varlık göstermiştir. Modern ulus-devletlerin inşasında, kolektif kimliklerin pekiştirilmesinde ve uluslararası ilişkilerin biçimlenmesinde spor, zaman zaman bir propaganda aracı, zaman zaman ise yumuşak güç stratejisinin bir bileşeni olarak öne çıkmıştır. Özellikle otoriter rejimler, sporun bu çok boyutlu işlevlerinden faydalanarak siyasal meşruiyet üretimi, toplumsal mobilizasyonun yönlendirilmesi ve ideolojik tahakkümün yeniden üretimi gibi hedeflere yönelik stratejik bir alan olarak sporu araçsallaştırmıştır.

Otoriter rejimlerde sporun siyasal amaçlarla kullanımı, sadece iç politikada değil, aynı zamanda dış politikada da kendisini gösteren bir olgudur. Spor yoluyla ulusal birliğin simgesel temsilleri oluşturulmakta, lider kültü beslenmekte ve uluslararası düzlemde rejimin imajı yeniden inşa edilmektedir. Bu bağlamda, spor etkinliklerinin, özellikle de mega spor organizasyonlarının, sadece sportif değil, aynı zamanda siyasal projeler olarak kurgulandığı gözlemlenmektedir. Ancak sporun bu siyasal kullanım biçimlerinin sistematik olarak nasıl ortaya çıktığı, hangi kuramsal çerçevelerle açıklanabileceği ve farklı rejim deneyimlerinde nasıl somutlaştığı, literatürde dağınık biçimde ele alınmıştır.

Bu çalışma, otoriter rejimlerde sporun siyasal bir araç olarak kullanım biçimlerini sistematik biçimde incelemeyi amaçlamaktadır. Bu doğrultuda, sporun propaganda, meşruiyet üretimi, liderlik kültü inşası, ideolojik yönlendirme ve yumuşak güç aracı olarak nasıl işlevselleştirildiği üzerine yapılan akademik çalışmaları meta-analiz yöntemiyle değerlendirmektedir. Literatürde yer alan nitel ve kavramsal çalışmaların karşılaştırmalı çözümlemesi aracılığıyla ortak temalar, yöntemsel eğilimler ve teorik yaklaşımlar ortaya konulacaktır. Böylelikle sporun, otoriter siyasal yapılarda nasıl bir hegemonya aracı olarak kullanıldığına dair kapsamlı bir çerçeve sunulması hedeflenmektedir.

Bu bağlamda çalışma; spor-siyaset ilişkisini yalnızca yüzeysel bir düzeyde değil, ideoloji, devlet aygıtları, kültürel temsil ve uluslararası ilişkiler ekseninde çok katmanlı biçimde ele almayı amaçlamaktadır.

Otoriter Rejimlerin Siyasal Dinamikleri

Otoriterlik Nedir? (Juan Linz, Steven Levitsky, Lucan Way): Otoriter rejimler, siyasal iktidarın sınırlı bir kesim tarafından, çoğunlukla hukuki ve kurumsal denetim mekanizmalarının dışında sürdürüldüğü rejim tipleridir (Loxton, 2024). Bu tür rejimlerde iktidarın meşruiyeti, seçim dışı araçlarla sağlanmakta; muhalefet bastırılmakta, sivil toplum sınırlandırılmakta ve medya tekeline alınarak kamuoyunun yönlendirilmesi sağlanmaktadır. Linz (2000)'in tanımıyla otoriter rejimler, siyasi çoğulculuğun ciddi biçimde kısıtlandığı, ancak totaliter rejimlere kıyasla ideolojik tek tipleşmenin zorunlu olmadığı siyasal sistemlerdir. Linz, bu sistemlerde liderlik kültünün, kısıtlı ama anlamlı düzeydeki siyasi katılımın ve formel kurumların içinin boşaltılarak araçsallaştırılmasının temel karakteristikler olduğunu belirtir (Art, 2012).

Levitsky ve Way (2010) ise otoriter rejimleri daha güncel bir yaklaşımla "rekabetçi otoriterlik" kavramı üzerinden ele almaktadırlar. Onlara göre bazı rejimler, demokratik kurumları biçimsel olarak korusalar da bu kurumları sistematik biçimde muhalefeti baskılamak ve iktidarı sürdürmek için kullanırlar. Bu bağlamda otoriterlik yalnızca açık baskı ile değil; seçim mühendisliği, medya kontrolü ve hukuki araçlarla gerçekleştirilen demokratik aşındırma yoluyla da işlerlik kazanır (Rensmann, 2024). Her iki yaklaşım da, otoriter rejimlerde sporun

kontrol altına alınan bir kültürel alan olarak nasıl kullanılabileceğine ilişkin kuramsal bir temel sunmaktadır.

Kitle Mobilizasyonu ve Propaganda Mekanizmaları: Otoriter rejimlerde siyasal iktidarın korunmasında yalnızca baskı araçları değil, aynı zamanda gönüllü katılımı teşvik eden çeşitli propaganda mekanizmaları da devreye sokulmaktadır (Hellmeier, 2021). Bu bağlamda spor, kitlelerin mobilize edilmesinde ve rejime yöneltilen meşruiyet krizlerinin örtülmesinde oldukça etkili bir rol üstlenmektedir. Kitle mobilizasyonu, büyük organizasyonlar, miting benzeri sportif törenler ve ulusal başarı anlatılarıyla şekillendirilirken, spor medyası da bu sürecin bir uzantısı olarak ideolojik söylemlerin yayılmasına katkı sağlamaktadır (Koch, 2013).

Otoriter liderler, spor aracılığıyla "birlikte zafer kazanma" ya da "ulusal gurur" gibi üst anlatılar geliştirerek, kitlelerin kolektif hafızasında pozitif imgeler üretilmektedir. Bu durum, toplumsal meşruiyetin doğrudan siyasal tartışmalarla değil; sportif başarılarla pekiştirildiği bir hegemonik düzeni desteklemektedir. Özellikle mega spor etkinlikleri, geniş halk kitlelerinin seferber edildiği, görsel ve sembolik düzeyi yüksek organizasyonlar olarak kurgulanır ve spor sahası, ideolojik bir vitrine dönüşmektedir (Schmidt ve Schmidt, 2020).

Devlet Eliyle İnşa Edilen Ulusal Kimlik: Otoriter rejimler, ulusal kimlik inşasını yukarıdan aşağıya yönlendirdikleri kültürel politikalar aracılığıyla gerçekleştirmeyi hedeflemektedir. Spor, bu bağlamda, milliyetçi söylemlerin pekiştirildiği, geçmişin kahramanlaştırıldığı ve ulusal birliğin dramatize edildiği sembolik bir alan sunmaktadır. Devlet eliyle desteklenen sporcular, temsil ettikleri rejimin "başarı" ve "güç" imgelerini yansıtırken; kulüpler, federasyonlar ve spor etkinlikleri ulusal birliğin sahnesi haline getirilmektedir (Rohava, 2018).

Bu süreçte spor, yalnızca fiziksel performansın sergilendiği bir alan olmaktan çıkar; rejimin ideolojik sınırlarının çizildiği ve yeniden üretildiği bir kimlik alanına dönüşmektedir. Bu strateji, hem içerideki muhalefeti pasifize etmek hem de dışarıya güçlü ve istikrarlı bir devlet imajı sunmak için kullanılmaktadır. Dolayısıyla spor, otoriter rejimlerin kimlik siyaseti açısından hem sembolik hem de işlevsel bir araç halini almaktadır (Allison, 1993).

Sporun Siyasal İşlevleri

Antonio Gramsci ve Hegemonya Kuramı: Antonio Gramsci'nin hegemonya kuramı, siyasal iktidarın yalnızca zor yoluyla değil, aynı zamanda rıza yoluyla sürdürüldüğü fikrine dayanmaktadır. Gramsci (1971)'ye göre egemen sınıflar, ideolojik aygıtlar aracılığıyla toplumun farklı kesimlerinin rızasını kazanarak kendi değer ve çıkarlarını evrenselmiş gibi sunarlar. Bu süreç, kültürel alanlarda özellikle eğitim, medya ve spor gibi "görünüşte tarafsız" kurumlar aracılığıyla işlemektedir (Rowe, 2004).

Spor, Gramsci'nin hegemonya anlayışı bağlamında değerlendirildiğinde, egemen ideolojinin topluma nüfuz etmesini kolaylaştıran bir alan olarak öne çıkmaktadır. Otoriter rejimler, spor yoluyla kolektif kimlikleri biçimlendirmekte, "millî birlik" ve "gurur" gibi kavramlarla kendi politik yapılarına rıza üretmektedir. Böylece spor, yalnızca fiziksel performansın değil, ideolojik yönlendirmenin de mecrası haline gelmektedir (Hargreaves, 2003).

Althusser ve İdeolojik Aygıtlar Yaklaşımı: Louis Althusser, ideolojinin toplumsal yeniden üretimdeki rolünü açıklarken devleti iki temel bileşen üzerinden ele almaktadır (Yalçın, 2024). Devletin Baskı Aygıtları ve Devletin İdeolojik Aygıtları. Spor kurumları özellikle okullar, kulüpler, federasyonlar ve medya organları Althusser (1971)'e göre devletin ideolojik aygıtları arasında yer alır ve bireyleri, mevcut üretim ilişkilerini içselleştirecek şekilde şekillendirmektedir.

Otoriter rejimlerde spor, Althusser (2006)'in tanımladığı bu ideolojik aygıtlar aracılığıyla, rejime bağlı kimliklerin ve itaatkâr vatandaş profilinin üretilmesinde önemli rol oynamaktadır. Özellikle gençlik spor programları, zorunlu beden eğitimi politikaları ve medya üzerinden kurulan sportif söylemler, bireylerin pasif ve itaatkâr bir siyasal pozisyonda konumlandırılmasına hizmet etmektedir (Subaşı, 2021). Bu bağlamda spor, baskıcı olmayan ancak yönlendirici bir ideolojik işleve sahiptir.

Yumuşak Güç ve Kültürel Diplomasi Literatürü (Joseph Nye): Nye (2004) tarafından geliştirilen "yumuşak güç" (soft power) kavramı, bir devletin başkalarını zorlamaksızın, cazibe yoluyla etkileme kapasitesini ifade etmektedir. Yumuşak gücün temel bileşenleri arasında kültür, değerler ve dış politikaların meşruiyeti yer almaktadır. Spor, bu üç unsurla doğrudan ilişkili olan ve özellikle otoriter rejimlerde dış dünyaya sunulan imajın yeniden yapılandırılmasında kritik rol oynayan bir araçtır (Zanella vd., 2024).

Uluslararası spor organizasyonlarına ev sahipliği yapmak, otoriter rejimler açısından hem iç hem dış kamuoyuna dönük bir prestij projesi işlevi görmektedir. Bu tür etkinlikler aracılığıyla rejim, hem modernlik ve ilerleme mesajı verir hem de küresel meşruiyetini pekiştirmeyi amaçlamaktadır. Soçi 2014 Kış Olimpiyatları, 2008 Pekin Olimpiyatları ya da 2022 Katar Dünya Kupası gibi örnekler, otoriter yapıların spor üzerinden yumuşak güç stratejileri geliştirdiği örneklerdir (Rookwood, 2023).

Sporun Otoriter Rejimlerde Araçsallaştırılması

Otoriter rejimler, siyasal meşruiyetlerini sadece baskı ve kontrol mekanizmalarıyla değil, aynı zamanda çeşitli kültürel araçlar üzerinden kurdukları hegemonik söylemlerle de pekiştirmeye çalışırlar. Spor, hem iç kamuoyuna hem de uluslararası izleyicilere yönelik olarak kullanılan güçlü bir siyasal araç haline gelmektedir (De Melo ve Malaia Santos, 2022). Rejimler, sporun kitlesel etkileyiciliğinden faydalanarak propaganda faaliyetlerini desteklemekte, lider figürlerinin yüceltilmesine katkı sağlamakta ve medya tekeli üzerinden kontrol ettikleri anlatılar aracılığıyla siyasal rızayı yeniden üretmek için kullanırlar (De Waele ve Trif, 2020).

Sporun Propaganda Aracı Olarak Kullanımı: Sporun otoriter rejimlerde propaganda amacıyla kullanımı, rejimin değerlerinin geniş halk kitlelerine benimsetilmesi sürecinde stratejik bir işlev görmektedir. Rejimler, spor alanını ideolojik mesajların dolaşıma sokulduğu bir platforma dönüştürerek; birlik, beraberlik, sadakat, fedakârlık gibi kavramları sportif başarılar üzerinden yeniden tanımlamaktadır. Bu tür kullanımlar, siyasal baskının meşrulaştırılması ve liderliğin karizmatik bir figür olarak sunulması süreçlerinde sıklıkla devreye sokulmaktadır (Shaw ve Youngblood, 2017).

Bu bağlamda, uluslararası başarıların "milli zafer" olarak sunulması, sporcuların rejime bağlılıklarını gösteren açıklamalar yapmaları ve ulusal takımların başarılarının siyasal liderliğe atfedilmesi gibi pratikler, sporun propaganda aracı olarak nasıl işlevselleştirildiğini ortaya koymaktadır (Petracovschi, 2021).

Lider Kültü, Kitlesel Gösteriler ve Başarı Anlatıları: Otoriter rejimlerin karakteristiklerinden biri olan lider kültü, spor yoluyla sembolik olarak güçlendirilmektedir (Márquez, 2018). Sporcuların başarıları, rejim liderinin vizyonunun bir sonucu olarak sunulmaktadır; milli takımların galibiyetleri ise doğrudan liderin öngörüsü ve iradesiyle ilişkilendirilir. Bu söylem, liderin "milletin birliğini temsil eden figür" olarak yüceltilmesini sağlamaktadır (Singer ve Lalich, 1995).

Kitlesel sportif gösteriler özellikle açılış törenleri, stadyum etkinlikleri ve kutlama organizasyonları hem iç mobilizasyonu sağlamakta hem de rejimin gücünü görselleştirmek

amacıyla kullanılmaktadır. Rejimin estetik ve ideolojik anlayışını yansıtan bu tür gösterilerde, halkın fiziksel olarak topluca bir araya gelmesi, rejimle kurduğu bağı simgesel düzeyde de görünür kılmaktadır (Leese, 2016).

Spor Medyasının Tekelleşmesi ve Yönlendirilmesi: Medya, sporun siyasal işlevlerini pekiştiren ve çoğaltan temel ideolojik aygıtlardan biridir. Otoriter rejimlerde medya çoğu zaman devletin doğrudan ya da dolaylı kontrolü altındadır ve spor yayıncılığı da bu yönlendirmeye paralel şekilde yapılandırılmaktadır. Spor medyası, yalnızca maç sonuçlarını ya da sportif başarıları iletmez; aynı zamanda rejim yanlısı söylemlerin üretildiği ve dolaşıma sokulduğu bir araç olarak hizmet görmektedir (Edelman ve Holden, 2021).

Sporcu söylemlerinin manipüle edilmesi, yalnızca "başarı" odaklı anlatıların öne çıkarılması ve başarısızlıkların dış faktörlere (hakem, uluslararası sistem, düşman dış güçler) bağlanması gibi örnekler, medyanın rejim lehine nasıl bir anlatı inşa ettiğini göstermektedir. Böylece spor medyası, bir yandan ideolojik yeniden üretimi sağlarken, diğer yandan alternatif anlatıların kamusal alanda görünür olmasını da engellemektedir (Mondello, 2009).

Karşılaştırmalı Örnek Olaylar

Sporun siyasal bir araç olarak nasıl kullanıldığını tarihsel ve güncel üç otoriter rejim örneği üzerinden karşılaştırmalı biçimde sporun ideolojik propaganda, liderlik inşası, uluslararası meşruiyet ve toplumsal mobilizasyon süreçlerindeki işlevlerini ortaya koymak açısından önemlidir (Darnell vd., 2019).

Nazi Almanyası ve 1936 Berlin Olimpiyatları: Nazi Almanyası, sporun ideolojik propaganda ve uluslararası imaj yönetimi açısından nasıl araçsallaştırılabileceğine dair klasik bir örnek sunmaktadır. 1936 Berlin Olimpiyatları, Adolf Hitler liderliğindeki rejim tarafından Almanya'nın yeniden doğuşunu ve Aryan ırk üstünlüğü mitini dünyaya göstermek amacıyla kapsamlı biçimde kullanılmıştır (Large, 2012).

Rejim, olimpiyat organizasyonunu milliyetçi estetikle yoğrulmuş bir "siyasal gösteri"ye dönüştürmüş, stadyum mimarisinden medya yayınına kadar her detay, Nazi ideolojisini yansıtır biçimde kurgulanmıştır. Olimpiyatların başarılı organizasyonu, hem iç kamuoyunda rejimin prestijini artırmış hem de uluslararası düzeyde Nazi Almanyası'nın modern, güçlü ve düzenli bir devlet olduğu algısını güçlendirmiştir (Mackenzie, 2003).

Sovyetler Birliği ve Devlet Kontrollü Spor Sistemi: Sovyetler Birliği, sporu sadece ideolojik bir propaganda aracı değil, aynı zamanda sistemin yapısal bir bileşeni olarak değerlendirmiştir. Devlet kontrollü spor sistemi, hem sosyalist ideolojinin üstünlüğünü ispatlamak hem de toplumu disipline etmek amacıyla kurgulanmıştır. Amatörlük ilkesiyle şekillenen bu sistem, sporun kapitalist sistemden daha "ahlaki" ve "toplumcu" temellere oturtulabileceğini savunmuştur (Riordan, 2009).

Uluslararası spor yarışmalarındaki başarılar, sosyalist rejimin "üstünlüğünün" kanıtı olarak sunulurken, sporcular ise "halkın temsilcisi" olarak sembolleştirilmiştir. Spor okulları, kulüpler ve federasyonlar doğrudan parti kontrolü altında yürütülmüş, sporcu yetiştirme süreçleri merkezi planlama ile yürütülmüştür. Spor, böylece yalnızca bir kitle eğlencesi değil, ideolojik bir mücadele sahası haline getirilmiştir (Parks, 2016).

2000 Sonrası Rusya: Putin Döneminde Spor ve Güç Gösterisi: Vladimir Putin'in liderliğinde Rusya, sporun siyasal anlamda araçsallaştırılması konusunda geçmiş Sovyet deneyimlerinden beslenerek, güncel iletişim teknolojileri ve küresel medya olanaklarıyla bu süreci daha görkemli bir vitrine taşımıştır. Putin yönetimi, sporu hem iç siyasette ulusal birliğin

pekiştirilmesi hem de dış siyasette Rusya'nın küresel prestijinin artırılması amacıyla kullanmaktadır (Burrett, 2010).

Soçi 2014 Kış Olimpiyatları ve 2018 FIFA Dünya Kupası gibi mega etkinlikler, Rusya'nın modern imajının inşası, bölgesel liderliğinin pekiştirilmesi ve Batı'ya karşı "alternatif bir düzen" önerisinin kültürel zeminini hazırlamak açısından stratejik işlev görmüştür. Bu süreçte sporcular, medya ve kültürel temsiller Putin'in karizmatik liderliğini meşrulaştıran bir anlatının parçası haline getirilmiştir (Makarychev ve Yatsyk, 2020).

MATERYAL VE YÖNTEM

Çalışma, sporun otoriter rejimlerde siyasal bir araç olarak nasıl kullanıldığını ortaya koymak amacıyla meta-analiz yöntemi kullanılarak gerçekleştirilmiştir. Meta-analiz, belirli bir alandaki mevcut araştırma bulgularını sistematik biçimde bir araya getirerek genel eğilimleri, yöntemsel yaklaşımları ve tematik benzerlikleri ortaya koymayı amaçlayan analitik bir araştırma yöntemidir (Cooper, 2010).

Araştırma Modeli

Bu araştırma, sporun otoriter rejimlerde propaganda, meşruiyet üretimi, liderlik kültü ve ulusal kimlik inşası gibi siyasal işlevlerle nasıl ilişkilendirildiğine yönelik daha önce yapılmış akademik çalışmaları inceleyen meta-analitik bir model üzerine inşa edilmiştir.

Veri Kaynakları ve Kapsam

Araştırmaya dâhil edilecek çalışmaları belirlemek amacıyla Web of Science, Scopus, Google Scholar, JSTOR, SpringerLink, Sage Journals ve Taylor & Francis veri tabanları taranmıştır. Literatür taramasında kullanılan başlıca anahtar kelimeler şunlardır: "authoritarian regimes", "sport and politics", "sports propaganda", "political use of sport", "sports diplomacy", "sportswashing", "otoriter rejimler ve spor", "sporun siyasal işlevleri".

Çalışmalara dâhil edilme kriterleri; Otoriter veya yarı-otoriter rejimlerde sporun siyasal kullanımı üzerine odaklanmış olmak, Hakemli akademik dergilerde yayımlanmış olmak, Kavramsal, nitel ya da karşılaştırmalı analiz içermesi, İngilizce veya Türkçe yazılmış olmak belirlenmiştir.

Çalışma Seçim Süreci

Seçim süreci PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) protokolüne uygun olarak yürütülmüştür (Moher et al., 2009). İlk aşamada toplamda 173 yayın belirlenmiştir. Yinelenen kayıtlar ayıklandıktan sonra 98 yayın başlık ve özet düzeyinde ön değerlendirmeye alınmıştır. Ayrıntılı içerik incelemesi sonucunda içerik ve yöntem kriterlerine tam uyum gösteren 23 çalışma detaylı incelemeye, bunlardan 7'si ise meta-analize dâhil edilmiştir.

Veri Toplama Süreci

Dâhil edilen çalışmalardan toplanan veriler aşağıdaki ölçütlere göre sistematikleştirilmiştir: Yayın bilgileri (yazar, yıl, başlık, kaynak), Ülke/rejim örneği, Kullanılan yöntem ve yaklaşım, Siyasal işlevsel temalar (propaganda, liderlik kültü, ulusal kimlik, yumuşak güç vs.), Ana bulgular ve öneriler olarak süreç değerlendirilmiştir.

Verilerin Analizi

Veriler, nitel meta-analiz yöntemi doğrultusunda içerik analizi ve tematik kodlama teknikleriyle değerlendirilmiştir (Timulak, 2009). Çalışmalarda geçen kavramlar, siyasal işlevler, liderlik stratejileri ve medya kullanımı gibi temalar üzerinden kodlanmış; ortak eğilimler ve bulgular

temalar etrafında yapılandırılmıştır. Ayrıca, siyasal bağlam (rejim tipi, tarihsel dönem), spor dalı ve medya kullanımı gibi değişkenler de ikincil kodlar olarak değerlendirilmiştir.

Etik İlkeler

Bu araştırma, daha önce yayımlanmış akademik çalışmalara dayandığı için doğrudan bireylerden veri toplanmamıştır. Bununla birlikte, analize dâhil edilen tüm yayınların, bulundukları ülkenin akademik etik kurallarına uygun biçimde yayımlanmış olması kriteri gözetilmiştir.

Bulgular ve Tartışma

Otoriter rejimlerin spor politikalarında giderek artan araçsallaştırma eğilimi, çağdaş siyasal iletişim stratejileriyle birleştiğinde sporu yalnızca bir etkinlik değil, çok katmanlı bir propaganda aracına dönüştürmektedir. Bu durum özellikle medya tekeli altındaki rejimlerde daha görünür hale gelmektedir. Schwenkel (2013), Vietnam örneğinde devletin spor etkinliklerini ulusal birlik ve yeniden doğuş söylemleriyle nasıl birleştirdiğini analiz ederken, sporun geçmişi siyasallaştırma aracı olarak da kullanıldığını vurgulamaktadır. Bu tür anlatılar, hem milliyetçiliği pekiştirmekte hem de mevcut liderliğin tarihsel süreklilik iddiasını güçlendirmektedir.

Benzer şekilde, Giulianotti (2015), sporun "halkla bütünleşmiş ideolojik bir gösteri"ye dönüştüğü durumlarda, bireylerin siyasal sistemle olan bağlarının yeniden üretildiğini savunur. Özellikle kitlesel futbol etkinlikleri, halkın doğrudan katıldığı sembolik törenlere evrilmekte ve bu yönüyle liderliğin meşruiyetini "sessiz rıza" ile pekiştirmektedir. Bu tür rıza, yalnızca baskıcı aygıtlarla değil, aynı zamanda duygusal bağlar, başarı anlatıları ve sembolik zaferlerle üretilmektedir.

Uluslararası düzlemde ise, spor etkinliklerinin "imaj temizleme" stratejisiyle eş zamanlı işlediği görülmektedir. Zaid ve Al-Sabah (2021), Körfez ülkelerinde sporun "sportswashing" stratejileriyle nasıl iç içe geçtiğini ve bu süreçte uluslararası insan hakları eleştirilerinin nasıl perde arkasına itildiğini göstermektedir. Bu bağlamda Katar, Suudi Arabistan ve BAE gibi ülkeler, uluslararası turnuvaları bir tür küresel vitrinde meşruiyet zemini yaratmak amacıyla kullanmaktadır.

Ayrıca, Cornelissen (2010), sporun kalkınma ideolojisi ile nasıl örtüştürüldüğünü ve özellikle Güney Afrika'nın 2010 FIFA Dünya Kupası bağlamında küresel prestij kazanımı ve iç politik istikrarı desteklemek amacıyla nasıl bir mega organizasyon stratejisi izlediğini detaylandırmaktadır. Bu durum, otoriter eğilimli veya hibrit rejimlerin sadece ideolojik değil, aynı zamanda ekonomik ve diplomatik fayda arayışı içinde spor politikalarını planladıklarını ortaya koymaktadır.

Sporun kültürel boyutu da otoriter rejimlerin siyasal anlatılarında önemli bir yere sahiptir. Majumdar ve Brown (2007), Hindistan'da kriketin yalnızca bir spor değil, aynı zamanda toplumsal yapıyı şekillendiren ve siyasal elitlerin halkla ilişkisini yeniden biçimlendiren bir alan olduğunu belirtmektedir. Bu örnek, otoriterliğe yatkın demokratik rejimlerde bile sporun halkın duygusal bağlarını siyasi araçlara dönüştürme gücüne sahip olduğunu göstermektedir.

Bu bağlamda değerlendirildiğinde, sporun otoriter rejimlerdeki işlevi yalnızca siyasal baskıyı meşrulaştırmakla sınırlı kalmamakta; ulusal kimlik inşasından dış politika araçsallaştırmasına, halkla ilişkilerden tarih yazımına kadar çok katmanlı bir ideolojik üretim alanına dönüşmektedir. Rejimler, sporu yalnızca desteklenen bir etkinlik olarak değil, bizzat yönlendirilen ve kurumsallaştırılan bir hegemonya aracına dönüştürmektedir.

Tablo 1. Otoriter Rejimlerde Sporun Siyasal Kullanımına İlişkin Meta-Analiz Bulguları

Yazar/Yıl	Ülke/Odak	Ana Bulgular
Phillips (2022)	Almanya, İtalya, İspanya	Spor, lider kültü ve ideolojik seferberlik için araçsallaştırılması.
Grix ve Lee (2013)	Gelişmekte Olan Devletler	Mega spor etkinlikleri yumuşak güç stratejilerinin parçası haline getirilmesi.
Kutidze (2022)	Rusya, Gürcistan	Sporcular, rejim propagandasında sembolleştirilmesi.
Manzenreiter (2010)	Çin (2008 Pekin)	Olimpiyatlar Çin'in imaj yönetimi ve modernleşme stratejisinde kritik rol oynaması.
Grix (2013)	Çeşitli Otoriter Rejimler	Olimpiyatlar ulusal gurur ve prestij kazanımı için kullanılması.
Boykoff (2016)	Çeşitli Olimpiyat Ev Sahipleri	Tarih boyunca olimpiyatlar ideolojik gösteri alanı olarak işlev görmesi.
Tomlinson ve Young (2006)	Olimpiyatlar ve Dünya Kupası	Küresel etkinlikler ulusal kimlik inşasında kullanılması; kültür-politika iç içe geçmesi.

Tablo 1'e göre, otoriter rejimlerin spor politikalarını benzer stratejik çerçevelerle yapılandırdığını ortaya koymaktadır. İlk olarak, sporun lider kültü inşasında sistematik bir biçimde kullanıldığı görülmektedir. Özellikle Phillips (2022) ve Kutidze (2022), sporcuların rejime bağlılıklarının ön plana çıkarıldığı ve spor başarılarının doğrudan siyasal liderliğe atfedildiği uygulamaları analiz etmiştir. Bu durum, otoriter rejimlerin karizmatik liderliği meşrulaştırma çabalarının bir parçası olarak değerlendirilebilir.

İkinci önemli bulgu, sporun ulusal birlik ve ideolojik mobilizasyon açısından taşıdığı işleve ilişkindir. Boykoff (2016) ve Grix (2013), mega spor etkinliklerinin geniş kitlelere rejim lehine kolektif duygular aşılamak üzere araçsallaştırıldığını göstermektedir. Bu yönüyle spor, sadece fiziksel rekabetin değil, siyasal seferberliğin de bir mekânı haline gelmiştir.

Üçüncü olarak, sporun yumuşak güç stratejileri bağlamında nasıl kullanıldığına dair önemli bulgular elde edilmiştir. Grix ve Lee (2013) ve Manzenreiter (2010), Çin ve benzeri otoriter rejimlerin uluslararası arenada imajlarını yumuşak güç unsurlarıyla restore etme çabalarında spor mega etkinliklerine merkezi bir rol atfettiğini ortaya koymuştur. Bu da sporun dış politika enstrümanı olarak nasıl kurumsallaştığını göstermektedir.

Son olarak, Tomlinson ve Young (2006) çalışması, ulusal kimlik inşasında sporun kültürel-siyasal birleştirici rolüne odaklanmıştır. Bu yaklaşım, sporun yalnızca güncel politik değil, tarihsel ve kültürel anlamda da rejimin ideolojik projelerine hizmet ettiğini vurgulamaktadır.

SONUÇ ve ÖNERİLER

Bu çalışma, sporun otoriter rejimlerde siyasal bir araç olarak nasıl konumlandırıldığı ve işlevselleştirildiğini meta-analitik bir perspektiften ele almayı amaçlamıştır. Bu doğrultuda, literatürde öne çıkan nitel ve kuramsal akademik çalışmanın sistematik içerik analizi yoluyla karşılaştırmalı olarak incelenmesi sonucunda, sporun yalnızca kültürel ya da rekreatif bir faaliyet değil; aynı zamanda siyasal meşruiyetin inşası, ideolojik yönlendirme, liderlik kültü

üretimi ve ulusal kimlik inşasında stratejik olarak kullanılan çok katmanlı bir hegemonya aracı olduğu açık biçimde ortaya konmuştur.

Çalışmanın bulguları göstermektedir ki, otoriter rejimlerde sporun siyasal işlevi üç temel strateji etrafında şekillenmektedir; *Meşruiyet üretimi***,** *kolektif kimlik inşası* ve *uluslararası imaj yönetimi***.** Özellikle sporcuların başarısının liderlik kültüyle özdeşleştirilmesi, mega spor etkinliklerinin ulusal birlik ve gurur anlatılarına entegre edilmesi ve spor medyasının ideolojik bir aygıta dönüştürülmesi, bu stratejilerin somut tezahürleri olarak karşımıza çıkmaktadır.

Gramsci'nin hegemonya kuramı ve Althusser'in ideolojik aygıtlar, yaklaşımı çerçevesinde yapılan analizler, sporun görünüşte tarafsız bir alan olmasına rağmen otoriter rejimlerde doğrudan siyasal kontrol ve yönlendirmeye tabi olduğunu ortaya koymuştur. Bu bağlamda spor; sadece baskının değil, rızanın da üretildiği bir ideolojik üretim alanı haline gelmiştir.

Özellikle Nazi Almanyası, Sovyetler Birliği ve Putin sonrası Rusya örneklerinde, sporun lider figürüyle özdeşleştirilerek iktidarın karizmasını pekiştirdiği, geniş kitleleri seferber eden kitlesel etkinliklerin propaganda aracına dönüştüğü ve sporun ulusal kimliğin görsel ve kültürel inşasında işlevsel bir rol üstlendiği görülmüştür. Ayrıca yumuşak güç stratejileri bağlamında Çin, Katar ve Rusya gibi ülkelerde sporun, dış politika aracı olarak kullanıldığı, rejimin insan hakları eleştirilerine karşı meşruiyet üretiminde başat bir rol oynadığı dikkat çekmektedir.

Öneriler

Gelecek araştırmalarda, farklı rejim türleri arasında (demokratik, yarı-demokratik ve otoriter) spor politikalarının karşılaştırmalı analizi yapılabilir. Böylece sporun siyasal işlevleri arasındaki farklar daha sistematik biçimde ortaya konabilir.

Spor medyasının tekelleşmesi üzerine odaklanan çalışmalar, medya içeriği analizleriyle desteklenerek, rejim söylemleri ile sporcu temsil biçimleri arasındaki ilişkiyi derinlemesine incelenebilir.

Gençlik spor programları ve okul sporları, otoriter rejimlerin ideolojik formasyon mekanizmaları içinde özel bir yer tutmaktadır. Bu alan, sporun eğitim sistemi üzerinden nasıl ideolojik yönlendirme aracı olarak kullanıldığına dair daha fazla araştırma yapılabilir.

Sporun kadınlar, etnik gruplar veya muhalif sporcular üzerindeki etkisi, mevcut literatürde sınırlı olduğu görülmüştür. Rejimlerin toplumsal cinsiyet politikaları ile spor ilişkisi, otoriter yapılar özelinde detaylı incelenebilir.

Politika yapıcılar ve uluslararası spor örgütleri, sporun siyasal araçsallaştırılmasına karşı daha şeffaf ve denetleyici politikalar üretmelidir. Özellikle mega etkinliklerin düzenleyici kurumları, ev sahibi ülkelerin insan hakları, ifade özgürlüğü ve medya bağımsızlığı gibi kriterlere uymalarını gözetmelidir.

Sonuç olarak, sporun yalnızca kültürel bir etkinlik ya da fiziksel rekabet alanı olmaktan öte, otoriter rejimlerde siyasal iktidarın yeniden üretildiği, meşruiyetin pekiştirildiği ve ideolojik yönlendirmelerin gerçekleştirildiği çok katmanlı bir hegemonya alanı olarak işlev gördüğü sonucuna ulaşılmıştır. Bu kapsamda sporun; siyaset bilimi, iletişim çalışmaları, kültürel çalışmalar ve uluslararası ilişkiler gibi disiplinler arası çerçevelerle birlikte analiz edilmesi, bu olgunun bütüncül biçimde kavranabilmesi açısından önem arz etmektedir.

ABSTRACT

Turkish is a significant world language, both culturally and linguistically, due to its rich history, extensive vocabulary, and extensive geography. Consequently, the discipline of teaching Turkish to foreigners has gained considerable importance. In today's globalised world, the interaction between languages and the rise of multilingualism are becoming increasingly significant. Teaching Turkish as a foreign language has attracted growing interest, particularly in Middle Eastern countries, with Jordan being a focal point of this interest. The demand for learning Turkish in Jordan is escalating daily. This study highlights the importance of teaching Turkish as a foreign language in response to the increasing need for multilingualism in a globalising world. It aims to thoroughly examine the challenges encountered in this process within Jordan. The research employs phenomenology, a qualitative research design, and involves semi-structured in-depth interviews with 11 instructors of Turkish as a foreign language working in Jordan. The growing demand for the Turkish language in Jordan can be attributed to several factors, including Turkey's relations with Middle Eastern countries, the popularity of Turkish TV series and films, the increase in tourism activities, and the interest in Turkish universities. This surge in demand has led to the widespread teaching of Turkish in the country. However, various challenges have been identified, including differences in language structure, insufficient teaching materials, a teacher shortage, and low student engagement.

Keywords: Jordan, Teaching Turkish to Foreigners, Turkish.

[1] This paper is based on the thesis titled ‘Examination of Problems in Teaching Turkish as a Foreign Language in Jordan.’

Introduction

In today's world, where globalisation and intercultural interactions are intensifying, learning different languages has become not only a communicative skill for individuals but also a social, economic and cultural necessity. In this context, the teaching of Turkish as a foreign language has gained increased importance with Turkey's growing influence in the international arena and the global dissemination of its cultural products. The global popularity of Turkish TV series, films, literary works, and other artistic elements is a key factor driving interest in the Turkish language (Gürgendereli, 2023; Uçak & Yazıcı Şahin, 2023; Uluçay, 2023).

Turkey's historical, economic, and cultural ties with Middle Eastern countries play an important role in increasing the demand for learning Turkish in this region. The shared history and cultural ties inherited from the Ottoman Empire have created a strong foundation for relations between Turkey and Middle Eastern countries. In this context, Turkish is seen not only as a language but also as a historical bridge and cultural link in countries such as Jordan. Economic relations are another critical factor supporting this demand. Turkey's increased trade cooperation with Jordan, the active role of Turkish companies in the Jordanian market, and the intensification of tourism activities between the two countries have further increased the need to learn Turkish. In addition, the opportunities offered by Turkey in the field of education, particularly the support provided to Jordanian students through the Turkey Scholarships Programme, have increased the number of Jordanian youth seeking to study at Turkish universities and further strengthened interest in the Turkish language. When all these factors are taken together, it is clear that Turkey's historical, economic and cultural ties have significantly increased the demand for Turkish language learning in Jordan at both the individual and institutional levels (Kırbaş, 2019).

Jordan is a key focus point for teaching Turkish as a foreign language. The development of economic and cultural cooperation between Turkey and Jordan has increased the motivation of Jordanian students to learn the Turkish language. The increase in the number of Jordanian students who want to study at Turkish universities shows that Turkish has become a necessity in this country. Additionally, institutions such as the Turkish Scholarships Programme and the Yunus Emre Institute are undertaking significant efforts to support Turkish language education in Jordan. However, despite these positive developments, the teaching of Turkish as a foreign language in Jordan faces various challenges. These challenges range from insufficient teaching materials to teachers' lack of pedagogical knowledge and students' motivation problems.

Aim

The primary objective of this study is to thoroughly investigate the challenges encountered in teaching Turkish as a foreign language in Jordan. In this regard, the aim is to identify various problems encountered in the language learning process. In addition, the causes of these problems have been analysed and solutions proposed.

Method

This research is a qualitative study designed to examine the challenges encountered in teaching Turkish in Jordan. The study uses a phenomenological design. Phenomenology is a qualitative research approach that aims to understand individuals' experiences of a particular phenomenon and reveal the essence of these experiences (Moustakas, 1994). This design provides an appropriate framework for exploring teachers' personal experiences of the challenges they encounter in teaching Turkish and the deeper meanings behind these experiences. The phenomenological design employed in this study utilised an explanatory phenomenological approach. Explanatory phenomenology seeks to foster a profound understanding of individuals'

experiences and uncover the common themes that emerge from these experiences (Smith et al., 2009). In this study, semi-structured interviews with teachers enabled a detailed examination of these experiences.

Findings

As a result of the interviews conducted within the scope of the research, three main themes were identified regarding the teaching of Turkish in Jordan. The problems of teaching Turkish in Jordan were examined under three main sub-themes: language-related difficulties, educational environment problems, and student motivation. Language-related difficulties are significant obstacles that students encounter in the language learning process. These difficulties can be addressed in a wide range, from pronunciation problems to structural differences in the language. Two codes were identified for the sub-theme of language-related difficulties: structural differences in the language and pronunciation problems. The sub-themes of language structure differences and pronunciation problems were derived from the views of almost all participants. Since Turkish is an agglutinative language, it can be complex for students with different language structures, such as Arabic. Students may find it particularly difficult to learn language structures. The views of the instructors named Veli and Rahman exemplify this idea:

> In Jordan, Arabic is our native language, so when we learn a foreign language, the first thing we need to do is look at the family to which that foreign language belongs. Examining both Arabic and Turkish, Arabic is a Semitic language, while Turkish is an Altaic language. The difficulties start here. Since they belong to different families, each language has distinct characteristics. (Veli)

> The grammatical structures and linguistic differences between Turkish and Arabic were particularly challenging for students, especially the agglutinative language structure and sound harmonies, which required time for them to become accustomed to. In terms of agglutinative language structure, since Turkish is an agglutinative language, suffixes are added to words and phrases to create new meanings and convey new ideas. Arabic, on the other hand, is a root-based language, so the logic of word formation is very different. Students struggle to learn both the correct order and usage of suffixes in the Turkish language. For example, the suffix ‘da, de’ is used in Arabic at the beginning of the word. In Turkish, we say ‘okulda.’ The suffix comes at the end of the word, but in Arabic, it comes at the beginning of the word. When students speak, especially when they first learn Turkish, they say things like ‘da okul, da üniversite.’ (Rahman)

This study examines the educational environment in Jordan. In this context, issues specific to Jordan are discussed under this sub-theme. Inadequate educational materials and resources can negatively affect students' learning processes. Lack of technological equipment can reduce learning opportunities, notably by limiting access to digital resources. The views of the instructor, known as Hakan, illustrate this situation:

> The classes are crowded, and from a physical standpoint, there is a need for a separate building designed for different languages, with U-shaped tables. We need classrooms where we can hang Turkish materials. Another problem is that students have to walk too far within the faculty. After leaving one class, they have to go to another class that is very far away, which is difficult for the students. They come tired from one class and go to another, for example, they leave an English class and go to a Turkish class, which tires them both mentally and physically. Additionally,

> I believe it would be beneficial to have a separate Turkish building where Turkish is spoken. What is needed here is a complex. (Hakan)

Student motivation is a significant obstacle that is often encountered in language learning. This sub-theme addresses students' lack of motivation, uncertainty about their goals, and fear of making mistakes in the language learning process. Students' inability to clarify their language learning goals can lead to a lack of motivation. Clear goals enable students to focus more on their learning processes. The views of instructors Yaprak and Rahman support this idea:

> Some students may not have a clear goal in mind when learning the Turkish language. This can lead to a loss of motivation in the language learning process. Students who link language learning to educational or job opportunities in Turkey appear to be more motivated, while those without this goal may progress more slowly. (Yaprak)

> Some students lack sufficient motivation to learn the Turkish language. They are unaware of the advantages or opportunities of learning Turkish. I can explain it like this: the student asks, 'What will happen if I learn Turkish or if I don't learn it?' What will I do with this diploma after graduation? Where will I work? I will exhaust myself for three or four years, and after graduation, I will not be able to work anywhere with this diploma. Even if there are places to work, there are few of them, so I don't need to learn. When they think this way, it becomes challenging to engage them in conversation and teach them the Turkish language. (Rahman)

Conclusion and Recommendations

This study aims to comprehensively analyse the problems encountered in the process of teaching Turkish as a foreign language in Jordan and the solutions developed by teachers to address these problems. Conducted within the framework of qualitative research methods, this case study aims to reveal the fundamental difficulties and potential for improvement in the field by thoroughly examining the experiences of Turkish teachers in Jordan.

The study's findings reveal that Turkish language teaching in Jordan faces challenges in multiple dimensions. The data obtained from the teachers' perspectives were grouped under three main themes: language-related difficulties, educational environment problems, and student motivation.

The findings of this study are consistent with various studies conducted in the field of Turkish language teaching as a foreign language within the country. For example, studies conducted by Islıoğlu (2015) and Can (2023) also emphasised the problems encountered in grammar and writing skills. In addition, researchers such as Akyürek (2021) and Memiş (2021) have also highlighted issues, including the shortage of qualified teaching staff and inadequate materials. This situation suggests that the problems in the Jordanian context are similar to the common difficulties encountered in teaching Turkish as a foreign language in general.

The methodological approach of the study is based on a qualitative design that allows for an in-depth understanding of the experiences of Turkish teachers in Jordan. The thematic analysis of the data obtained through semi-structured interviews systematically revealed the fundamental problems in the field and the teachers' suggestions for addressing these issues. However, the fact that the research focuses primarily on the instructor's perspective and does not fully reflect the student's perspective can be considered a limitation. Future research that also examines

students' experiences may provide a more comprehensive picture. Furthermore, the study's limited context to Jordan restricts the generalizability of the findings to other countries.

Based on the findings of this study regarding the challenges faced in teaching Turkish as a foreign language in Jordan, several recommendations can be made.

First, it is essential to develop and provide learners with adequate teaching materials tailored to their needs. This includes creating textbooks, multimedia resources, and digital content that reflect the cultural and linguistic contexts of both Turkey and Jordan.

Additionally, continuous professional development should be offered to Turkish language instructors. Workshops and training sessions focusing on pedagogical strategies, language acquisition theories, and the specific challenges of teaching Turkish to Arabic speakers can enhance teaching effectiveness.

Improving educational environments is also crucial. Academic institutions should invest in creating dedicated language learning spaces equipped with the necessary technological tools and resources that facilitate interactive learning.

To foster student motivation, it is essential to communicate the benefits of learning Turkish. Informational sessions highlighting career opportunities, cultural exchanges, and the advantages of bilingualism in today’s globalised world can significantly enhance student engagement.

Establishing cultural exchange programs between Turkey and Jordan can provide students with immersive experiences. Such initiatives allow learners to engage directly with the language and culture, thereby increasing their interest and motivation to learn.

Incorporating technology into language learning can also improve student engagement. Online platforms, language learning applications, and virtual classrooms can offer flexible and interactive learning experiences.

Finally, future research should include the perspectives of students to gain a comprehensive understanding of their experiences and challenges in learning Turkish. This approach can inform more effective teaching strategies and curriculum development.

By implementing these recommendations, the teaching of Turkish as a foreign language in Jordan can be significantly improved, ultimately leading to better learning outcomes for students.

ENERGY JUSTICE AND THE SOCIAL DETERMINANTS OF HEALTH: A CRITICAL EXAMINATION OF THE IMPACT OF ENERGY POVERTY ON SOCIAL HEALTH

Hafize Nurgul DURMUS SENYAPAR
Assoc. Prof., Gazi University, Faculty of Health Sciences, Department of Social Work, Ankara-Türkiye, nurguld@gazi.edu.tr, ORCID: 0000-0003-0927-1643

ABSTRACT

This study adopts an interdisciplinary lens to examine energy poverty within the framework of the social determinants of health, focusing on the multifaceted consequences of unequal access to energy on individuals' physical, mental, and social well-being. Employing conceptual analysis, policy document review, and critical interpretive methods, the research frames energy access not as a mere infrastructural deficiency but as a critical issue of social justice, public health, and environmental sustainability. Anchored in the principles of distribution, governance, and recognition, the study situates energy justice at the core of equitable energy transitions. Disadvantaged groups—particularly women, older adults, children, and low-income populations—are disproportionately burdened by limited energy access, which reinforces social exclusion and exacerbates health disparities. The analysis highlights the need to address the social dimensions of clean energy transitions under the notion of a "just transition" and underscores the importance of integrating energy policy with social protection and employment strategies to mitigate inequality. The strategic role of social work institutions is also explored, advocating for a shift from temporary relief to preventive and empowering service models. The study offers conceptual and practical insights toward recognizing energy access as a component of the right to health and integrating energy justice into public health strategies. While the absence of empirical data is acknowledged as a limitation, the work provides a theoretical foundation for future local and comparative research on vulnerable populations. Tackling energy poverty through multi-actor and holistic frameworks is no longer optional but an urgent imperative for building sustainable well-being and a more equitable society.

ENERGY JUSTICE AND THE SOCIAL DETERMINANTS OF HEALTH: A CRITICAL EXAMINATION OF THE IMPACT OF ENERGY POVERTY ON SOCIAL HEALTH

ÖZET

Bu çalışma, enerji yoksulluğunu sağlığın sosyal belirleyicileri bağlamında disiplinlerarası bir yaklaşımla ele almakta ve enerjiye erişimdeki eşitsizliklerin bireylerin fiziksel, ruhsal ve toplumsal sağlık durumları üzerindeki çok boyutlu etkilerini incelemektedir. Kavramsal analiz, politika belgeleri incelemesi ve eleştirel yorumlayıcı değerlendirme yöntemleriyle yürütülen araştırma, enerji adaleti çerçevesinde dağıtım, yönetişim ve tanınma ilkelerini temel alarak enerjiye erişimin yalnızca altyapısal bir sorun değil; aynı zamanda sosyal adalet, halk sağlığı ve çevresel sürdürülebilirlik meselesi olduğunu ortaya koymaktadır. Özellikle kadınlar, yaşlılar, çocuklar ve düşük gelirli gruplar başta olmak üzere kırılgan toplulukların enerjiye erişimde yaşadıkları dezavantajlar, sosyal dışlanmayı ve sağlık eşitsizliklerini derinleştirmektedir. Araştırmada, temiz enerjiye geçiş süreçlerinin sosyal boyutları "adil dönüşüm" ilkesi kapsamında değerlendirilmiş, enerji politikalarının eşitsizlik üretme riskine karşı sosyal koruma ve istihdam politikalarıyla bütünleştirilmesi gerektiği vurgulanmıştır. Ayrıca sosyal hizmet kurumlarının bu alandaki stratejik rolü tartışılmış; enerji yoksulluğunun yalnızca geçici yardım uygulamalarıyla değil, önleyici ve güçlendirici sosyal hizmet modelleriyle ele alınması gerektiği savunulmuştur. Çalışma, enerjiye erişimin sosyal bir sağlık hakkı olarak tanınması ve enerji adaletinin halk sağlığı stratejilerine entegre edilmesi yönünde kuramsal ve pratik katkılar sunmaktadır. Saha verisiyle desteklenmemiş olması araştırmanın sınırlılığı olarak değerlendirilmekle birlikte, gelecekte kırılgan gruplar üzerinde yapılacak yerel ve karşılaştırmalı çalışmalar için kavramsal bir temel sunmaktadır. Enerji yoksulluğuyla mücadelenin, sürdürülebilir refah ve adil bir toplum inşası açısından çok aktörlü ve bütüncül yaklaşımlarla ele alınması artık ertelenemez bir gerekliliktir.

Keywords: Energy justice; Social determinants of health; Energy poverty; Social health inequalities; Social welfare policies; Just transition

1. Introduction

Health is a complex and multidimensional phenomenon that cannot be reduced solely to biological characteristics or access to healthcare services. A growing body of academic literature demonstrates that individual health outcomes are significantly shaped by social determinants such as living environment, socioeconomic status, education level, housing conditions, and access to energy (Daniel et al., 2018; Frank et al., 2020; Köktaş & Selçuk, 2018; Marmot, 2005). In particular, access to energy plays a central role in meeting basic human needs, directly affecting rights related to heating, lighting, hygiene, food preservation, and participation in digital services (Durmus Senyapar et al., 2024; Pehlivanoğlu & Yilmaz, 2022; IEA, IRENA, UN, World Bank and WHO, 2024).

Energy poverty refers to the condition in which individuals lack sufficient or any access to energy services (Maxim et al., 2016). It can be defined either as the inability of a household to meet basic energy needs (e.g., heating, lighting, cooling) for physical or financial reasons, or as having access to energy infrastructure without the capacity to benefit from it adequately (Emre et al., 2023; Middlemiss, 2022). In Turkey, inequalities in energy access are particularly pronounced among low-income individuals, rural populations, and other disadvantaged groups, limiting their ability to maintain basic living standards (Kose, 2019). These disparities not only reflect energy injustice but also exacerbate health inequalities, as economic activities based on carbon-intensive growth contribute to climate-driven health burdens among vulnerable populations (İpek & İpek, 2024; Yılmaz, 2022; TUIK, 2024).

Households experiencing energy poverty often face difficulties allocating sufficient resources to essential energy services due to low income and high energy costs (Xu & Chen, 2019). This results in compromised domestic energy practices related to heating, cooling, and cooking, often forcing households to cut spending on health, education, social engagement, or nutrition, or to resort to unhealthy and polluting energy sources. Urgent policy measures are needed, such as promoting energy-efficient buildings and renewable energy sources tailored to local dynamics (Öcal & Başarslan-Arslan, 2022; Tuğaç, 2022). Ensuring justice in energy production, distribution, and consumption, and guaranteeing equitable representation of vulnerable groups in these processes, is imperative. Yet, accessibility cannot be defined merely by the physical or geographic availability of energy services. When evaluated alongside equity and continuity, accessibility must also ensure that individuals can benefit from energy services at a reasonable and affordable cost (Durmus Senyapar et al., 2024; PehliVanoğlu & Yilmaz, 2022; IEA, IRENA, UN, World Bank and WHO, 2024).

From the perspective of energy policy, Turkey appears to have made significant progress in ensuring access to energy in alignment with Sustainable Development Goal 7. However, several structural and political barriers remain. The pace of renewable energy investment has not kept up with national targets, exposing the tension between economic growth and environmental sustainability. This signals both a bottleneck and a potential pathway forward (Telli & Ozkan, 2024). Furthermore, renewable energy, which holds strategic importance for sustainable development, is also a critical determinant of public health (Ecevit et al., 2022). Recognizing access to energy as a fundamental human right is no longer confined to environmental policies—it has become central to social welfare agendas. As affirmed by the European Social Charter and the United Nations' 2030 Sustainable Development Goals (SDG 7), ensuring access to affordable, reliable, sustainable, and modern energy for all is a prerequisite for a healthy life (UNDP, 2025). Thus, addressing energy poverty requires not only infrastructural interventions but also an integrated policy framework grounded in social justice, equity, and public health.

Although energy poverty is typically framed in technical and economic terms, its direct and indirect effects on public health remain underexplored in the social policy literature. Among low-income and vulnerable groups, lack of access to energy leads to a cascade of negative outcomes, ranging from respiratory illnesses and psychological distress to social exclusion and educational inequality. Therefore, energy access must be reframed as both a matter of social justice and a right to health. This study contributes to the literature by linking energy poverty with public health and social work from the perspective of energy justice. By outlining the strategic role of social work institutions in addressing energy-related inequalities, the study also offers policy-relevant insights for practitioners and decision-makers.

The aim of this research is to provide a conceptual analysis of energy poverty through the lens of the social determinants of health, and to critically evaluate health inequalities from the perspective of energy justice. It further seeks to explore how principles of a "just transition" can inform health policy by incorporating the social dimensions of clean energy transitions. In this context, the study addresses the following research questions:

1. How does energy poverty affect individuals' physical and mental health in relation to the social determinants of health?
2. How can energy justice—through the dimensions of distribution, governance, and recognition—be linked to public health policies and social work practices?
3. In what ways is social justice overlooked in energy transition processes, and what risks does this pose for vulnerable populations?
4. What strategic roles should social work institutions assume in addressing energy poverty, and how can they foster socially innovative responses?
5. How can the integration of energy poverty into public health strategies contribute to the restructuring of social welfare policies?

In addition to its conceptual contributions, this study also provides practical recommendations for policymakers, local governments, and social work institutions. Concrete proposals are developed to restructure energy assistance programs through a rights-based approach, expand social aid mechanisms to include energy poverty, and enhance the operational roles of social services. The study also proposes the development of an "Energy Support Index" and the establishment of "Energy Social Work Units" within municipalities, offering structural recommendations to promote inclusive and sustainable social welfare systems based on energy justice.

2. Conceptual Framework

2.1. Social Determinants of Health: Income, Housing, Environment, and Access to Services

Social determinants of health refer to the social and structural conditions that individuals are exposed to throughout their lives, which affect their health status, functionality, and overall quality of life (Daniel et al., 2018; Frank et al., 2020; Köktaş & Selçuk, 2018; Marmot, 2005). These determinants range from individual-level characteristics to systemic factors and play a crucial role in shaping health inequalities. Under conditions of poverty, these determinants become even more pronounced, and disadvantages in areas such as education, income, housing, environmental conditions, and access to healthcare deepen health disparities.

In recent years, poverty has increasingly been understood not merely as a lack of income but as a multidimensional phenomenon involving deterioration in health status, limited access to education, and inadequate living conditions (Putri et al., 2024). It has been emphasized that poverty contributes to poor health indicators, the spread of infectious and chronic diseases, preventable early mortality, and adverse outcomes in child health—all of which may have intergenerational impacts (Güler et al., 2022). Furthermore, studies have shown that low health literacy—often resulting from a limited understanding of diseases and treatments—constitutes an independent risk factor for poor health outcomes. In this regard, health literacy plays a critical role in advocacy and in the delivery of equitable, justice-oriented health services, especially within strategies to combat poverty (Gözlü, 2020).

2.2. Energy Poverty: Definition, Measurement Methods, and Social Implications

Energy poverty is a multidimensional social issue that arises when individuals are unable to access essential energy services due to economic, technical, or infrastructural constraints, thereby experiencing a decline in their overall quality of life (Okushima, 2017). It stems from a combination of barriers, primarily financial and technical, that hinder access to basic energy needs and directly impact living standards. In the Turkish context, energy poverty is often associated with low income levels and is typically measured using indicators such as the share of household energy expenditures in total income (Dogan et al., 2021). However, income-based approaches alone are insufficient for capturing the complexity of energy poverty (Kose, 2019). This form of deprivation is also shaped by high energy prices, inadequate infrastructure, regional disparities, and frequent interruptions in energy supply.

In Turkey, data on energy poverty largely rely on subjective indicators, such as self-reported experiences of insufficient heating (İpek & İpek, 2024). Common metrics include the ratio of energy spending to household income, the energy efficiency of dwellings, and the prevalence of households living in inadequately heated homes (Üstündağlı Erten et al., 2023). These limitations point to the necessity of adopting more comprehensive and multidimensional approaches for measuring energy poverty (Isazade & Altan, 2023).

Beyond its physical consequences, energy poverty profoundly affects mental health, social participation, and educational attainment. One key concern in the literature is that cold, dark, and uncomfortable living conditions resulting from energy deprivation may trigger psychological distress such as anxiety, stress, and depression (Bègue et al., 2022). Students who lack proper heating and lighting conditions for studying face compounded educational inequalities (Sule et al., 2022). Given that social interaction largely occurs within domestic environments, energy-poor households often withdraw from social activities such as hosting guests, engaging in community life, or accessing digital tools. Energy poverty, therefore, must be addressed not only as an economic issue but also as a social, psychological, and cultural concern.

As a problem with far-reaching economic, social, and environmental ramifications, energy poverty increasingly intersects with public health and social justice concerns in the context of sustainable development (Lee & Yuan, 2024). As highlighted in the Brundtland Report, societies where poverty is widespread are more susceptible to ecological crises (UN, 1987). Deprived of access to modern energy services, poor populations are often forced to overexploit environmental resources, which in turn accelerates ecological degradation and further undermines their quality of life (Adom et al., 2021). This vicious cycle jeopardizes not only the environment but also access to basic human needs. Consequently, inadequate distribution of resources and the failure to achieve sustainable development goals deepen social inequality and transform energy poverty into a broader issue of social justice (Özgenç, 2015).

2.3. Energy Justice: Principles of Distributional, Procedural, and Recognitional Equity

Energy justice is closely linked to environmental and climate justice and advocates for the fair distribution and sharing of energy services and benefits. It refers to a framework that aims to ensure fairness in the production, distribution, and consumption of energy. Distributional justice in energy involves the equitable allocation of energy resources across society. In Turkey, inadequate energy infrastructure in rural areas limits access to energy services for residents in those regions, reinforcing spatial and social inequalities (Durgun, 2024).

Procedural justice, in the context of regulatory frameworks, reveals significant shortcomings in democratic participation. An analysis of Turkey's energy security policies between 2000 and 2020 shows that decision-making processes were largely dominated by technical experts and political authorities. This has constrained public engagement—a core element of participatory democracy—and limited transparency in governance. Key institutions such as the Ministry of Energy and Natural Resources and the Energy Market Regulatory Authority (EPDK), along with affiliated agencies, have maintained a dominant role in policy formulation and implementation. As a result, societal actors and civil society organizations have had minimal involvement in energy governance. These conditions underscore the need to enhance citizen participation in decision-making and to strengthen mechanisms of transparency so that public interests can be better represented in energy policymaking (Koca & Yoldaş, 2022).

Recognitional justice calls for the acknowledgment of the specific needs of marginalized and excluded groups in energy policy. The rights of vulnerable populations—including older adults, persons with disabilities, and women—to access energy are rarely prioritized in social service frameworks or in climate justice agendas, despite the disproportionate burdens they face in the context of energy poverty and climate crises (Özkaya, 2024).

3. Methodology

This study is designed as a literature-based qualitative inquiry. In alignment with its primary aim, the research adopts a conceptual and critical approach to analyze the impact of energy poverty on the social determinants of health. Core concepts such as energy poverty, energy justice, health inequalities, and just transition are analytically framed within a structured conceptual framework.

The analysis is grounded in a comprehensive review of recent peer-reviewed articles, policy documents, and reports issued by international organizations. The literature was systematically reviewed thematically, with a temporal focus on sources published between 2015 and 2025. Within the Turkish context, official documents issued by relevant institutions, along with national policies on social services, social assistance, and energy support programs, were examined.

This review identified structural misalignments between the approaches to energy access reflected in policy documents and the mechanisms of social protection. Drawing on conceptual and policy analysis, the study interprets the causal linkages between energy poverty and public health outcomes from a critical social policy perspective. Particular attention is given to how vulnerable groups—such as women, the elderly, children, and residents of rural areas—are systematically excluded from energy access, and how this exclusion deepens existing social inequalities.

The limited institutional capacity and implementation challenges faced by social service organizations are also examined through the lens of rights-based policy frameworks and social innovation. This multilayered methodological strategy allows the study to go beyond theoretical

interpretation by offering original and actionable recommendations for restructuring energy policies in ways that promote health equity and social justice.

4. Thematic Analysis

4.1. Impacts on Physical Health

Energy poverty exerts a wide range of direct and indirect negative effects on physical health. One of the most pressing consequences is indoor air pollution resulting from limited access to clean energy (Pan et al., 2021). The use of solid fuels for cooking—common in energy-poor households—exposes family members, particularly women and children, to harmful particulate matter, increasing the long-term risk of chronic illnesses (Reyes et al., 2019). According to the World Health Organization, indoor air pollution is responsible for millions of premature deaths globally (Nwanaji-Enwerem et al., 2020). Additionally, the inability to sufficiently heat homes during winter due to lack of energy access contributes to cold-related illnesses and weakens the immune system (Straub, 2017). In this context, energy poverty is not merely a material deprivation but constitutes a significant public health risk and must be addressed as such in health policy frameworks

The consequences of inadequate energy consumption extend beyond heating and have critical implications for food security and the sustainability of agricultural production. Households with limited access to energy tend to rely on low-quality, long-shelf-life food products, as they often lack proper refrigeration (Candelise et al., 2021). Similarly, the ability to store medications under appropriate conditions is compromised. Agricultural activities—including irrigation systems, machinery, cold chains, and transportation—are heavily dependent on energy. Fluctuations in fossil fuel prices drive up production costs, adversely affecting both crop and livestock sectors, which leads to instability in food supply chains.

As highlighted in the study, rising energy prices contribute to stagnation in agricultural output, thereby restricting access to food and pushing prices upward (Radmehr & Rastegari Henneberry, 2020). Limited access to energy particularly undermines the competitiveness of small-scale producers in rural areas and amplifies the fragility of food systems. As a result, energy access not only influences production processes but also directly affects the availability, affordability, and sustainability of food, rendering it a critical determinant of food security (Candelise et al., 2021).

4.2. Mental Health and Psychosocial Impacts

Energy insecurity not only affects physical well-being but also has profound consequences for mental health. Insufficient heating and lighting trigger stress, anxiety, and feelings of helplessness among individuals (Campagna, 2016). Uncertainty in access to energy services disrupts daily routines and fosters a constant atmosphere of financial insecurity (Zhang et al., 2023). Low socioeconomic conditions are known to have a profound and multifaceted impact on psychological well-being (Evans, 2016). Individuals with low socioeconomic status (SES) are more frequently exposed to social and environmental threats, which negatively impact their emotional resilience and cognitive capacity (Kamilçelebi, 2024). The scarcity of material resources often leads to persistent uncertainty and helplessness, creating fertile ground for psychological disorders such as anxiety, stress, and depression (Ettman et al., 2024).

Low-SES individuals are more likely to experience other-oriented emotions—such as compassion, affection, and empathy—stemming from interdependent relationships developed as coping mechanisms under hardship (Liu et al., 2023). However, this form of social attachment can impede the pursuit of individual emotional fulfillment and may, over time, result

in psychological exhaustion (Gökdağ, 2021). From this perspective, addressing socioeconomic inequalities should not only aim to improve material welfare but should also be regarded as a strategic policy objective to enhance psychological well-being.

Poverty should be understood not merely as economic deprivation, but as a multidimensional phenomenon that threatens the psychological and social integrity of individuals (Alloush, 2024). With the intensification of socioeconomic inequality under globalization, urban populations living in poverty experience heightened feelings of exclusion, insecurity, and worthlessness. The erosion of emotional resources leads to the widespread emergence of psychological symptoms such as depression, burnout, and anger (Bianchi et al., 2017). In urban settings, spatial segregation exacerbates these dynamics by prompting the poor to compare their lives with wealthier groups, which intensifies psychological strain and may give rise to social envy, feelings of exclusion, and even tendencies toward collective violence.

Energy poverty further limits individuals' social interactions and weakens community bonds (Stojilovska et al., 2023). Among young people in particular, prolonged social isolation can negatively affect identity formation and the development of a sense of belonging.

4.3. Vulnerable Groups and Inequality

Energy poverty functions as a form of structural inequality that disproportionately affects vulnerable populations—particularly older adults, women, children, and low-income individuals—thereby exacerbating existing social vulnerabilities. In households with limited access to electricity and clean energy sources, children fall behind in their education, while older adults face heightened health risks due to inadequate heating conditions (Banerjee et al., 2021). Women, especially in rural areas, tend to rely more heavily on traditional cooking methods, which results in both time poverty and increased exposure to indoor air pollution caused by solid fuels (Imran & Ozcatalbas, 2020). This dual burden not only intensifies gender-based inequalities but also constrains women's productive roles in public life. As such, energy poverty must be addressed not solely as an economic issue but as a matter of social justice and human rights.

In addition, rural–urban disparities and regional inequalities reveal the spatial dimensions of energy poverty (Wan et al., 2024). In many rural areas, households continue to use traditional and unsafe energy practices, which heighten health risks for women and children in particular (Imran & Ozcatalbas, 2020). These practices further widen the gap between demographic groups and reinforce intergenerational cycles of inequality (Tuncer, 2019).

4.4. Social Justice in Energy Transition Processes

Although the transition to clean energy is a welcome development in terms of environmental sustainability, the social dimension of this transformation—if not adequately addressed—may give rise to new forms of inequality. Ensuring social justice within energy transition processes is essential to guarantee that the shift toward a low-carbon economy serves not only environmental goals but also advances social equity and decent work opportunities. The "just transition" framework emphasizes the principle that no one should be left behind during this process (McCauley & Heffron, 2018). It specifically calls for the protection of workers in fossil fuel industries, disadvantaged regions, and vulnerable social groups.

While the green economy is expected to generate employment in emerging sectors, it also entails potential job losses in others. Accordingly, active and passive labor market policies, reskilling programs, social protection mechanisms, and robust social dialogue platforms are vital to mitigating transitional risks and upholding social justice (Sage, 2015). Without such

measures, the uneven distribution of transformation costs may deepen existing inequalities and lead to broader social unrest (Görmüş, 2024).

Energy transition processes must therefore be approached not only through technical and economic lenses, but also with a focus on their social implications. This includes ensuring the participation of vulnerable groups and developing comprehensive policy tools—ranging from employment strategies to social support mechanisms. In Turkey, efforts have been made to strike a delicate balance between energy supply security and environmental sustainability within the broader development agenda (Kok & Benli, 2017). However, disparities in access to energy across different socioeconomic groups have not been sufficiently addressed in the transition process.

A truly sustainable development approach must go beyond ecological conservation to encompass fair access to energy services, inclusive participation in decision-making, and equitable distribution of benefits from technological transformation. In this regard, the equitable redesign of energy policies plays a crucial role in integrating social justice into the clean energy transition (Özekan, 2023).

5. Policy Discussion and Social Work Perspective

5.1. Should Energy Poverty Be Integrated into Social Welfare Policy?

Energy poverty refers to the inability of individuals to access sufficient energy to meet their basic daily needs (Faiella & Lavecchia, 2021). This condition is not merely an economic issue but fundamentally a matter of social justice. Transitioning social services toward a rights-based structure necessitates the inclusion of essential needs, such as energy access, within the scope of social welfare policy (Manasi & Mukhopadhyay, 2024). A historical examination of the development of social services in Turkey reveals that assistance efforts were long confined to a charitable framework (Acar & Polat, 2023). However, the modern conception of social work mandates professional interventions under the institutional responsibility of the state. Within this framework, energy poverty, like housing, education, and healthcare, must be treated as a basic human right and incorporated into the design of social service policies (Kyprianou et al., 2019). The recognition of energy poverty as an integral part of welfare policy is therefore essential (Reçber, 2019). Moreover, energy poverty is intrinsically linked not only to economic inequality but also to environmental injustice. In particular, developing countries face severe environmental and social consequences due to a lack of access to energy (Filho et al., 2025). Communities that lack access to modern energy services often resort to traditional and environmentally harmful sources such as biomass and coal for heating and cooking (Bruce et al., 2015). This exacerbates indoor air pollution, contributing to deforestation and declines in agricultural productivity, which in turn lead to a cascade of negative effects. As such, energy poverty is not simply a matter of individual living standards but a multidimensional phenomenon with direct implications for public health, educational equity, and environmental degradation.

Accordingly, the integration of energy poverty into social welfare policy has become imperative for achieving holistic progress in the domains of health, environment, education, and economic development (Ateş & Atay Polat, 2023). Incorporating energy poverty into the broader social assistance system could serve as a key instrument for enhancing the quality of life for disadvantaged groups (Best et al., 2021).

5.1. Should Energy Poverty Be Integrated into Social Welfare Policy?

Energy poverty refers to the inability of individuals to access sufficient energy to meet their basic daily needs. This condition is not merely an economic issue but fundamentally a matter of social justice. Transitioning social services toward a rights-based structure necessitates the inclusion of essential needs, such as access to energy, within the scope of social welfare policy (Frigo et al., 2021). A historical examination of the development of social services in Turkey reveals that assistance efforts were long confined to a charitable framework (Dorlach, 2015). However, the modern conception of social work mandates professional interventions under the institutional responsibility of the state. Within this framework, energy poverty, like housing, education, and healthcare, must be treated as a basic human right and incorporated into the design of social service policies. The recognition of energy poverty as an integral part of welfare policy is therefore essential.

Moreover, energy poverty is intrinsically linked to economic inequality and environmental injustice (Hassan et al., 2022). Developing countries face severe environmental and social consequences due to a lack of access to energy (Drago & Gatto, 2023). Energy poverty is not simply a matter of individual living standards, but a multidimensional phenomenon with direct implications for public health, educational equity, and environmental degradation. Consequently, integrating energy poverty into social welfare policy has become imperative for achieving comprehensive progress in the domains of health, environment, education, and economic development conditions (Banerjee et al., 2021). Incorporating energy poverty into the broader social assistance system could serve as a key instrument for enhancing the quality of life for disadvantaged groups.

5.2. Integrating Energy Justice into Public Health Strategies

Integrating energy justice into public health strategies is crucial for achieving environmental sustainability and promoting social equity, as well as the right to health. The principle of energy justice requires that energy policy be focused on achieving supply security and efficiency, and be designed to contribute significantly to public health outcomes (McMonagle et al., 2021). Once energy access is recognized as a human right, public health strategies must be restructured around this rights-based framework, with local energy assistance systems designed to reduce health disparities.

Energy justice should also be viewed as a social work issue, as it directly impacts individuals' quality of life. The social work profession is inherently multidisciplinary, to enhance individual well-being, secure social justice, and protect human rights (Şimşek & Altun, 2021). In this context, workplace-based social services and institutional corporate social responsibility efforts must address employees' psychosocial health and their environmental conditions (Macassa et al., 2021). Accordingly, access to clean, safe, and sustainable energy should be regarded as a fundamental right for which social workers must advocate. When public health strategies are aligned with energy justice, social work can offer both preventive and empowering interventions that improve living conditions and contribute to long-term sustainable development.

5.3. The Role of Social Service Institutions in Energy Assistance Policies

Social service institutions play a strategic role as providers of aid in the fight against energy poverty and as agents of social innovation. The growing necessity to implement innovative practices in social policy has positioned these institutions at the core of systemic transformation. Particularly in the context of public-sector-supported innovations, tackling a multidimensional issue like energy poverty requires inter-institutional collaboration and data-driven approaches

(Sareen et al., 2020). In this regard, the integration of digital technologies into unified information systems for social assistance delivery represents a major advancement. Such systems enhance the identification of those in need and increase the effectiveness of support (Kolokotsa, 2016). Leveraging these tools, social service institutions can transform energy assistance into preventive and empowering social policy instruments—an essential strategy for promoting sustainable welfare (Ates, 2020).

In Turkey, a range of public social assistance mechanisms has been implemented to address energy poverty. According to the Ministry of Family and Social Services' 2024 Annual Report, the "Türkiye Family Support Program" provided support amounting to 46.48 billion Turkish lira to approximately 3.6 million households (ASHB, 2025). However, the effectiveness of social assistance is not determined solely by its monetary value or frequency, but rather by whether it is delivered through an integrated and coordinated social service framework that involves local governments and institutional actors.

One of the major challenges in municipal social work is the fragmented structure of service delivery, with responsibilities scattered across various departments, leading to inefficiencies and role duplication (Yuen, 2020). The limited employment of professional social workers in municipalities, coupled with unclear job definitions and weak institutional coordination, hinders the effective targeting and delivery of social support (Heitmann, 2017). Yet an effective social assistance system requires sustainable coordination between municipalities, central government agencies, civil society organizations, and universities. To move beyond short-term relief and toward empowering, inclusion-oriented, and long-term welfare solutions, institutional cooperation and data-informed planning are of critical importance (Açıkgöz et al., 2024). Accordingly, energy support programs must be implemented in close coordination with social service institutions and local governments (Leonhardt et al., 2022). This will enable both more efficient targeting of support measures and monitoring of recipients' psychosocial well-being over time.

Within this framework, clearly defining the intervention areas of social service institutions in the context of energy poverty is essential for developing holistic policy solutions and effective implementation strategies (Jacques- Aviñó et al., 2022). Building on the thematic findings presented in earlier sections, the study provides an analytical overview that links the physical and mental health effects of energy poverty to corresponding social work interventions. The following table summarizes the key intervention areas for social service institutions in response to various manifestations of energy deprivation and their associated health-related consequences. This structure aims to offer a multidimensional and target-oriented roadmap for policymakers and practitioners.

Indicator of Energy Poverty	Physical Health Impact	Mental / Psychosocial Impact	Social Work Intervention Area
Inadequate home heating	Respiratory infections, increased risk of illness	Anxiety, depression, and social isolation	Fuel and energy assistance programs; assessment of indoor environmental conditions
Use of solid fuels / indoor air pollution	Asthma, COPD, cardiovascular diseases	Anxiety, long-term stress burden	Health education, referral to clean energy alternatives, and advocacy focused on women and children
High proportion of income spent on energy	Cutbacks in nutrition and medication	Perceived poverty, helplessness	Integration of social assistance and energy support programs
Lack of access to education and digital services (lighting, internet)	Poor academic performance, learning difficulties	Social exclusion, loss of belonging among youth	Child protection, educational support, and local solutions for digital inclusion
Intermittent energy access (frequent outages, restricted access)	Food spoilage, hygiene issues, and improper storage of medication	Fear for the future, insecurity	Crisis intervention services, local monitoring of energy security, and coordination of social service networks
Exclusion from clean energy transition processes	Resorting to harmful alternatives, exposure to environmental risks	Lack of political representation; structural exclusion	Ensuring representation of vulnerable groups in just transition planning, participation in policymaking

6. Conclusion and Recommendations

This study has approached energy poverty through an interdisciplinary lens within the framework of the social determinants of health, revealing its multidimensional impacts on physical, mental, and social well-being. The lack of access to energy, particularly among vulnerable groups, emerges as a structural issue that deepens social exclusion and threatens public health. The findings demonstrate that energy poverty is not merely a matter of technical infrastructure or economic insufficiency; rather, it is closely tied to social justice, human dignity, and the inclusiveness of public policy. From an energy justice perspective, the analysis highlights the need for energy policies to be restructured not only around supply security and efficiency but also with a rights-based, participatory, and environmentally sustainable orientation.

The study emphasizes the crucial role of social service institutions in implementing preventive and empowering policy tools to combat energy poverty. Key recommendations include recognizing energy access as a social right to health, managing energy assistance through data-driven mechanisms, and integrating support into local governance through social municipalism. Proposals such as the development of an Energy Support Index and the establishment of Energy Social Work Units within local governments offer concrete and actionable roadmaps for enhancing institutional capacity and promoting sustainable social welfare.

Nevertheless, a primary limitation of this study is the absence of field data. It does not incorporate qualitative or quantitative analyses that reflect individual experiences of energy poverty. Conducted through conceptual and policy analysis, the research follows a literature-based framework and does not include empirical comparisons. This necessitates caution in interpreting the findings across different local contexts.

Future research should prioritize regional field studies on energy poverty, including in-depth analyses of access experiences among vulnerable groups and evaluations of policy outcomes through impact assessment models. Special attention should also be given to the unique barriers faced by children, women, older adults, and persons with disabilities in accessing energy,

through interdisciplinary investigations that can inform more comprehensive policy development.

In this regard, energy access must be acknowledged not as a purely technical concern, but as a fundamental right situated at the intersection of social welfare, public health, and environmental responsibility. Addressing energy poverty is no longer the sole domain of social workers or environmental engineers—it must become a shared responsibility among local administrators, urban planners, public health professionals, and policymakers. A holistic and inclusive transition grounded in energy justice is not only essential for mitigating today's inequalities but also key to building a more equitable future.

ABSTRACT

Most of the world's energy needs are met from fossil sources. However, the gases released by the gradual decrease in fossil resources and the combustion of fuels obtained from these sources have negative aspects such as environmental pollution, acid rain or global warming. Therefore, the demand for electric vehicles is increasing, especially in the automotive industry. Due to the increasing demands, many different types of electric vehicles are produced.

With the rapidly developing technology, the establishment of standards and tests for electric vehicles has become an important issue for the widespread adoption and success of electric vehicles. Safety standards address the potential risks associated with electric vehicles, including electrical hazards, fire prevention, collision safety, and emergency response protocols. Compliance with safety standards builds consumers' trust and confidence in electric vehicle technology.

In this study, the history of electric vehicles, various types and tests performed according to standards in electric vehicles are included. In order to make the study more efficient, Battery Vibration Test and Test Standards for Electric Vehicles, Leak Tests in Electric Vehicles, Safety Tests in Electric Vehicles, Efficiency test and analysis of electric vehicles were examined under 4 main headings.

Keywords: Electric vehicle, safety tests, highways.

Introduction

Electric cars emit less carbon dioxide into the environment and play a significant role in combating air pollution. At the same time, they have higher energy efficiency. The cost of electric cars is generally higher compared to fossil fuel vehicles. However, it is expected that costs will decrease with advancements in battery technologies and incentives. Electric cars have many advantages. They provide a quieter ride, produce less vibration, and offer lower operating costs. Additionally, electricity is a cheaper and more stable energy source. One disadvantage of electric cars is the currently limited charging infrastructure. The spread of charging stations and the development of fast charging technologies could solve this problem. The range of electric cars is increasing with advancements in battery technologies. Now, many electric cars can travel long distances of 300-400 km on a single charge (Bediroğlu & Gencer, 2024).

Governments and car manufacturers are promoting the widespread adoption of electric vehicles. Policies such as tax advantages, incentives, and low emission zones aim to increase the use of electric cars. Electric vehicles are considered a part of a sustainable future. Given the depletion of fossil fuels and their environmental impacts, electric vehicles are expected to play a significant role in the energy transition. The combination of electric cars with autonomous driving technologies is also anticipated. While autonomous driving offers significant advantages in terms of safety and comfort, it can further enhance the energy efficiency of electric vehicles (Ustabaş, 2014).

Standards determine the emissions, energy efficiency, energy consumption, performance, range, speed, and charging time of electric vehicles. They are also used to assess the safety and environmental impacts of electric vehicles. Topics such as battery performance of electric vehicles, safety of electrical systems, and vehicle recycling are also evaluated within these standards. Thanks to these standards, electric vehicles can be used more safely, in an environmentally friendly, and performance-efficient manner. At the same time, they promote competition among manufacturers and support technological developments in the industry (Menak et al, 2021).

An electric car is a vehicle that is driven using one or more electric motors by utilizing electricity stored in batteries and other energy storage devices. Electric motors provide instant torque and enable powerful and balanced acceleration. There are various types of electric cars. The most common are fully electric cars (Battery Electric Vehicles - BEV) and Plug-in Hybrid Vehicles (Plug-in Hybrid Electric Vehicles - PHEV) (Ediz, 2017).

Fully electric cars operate solely on electric motors and draw energy from batteries. These vehicles offer a zero-emission driving experience and typically use large batteries that have a longer range. Fully electric cars can be charged at charging stations or from home electrical outlets. The charging time varies depending on the battery capacity and the type of charger used (Markel and Simpson, 2007). Figure 1 shows the drive system of an electric vehicle.

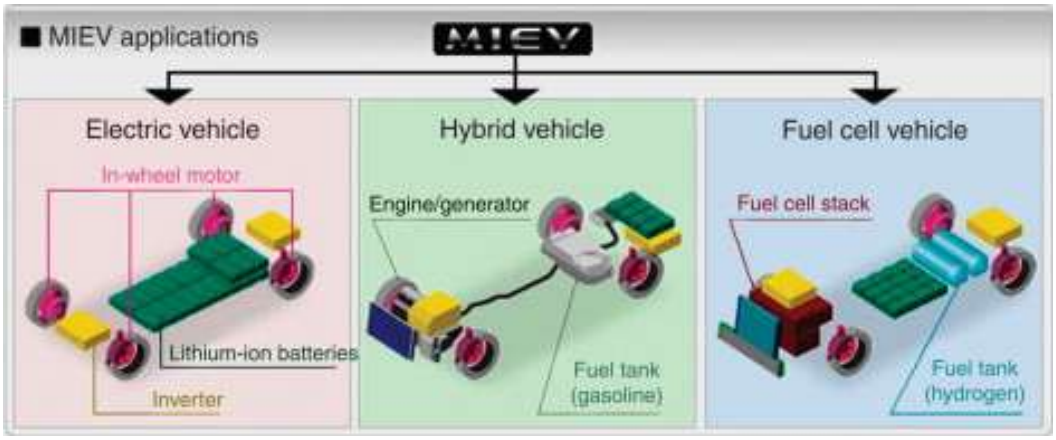

Figure 1. Electric drive systems in electric vehicles (Gutmann, 2009)

As seen in Figure 2, the first electric vehicle produced in the world was invented by Thomas Davenport in Vermont, America in 1835 (Segrave, 2019).

Figure 2. Thomas Davenport First Electric Vehicle

The first electric car in Turkey was ordered by II. Abdulhamid from Messrs Immisch & Co in England in 1888. This car, specially designed by the company's engineers Magnus Volk and Moritz Immisch, had two closely positioned small wheels instead of one large wheel at the front and was equipped with a 20 Ampere 48 Volt 1 horsepower motor patented by Immisch. Abdulhamid was very pleased with this car and rewarded both engineers, which allowed them to gain international fame (Akandere & Öztürk, 2024).

Figure 3. The first electric vehicle in Turkey made for Abdulhamid II by Messrs Immisch & Co (Segrave, 2019)

1888: Andreas Flocken's four-wheeled electric vehicle is shown in Figure 4. It had a high iron-wheeled wagon with an electric motor that transmitted about 0.9 kW (1 hp) power. The wooden vehicle reached a maximum speed of 15 km/h and weighed 400 kg (882 lb) (Seely, 2002).

Figure 4. Andreas Flocken's four-wheeled electric vehicle (Seely, 2002).

Electric Vehicle Types

- **Electric Vehicles (EVs)**

Unlike internal combustion engine vehicles, electric vehicles use the electrical energy they draw from the battery instead of requiring fuel combustion to start the engine. The capacity of the battery determines the range of this type of electric car, which is the distance it can travel on a single battery charge (Gürbüz & Kulaksız, 2016). Figure 5 shows the entirely electric vehicle battery and motor group.

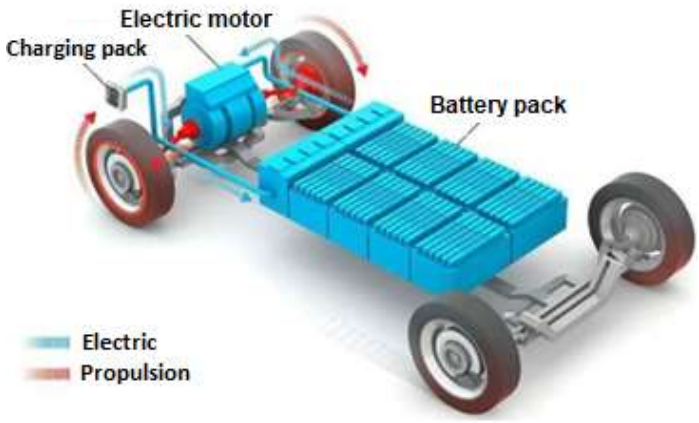

Figure 5. Fully electric vehicle interior structure (Kül, 2023)

- **Hybrid Electric Vehicles (HEVs)**

The concept of a hybrid car refers to vehicles that have both an internal combustion engine and an electric motor. The fuel engine and electric motor in hybrid vehicles work together to provide movement. Typically, the electric motor is active when the vehicle is progressing at a steady and slow speed. As the speed of the vehicle increases, the fuel engine either engages alone or works in conjunction with the electric motor (Formentin, 2021, Zia, 2016). The operation of the hybrid electric vehicle is shown in Figure 6.

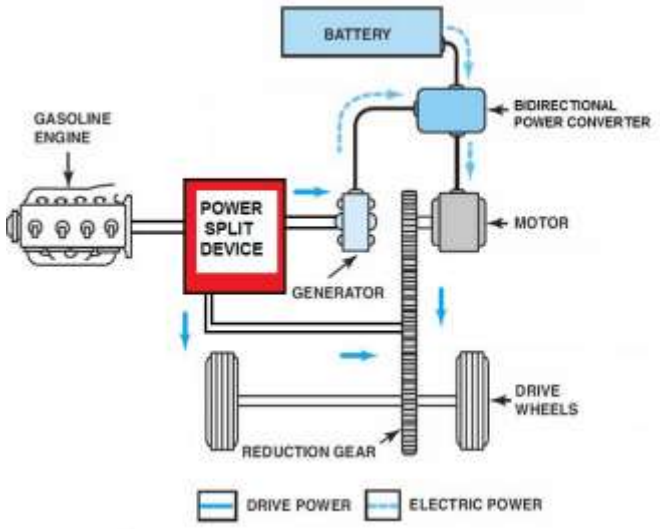

Figure 6. Hybrid Electric Vehicles (HEVs) (Zia, 2016)

- **Mild Hybrid Electric Vehicles (MHEVs)**

Mild hybrid vehicles are cars equipped with electric technology that supports the engines of traditional internal combustion engine vehicles, regardless of whether they have gasoline or diesel engines, and reduces fuel consumption. This support electric motor takes over the role of the starter motor in the car and usually uses a 48-volt battery (Dvadnenko & Dziubenko, 2023).

Mild hybrid cars can start moving with the electric energy they contain, without the need to ignite fuel, and respond faster compared to their competitors. At the same time, they reduce overall costs by not consuming fuel at low speeds. When your vehicle requires more power while cruising, it allows you to obtain extra power by engaging the electric motor, providing high performance. Additionally, it keeps your fuel consumption at an optimal level. During deceleration, the 48-volt hybrid battery is charged, ensuring that the energy generated during braking does not go to waste (Benajes et al., 2019).

- **Plug-in Hybrid Electric Vehicles (PHEVs)**

A plug-in hybrid vehicles is a car that operates using electricity provided by its batteries as well as fossil fuels such as gasoline or diesel. Vehicle owners can charge the battery in their vehicles by plugging it into a charging station (Ediz, 2017). At the same time, a system called regenerative braking helps charge the batteries by providing power to the battery every time the driver brakes. Plug-in hybrids use electricity from the battery to move the wheels, and when the batteries are depleted, the gasoline engine kicks in to provide power for movement (Singh et al., 2021). Figure 7 shows a plug-in hybrid electric vehicle.

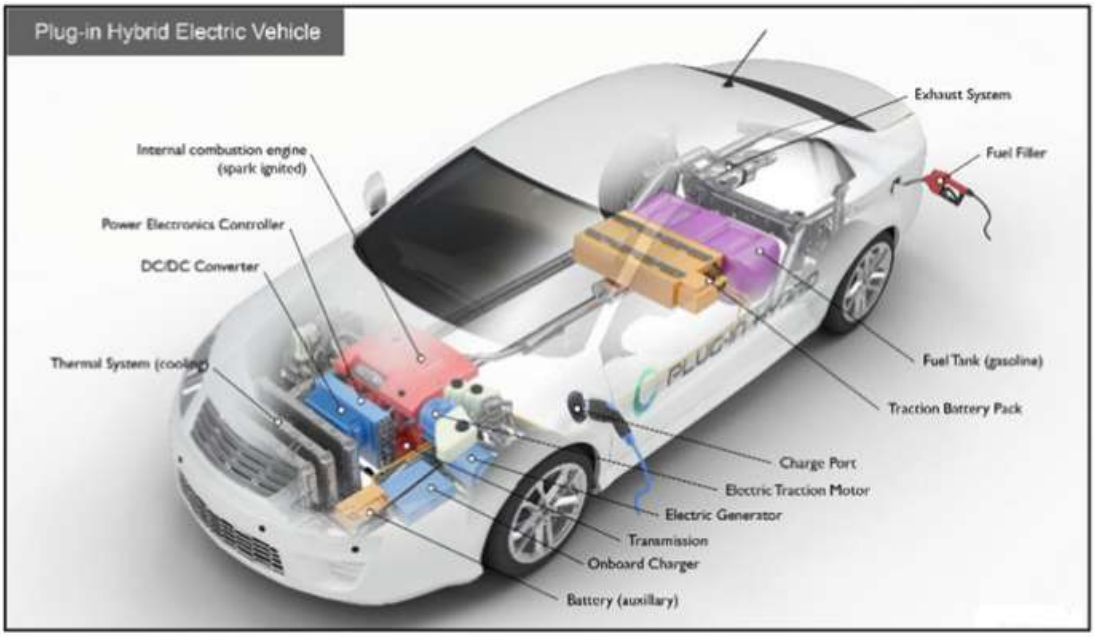

Figure 7. Plug-in hybrid electric vehicle (Singh et al., 2021)

- **Fuel Cell Electric Vehicles (FCEVs)**

In the most basic terms; it occurs as a result of the reaction of hydrogen in the fuel cell with oxygen in the air. The produced electrical energy is used to power the electric motor, similar to fully electric vehicles. As a result, only steam and hot air are emitted into the environment. Fuel cell cars can also recover energy lost during braking and store it in the battery (Arat et al. 2020). Figure 8 shows the internal structure of a fuel cell electric vehicle.

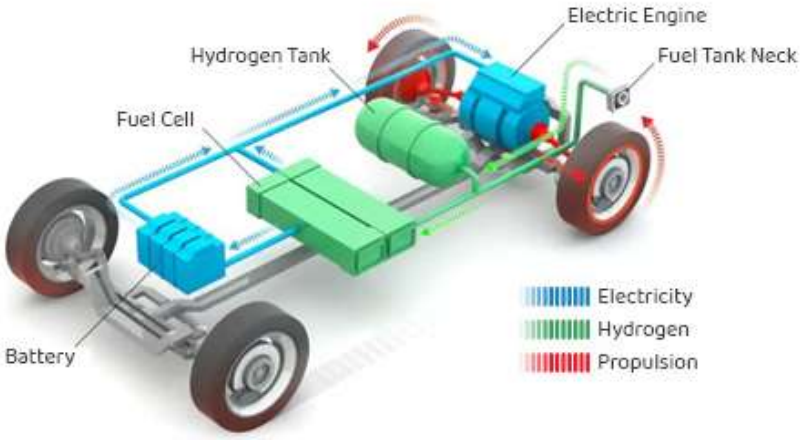

Figure 8. Fuel cell electric vehicle interior structure (Kül, 2023)

Advantages and Disadvantages of Electric Vehicles

	Advantages	Disadvantages
Electric Vehicles (EV)	➢ Zero exhaust emissions ➢ Silent operation ➢ Fast battery charging ➢ Energy recovery through regenerative braking ➢ Low fuel and operating costs	× Limited range × The need for development in battery technology × Limited infrastructure for charging stations in public areas
	Advantages	**Disadvantages**
Hybrid Electric Vehicles (HEVs) **Plug-in Hybrid Electric Vehicles (PHEVs)**	➢ Low fuel costs ➢ Low exhaust emissions due to low fuel consumption ➢ Energy recovery through regenerative braking ➢ Option to charge from the grid ➢ Performance efficiency with optimum fuel use ➢ Energy recovery through regenerative braking	× High production costs × Complexity of power transmission in two different engines × Limited access to spare parts × Higher production cost × Cost and replacement of batteries × Additional weights added by batteries and power electronics
	Advantages	**Disadvantages**
Fuel Cell Electric Vehicles (FCEVs)	➢ No dependence on petroleum ➢ Zero exhaust emissions ➢ Energy recovery with regenerative braking ➢ Higher energy efficiency compared to Iym	× Very high production costs × Challenges in hydrogen production and storage × Difficulties in the use of hydrogen as fuel × Increased safety measures due to high pressure in hydrogen usage

Standards in Electric Vehicles

The automotive and electrical standards applied by the industry not only ensure that complex components and subsystems operate as intended but also reduce the likelihood of failure after they are integrated. Vehicles are large systems composed of other smaller systems, meaning that each must work in cooperation for the larger system to function. Each requires extensive verification and validation to identify and diagnose any issues that need to be corrected. The importance of standards has created a long list of requirements that companies must meet, and many of these have been categorized according to different qualities and types of needs. The different areas where EV standards are formed include:

• Electric vehicle and performance testing

• Electrical safety and functional safety testing

• Cybersecurity and software testing

There are specific groups that develop and publish standards. Some standard organizations are national, while others are international and encompass numerous countries around the world. Each focuses on the implementation of standards in different areas that help advance the development of automotive products and systems. To convey the importance of EV standards, it will be helpful to identify specific examples (AB 134/2014, 2024; AB 168/2013, 2024).

Tests Conducted on Electric Vehicles

- **Battery Vibration Testing and Testing Standards for Electric Vehicles**

The Battery, one of the most critical components of electric vehicles, is in an important development process to meet the needs of electric vehicle manufacturers. Testing standards and procedures are also continuously being evaluated and updated.

To ensure the safety and robustness of battery technology, the battery must undergo Vibration and Shock Testing. Currently, there are three internationally recognized test standards commonly used for Vibration and Shock Testing of Batteries. These are UN 38.3, ISO 12405-1, and SA J2380. However, some vehicle manufacturers have their own testing standards (Hooper & Marco, 2014; Lang & Kjell, 2015). The battery vibration test standards for electric and hybrid vehicles are shown in Table 1.

Table 1. Battery vibration test standards for electric and hybrid vehicles (Hooper & Marco, 2014).

Standard	Type of vibration test	Frequency range (Hz)	Peak loading (swept sine wave)	Peak loading (random PSD wave)	Scope of the Standard	Vibration profile created from EV data	Test correspond to a desired vehicle life
UN38.3	Shaped swept sine wave (*X*, *Y* and *Z* axes)	7–200	8 g 50 Hz–200 Hz	N/A	Legislative	No	No
ECE R100 Vibration	Shaped swept sine wave (*Z* axis)	7–50	1.02 g 7 Hz–18 Hz	N/A	Legislative	No	No
J2380/USABC Procedure 10	Random PSD/shaped swept sine (*X*, *Y* and *Z* axes)	10–190	3 g 10 Hz–20 Hz	0.1 $(g)^2$/Hz at 10 Hz–20 Hz or 3 g from 10 to 20 Hz	Duty of care	No	Yes 100,000 miles
BS62660	Random PSD (*X*, *Y*, and *Z* axes)	10–2000	N/A	2.05 $(g)^2$/Hz at 10 Hz	Duty of care	No	No

- **Sealing Tests in Electric Vehicles**

Electric vehicles have emerged as a result of the technological era. In response to the need to create a sustainable future, engines that do not consume oil, provide fuel savings, operate

efficiently, and run silently have been designed. Electric vehicles powered by this engine and battery are increasingly preferred every day (Nişancı & Kurtuluş, 2022).

The tightness of batteries in electric vehicles should be tested according to IP67 standards. For batteries used in harsh environments, leak tightness tests can be performed at higher standards such as IP69. Since standardized parameters and methods for battery leak tests have not yet been established worldwide, the methods applied vary from manufacturer to manufacturer. Two different issues can be mentioned that affect battery leak tests and put production lines at risk. The first is the difficulty of detecting small leaks due to the large volume of batteries used in larger vehicles such as buses, and the second is the inflation of flexible parts affecting the test results. Battery leak tests can be conducted using the Differential Pressure Drop Method. The goal is to perform precise, rapid, reportable, and repeatable leak tests (Hooper & Marco, 2014).

Electric Vehicles and Hydrogen Tanks use type 4 hydrogen tanks with fuel cell vehicles. These tanks are made of composite materials from carbon fiber. The sealing of hydrogen storage tanks, which hold hydrogen at 350-700 Bar, is important considering that hydrogen is a flammable gas at high pressure. It is desired to have a maximum leakage limit of 10-2 mBar l/s. The leak tests for hydrogen tanks are performed in the industry using three different methods: Helium Vacuum Chamber, Helium Sniffer, and Pressure Drop. The helium method offers higher sensitivity and allows for leak testing to be completed in shorter durations. However, the pressure drop method, while requiring longer test times, provides cost advantages to manufacturers (Kjell & Lang, 2013).

Electric motors are also adversely affected by water, steam, and dust. Therefore, the sealing tests conducted according to IP67 standards are the minimum requirements. In situations where air cannot be applied internally, an external testing method can be used. Another advantage of this method is that it reduces the test volume. In cases where the interior of the product can be pressurized, sealing tests can be conducted using the differential pressure drop method (Castillo, 2015).

Electric Vehicles and Fuel Cells, Fuel cells consist of bipolar plates which are separated by membranes and located between two end plates. The bipolar plates have a structure with 2 cavities and a cycle. While process gases such as hydrogen and air are present in the cavity structure, the cycle contains coolant. The leak tests of these two structures must be conducted separately. The leak test of the coolant is a three-stage process: it includes a leak test that checks the transition of hydrogen to the external environment and a leak test that controls the hydrogen cooling cycle. For higher precision in the leak tests of fuel cells, the helium vacuum chamber method is preferred (Savran et al., 2024; Arat et al., 2020).

- **Safety Tests Conducted on Electric Vehicles**

Electric vehicles require a different safety standard compared to traditional internal combustion engine vehicles. The battery technology and electrical systems of electric vehicles necessitate special safety measures and testing standards. Therefore, specific tests and standards have been established for the safety of electric vehicles.

The tests conducted to ensure safety in electric vehicles include crash tests, fire tests, battery safety tests, and electrical safety tests. Crash tests are performed to ensure the safety of passengers and the vehicle in the event of a collision. These tests are carried out to evaluate the structural integrity of the vehicle and passenger safety. Fire tests are conducted to assess the resistance of the vehicle's battery system to fire. Battery systems in electric vehicles can be

sensitive to fire, which is why fire tests are of great importance. Additionally, battery safety tests are also carried out to evaluate the safety and durability of the vehicle's battery system (BM Regülasyon-78, 2024; BM Regülasyon-141, 2024).

Electrical safety tests are carried out to ensure the safety of the vehicle's electrical systems. These tests check the insulation, grounding, and isolation of the vehicle's electrical systems. Electrical safety tests are of great importance for electric vehicles due to their high voltage electrical systems. The safety standards set for electric vehicles are established by international organizations and the automotive industry. These standards are created to ensure the safety of vehicles and to guide the industry. Electric vehicle manufacturers must adhere to these standards and produce their vehicles in accordance with them (AB 134/2014, 2024; AB 134/2014, 2024; AB 3/2014, 2024).

- **Efficiency testing and analysis of electric vehicles**

The results obtained from tests conducted on automobiles under real conditions differ from those obtained on test benches. This is a common occurrence that happens frequently. It is also prevalent in driving cycle tests such as the 10-15 mode in Japan or FTP72 and FTP75 in the USA. To overcome these differences and to approach realistic driving conditions, a new standard – WLTP (Worldwide Harmonized Light Vehicles Test Procedure) – has been developed. This standard represents a more realistic procedure for evaluating not only traditional cars but also future electric vehicles such as hybrids, BEVs (Battery Electric Vehicles), PHEVs (Plug-In Hybrid Electric Vehicles), and FCEVs (Fuel Cell Electric Vehicles). The WLTP standard is more dynamic and provides results that are closer to actual road performance (Marmaratek, 2025; Balcı et al., 2023).

The key differences between the NEDC and WLTP standards are listed below:

• 30 minutes longer per test cycle

• 23.3 km longer distance instead of 11 km

• Higher speed of 131 km/h instead of 120 km/h and average speed between 34 km/h and 46.5 km/h

• Cold start

• Higher acceleration and deceleration during driving (Marmaratek, 2025)

Figure 10. DEWETRON ile otomobil testi

In addition, transitioning from 2 region (city and highway) tests to tests based on 4 regions and real driving values (low, medium, high, and extra high-speed regions) makes the results more realistic and comparable. A road test under real conditions is the best and of course the most realistic way to test. These tests become more important for evaluation during development and aim to increase efficiency and reduce costs. Road tests provide a comprehensive review of the car, including all parameters for battery management and autonomous driving, as well as the interaction of different tasks (Marmaratek, 2025; Bayrakçeken, 2019 ; Formantin, 2021).

The power consumption test table seen in Table 2 shows the differences between the two standards mentioned earlier and the real road test. The value taken from the manufacturer's data sheet (NEDC) has been compared with the value from the test bench (WLTP) and the on-road test (Marmaratek, 2025).

Table 2. Comparison of different test procedures

	Datasheet (NEDC)	Test bench (WLTP)	On-road (WLTP)
kWh/100 km	15.3	16.2	18.5

Hybrid, BEV, PHEV, and FCEV evaluation tests require highly precise measurements of all electrical and mechanical parameters. In addition, communication interfaces (e.g., CAN / CAN-FD and automotive Ethernet) are required in combination with a precise IMU (Inertial Measurement Unit) with DGPS (Differential Global Positioning System). A processor unit with a Kalman filter is also used for evaluating inertial sensors and GPS signals. Figure 9 provides an overview of some test parameters (Isermann & Wesemwier, 2019; Jin 2022).

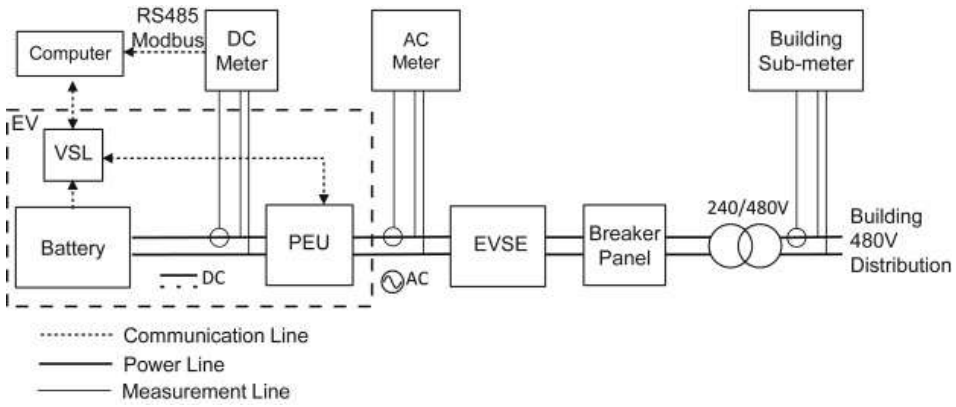

Figure 9. Example of electric vehicle measurement configuration (Apostolaki-Iosifidou, 2017)

Conclusion

According to the literature study, electric vehicles have started to be preferred over fossil fuel-powered vehicles in today's technology. Therefore, most companies are launching electric vehicle models.

As a result, specific tests and standards have been established for the safety of electric vehicles. These tests and standards ensure that the vehicles serve the environment and users safely. With the prevalence of electric vehicles, safety standards are continuously updated and improved. In

this way, electric vehicles will continue to be an environmentally friendly and safe transportation alternative. The performance of electric vehicles is measured by factors such as speed, range, and charging time. Standards ensure that vehicles have a certain level of performance. This allows users to have a satisfying driving experience and enables vehicles to compete with other transportation options.

When testing is conducted according to standards, solutions will be sought for safety issues related to the vehicle, performance and efficiency issues, problems arising from environmental impacts, and problems caused by market confusion.

ABSTRACT

This study experimentally investigates the thermal behavior of a lithium-ion battery pack subjected to varying ambient temperatures (25 °C, 35 °C, and 45 °C) and discharge rates (1C, 2C, and 3C). The battery pack was composed of nine INR18650A28 cylindrical lithium-ion cells configured in a 3S3P arrangement. T-type thermocouples were attached to the surface of each cell to monitor temperature evolution, and measurements were recorded at one-minute intervals using a data logger. Discharge tests were performed in constant current mode via a programmable electronic load within a controlled environmental chamber. The results reveal that both ambient temperature and discharge rate exert a significant influence on the pack's thermal performance. While the maximum temperature differences among cells remained below 3 °C at 1C and 2C, they exceeded 3 °C at 3C, reaching up to 4.21 °C at the highest ambient temperature. These findings underscore the necessity of an effective thermal management system to ensure uniform temperature distribution among battery cells, enhance operational safety, and prevent potential thermal runaway.

Keywords: Battery Safety, Discharge Rate, Lithium-Ion Battery, Thermal Management

Introduction

The rapid consumption of energy resources on a global scale and the increase in carbon emissions from fossil fuels have led countries towards sustainable and environmentally friendly energy solutions. In this context, electric vehicles have become one of the most important components of environmentally friendly transportation systems in line with zero emission targets (Tie & Tan, 2013; Xiao et al., 2021). At the heart of electric vehicles, lithium-ion batteries are preferred for their high energy density, long cycle life and lightweight construction. However, the safe and efficient operation of these batteries is highly dependent on the success of thermal management. High temperatures can lead not only to poor performance, but also to rapid aging, capacity loss, and even thermal runaway and explosion (Dilbaz, 2023; Selimefendigil et al., 2023).

Battery cells generate heat due to ohmic and chemical reactions that occur during charge and discharge. Especially at high discharge rates, this temperature rise can reach critical levels and cause the battery system to become unstable. In the literature, battery temperature exceeding 50 ºC has been shown to have negative effects on life and safety (Rezvanizaniani et al., 2014).

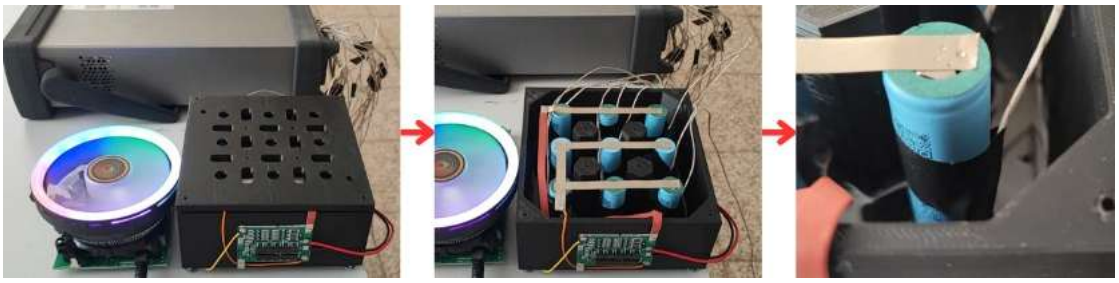
Environmental temperature is also a critical parameter in battery temperature management. Increasing the ambient temperature directly affects the maximum temperature values reached by the battery cells, increasing the overall temperature levels of the system and increasing temperature imbalances (Bao et al., 2024). Therefore, it is necessary to develop an effective heat management strategy that takes into account not only intracellular heating but also environmental conditions (Saxon et al., 2024). The uniformity of the temperature distribution within the battery groups and on the cell surfaces is of great importance. In the literature, it is stated that the temperature differences inside the battery cell or on the surface should not exceed 5 ºC (Karatas & Sokmen, 2022; Ni & Wang, 2020). The surface temperature of a lithium-ion battery cell was measured with different types and thicknesses of thermocouples (K, T and E) and the results were compared with an infrared (IR) camera. Thin wire thickness thermocouples are reported to have the fastest response time and the most accurate temperature measurement, while thick thermocouples show low temperature measurement accuracy and slow response time. As a result, T-type thermocouples are proposed as the most suitable sensors for battery surface temperature measurements (Koshkouei et al., 2024). In order to improve the safety of lithium-ion batteries at high temperatures and high discharge rates, a novel Battery Thermal Management System (BTMS) was designed and tested using liquid cooling and Phase Change Materials (PCM) in a honeycomb structure. As a result of experimental and numerical analysis, optimum cooling was achieved with the use of 12% graphite doped PCM and 25 mm cell spacing, with a maximum temperature of 45.7 ºC and a maximum temperature difference of 4.4 ºC (Yang et al., 2023).

In this study, the effects of different ambient temperatures and discharge rates on the temperature distribution within the battery pack are demonstrated with direct experimental data. Unlike the cooling system optimizations common in the literature, only the effect of environmental variables is investigated in isolation in this study. Thus, original and practical results have been obtained for the necessity of maintaining temperature uniformity in terms of battery safety.

Materials and Methods

In this study, the thermal behavior of a lithium-ion battery module under different ambient temperatures (25 ºC, 35 ºC and 45 ºC) and discharge rates (1C, 2C and 3C) is experimentally investigated. The battery pack used in the experimental setup consists of a total of 9 cylindrical

lithium-ion batteries formed by 3 series 3 parallel (3S3P) connections. A real-time photograph of the experimental setup and the connection diagram of the Battery Management System (BMS) and lithium-ion battery cells are shown in Figure 1. Technical specifications of the batteries are given in Table 1. A T-type thermocouple was installed to measure the surface temperature of each battery cell and the ambient temperature was monitored with an additional thermocouple. All temperature data were recorded at 1-minute intervals with a Keysight data logger. In order to analyze the thermal behavior of the battery module, discharge experiments were performed in constant current mode at 1C, 2C and 3C rates. The discharge processes were controlled by DLP24P programmable electronic load device and their effects on temperature distributions were evaluated.



(a)

Figure 1. (a) Real-time photograph of the experimental setup (b) The schematic of the BMS and battery cell connections

Table 1. Technical specifications of the lithium-ion battery.

Process	Parameter	Value
Charge	Standard Charge Current	1400 mA
	Max. continuous discharge current	400 mA
	End voltage	4.2 V
	Cut-off current	140 mA
Discharge	Standard Discharge Current	560 mA
	Max. continuous discharge current	14000 mA
	Max. conditional discharge current	25000 mA
	(SOC>70% cut-off temperature 80 ºC)	
	End voltage	2.5 V
Operating Temperature	Charge	0 ºC / 60 ºC
(Cut-off temperature 80ºC)		
	Discharge	-30 ºC / 60 ºC

Findings and Discussion

The average surface temperature changes of the lithium-ion battery pack at different discharge rates (1C, 2C and 3C) under different ambient temperatures are shown in Figure 2. In Figure 2 (a), at 25 ºC ambient temperature, the maximum temperatures at 1C, 2C and 3C discharge rates were recorded as 29.01 ºC, 37.20 ºC and 45.01 ºC, respectively. In Figure 2 (b), at 35 ºC ambient temperature, the maximum temperatures measured at the same discharge rates were 39.44 ºC, 46.72 ºC and 54.73 ºC. In Figure 2 (c), at 45 ºC ambient temperature, the maximum temperatures of the battery group were 49.36 ºC, 56.57 ºC and 64.58 ºC. These results show that both ambient temperature and discharge rate have significant effects on the thermal behavior of the battery pack. In particular, the combination of high ambient temperatures and high discharge rates leads to critical temperature increases that can threaten battery safety.

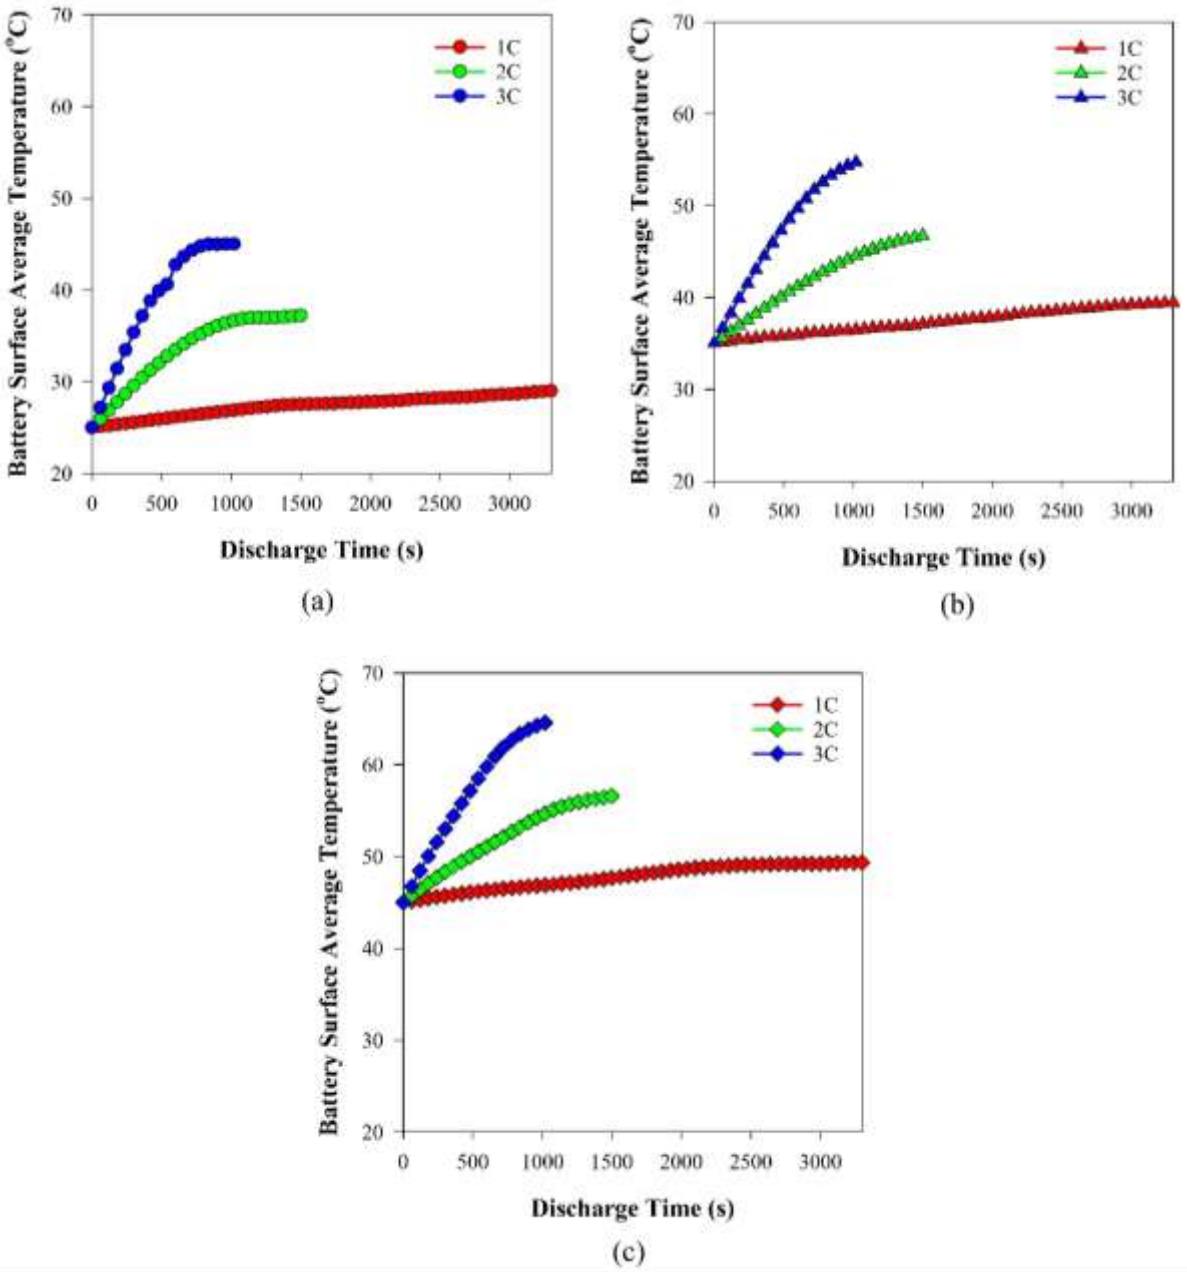

Figure 2. Change in the average surface temperature of the battery pack at different ambient temperatures and different discharge rates (a) 25 ºC, (b) 35 ºC and (c) 45 ºC

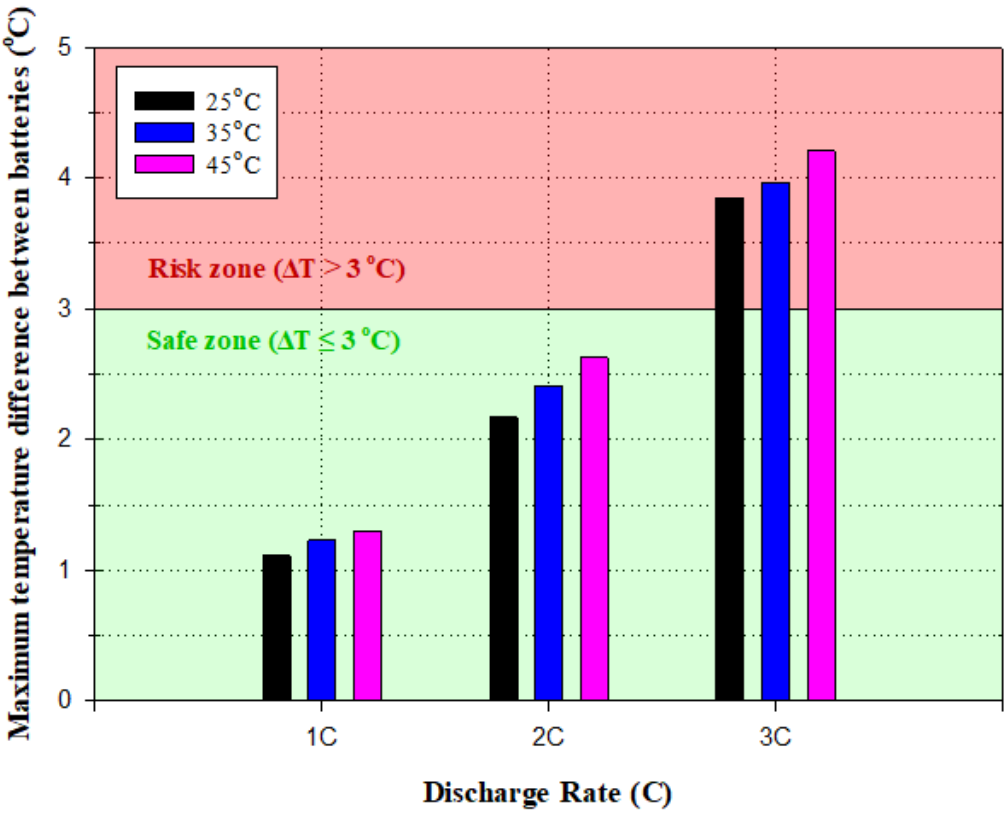

Figure 3. Effect of ambient temperature and discharge rate on the maximum temperature difference between lithium-ion battery cells

Figure 3 shows the variation of the maximum temperature difference between the cells in a lithium-ion battery pack depending on different ambient temperatures and discharge rates. According to the literature, the temperature difference between the battery cells in battery packs should not exceed 5 °C. However, in order to increase battery life and performance, it is recommended to keep this difference at 3 °C or lower. Accordingly, in this study, the area with a temperature difference of 3 °C or less was defined as a safe area and above 3 °C was defined as a risky area. Since the temperature difference did not exceed 5 °C under any circumstances, a separate hazardous zone was not required. According to the results of the experiment: At a discharge rate of 1C, at all ambient temperatures (25 °C, 35 °C and 45 °C), the temperature difference remained in the range of 1.11-1.30 °C and remained within the safe zone. At 2C discharge rate, the temperature difference was measured between 2.17-2.63 °C and a slight upward trend in the temperature difference was observed due to the increase in the ambient temperature. At 3C discharge rate, the temperature difference increased significantly and moved into the risk zone. At ambient temperatures of 25 °C, 35 °C and 45 °C, temperature differences of 3.85 °C, 3.96 °C and 4.21 °C were recorded, respectively. These findings suggest that under a discharge rate of 3C, a temperature imbalance occurs between the cells regardless of the ambient temperature, which may increase the risk of thermal runaway when high discharge rate and high ambient temperature are combined.

Conclusion and Recommendations

In this study, the thermal behavior of a lithium-ion battery pack under varying ambient temperatures and discharge rates was experimentally analyzed. A 3S3P configured battery pack was subjected to different thermal and electrical conditions, and temperature distribution among the cells was closely monitored. The main findings obtained from the study are summarized as follows:

- At 1C discharge rates, the maximum temperature differences between battery cells remained within 1.11–1.30 °C across all ambient temperatures.
- For a 2C discharge rate, slight increases in temperature differences were noted, but all values stayed below 3 °C, which is acceptable for battery performance and safety.
- At 3C discharge rates, the maximum temperature differences exceeded 3 °C, reaching 3.85 °C at 25 °C ambient, 3.96 °C at 35 °C ambient, and 4.21 °C at 45 °C ambient, indicating increased thermal imbalance risks.
- The combination of high ambient temperature and high discharge rate negatively affected the thermal distribution within the battery pack, potentially increasing the risk of thermal runaway.
- Effective thermal management strategies are essential, particularly under extreme operating conditions, to ensure cell temperature uniformity and prevent performance degradation and safety hazards.

Thanks and Information Note

This study was financially supported under the project number 2004592 within the scope of the TEKNOFEST 2024 Environment and Energy Technologies Competition Program. The authors would like to express their gratitude to TEKNOFEST for enabling the realization of this research.

ABSTRACT

This study presents the development of a safety-oriented robotic end effector that integrates pneumatic actuation with computer vision technologies for use in industrial automation environments. The motivation behind the project lies in minimizing occupational hazards by enabling robotic end effectors to autonomously detect and respond to potential human presence in their workspace. By doing so, the system aims to halt operations in unsafe conditions and resume seamlessly when the area is cleared, thereby reducing the risk of injury without compromising productivity. The system utilizes an ESP32 microcontroller and an OV2640 camera module to implement image-based human detection, specifically focusing on identifying hands or fingers. Once detected within the operational range, the robot's pneumatic mechanism instantly ceases movement, prioritizing safety. Upon clearance, it automatically resumes its task. Pneumatics was chosen for its inherent advantages—fast response, precise control, and energy efficiency—making it highly suitable for high-cycle industrial applications. This solution is not only cost-effective but also modular and adaptable, offering scalability for future integration with AI-driven decision-making algorithms and additional sensors. Its compatibility with Industry 4.0 standards and smart manufacturing paradigms positions it as a forward-looking innovation that addresses both safety and efficiency in collaborative human-machine settings. The proposed system reflects a novel engineering approach, emphasizing preventive safety through real-time environmental awareness and intelligent control strategies.

Keywords: End Effecor, Image Processing, Pneumatics

Introduction

In recent years, the rapid progression of robotics and automation technologies has profoundly transformed industries such as manufacturing, logistics, healthcare, agriculture, and even domestic environments, leading to unprecedented improvements in productivity, accuracy, and operational efficiency. As these automated systems and robots increasingly operate alongside humans in shared workspaces, the importance of ensuring occupational safety and accident prevention has become a critical aspect of industrial design and operational management. Traditional safety measures, including physical barriers, safety cages, emergency stop buttons, and light curtains, although proven effective, often introduce significant limitations such as reduced flexibility, decreased workspace utilization, increased installation and maintenance costs, and reduced overall productivity due to rigid operational constraints. These limitations have spurred the development of more advanced, intelligent safety systems that can dynamically monitor human presence and activity in real-time, enabling robots to adapt their behavior instantaneously to prevent potential accidents. The advent of computer vision technologies, which leverage high-resolution cameras, image processing algorithms, and machine learning techniques, has opened up new possibilities for creating sophisticated human detection systems that are more flexible, accurate, and responsive. These systems can identify human features, gestures, postures, and movements, providing essential contextual information that allows robotic systems to operate more collaboratively and safely in unstructured or semi-structured environments. Integration of sensors and microcontrollers such as the ESP32, combined with embedded cameras and pneumatic actuation mechanisms, further enhances these safety systems by enabling rapid detection and immediate physical response—such as halting robot motion, activating safety barriers, or triggering alarms—without reliance on bulky infrastructure or manual controls. Such integrated solutions are particularly vital in collaborative robotics (cobots), where humans and robots work in close proximity, often sharing the same workspace, necessitating highly reliable, real-time safety protocols that do not impede workflow or productivity.

Despite the promising advancements in this field, several significant challenges remain. One of the primary issues is achieving high detection accuracy under diverse environmental conditions, including varying lighting, shadows, occlusions, cluttered backgrounds, and dynamic human movements. False positives—where the system incorrectly identifies a human or perceives a non-threatening object as a human—can lead to unnecessary halts or operational delays, reducing efficiency and potentially causing safety fatigue or complacency. Conversely, false negatives—missed detections—pose serious safety risks, as they fail to prevent potential accidents. Furthermore, latency in detection and response, especially in fast-moving industrial environments, can be critical; any delay between human detection and system response could result in injuries or equipment damage. Cost considerations also play a vital role, as many advanced safety systems require sophisticated sensors and high-end processing units, which may be prohibitive for small- and medium-sized enterprises. Therefore, designing a cost-effective, scalable, and easy-to-integrate safety solution remains a key goal.

This research aims to address these multifaceted challenges by developing an integrated, intelligent safety system that combines state-of-the-art computer vision techniques, microcontroller-based control modules such as the ESP32, and pneumatic actuation mechanisms for rapid physical response. The core objective is to create a reliable, real-time human detection system capable of functioning efficiently under different environmental conditions, minimizing false alarms while maximizing detection accuracy and response speed. The system design emphasizes affordability and simplicity to facilitate widespread adoption

across various industrial sectors, including manufacturing lines, warehouses, hospitals, and collaborative robotic setups. By integrating these components, the system can automatically detect human presence within a designated safety zone, trigger immediate halting of robotic operations, activate safety barriers, or initiate other protective actions, thereby significantly reducing the risk of accidents and injuries. Such an approach not only enhances safety standards but also promotes greater confidence in automation and human-robot collaboration, encouraging broader implementation of intelligent safety protocols that are adaptable, responsive, and cost-effective.

Moreover, this study seeks to explore the potential for further innovations, such as integrating additional sensors (e.g., ultrasonic, infrared), employing advanced machine learning algorithms for better recognition under challenging conditions, and developing adaptive response strategies that consider the context and proximity of detected humans. It also aims to evaluate the system's performance through extensive testing in real-world industrial environments to ensure robustness, reliability, and compliance with safety regulations. Ultimately, the goal is to contribute meaningful advancements to the field of industrial safety, fostering safer, more efficient, and more harmonious human-robot interactions, and laying the groundwork for future developments that will enable smarter, more adaptable safety systems capable of meeting the evolving demands of modern industry. This comprehensive approach seeks not only to mitigate current safety challenges but also to pave the way for innovative, integrated solutions that enhance the overall safety culture in automation-driven workplaces, ensuring that technological progress benefits both workers and enterprises alike.

Materials and Methods

The development of the safety-oriented robotic end effector involved the selection and integration of several key components designed to work synergistically to achieve reliable human detection and rapid response. The primary hardware includes an ESP32 microcontroller, renowned for its high processing capability, low power consumption, and built-in Wi-Fi and Bluetooth connectivity, making it suitable for real-time control and communication in industrial environments. Attached to the ESP32 is the OV2640 camera module, which provides high-resolution image acquisition necessary for accurate human feature detection. To facilitate rapid and effective actuation upon detection, pneumatic systems were chosen due to their quick response times, energy efficiency, and ease of control. The pneumatic setup comprises a compact compressor, a series of solenoid valves, and pneumatic cylinders that serve as the physical mechanism to halt or modify the robot's movement when necessary. The control signals generated by the ESP32 are sent to the solenoid valves, which in turn control the flow of compressed air to the pneumatic cylinders, enabling immediate intervention. The image processing pipeline begins with the acquisition of real-time images through the OV2640 module, which are then pre-processed to enhance detection accuracy. Pre-processing steps include noise reduction, contrast adjustment, and normalization. For human detection, a custom-trained lightweight machine learning model based on convolutional neural networks (CNN) is employed, optimized for embedded systems to balance accuracy and computational load. Alternatively, traditional image processing techniques such as color segmentation, skin-tone detection, and contour analysis can be utilized for environments with controlled lighting conditions. Once a human hand or finger is detected within a predefined safety zone—an area established relative to the robot’s operational workspace—the system immediately triggers an emergency stop sequence. The real-time detection and response cycle are designed to operate within milliseconds, ensuring safety without significant delay. The system architecture emphasizes modularity and scalability. The ESP32 microcontroller interfaces with the vision

system, pneumatic controls, and communication modules via standard protocols such as UART, I2C, or Wi-Fi. This design allows easy integration with existing industrial control systems or future expansion to include additional sensors like LIDAR, ultrasonic sensors, or infrared detectors for enhanced environmental awareness. Safety logic algorithms are implemented in embedded C, enabling fast decision-making processes, while the entire setup is housed within a rugged enclosure suitable for industrial conditions. Power supplies are carefully selected to ensure stable operation, with backup power options considered for critical safety functions. The experimental setup involves mounting the system on a robotic arm or workstation, with safety zones clearly marked, and human subjects performing predefined movements to test detection accuracy, response times, and overall reliability under various lighting and background conditions. Data logging and analysis tools are employed throughout testing to evaluate system performance, identify failure modes, and optimize detection thresholds.

Findings and Discussion

Experimental tests demonstrated that the integrated vision and pneumatic safety system effectively detected human presence within the workspace, halting robot movements within milliseconds to prevent potential injuries. The system achieved a high detection accuracy under controlled conditions, alerting and stopping operations promptly when a human hand or finger was within the safety zone. The pneumatic actuation provided a reliable and rapid response, essential in high-speed industrial processes. Moreover, the modular architecture facilitates scalability, enabling future incorporation of AI-based decision-making algorithms, additional sensors, and communication modules compliant with Industry 4.0 standards. The approach offers a significant safety improvement over traditional methods, reducing the risk of accidents without interrupting the overall workflow. However, some limitations were observed, including sensitivity to environmental factors such as lighting variations and background complexity, which may affect detection accuracy. Therefore, further research is recommended to enhance the robustness of the image processing algorithms and validate system performance in diverse industrial scenarios.

Conclusion and Recommendations

In conclusion, this study successfully demonstrates the feasibility and effectiveness of integrating computer vision, microcontroller-based control, and pneumatic actuation to enhance occupational safety in robotic working environments. The developed system offers a rapid, reliable, and cost-efficient solution for real-time human detection and immediate response, thereby significantly reducing the risk of accidents and promoting safer collaboration between humans and robots. The experimental results indicate that the system can detect human presence accurately within milliseconds, respond swiftly through pneumatic intervention, and operate effectively under different environmental conditions, showcasing its robustness and adaptability. However, despite these promising outcomes, several limitations have been identified that warrant further research and development. These include potential challenges in dynamic or cluttered environments where false detections might occur, the need for more advanced machine learning models to improve detection accuracy, and considerations related to system scalability and integration with existing industrial infrastructure. To maximize the system’s potential and facilitate wider adoption, future studies should focus on incorporating more sophisticated sensor fusion techniques, such as combining vision with ultrasonic or infrared sensors, to enhance detection reliability. Additionally, developing adaptive algorithms capable of learning and adjusting to changing environmental conditions can further improve performance. A focus on miniaturization and power optimization will also be beneficial for deploying the system in diverse industrial settings. Moreover, establishing standardized safety

protocols and conducting long-term field testing are essential to validate the system's effectiveness in real-world scenarios and ensure compliance with safety regulations. Future work could explore the integration of IoT frameworks for remote monitoring and diagnostics, enabling predictive maintenance and continuous safety assurance. Finally, collaborations with industry stakeholders and regulatory bodies are recommended to facilitate the transition from prototype to commercial deployment, ensuring that such safety systems can be reliably implemented at scale to foster safer, more productive, and more intelligent manufacturing environments.

Thanks and Information Note

We extend our heartfelt and sincere gratitude to all team members, industry partners, research collaborators, and supporting institutions whose unwavering dedication, expertise, and resources have been instrumental in the successful execution and progression of this project. Their valuable contributions, insightful feedback, and collaborative spirit have significantly enriched the research process and outcomes. We also wish to acknowledge the essential role played by our industrial partners, whose real-world insights and practical support have helped us tailor our solutions to meet actual operational needs and challenges faced in various industrial environments. Furthermore, we recognize the importance of the support provided by research and academic institutions that facilitated access to essential tools, facilities, and knowledge resources, thereby enabling us to carry out in-depth investigations and comprehensive testing. Our sincere thanks extend to the funding agencies and governmental bodies that recognized the importance of this research and provided financial support, ensuring the continuity and depth of our study.

ABSTRACT

Within the scope of this project, a compact, table-type pneumatic bending machine has been developed to ensure the precise and repeatable bending of sheet metal.The system produces mechanical movement through pneumatic cylinders and performs controlled bending operations.All operations can be remotely controlled via a user-friendly mobile application that works over Bluetooth communication.The machine body is manufactured from high-strength steel alloys, providing structural rigidity and long-lasting use.Its compact dimensions enhance the device's portability and allow for quick adaptation to different production environments.In the pneumatic system, low-pressure air inlets have been used, and all flow control is secured with high-precision valves and pressure regulators.Thus, the system operates safely and maintains consistent performance in every cycle.To increase the precision of the bending process, the stroke movement of the pneumatic cylinder has been supported by specially designed molds and fixtures.Therefore, optimal process repeatability has been achieved for different material thicknesses.The control system has been developed to work in harmony with Android and iOS-based mobile devices, allowing users to manage the machine remotely and in real-time.The system interface allows for the adjustment of operational parameters and the monitoring of process steps.The developed machine offers a wide range of applications, from industrial production environments to small-scale workshops and prototyping efforts, demonstrating high performance in terms of both efficiency and ease of use.

Keywords: pneumatic, mobile application, flow control, portable

Introduction

The primary objective of this project is to develop a compact, desktop-sized pneumatic bending machine that can be remotely controlled via a mobile application. The aim is to provide a space-efficient, user-friendly, and digitally controlled system that offers an economical, portable, and efficient solution suitable for both industrial and small-scale production environments—standing as an alternative to traditional bending machines.

Within the scope of the project:

-Precise and repeatable bending of sheet metal is achieved,

-Real-time remote control of the system is made possible through a Bluetooth-connected mobile application,

-The use of high-precision valves and dies enhances technical accuracy and operational safety during production processes.

As a result, users can manage production operations more quickly, safely, and flexibly. Furthermore, due to its compact design, the system can be conveniently utilized in prototyping applications, educational laboratories, and workshops with limited space.

Materials and Methods

Below is a list of the main materials and components used in the development of the compact pneumatic bending machine controlled via a mobile application:

1. **Mechanical Structure and Frame Materials**

High-strength steel alloys:

Used for the machine frame and supporting structures to ensure durability and rigidity.

Aluminum profiles (optional):

Preferred in some supporting parts for their lightness and ease of assembly.

Fasteners (screws, nuts, bolts, washers):

Used for assembling and mounting various parts.

2. **Pneumatic Components**

Pneumatic cylinder:

Generates mechanical motion to perform the bending operation.

Solenoid valve:

Used to direct the airflow and control the cylinder.

Pressure regulator:

Reduces and stabilizes the incoming air pressure to the desired level.

Flow control valves:

Used to adjust the movement speed of the cylinder.

Air filters and lubricators (FRL unit):

Provide clean and lubricated air to the pneumatic system.

Pneumatic hoses and connectors:

Enable air transmission within the system.

3. **Electronic and Control Components**

ESP32 microcontroller board:

Enables Bluetooth communication with the mobile application and controls the valves.

Relay module:

Used to control pneumatic valves with the low-power outputs of the ESP32.

Power supply (12V adapter or battery):

Provides the required electrical power for the system.

Button and emergency stop switch:

Installed as a safety measure.

4. **Software and Mobile Application Components**

Mobile application (Android/iOS):

Allows users to start, stop, and configure bending operations through a user interface.

Bluetooth communication module (integrated in ESP32):

Enables wireless communication with the mobile device.

Arduino IDE / PlatformIO:

Used to develop the software for the ESP32 microcontroller.

5. Dies and Fixtures

Bending dies and fixtures (steel):

Specially designed parts that ensure precise and stable bending of the sheet metal.

Findings and Discussion

Successful Compact Design:

The developed pneumatic bending machine is designed in compact, desktop-friendly dimensions. This makes it suitable for use in small workshops and prototype production areas.

Precise and Repeatable Bending Operation:

Thanks to the pneumatic system and custom molds, high accuracy and repeatability have been achieved in bending operations performed on materials of different thicknesses. Measurement results have shown that the desired bending angles are achieved within a ±1° tolerance.

Mobile Application Controlled Operation:

Through a Bluetooth-based mobile application, remote control of the device and real-time parameter adjustments have been seamlessly provided. The functionality and simplicity of the user interface were positively evaluated in terms of user experience.

Pneumatic System Performance:

Low-pressure air inputs and the use of precise regulators ensured safe and stable system operation. Smooth and controllable speeds were achieved in cylinder movements.

Conclusion and Recommendations

The compact pneumatic bending machine developed within the scope of this project offers a precise, repeatable, and safe bending solution with the ability to be remotely controlled via a mobile application. Thanks to the high accuracy and stability of the pneumatic system, sheets of varying thicknesses have been successfully bent. Its compact and portable design has emerged as an ideal alternative for small-scale production workshops and educational environments. Additionally, the user-friendly mobile application has enhanced flexibility and efficiency by allowing easy management of process parameters. Overall, the project has achieved success both technically and economically, demonstrating the positive contributions of integrating pneumatic and digital control technologies into production processes.

Sensor Integration:

By integrating sensors (e.g., potentiometers, force sensors) for real-time measurement of parameters such as bending angle and force, the control system can be made more precise and automated.

Data Recording and Analysis:

Cloud-based or local database solutions can be developed for recording and analyzing process data. This allows for monitoring and improving production quality.

Multi-Axis Bending:

By expanding the system with pneumatic cylinders that move along different axes, more complex bending operations can be performed.

Energy Efficiency:

Methods for air recovery and pressure optimization can be researched for energy savings in the pneumatic system.

Industrial Integration:

The machine can be developed to support industrial communication protocols (Modbus, OPC-UA, etc.) for integration with factory automation systems.

Mobile Application Development:

To enhance user experience, graphical bending programs, training modules, and fault diagnosis features can be added to the application.

Thanks and Information Note

This project aims to develop a compact and portable pneumatic bending machine that can be controlled via a mobile application. In the prototype stage, the technical specifications, mechanical structure, pneumatic circuit, and control software of the system have been successfully designed and implemented. The results obtained have shown that the device can

perform precise and repeatable bending operations in different production environments. The remote control capability provided by the mobile application has increased ease of use and efficiency. The project offers a suitable solution for a wide range of applications, from small-scale workshops to industrial production..

References

This innovative project on a mobile-controlled pneumatic bending machine highlights the integration of pneumatic, electronic, and software components to achieve precise, safe, and portable sheet metal bending, suitable for various industrial and educational applications. The system's design emphasizes portability, user-friendliness, and high accuracy, with potential enhancements such as sensor integration, data analysis, multi-axis bending, and industrial communication protocols to expand functionality and efficiency. ABSTRACT

Numerous physical factors influence a battery, among which temperature, voltage, and vibration are currently the most significant. Circuit arrangements called battery management systems (BMS) have been developed over the last few years to track the physical changes occurring in the battery. BMS is vital in extending the battery's life and protecting its health. This technological advancement of the battery has also influenced the defense industry and military vehicles. The study examined the advantages of using Fiber optic sensors in BMSs for safer, less prone to harsh environments, and longer-duration management for military vehicle batteries in extreme environments. It is seen that the use of Fiber optic vibration sensors in the explained battery management system is beneficial in terms of non-interference of the battery by external magnetic fields, lighter structure, being quicker than Fiber sensors since data transmission occurs with the help of light, and in measurement parameters like high accuracy and sensitivity. Such a BMS structure has been simulated with the help of Arduino or any microprocessor. Weight reading can also be taken for different battery life predictions. Based on the literature review, no direct research has been done on a fiber optic-based BMS structure in vibration measurements for military batteries. However, it was mentioned that the Fiber optic-based vibration sensor has significant advantages in military applications with its lightweight, low cost, and high sensitivity measurement. It is hoped that the result of this study will be significant in the creation of intelligent battery systems for future use in the defense sector.

Keywords: Battery management system, fiber optic sensor, military batteries, real-time monitoring, vibration detection

Introduction

The stable, reliable, and high-efficiency operation of energy storage units is critical for maintaining state-of-the-art defense systems. Batteries in military platforms are exposed to various stress factors, including temperature, humidity, impact, and vibration. Therefore, it is crucial to monitor the current status and performance of the battery. Battery Management Systems (BMS) are basic control units that address this need (Yılmaz et al., 2024). BMSs are essential for prolonging battery lifespan and maintaining health. This technological advancement in battery systems has impacted the defense industry and military vehicles (Üçgün et al., 2021). BMSs are integrated control systems that continuously monitor and manage basic battery parameters to ensure energy storage units' safe, efficient, and long-lasting operation (Kıvanç, 2019). They provide real-time information about the battery's current status by monitoring critical data such as voltage, temperature, and state of charge (SoC) (Ranawat & Prasad, 2018). They also transmit this data to users or upper-level control units, enabling timely action against potential overvoltage, temperature increases, or unbalanced charge/discharge conditions. Thus, the BMS increases operational safety and optimizes battery life (Aktaş et al., 2020).

A battery pack is a structure formed by assembling multiple battery cells in a specific configuration. These packs are formed by configuring the cells in series or parallel to provide the required voltage and current levels for the application. Battery cells connected in series determine the total output voltage, while those connected in parallel increase the total current capacity and energy density the system provides. In these configurations, imbalances between cells can negatively affect voltage or temperature differences. This is where BMS comes into play, ensuring these different connections' coordinated and safe operation (Akgündoğdu et al., 2017).

As a result of research conducted in the late 1990s, the basic functions that a battery management system (BMS) should have can be classified as follows: data collection, determination of battery status (i.e., charge status), electrical management, thermal management, and security management. Figure 1 (Jossen et al., 1999) shows BMS sub-components.

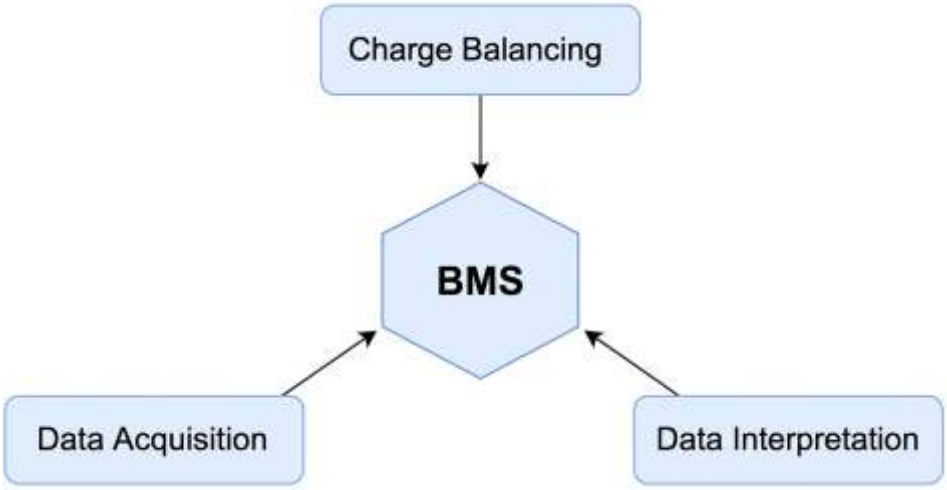

Figure 1. BMS Architecture

The data collection function allows the battery system and basic parameters related to the vehicle's power system to be continuously monitored and recorded through various sensors.

This function enables the measurement of many parameters, such as the input and output current of the battery, voltage values based on the battery pack and cells, and battery and ambient temperatures, in real time.

Determining the battery status involves calculating fundamental indicators that show the battery's current performance, lifespan, and operational adequacy. In this context, the battery system's status is expressed through critical parameters such as state of charge (SoC), state of health (SoH), state of energy (SoE), and remaining useful life (RUL). Accurately estimating these parameters significantly improves the BMS's decision-making processes and directly impacts the safety and efficiency of battery use (Piller et al., 2001).

The battery safety management function aims to ensure system safety by preventing electrical and physical limit values from exceeding during battery operation. One of the basic components of this function is the continuous monitoring of the depth of discharge. Deep discharge occurs when a large portion of the battery's capacity is used. This can lead to negative consequences, such as capacity loss, cell imbalance, and irreversible damage in the long term (Karadağ & Dikmen, 2021).

Fiber optic (FO) sensor technologies are gaining more and more attention for integration into BMS circuits. These sensors offer several technical and physical advantages over traditional electrical sensors, particularly for vehicles and systems operating in harsh environments. FO sensors offer several key advantages, including high immunity to electromagnetic interference, high sensitivity, wide temperature resistance, chemical stability, small size, and flexible structure (Corbellini et al., 2012).

Fiber optic (FO) sensors can precisely monitor parameters such as temperature, voltage, pressure, strain, and vibration thanks to their features. This increases battery cells' operational safety and performance efficiency (Bao & Chen, 2012). First, fiber Bragg grating (FBG)-based sensors offer high resolution and signal stability in multi-parameter detection because they can perform wavelength-based measurements. Additionally, these sensors can be directly integrated into battery cells due to their small size, providing cell-based monitoring and facilitating the early detection of imbalances between cells (Hill & Meltz, 1997).

The passive structure of fiber optic (FO) sensors means they do not require an external energy source. This makes them ideal for military applications with sensitive security and limited energy access. Additionally, the fiber lines used for signal transmission in these sensors can carry data with minimal loss over long distances, enabling high accuracy and the timely transfer of information to central control units (Kersey et al., 1997).

Materials and Methods

The experimental system developed in this study is based on a prototype of a microcontroller-powered battery management system (BMS). The Arduino platform was chosen for the hardware infrastructure. The system uses sensors based on the piezoelectric principle and a fiber Bragg grating (FBG)-based fiber optic sensor to detect vibrations. In the experimental setup, battery samples with different levels of aging — one unused, one used and worn out, and one at the end of its life — are placed on a vibrating surface. The relevant sensors are integrated with physical contact to the surface of each battery. The vibration data obtained through the sensors is monitored in real time in the Arduino IDE environment, and the goal is to record it simultaneously using the SD card module.

The system processes analog signals from sensors mounted on the battery's surface by converting them into digital data with the Arduino's ADC (analog-to-digital converter) unit. The real-time data obtained is analyzed to determine if the vibration level is related to the battery's health. If the threshold value is exceeded, the system disconnects the load circuit, puts the battery into protection mode, or warns the user. The system is designed to be lightweight, portable, low-power, and long-lasting in military field conditions for military vehicles. The Arduino code for the BMS circuit, created with the help of a fiber optic vibration sensor, is shown below.

Thanks to their basic advantages, such as electromagnetic field immunity, high sensitivity, bandwidth, chemical inertness, and compact design, FO sensors offer more reliable detection solutions, especially in military and industrial areas with intense electromagnetic interference. Additionally, FO sensors can accurately measure physical parameters such as temperature, strain, and vibration thanks to their sensitivity to changes in light wavelength. Their structure without metallic components also makes them safer in high-voltage systems, providing a positive advantage for use in sensitive areas, such as explosive environments or weapon systems. Their miniature, flexible structures allow them to be easily placed in narrow spaces like battery cells. This feature significantly increases the operational efficiency of directly observing intra-cell parameters.

However, the fragile nature of the sensors sometimes requires physical protection in environments with vibration or impact. Despite this limitation, their compact, passive structure makes them stand out in terms of low maintenance and energy consumption over the long term.

This study developed a vibration monitoring system to detect potential hazards caused by vibration and increase battery safety. The system is based on an Arduino microcontroller platform that continuously monitors analog data obtained from the fiber Bragg grating (FBG) sensor output. When vibration intensity exceeds a predetermined threshold, the system automatically disconnects the battery load from the circuit and alerts the user with a visual warning. Additionally, sensor data is recorded in real time on an SD card for long-term monitoring and analysis. This structure protects the battery system against vibration-induced failures and stores the obtained data for further analysis. The code fragment developed in this context is shown in Figure 2.

Findings and Discussion

During testing, it was observed and recorded that the vibration signals detected in worn and expired batteries had a higher amplitude and were irregular. Therefore, we can conclude that internal structural deterioration increases vibration sensitivity. The high sensitivity of fiber optic sensors enables the BMS's failure prediction and protection algorithms to work more effectively. In particular, the electromagnetic immunity and miniaturization of fiber Bragg grating (FBG) sensors increase the system's adaptability to the field.

Conclusion and Recommendations

The fiber optic vibration sensor supported by the BMS developed within the scope of this study provides an effective monitoring and protection solution for military batteries, especially those operating in harsh environmental conditions. Experimental applications revealed that vibration data from batteries at various stages of aging directly correlates with battery health. In this context, high-amplitude and irregular vibration signals were especially prevalent in worn and

exhausted batteries. These results demonstrate that the system can play a critical role in preventive maintenance planning and the early diagnosis of sudden failures.

The electromagnetic immunity, high sensitivity, and compact design of fiber optic sensors facilitate integration into military applications. The system's low cost, flexibility, and portability, thanks to its Arduino-based structure, provide significant advantages in field tests and modular development processes.

Future studies plan to develop this system with multiple sensor configurations, wireless communication capabilities, and intelligence-supported data processing algorithms. This will enable the simultaneous monitoring of not only vibration but also multiple physical parameters such as temperature, voltage, current, and humidity, providing a comprehensive and intelligent battery management system infrastructure.

```

ELECTRICITY PRODUCTION FROM NATURE (*Aloe vera*)

Mahdi Tajalian Mofrad
Master's student of Department of Agrotechnology, College of AbuRaihan, University of Tehran, Iran, ORCID: 0009-0006-4892-9443

ABSTRACT

Energy production and conversion is one of the most important and challenging fields of science and technology in today's world. With the expansion of energy needs and the increasing world population, the development of new and sustainable methods of energy conversion is a matter of environmental protection and energy security. Among the advanced ones in this field are energy conversion systems based on biochemical and bioelectric principles that, by utilizing functions and mechanisms derived from biological structures and organisms, enable the production and conversion of energy into clean and sustainable forms. Biochemical energy conversion systems are designed to use biological methods to produce energy, including light-sensitive solar cells and biological fuel cells. These systems, by simulating and utilizing biological methods such as energy production from chemical compounds in living cells, become usable energy sources. On the other hand, bioelectrical systems are able to generate electrical energy by utilizing biological electrochemical interactions between chemicals and biological components.

One of the challenges associated with designing biochemical and bioelectrical energy conversion systems is providing methods to increase efficiency and reduce the costs of production and use of these systems.

This article presents the results of a research on the energy conversion process using plant to generate electricity for the Iranian climate.

Keywords: Electricity production, Nature power, Green energy.

Introduction

8. Electrode potential is defined as the potential of a cell containing an electrode acting as the cathode and a standard hydrogen electrode as the anode. Reduction always occurs at the cathode and oxidation at the anode. Electrode potential (Heusler, 1986) can be related to an electrochemical cell, in which two dissimilar metals conduct an electric current and are treated as they tend to release electrons. For example, when zinc metal is placed with copper metal in their respective electrolytes (Hill, 2007), zinc begins to lose electrons through an external wire connection.

9.

Materials and Methods

Materials and Methods

The materials required for the experiment are given in this PLAN. In the entire plan, an aloe vera pot and several sets of cables for the anode and cathode were used. The materials used include:

A - Pot soil substrate

B - Pot or cultivation container

C - Aloe vera plant under test

D - Ammeter (amperage measuring instrument)

E - Copper metal and copper rod

F - Zinc metal and zinc metal strip

Findings and Discussion

In this design, two materials, tin and copper, have been used in the sample pot, so that copper metal and copper rod have been used in the soil and tin metal has been used on the leaves of the aloe vera plant.

From both metals, a coated wire cable has been stretched to terminals 1 and 2, and in order to minimize manual intervention and human error, the terminal has been used in all these designs. In the photos, this item is marked with the label PLAN A.

Table 1. Test result and voltage measurement in millivolts

After obtaining the results of the experiments and tests, the following graph was obtained. Also, the statistical results of the experiments performed are in accordance with the table below. (Table 2). The graphs and charts obtained from the results are also in accordance with Figure 2, which we will examine in the next section. (Figure 2)

Standard Error	SSD	Standard Deviation	P-Variance	Variance	Mean	Number	leaf Material on the	Material inside the soil
2.88	17.26	17.02	297.84	297.84	60.39	36.00	**Tin**	**Copper**

Table 2. Statistical results obtained from sampling

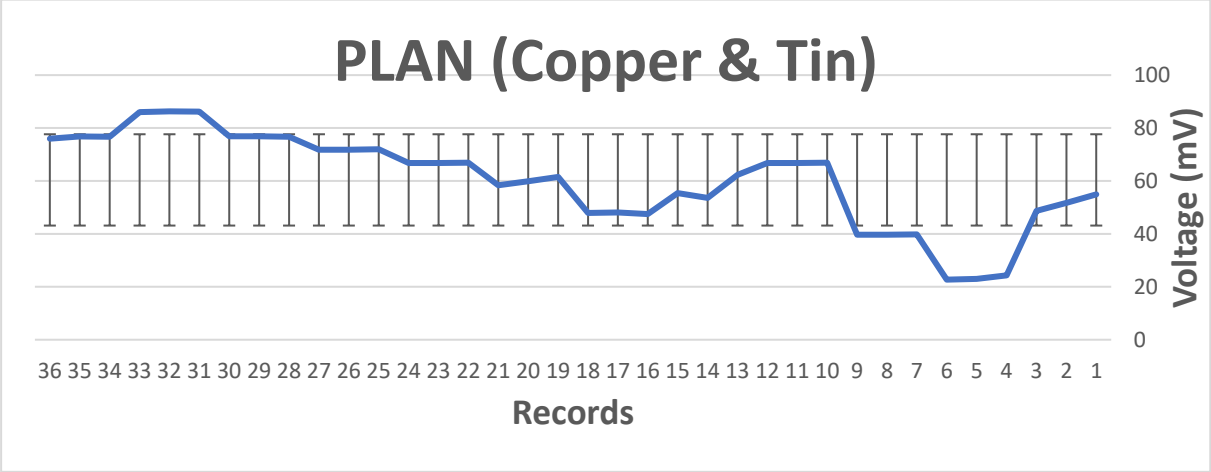

Figure 2. Graph of the results obtained from the experiment

Conclusion and Recommendations

Based on the results obtained, I suggest that by connecting plants in series and wiring them, the voltage obtained will be strengthened, and ion exchange can also be increased by replacing the soil substrate with marsh substrates. I also suggest that by using soil drainage and creating metal rods and grids in the soil, ion exchange can be increased, which will increase ion exchange and voltage, and by using this clean and useful energy, lighting can be provided at minimal cost.

Thanks and Information Note

Many thanks to Dr. Jafar Masah, Director of the Department of Agricultural Engineering, University of Tehran, who provided me with her unwavering and friendly guidance in the development and implementation of this project..

BIOFILM FORMATION INVOLVING FOOD BORNE PATHOGENIC AND HEALTH PROMOTING MICROORGANISMS

Tope James, Ogidi
Head of Department, Newland Polytechnic, Ilorin, Kwara, Nigeria, Department of Science Laboratory Technology, Ogidi.t@newlandpolytechnic.edu.ng
ORCID: 0009-0009-0925-262X

ABSTRACT

Biofilms are organized group of microorganisms living within a self-produced matrix of polymeric substances which gets attached to several surfaces. Biofilm formation is a dynamic process and different mechanisms are involved in their attachment and growth. Extracellular polymeric substances play an important role in the attachment and colonization of microorganisms to food-contact surfaces. Biofilm formation process on food contact surfaces can have a detrimental effect on the microbial status of food. The presence of biofilm on food leads to increase risk of food poisoning from pathogens. Preventive and control strategies like hygienic plant lay-out and design of equipment, choice of materials, correct use and selection of detergents and disinfectants can be used in controlling biofilm formation on food-contact surfaces. Biofilm formation by bacteria and their subsequent resistance to antibiotic and bactericidal is slow and it brings serious threat to public health as well as domestic health. The use of health promoting microorganisms against specific biofilm-associated bacteria must be adequately explored to prevent diseases. Health promoting microorganisms in biofilm formation have been used to prevent or treat gastrointestinal tract diseases. Health promoting microorganisms have beneficial impact on oral microbiota. Dental caries and diarrhea can be treated and prevented prophylactically by the use of health promoting microorganisms.

Keywords: Biofilm; Colonization; Microbiota; Extracellular polymeric substances; Pathogens; Control

Introduction

Biofilms are organized group of microorganisms living within a self-produced matrix of polymeric substances which gets attached to several surfaces (Franklin *et al.,* 2011). These collectives of microbes are found to be ubiquitous in almost every environment. Biofilms may be

form on solid biological or non-biological surfaces and are medically important, accounting for most of the microbial infections in the body. Biofilms are composed by a mass of microorganisms attached to a surface, such as a surface of a medical device, and the associated extracellular substances produced by one or more of the attached microorganisms. These biofilms are prevalent on most wet surfaces in nature. Biofilms have been seen to be present on liquid surfaces as a floating mat and in submerged state also. Biofilms contain either homogenous or heterogeneous communities of microorganism, embedded on a matrix of extracellular polymeric substances (Flemming and Wingender, 2010). Extracellular polymeric substances mainly consist of polysaccharides, but other biomolecules like proteins, lipids and nucleic acids are also present in extracellular polymeric substances. Polymers like glycopeptides, lipids and lipopolysaccharides form a scaffold and hold the biofilm together. Extracellular polymeric substances of biofilms are hydrogels which exhibit viscoelastic behavior. These properties allow the biofilms to withstand mechanical stress. The nutrients that are present in the matrix of extracellular polymeric substances are trapped for the use of bacteria. The water in the matrix is efficiently trapped by hydrogen bonding with the hydrophilic polysaccharides in extracellular polymeric substances. Genetic and environmental factors contribute towards the microbial biofilm formation. Bacteria can adapt to different environmental conditions by modifying their biofilm structure. The communities of microorganism of biofilms usually take part in the production and degradation of organic matter, the remediation of many environmental recalcitrant pollutants, the cycling of nitrogen, sulphur and many metals, in the purification of sewage, in the treatment of groundwater contaminated with petroleum, and in the process of nitrification, microbial biofilms play a major role. Rhizospheric soil has increase in soil fertility and plant growth becaue of the activities of microbial biofilms. In acid mine drainage (at a pH of 1), microbial biofilm plays an important role in the cycling of sulphur. The polymers of microbial biofilm on enhances the degradative ability of the organisms. Microorganisms in biofilm on polymer surface attained higher fitness in reproductive competency (Foreman and Wormald, 2010). Extracellular enzymatic activities in extracellular polymeric substances assist detoxification of heavy metals by transformation and subsequent precipitation in the exopolymeric mass. Microorganisms in biofilm exhibited higher metabolic functional diversity and metabolic cooperation than microorganisms in planktonic form. The enhanced metabolic functional diversity and phenotypic plasticity in biofilm residing microorganisms facilitate improved degradation of the polymer. Biofilm forms complexes with positively charged metal cations causing metal immobilization within the exopolymeric network.

Biofilms have many negative activities, the immune responses are not much effective against bacterial biofilms in comparison with their planktonic counterpart . Many bacterial pathogens that are initially considered as strictly extracellular can persist inside the host by the formation of biofilm through the process of adaptation that results in the evasion of the bacteria from innate immunity of the host. The evasion of biofilms from host innate response proves harmful to the host, as the inflammatory influx released by the body in response to the bacterial infection can damage the host tissues. The presence of biofilms in bacterial infections can increase the pathogenicity of the bacteria and protects the bacteria from being destroyed by external

treatment. Biofilm may exist in a variety of microbial infections as well as on the surface of the medical implants including catheters (Vasudevan, 2014). Some populations of biofilm-associated bacteria show antibiotic resistance, reduction in growth rate, secretion of different surface molecules and virulence factors and facilitates gene transfer among bacteria which can lead to increase in the number of virulent strains (Cortes *et al.,* 2011).

Biofilm matrix retards the diffusion of antibiotics through their extracellular polymeric substances , and this increases drug resistance among microbial population. Another possible mechanism of drug resistance of microbial biofilm can be mediated by the differential gene expression of biofilm cells compared to its planktonic form. Apart from this drug resistance, biofilms also exhibit resistance against bacteriophages, chemical biocides, amoebae, etc., (Costerton *et. al.,* 1999).Host immune responses is ineffective against microbial biofilms because biofilm cells regularly change the surface antigens through rapid alteration in gene expression. However, host immune responses against biofilm prove harmful for body tissues as the secretion of inflammatory cytokines at the site of biofilm formation is unable to destroy the biofilm structure but rather can cause wounds at the surrounding tissues. By these activities biofilm environment protects bacteria from external assaults, predator attack and chemical treatment like antibiotics.

Discussion and Findings: Stages of Biofilm Formation: Microbial biofilm grows through five consecutive stages such as initial reversible attachment, irreversible attachment, maturation stage I, maturation stage II and dispersion. Biofilm growth is guided by a sequence of physical, chemical and biological processes. Biofilm formation depends on an interaction between three main components: the bacterial cells, the attachment surface and the surrounding medium.

The first stage involves planktonic microbial cells adhering to the surface either by physical forces or by bacterial appendages such as pilli or flagella. A lot of factors like surface functionality, temperature and pressure can modulate the bacterial adhesion greatly. Attachment of a microbial cell to a surface is known as adhesion, whereas the attachment among microbial cells is termed as cohesion. Physical forces related to bacterial adhesion to surfaces comprise the van der Waals forces, steric interactions and electrostatic (double layer) interactions.

In the second stage, some of the reversibly attached cells remain immobilized and become irreversibly adhered when the attractive forces are greater than repulsive forces. It has been reported that the physical appendages of bacteria like flagella, fimbriae and pili overcome the physical repulsive forces of the electrical double layer of the cell and the surface and consolidate the interactions between bacteria and the surface. Cell surface hydrophobicity contributes a crucial role in biofilm formation when the bacteria adhere to a hydrophobic nonpolar surface because the hydrophobic interaction between the surface and the bacteria reduces the repulsive force between them. In the first and second stages of biofilm formation microbial cells initiallyare loosely associated with the concerned surface, which is then succeeded by specific and strong adhesion.

The third stage of biofilm formation is the maturation, In this stage, microbial cells start communicating among each other by the production of auto inducer signals (Vasudevan, 2014) that resulted in the expression of biofilm-specific genes. In this stage, microorganism secretes a matrix of extracellular polysaccharide substances to stabilize the biofilm network. Microbes like *P. aeruginosa* makes and releases three polysaccharides, namely alginate, Pel and Psl which provide the stability to the biofilm. Alginate interacts with nutrients and water and supplies nutrients to the biofilm (Rasamiravaka *et al*., 2015). Pel (glucose rich polysaccharide) and Psl (pentasaccharide) act as a scaffold for the structure of the biofilm. In addition to extracellular polysaccharide substances, thee DNA is also responsible for cellular

communication and stabilization of *P. aeruginosa* biofilm. Fresh *Pseudomonas* biofilms are more susceptible to DNase treatment compared to mature biofilm, suggesting the stabilizing role for e DNA during the initial biofilm stages when extracellular polysaccharide substances components are less. In this stage, the biofilm becomes multi-layered and their thickness is increased up to 10 µm (Wade, 2013)

In the fourth stage, the size of the microcolony increases and its thickness reaches to about 100 µm. Microcolonies in biofilm quiet often contain diverse microbial communities. These multispecies micro-consortia function in a relatively complex and coordinated manner. Their close proximity enhances substrate exchange, distribution of metabolic products and removal of toxic end products. For example, degradation of complex organic matter into methane and carbon di oxide during anaerobic digestion requires the involvement of at least three types of bacteria. Fermentative bacteria start the catabolism of complex organic compounds and produces acids and alcohols from the organic compounds. These substrates are then consumed by acetogenic bacteria as their substrates. Methanogen gains energy by converting acetate, carbon di oxide and hydrogen to methane. Biofilm offers a perfect environment for the establishment of syntrophic association (Flemming and Wingender, 2010). Syntrophism is a type of symbiosis in which two metabolically distinct microbes depend on each other in order to exploit certain substrates for their energy source. The third and fourth stages comprise the aggregation of the cells, forming microcolonies followed by the growth and maturation of the adhered cells. In this maturation stage, biofilm becomes adopted with the external condition by manipulating its structure, physiology and metabolism.

The fifth stage is the dispersion, it involves the shedding of the biofilm and return of sessile cells to the motile form. Finally, in this stage, biofilm spreads and colonizes new surfaces. In this phase, the microbial community inside the biofilm produces different saccharolytic enzymes which break the biofilm stabilizing polysaccharides and releases surface bacteria residing on the top of biofilm structure for colonization to a new surface (Rodrigues et. al., 2011)

Signalling events in Biofilm Formation

Formation of a biofilm is dependent on the interaction between the environmental stimuli and the reciprocation of the corresponding signalling events by the microorganisms (Fridman *et. al.,* 2013). There are many sensing systems that can integrate the environmental stimuli into signalling pathways. These sensing systems can induce responses from two-component systems (TCS), extra cytoplasmic function (ECF) signaling pathway and quorum sensing (QS) events. Secondary messengers like c-di-GMP (cyclic guanosine monophosphate**)** are also involved in triggering biofilm formation . In the formation of biofilm, a coordinated network of gene expression is required in a stepwise manner. These signalling events play a very important role for microbial biofilm formation by developing adaptive responses against external and internal stimuli (Bordi and de Bentzmann, 2011).

Biofilm and Drug Resistance

Antibiotic resistance of free-living bacteria usually involves inactivation of the antibiotic, modification of targets, and exclusion of the antibiotic. The acquisition of specific genetic factors, such as genes for β-lactamase are required for these actions. One of the most important aspects of bacterial biofilm formation is the increased resistance of the constituent microbes to

antibiotics and other stressors. The structure of the biofilm and the characteristics of the sessile cells produce resistance towards the antimicrobial agents which lead to a protected environment against adverse conditions and the host's defenses. Bacterial biofilm provides a protective mechanism for the cells to be less susceptible to antibiotics, dispersal of biofilm for removal of cells outside the matrix enables antibiotics for treatment of bacterial infections. Removal of these cells from the matrix of the biofilm renders them to be susceptible to antibiotics. Free living bacteria are more susceptible to antibiotic treatment and to host defense mechanisms. The minimal inhibitory concentration and minimal bactericidal concentration of antibiotics to biofilm-growing bacteria being up to 100 -1000 fold higher than for free bacteria, and possibly 150-3000 times more resistant to disinfectant (Bordi and Bentzmann, 2011

Biofilm Formation in Food Industry: industry of fermented food products (sausages, cheeses etc), biofilm formation by some useful and technological bacteria (e.g. staphylococci, lactococci, lactobacilli) can be desirable, as a mean of the enhancement of food fermentation process, and more importantly as a mean of protection against the establishment of pathogenic biofilms (Chorianopoulos *et al*., 2008). Many pathogenic organsims adhere to food surfaces these Include foodborne bacterial biofilm such as *L. monocytogenes*, *Salmonella enterica*, *Yersinia enterocolitica, Campylobacter jejuni, Escherichia coli* O157:H7 Modern food processing supports and selects for biofilm forming bacteria on food-contact surfaces due to mass production of products, lengthy production cycles and vast surface areas for biofilm development. *In situ* biofilms have been recognized in various food processing industries, such as processors of cheese and other milk products, raw and cooked/fermented meats, raw and smoked fish etc. The attachment of bacterial pathogens to food surfaces such as *Escherichia coli* to beef muscle and adipose tissue (Rivas *et al*., 2006) and *S. Typhimurium*, *Yersinia enterocolitica* and *L. monocytogenes* to pork skin **(Wade, 2013)**

Prevention of Biofilm Formation: Strategies to plan against bacterial biofilm must be achieved by prevention of biofilm formation rather than dispersal of the formed biofilm. Strategies for prevention of biofilm formation include both chemical and mechanical methods. Prevention are carried out by the application of anti-microbial coating, anti-peptides, chelating agents, anti-biofilms enzymes, anti-adhesion agents and bacterial anti-biofilm polysaccharides (Reid, 2012)

Health Promoting Microorganisms

Health promoting microorganisms (probiotics) is a proposed alternatives to antibiotic treatment (Cotter *et al*., 2013). Biofilms of health promoting microbes in the oral cavity, gastro intestinal tract, urogenital and respiratory tract prevent establishment of pathogenic microbes.

Conclusion And Recommendation

Biofilms are commonly defined as communities of microorganisms attached to a surface, producing an extracellular matrix, in which these microorganisms are embedded. Biofilms are very diverse and unique, not just to the microorganism, but to the particular environment in which they are being formed. Pathogenic biofilms have been of considerable interest in the context of food safety. In particular, biofilm formation by bacteria is a serious concern in food industry, since the persistence of this bacterium in biofilms formed on food-contact surfaces may become a constant source of product contamination.

Particularly challenging is the attempt to understand the complexity of the interactions within a biofilm community, since these interactions between the different species influence the final outcome of this community. A clearer understanding of the factors which influence microbial attachment to abiotic surfaces could provide the information necessary to modify processes in food processing environments in order to reduce microbial persistence and therefore reduce the contamination of food products.

Biofilm formation by bacteria and their subsequent resistance to antibiotic and bactericidal is a slow and it brings serious threat to public health as well as domestic health. The identification of health promoting microorganisms for the inhibition of intercellular communications will provide the means to inhibit biofilm development since intercellular communications are certainly required for biofilm development and persistence, the use of probiotics against specific biofilm-associated bacteria must be adequately explored to prevent diseases. To better control
biofilms in food borne pathogen adequate hygienic practices must be observed.

Thanks And Information Notes

The author appreciate the Team of Staff in Newland Polytechnic Library for their support in getting necessary materials during the preparation of this paper review.

SOIL POLLUTANTS AND IMPACT ON AGRICULTURAL CROPS

OTELE AMA
Department of Science Laboratory Technology, School of Applied Sciences, Federal Polytechnic Ekowe, Bayelsa State, Nigeria
Email: amaotele1@ gmail.com

ABSTRACT

Soil pollution is an escalating environmental challenge that threatens global agricultural sustainability, food security, and ecosystem health. This study explores the types, sources, and impacts of soil pollutants on agricultural crops, with particular emphasis on recent scientific findings. Key contaminants include heavy metals (e.g., lead, cadmium, arsenic), synthetic pesticides, petroleum hydrocarbons, microplastics, and excess nutrients like nitrates and phosphates. These pollutants originate primarily from industrial discharges, excessive agrochemical use, urbanization, and poor waste management practices. Once in the soil, these substances alter microbial dynamics, reduce fertility, degrade structure, and inhibit vital plant physiological processes such as nutrient uptake, photosynthesis, and root development. For instance, heavy metals interfere with plant metabolism, while microplastics and petroleum hydrocarbons impair soil porosity and water retention. Regional case studies from Asia, Africa, and Europe reveal how pollution diminishes crop yields and quality, with significant implications for food safety due to bioaccumulation and biomagnification. Mitigation strategies such as bioremediation, organic farming, and precision agriculture are discussed alongside policy recommendations aimed at reducing pollutant input and enhancing soil monitoring. This review underscores the urgent need for integrated, multidisciplinary approaches to restore and protect soil health. By synthesizing current research and presenting practical interventions, the work contributes to ongoing efforts to promote resilient agricultural systems and environmental sustainability in the face of mounting anthropogenic pressures.

Keywords: Soil contamination, agricultural productivity, heavy metals, crop toxicity, soil management

Introduction

Soil is an essential natural resource and a fundamental component of terrestrial ecosystems. It plays a pivotal role in sustaining life on Earth by supporting agricultural productivity, regulating the hydrological cycle, mediating biogeochemical processes, and acting as a medium for plant growth, nutrient cycling, and water filtration (FAO, 2022). Healthy soils are the foundation of food security, enabling the cultivation of crops that feed billions globally. However, in recent decades, the quality and functionality of soils have been severely compromised due to increasing anthropogenic pressures.

Modern agricultural practices, industrial expansion, improper waste disposal, and rapid urbanization have significantly contributed to the accumulation of pollutants in soils. These pollutants include a wide range of substances such as heavy metals (e.g., lead, cadmium, arsenic), synthetic pesticides, industrial chemicals, petroleum hydrocarbons, and emerging contaminants like microplastics and pharmaceutical residues (Zhang et al., 2021; Ahmed et al., 2023). The presence of these pollutants disrupts soil microbial communities, degrades soil structure and fertility, and adversely affects plant health, ultimately posing a threat to agricultural sustainability and food safety.

Heavy metals are among the most persistent and toxic soil contaminants. Introduced mainly through industrial emissions, mining activities, sewage sludge, and the overuse of phosphate fertilizers, heavy metals accumulate over time and interfere with plant metabolic processes (Xu et al., 2021). Pesticides, though designed to target pests, often persist in the environment long after application. Their residues can alter soil enzymatic activity, reduce biodiversity, and accumulate in crop tissues, entering the food chain (Singh & Prasad, 2020). Similarly, petroleum hydrocarbons—originating from oil spills, vehicular emissions, and industrial waste—bind to soil particles, decreasing porosity and water retention while releasing toxic compounds that impair root development and photosynthesis (Li et al., 2022).

One of the more recent concerns is the growing presence of microplastics in agricultural soils. These plastic fragments, often originating from plastic mulch films, compost made from household waste, or irrigation with contaminated water, persist in the soil environment and have been found to reduce soil aeration, interfere with root-soil contact, and inhibit nutrient uptake in crops (Zhang et al., 2021). Furthermore, excessive use of nitrogen and phosphorus-based fertilizers contributes to nutrient pollution, which not only acidifies soils and diminishes microbial diversity but also leads to eutrophication of nearby water bodies, compounding the environmental impact (Ahmed et al., 2023).

Soil pollution has direct and indirect consequences for crop growth and yield. Contaminants can lead to stunted growth, reduced seed germination, poor root development, and accumulation of toxic substances in edible plant parts (Zhao et al., 2020). These changes not only reduce the quality and quantity of agricultural produce but also pose long-term risks to human and animal health through bioaccumulation and biomagnification. Moreover, polluted soils are less resilient to climate variability and more susceptible to erosion and degradation.

Addressing soil pollution requires a multidisciplinary approach, integrating environmental science, agronomy, toxicology, and policy development. Sustainable soil management practices such as phytoremediation, organic farming, and precision agriculture can help mitigate the negative impacts. However, these strategies must be supported by effective regulatory frameworks, farmer education, and investments in soil health monitoring systems.

This review provides a comprehensive overview of the types and sources of soil pollutants, their pathways of contamination, and their impacts on agricultural crops. It draws upon recent

scientific studies and evidence from 2020 onwards to highlight emerging trends, case studies, and potential solutions for reversing soil degradation and promoting sustainable agricultural development.

Case Studies and Regional Perspectives

Asia: In China and India, heavy metal contamination due to industrial effluents and overuse of fertilizers has resulted in reduced yields of rice and wheat. A study by Chen et al. (2021) showed that cadmium concentrations above 3 mg/kg significantly reduce rice grain quality and increase health risks for consumers.

Africa: In Nigeria, improper disposal of agrochemicals and electronic waste contributes to lead and arsenic contamination in agricultural soils. These pollutants are known to stunt the growth of maize and cassava, vital food crops in the region (Obi et al., 2023).

Europe: European studies have reported high concentrations of microplastics in soilsunder intensive horticultural production. In the Netherlands, microplastic particles were found to reduce lettuce biomass by 15% over two growing seasons (van den Berg et al., 2021).

Table 1 Mitigation Strategies

S/N	Mitigation Strategies	Description
1	Bioremediation	Bioremediation involves the use of microorganisms and plants to degrade, transform, or immobilize pollutants. Phytoremediation using hyperaccumulator species such as Brassica juncea is effective in extracting heavy metals (Singh et al., 2022).
2	OrganicFarming and Precision Agriculture	Minimizing the use of synthetic agrochemicals and adopting precision agriculture techniques can reduce the accumulation of pollutants. Organic amendments such as compost and biochar also improve soil health and immobilize toxic elements (Ahmed et al., 2023).
3	Policy and Regulation	Strengthening regulatory frameworks for the disposal of industrial waste and pesticide use is critical. Monitoring and soil testing programs should be integrated into national agricultural strategies (FAO, 2022).

Conclusion

Soil pollution represents a multifaceted challenge with profound implications for agricultural productivity, food safety, and environmental health. Addressing the issue requires a combination of scientific innovation, policy reforms, and community-based interventions. Sustainable soil management must become a cornerstone of future agricultural planning to safeguard crops and ensure long-term food security.

ABSTRACT

This study examines the influence of social media influencers on the consumption practices of Generation Z within the context of increasing digitalization and the central role of social media in daily life. Social media platforms have surpassed the boundaries of traditional advertising, giving rise to an interaction-based marketing model that directly shapes consumer behavior. At the heart of this transformation are influencers, who function not only as product promoters but also as trust-building figures and digital opinion leaders among their followers. Within the scope of this study, the ways in which Generation Z—often referred to as digital natives—access information, make decisions, and form consumption habits are analyzed in depth. Using in-depth interview methodology, the research explores Generation Z's perceptions of trust in influencers, the impact of influencers on purchasing decisions, and the perceived authority of influencers within digital spaces. Findings reveal that Generation Z places greater trust in influencers who communicate authentically and align with their personal values, even when the content is sponsored. This has led brands to radically transform their marketing strategies, prioritizing social media collaborations over traditional advertising. A more nuanced analysis of the findings shows that the influence of these figures extends beyond economic motivations. When Generation Z individuals identify with an influencer's lifestyle, value propositions, and sense of social responsibility, they tend to form a stronger emotional connection with the products and brands endorsed. Thus, purchasing decisions become a form of identity performance, with influencers acting as catalysts in this process. As media literacy increases among Generation Z, hidden sponsorships, product placements, and perception management strategies are more easily detected, making it increasingly challenging for influencers to sustain trust-based relationships. This study emphasizes the need to reassess the role of influencers in the contemporary digital ecosystem and provides a comprehensive analysis of the multi-layered processes shaping Generation Z's consumer behaviors.

INFLUENCERLARIN Z KUŞAĞI ÜZERİNDEKİ ETKİSİ: SATIN ALMA DAVRANIŞLARI VE KANAAT ÖNDERLİĞİ ÜZERİNE BİR İNCELEME

ÖZET

Bu çalışma dijitalleşmenin hız kazanmasıyla birlikte sosyal medyanın bireylerin günlük yaşamlarında merkezi bir konum elde etmesi sürecinde, influencerların Z kuşağının tüketim pratikleri üzerindeki etkisini incelemektedir. Sosyal medya platformları, geleneksel reklamcılığın sınırlarını aşarak, bireylerin tüketim davranışlarını doğrudan etkileyen etkileşim temelli yeni bir pazarlama anlayışı geliştirmiştir. Bu dönüşümün merkezinde yer alan influencerlar, yalnızca ürün tanıtımı yapan figürler değil, aynı zamanda takipçileri nezdinde güven inşa eden ve kanaat önderi işlevi gören aktörler hâline gelmiştir. Bu çalışma kapsamında, dijital yerliler olarak adlandırılan Z kuşağının bilgiye ulaşım biçimi, karar alma süreçleri ve tüketim alışkanlıklarındaki değişimler derinlemesine analiz edilmiştir. Bu bağlamda, araştırmada derinlemesine mülakat yöntemi kullanılarak, Z kuşağının influencerlara yönelik güven algıları, satın alma kararlarındaki etkileri ve dijital platformlarda sahip oldukları otorite boyutları ele alınmıştır. Elde edilen bulgular, Z kuşağının, sponsorluk içeriği taşısa bile sahip oldukları değerlerle örtüşen, özgün ve samimi iletişim kuran influencerlara daha fazla itibar ettiğini ortaya koymaktadır. Bu durum, markaların pazarlama stratejilerini radikal biçimde dönüştürmekte ve geleneksel reklam yöntemleri yerine sosyal medya iş birliklerine öncelik vermelerini zorunlu kılmaktadır. Elde edilen bulguların daha derinlemesine analizi, influencerların Z kuşağı üzerinde oluşturduğu etkilerin yalnızca ekonomik motivasyonlarla sınırlı olmadığını göstermektedir. Z kuşağı bireyleri; influencerların yaşam tarzları, değer önermeleri ve sosyal sorumluluk anlayışları ile özdeşlik kurduklarında, söz konusu fenomenlerin önerdiği ürün ve markalarla daha güçlü bir bağlılık geliştirmektedir. Bu durum uygulamaya geçirdikleri tüketim kararlarının ürünün özelliklerinden ziyade temsil ettiği kimlik ve değerler bütününe göre şekillendiğini ortaya koymaktadır. Dolayısıyla Z kuşağı açısından satın alma süreci bir tür kimlik performansına dönüşmekte ve influencerlar söz konusu sürecin katalizörü rolünü üstlenmektedir. Z kuşağının medya okuryazarlığının artmasıyla birlikte, içeriklerin perde arkasındaki sponsorluk ilişkileri, ürün yerleştirme stratejileri ve algı yönetimi taktikleri daha kolay teşhis edilmekte ve influencerlar için sürdürülebilir bir güven ilişkisi kurmayı zorlatırmaktadır. Bu çalışma influencerların modern dijital platformlar içerisindeki konumlarının yeniden değerlendirilmesi gerektiğini ortaya koymakta, Z kuşağının tüketim pratiklerini etkileyen süreci detaylı biçimde irdelemektedir.

Anahtar Kelimeler: Z Kuşağı, Satın Alma Davranışı, Influencer, Sosyal Medya, Dijital Pazarlama, Dijital Kanaat Önderliği.

GİRİŞ

Günümüzde Dijital iletişim araçları yaşamın merkezine konumlandırılmaktadır. Özellikle Z kuşağının tüketim alışkanlıklarının sosyal medya içerikleri doğrultusunda şekillendiği görülmektedir. Bu bağlamda araştırma, influencerların yalnızca birer ürün tanıtıcısı değil, aynı zamanda düşünce biçimlerini, değer yargılarını ve yaşam tarzlarını etkileyen kanaat önderleri olarak nasıl konumlandıklarını ortaya koymayı hedeflemektedir. Çalışmanın temel amacı sosyal medya fenomenleri olarak adlandırılan influencerların Z kuşağı üzerinde oluşturduğu etkiyi iki ana eksende incelemektir: Satın alma davranışları üzerindeki etkileri ve kanaat önderliği rolleri.

Sosyal medya ve sosyal ağ platformları, kullanıcıların günlük yaşamlarının bir parçası haline gelmiş, bu mecralarda kendine has tarzlarıyla öne çıkan ve belirli kitlelere hitap eden yeni, tanınan ve bilinen kişiler ortaya çıkmaya başlamıştır. Bu kişiler, "influencer" olarak adlandırılmakta ve sosyal medya üzerinde belli bir etki alanına sahip bireyler olarak kabul edilmektedir. Farklı konularda içerik üreten influencerlar; seyahat, yemek, moda gibi alanlarda takipçilerine tavsiyelerde bulunurlar. Influencer, sosyal medya ortamlarında yüksek takipçi sayısına sahip, belirli bir konuda içerik üreterek kullanıcı davranışlarını etkileyebilen birey olarak tanımlanır (Booth & Matic, 2011). Bununla birlikte, sosyal medya aracılığıyla bir ürün ya da hizmet hakkındaki görüş ve deneyimlerini takipçileriyle paylaşarak tanıtımını yapan kişi, ya da sahip olduğu dijital mecralar üzerinden belirli bir grubu etkileyebilen kişi anlamlarına da gelir. Aynı zamanda bu kişiler "fenomen" olarak da tanımlanabilir (Tureng). Influencerlar deneyimledikleri hizmet ve ürünlerle ilgili bilgileri takipçilerine aktararak onları yönlendirme gücüne sahiptir. Toplumsal yapının dönüşmesi ve teknolojik gelişmelerle birlikte, günümüzde sosyal medya sayesinde toplumun her kesiminden bireylerin tanınma ve ünlü olma şansı doğmuştur. Önceden belirli bir yetenek veya sınıfsal ayrıcalık gerektiren ünlü olma durumu, artık sosyal medya aracılığıyla daha geniş bir kitleye yayılmıştır (Tokay ve Akın, 2021; Tokay ve Akın, 2020; Mert, 2018).

Tek yönlü iletişimin hâkim olduğu geleneksel dönemin ardından gelen dijital çağ, sosyal medya platformlarının yükselişine sahne olmuştur. Bu platformlar influencer pazarlama için geniş fırsatlar sunmuştur. Rekabet ortamında öne çıkmak isteyen markalar da bu pazarlama yöntemini bilinçli ve stratejik şekilde kullanmaya yönelmektedir. Ulusal/uluslararası birçok firmanın pazarlama yöneticileri, sosyal medyada yüksek takipçi sayısına sahip ve markalarını doğru temsil edebilecek influencerlarla sponsorluk anlaşmaları yapmaktadır. Bu iş birlikleri sayesinde şirketler, sosyal medyada ürün/hizmetlerini tanıtma imkânı bulmakta, ürettikleri içeriklerin ağızdan ağıza yayılmasıyla oluşan fırsatlardan faydalanmaktadır (Kırçova ve Enginkaya, Ebru 2015). Z kuşağı, geleneksel reklam stratejilerine göre dijital ortamda üretilen özgün ve samimi içeriklere daha fazla güven duymakta ve markaların hedef kitlelerine ulaşma biçimlerini yeniden şekillendirmelerine zemin oluşturmaktadır. Dolayısıyla bu konunun ekonomik, sosyal ve kültürel boyutları akademik olarak incelenmesini zorunlu kılmaktadır.

Çalışma akademik literatüre katkı sağlarken pazarlama iletişimi, dijital medya ve tüketici davranışları alanlarında çalışan profesyonellere Z kuşağı ile daha etkili iletişim kurmanın yollarını göstermeyi amaçlamaktadır.

1. Dijitalleşme ve Sosyal Medyanın Yükselişi

Dijital dilin kökenleri, 19. yüzyılda matematikçi Gottfried Wilhelm Leibniz'in 0 ve 1 değerlerinden oluşan ikili aritmetik sistemi keşfetmesiyle atılmıştır. Bu sistem günümüzde dijital iletişimin ve bilgi teknolojilerinin temelini oluşturmaktadır. Dijital dilde her harf, sayı ve sembol, belirli bir kodlamaya karşılık gelir. Bilgisayarlar ve teknolojik cihazlar, tüm işlemlerini

bu kodlar üzerinden gerçekleştirir. Bu nedenle günümüz dijital dünyası, adeta ikili (binary) sistemin hâkim olduğu bir yapıya dönüşmüştür (Demir Askeroğlu, 2017).

Tarihsel süreçte medya her dönemde insan yaşamında merkezi bir rol oynamıştır. İlk çağda güvercin, imparatorluk dönemlerinde ulaklar aracılığıyla uzak coğrafyalara iletilen haberler günümüzde sosyal medya platformlarında saniyeler içinde kıtalararası yayılmaktadır**.** Bu dönüşüm, iletişimin toplum üzerindeki etkisini de derinleştirmiştir. Özellikle dijital medya araçlarının etkin kullanımı, etki ve tepki döngülerinde hız ve yayılım açısından belirgin artışlara yol açmış, yeni iletişim teknolojileri, sosyal yaşamın ayrılmaz bir parçası hâline gelmiştir (Çelik, 2022). Sosyal medya, kapsamlı sosyal etkileşimi mümkün kılan ve kullanıcılar arasında dijital topluluklar oluşturan web tabanlı platformlar olarak tanımlanabilir. Kullanıcılar bu platformlar aracılığıyla çevrim içi profiller oluşturmakta, ağlar kurmakta ve iletişim kurmaktadır. Profil sayfaları, bireylerin dijital kimliklerini temsil etmekte ve kişisel web sitesi işlevi görmektedir. Bu sayfalarda bireyler, demografik bilgilerinin yanı sıra eğitim düzeyleri, politik ve dini görüşleri, ilgi alanları, sosyal çevreleri ve gündelik yaşamlarına dair detayları paylaşmaktadır (Akar, 2010).

2. Z Kuşağı'nın Medya ve Tüketim Alışkanlıkları

Z kuşağı, önceki nesillerden farklı olarak sosyal medya ortamına doğmuş ve bu mecralarla iç içe büyümüş bir kuşaktır. Bu kuşak, sosyal medya platformlarını ağırlıklı olarak iletişim kurmak, bilgi edinmek ve eğlenmek amacıyla kullanmaktadır. Eğlencenin yanı sıra ürün ve hizmetler hakkında bilgi toplamak, fiyat karşılaştırması yapmak, sosyal ilişkilerini sürdürmek ve çevrim içi iş birlikleri geliştirmek gibi amaçlarla da bu mecraları etkin bir şekilde kullanmaktadır (Hidvégi & Kelemen-Erdős, 2016; Sarıoğlu & Özgen, 2018). Sosyal medyada aktif zaman geçiren genç kullanıcılar, markaların dijital platformlarda görünür olmasını ve çevrim içi alışveriş imkânı sunmalarını önemli bulmaktadır. Ayrıca Z kuşağı, satın aldığı ürünlerin ve yaşadığı deneyimlerin özgün ve kişiselleştirilmiş olmasına büyük önem atfetmektedir (Baldwin, 2018).

Z kuşağının alışveriş öncesi bilgi ihtiyacını karşılama oranları da bu kuşağın dijitalleşmeye olan yatkınlığını ortaya koymaktadır. Buna göre, bilgi kaynakları arasında internet %82,1 ile ilk sırada yer almakta, bunu %60 ile aile ve arkadaş görüşleri, %15,6 ile ürün katalogları, %11,3 ile broşürler ve %6,7 ile satış danışmanları izlemektedir (Hidvégi & Kelemen-Erdős, 2016). Türkiye'de Z kuşağı üzerine yapılan bir araştırmada, katılımcıların en çok kullandığı sosyal medya platformunun Instagram, ardından Facebook olduğu belirlenmiştir. Kullanım amaçları arasında sohbet ve eğlence ilk sıralarda yer almaktadır (Kılıç & Karadayılı, 2017). Kuşaklar arası satın alma davranışları üzerine yapılan bir çalışmada, Z kuşağının en sık alışveriş yaptığı yerin alışveriş merkezleri olduğu, aynı zamanda interneti en yoğun kullanan kuşak olduğu ve satın alma kararlarında ürünün fiyatına en çok dikkat eden grup olarak öne çıktığı tespit edilmiştir (Sarı & Harta, 2018). Benzer bir çalışmada ise Z kuşağı tüketicilerinin Y kuşağından farklılaşan özelliklere sahip olduğu ortaya konmuştur. Bu özellikler arasında mükemmeliyetçilik, marka ve modaya düşkünlük, düşünmeden alışveriş yapma eğilimi, bilgi karmaşası yaşama ve alışverişten kaçınma gibi eğilimler öne çıkmaktadır (Özden, 2019).

3. Influencer Kavramı ve Dijital Kanat Önderliği

Karar alma süreçlerinde insanların diğer bireylerden etkilenmesi insanlık tarihi boyunca gözlemlenen evrensel bir gerçekliktir. İnsanoğlu, doğası gereği tercihlerde bulunabilmek için güvenilir bilgi kaynaklarına yönelmektedir. Bu bilgi arayışı sürecinde, sevilen, saygı duyulan, güvenilen ve fikirlerine itibar edilen bireylerin, yani "kanaat önderlerinin" rolü kritik bir durak olarak öne çıkmıştır. Günümüzde kanaat önderlerinin toplumsal etkisi ve hedef kitlelerine ulaşma biçimleri iletişim teknolojilerinde yaşanan gelişmelere bağlı olarak önemli dönüşüm

geçirmiştir. Söz konusu kişiler dijital platformlar aracılığıyla bireyleri etkileme, yönlendirme ve bilgilendirme işlevlerini yerine getirmekte; geleneksel "kanaat önderi" kavramı sosyal medyada "influencer" kimliğiyle yeniden tanımlanmaktadır (Kazancı, 2022). Sosyal medya vazgeçilmez bir araç olarak kullanılmaya başlanmış ve toplumsal hayatta önemli bir konumu işgal etmiştir. Söz konusu bu konumundan işletmelerde kendilerine pay çıkararak sosyal medya uzantılı pazarlama yaparak tüketicilere ulaşmaya çalışmaktadır (Terkan, 2014). Tüketiciler artık mal ve/veya hizmeti alırken öncelikle sosyal medya, facebook, instagram vb sitelerden gerçek kullanıcı yorumlarına bakarak işlem başlatmaktadırlar. Diğer kullanıcılar gibi kendileri de ürün ve/veya hizmet hakkında görüşlerini kullanıcılara ve alıcılara iletmektedirler (Hashımzada, 2015).

Tüketici satın alma süreci, tüketicinin satın alma öncesi, satın alma aşaması ve sonrasına ait süreçleri kapsamaktadır. Tüketicinin neden satın aldığı sorusuyla da yakından ilişkili olan bir kavramdır. Süreç, satın alma davranışını bir karar süreci olarak incelemektedir. Tüketici satın alma karar süreci, fiili satın almadan daha önce başlamakta ve satın alımdan çok daha sonra da sonuçlarını devam ettirmektedir (Tek ve Özgül, 2005). Tüketicinin neyi, nereden, hangi şekilde, ne zaman, niçin satın aldıklarını açıklamaya çalışan tüketici davranışlarıdır (Akturan, 2007). Tüketicilerin online tüketici satın alma davranışlarında, online alışverişle ilgili üç temel fikre sahip oldukları görülmektedir. Bunlar; zamandan tasarruf, uygun fiyat, istek ve ihtiyacı doğrultusunda kendisine en uygun ürünü bulmaktır (Punj, 2011).

Sosyal medya platformlarında yüksek ikna gücüne ve etki potansiyeline sahip bireyler olan influencerlar; ünlüler, internet fenomenleri, blog yazarları (blogger), YouTuber'lar ve Instagram kullanıcıları gibi geniş bir yelpazeyi kapsamaktadır. Bu kişilerin, herhangi bir marka, ürün ya da hizmet hakkında yaptığı tavsiyeler, takipçilerinin satın alma davranışlarını doğrudan etkilemektedir. Influencerların takipçi profilleri genellikle sadık ve güven temellidir. Takipçiler, bu kişilerin paylaşımlarını güvenilir bulmakta ve onların deneyimlerinden yola çıkarak kendi yaşamlarına yön vermektedir (Canöz vd., 2020). Influencerlar genellikle iki temel grupta sınıflandırılmaktadır:

- Macro influencer: Resmî bir tanımı bulunmamakla birlikte, sosyal medya ortamında 100.000'in üzerinde takipçiye sahip ve fenomenleşmiş bireylerdir.
- Micro influencer: Belirli bir niş hedef kitleye hitap eden ve takipçi sayısı 100.000'in altında olan bireylerdir (Mahmutoğlu vd., 2018).

Günümüzde ürün çeşitliliğinin artması, tüketicilere daha fazla seçenek sunarken, satın alma karar sürecini de karmaşıklaştırmakta ve uzatmaktadır. Bu süreçte tüketicinin karar verme sürecini kısaltan en önemli unsurlardan biri, ürün ya da hizmete duyulan **güvendir**. Güven, bireyin marka ya da ürüne olan bağlılığını artıran kritik bir faktördür. Özellikle markaların güven temelli yaklaşımları, marka algısını pozitif yönde etkilemekte ve marka sadakati oluşturmada belirleyici olmaktadır. Tüketicinin, markanın niyetinden ve güvenilirliğinden emin olması durumu olarak tanımlanan marka güveni, müşteri memnuniyeti ve kalite sürekliliği açısından da büyük önem taşımaktadır (Tekin ve Tuğsal, 2019).

Reklam içerikleri, gelişen dijital teknolojilerle birlikte gündelik yaşamın hemen her alanında görünür hale gelmiştir. Ancak tüketiciler; kendilerini yansıtmayan, yaşam tarzlarıyla örtüşmeyen, somut fayda sunmayan reklamlara karşı giderek duyarsız hale gelmektedir. Bu nedenle, doğrudan pazarlama mesajlarının etkisi sorgulanmaya başlanmış ve markalar geleneksel reklam anlayışının ötesine geçme ihtiyacı duymuştur. Bu bağlamda, tüketicilerin güven duyduğu, deneyimlerini paylaşan bireylerin – yani influencerların – önemi artmıştır. Influencer marketing**,** markaların hedef kitleleriyle güven temelli bağ kurmasına olanak tanıyan

etkili bir pazarlama tekniği olarak öne çıkmaktadır. Günümüzün sosyal medya fenomenleri, geçmişin kanaat önderleri gibi, takipçileri üzerinde güven oluşturarak önemli bir etki alanı yaratmaktadır. Influencer marketing stratejisi, dijital tüketiciye dokunan, onunla etkileşim kurabilen, özgün ve pazarlanabilir içerik üretimi fikrine dayanmaktadır (Aktaş ve Şener, 2019). Influencerlar çekiliş düzenleme, yarışma yapma, firmalardan ücretsiz ürün alma ve bu ürünleri tanıtma, marka elçisi olma gibi farklı yöntemlerle ürün ve hizmet tanıtımı yapmaktadır. Ayrıca tanıtmakta oldukları ürünleri giyerek, kullanarak ya da tüketerek gündelik yaşamda da görünür kılmaktadırlar. Bunun yanında, diğer influencerlarla ya da ünlü kişilerle ortak projelerde yer alarak da takipçileri üzerinde pozitif ve yönlendirici bir etki oluşturmaktadırlar (Yalçın, 2024).

MATERYAL VE YÖNTEM

Bu çalışmada, nitel araştırma desenlerinden biri olan derinlemesine mülakat yöntemi kullanılmıştır. Araştırmanın amacı, influencerların Z kuşağı üzerindeki etkilerini çok boyutlu biçimde anlamlandırmak ve yorumlamaktır. Bu kapsamda, üniversite öğrencileri içinden seçilen 19 katılımcı ile mülakat gerçekleştirilmiştir. Katılımcılar, sosyal medyada aktif biçimde influencer içeriklerini takip eden ve bu içeriklerin satın alma davranışlarına etkisini değerlendirme yeterliliğine sahip bireylerden oluşmaktadır. Araştırma örneklemi, amaçlı örnekleme yöntemiyle belirlenmiş; farklı tüketim alışkanlıklarına ve sosyal medya kullanım düzeylerine sahip bireylerin görüşlerine ulaşılması hedeflenmiştir. Mülakat sürecinde katılımcılara; influencerlarla etkileşim düzeyleri, bu etkileşimin satın alma kararları üzerindeki etkisi ve influencerları bir kanaat önderi olarak görme nedenlerine ilişkin sorular yöneltilmiştir.

Veri toplama aracı olarak yarı yapılandırılmış mülakat formu kullanılmıştır. Mülakatlar hem yüz yüze hem de çevrim içi ortamlarda gerçekleştirilmiş; katılımcıların görüşlerini özgürce ifade edebilmeleri amacıyla açık uçlu sorulara yer verilmiştir. Elde edilen veriler**,** betimsel analiz yöntemiyle çözümlenmiştir. Analiz sürecinde, veriler tematik kodlama yoluyla gruplandırılmış ve influencerların Z kuşağı üzerindeki etkilerine ilişkin derinlemesine içgörüler elde edilmiştir. Böylece, dijital çağda kanaat önderliğinin tüketici davranışları üzerindeki etkisi çok yönlü değerlendirilmiştir.

Çalışmanın etik onay süreci Ankara Hacı Bayram Veli Üniversitesi Etik Komisyonu tarafından değerlendirilmiş ve 26.03.2025 tarihli, 341712 sayılı komisyon kararıyla, Araştırma Kod No: 2025/142 ile etik açıdan uygun bulunmuştur. Veri toplama süreci, etik ilkelere uygun olarak gerçekleştirilmiştir. Katılımcılara araştırmann amacı, süresi ve içerdiği haklar hakkında bilgilendirme yapılmış; görüşmeler öncesinde yazılı aydınlatılmış onam formları imzalatılmıştır. Katılım tamamen gönüllülük esasına dayanmış, kişisel bilgiler gizli tutulmuş ve tüm veriler anonimleştirilerek analiz edilmiştir. Araştırmanın örneklemini, farklı sosyoekonomik düzey, eğitim seviyesi ve okuma alışkanlıklarına sahip bireylerden oluşan heterojen bir grup oluşturmuştur. Tüm katılımcılar, 1997–2012 yılları arasında doğmuş bireylerden oluşan Z kuşağı mensuplarıdır. Katılım gönüllülük temelinde yürütülmüş ve katılımcılara diledikleri zaman görüşmeyi sonlandırabilecekleri açıkça belirtilmiştir.

Görüşmeler yüz yüze ve bire bir gerçekleştirilmiştir. Katılımcıların birbirinden veya üçüncü kişilerden etkilenme ihtimali ortadan kaldırılmıştır. Görüşme ortamları, katılımcıların kendilerini rahat ve güvende hissedecekleri sessiz ve özel alanlar olarak seçilmiştir. Görüşmelerde yarı yapılandırılmış soru formu kullanılmıştır. Verilerin derinliğini ve bütünlüğünü sağlamak amacıyla açık uçlu sorulara da yer verilmiştir.

BULGULAR

Bu bölümde, araştırma kapsamında görüşme yapılan 19 üniversite öğrencisine yöneltilen sorulara verilen yanıtlar analiz edilmiştir. Katılımcılara ilk olarak sosyal medya kullanım

sıklıkları ve tercih ettikleri platformlara ilişkin sorular yöneltilmiştir. Bu sorular aracılığıyla, Z kuşağı bireylerinin dijital ortamdaki davranış kalıplarını ve influencer içerikleriyle temas düzeylerini anlamak hedeflenmiştir.

Tablo 1. Katılımcıların Kullandıkları Sosyal Medya Platformları

Sosyal Medya Platformu	Sıklık (n)
TikTok	7
Instagram	4
Twitter/X	2
YouTube	2
Facebook	1
Pinterest	1
Snapchat	1
WhatsApp	1

Grafikte katılımcı yanıtlarında en fazla adı geçen sosyal medya platformları gösterilmektedir. Görüldüğü üzere TikTok olarak adlandırılan dijital mecra en çok tekrar eden platformdur.

Tablo 2. Katılımcıların Sosyal Medyaya Yönelik Olumsuz Geri Bildirimleri

Tema / Görüş	Sıklık (n)
Bağımlılık / Aşırı kullanım	9
Zaman kaybı / Kaybolma	6
Eleştiri / Bıkmışlık	4
Story paylaşma / Takıntı	2
Sadece mesajlaşma amacıyla kullanma	1
Sosyal medyayı hiç kullanmama	1
Algoritma etkisi	1

Öğrencilerin sosyal medya kullanımlarına ilişkin verdikleri yanıtlar, tematik analiz yöntemiyle kategorize edilmiştir. Elde edilen veriler doğrultusunda, en sık tekrar eden temaların bağımlılık ve aşırı kullanım olduğu görülmüştür. Bu bulgu, öğrencilerin sosyal medya ile kurdukları ilişkinin yoğun ve süreğen bir etkileşim biçimine dönüştüğünü göstermektedir. Bu durum, dijital mecraların Z kuşağının günlük yaşam pratiklerinde ne denli merkezi bir yere sahip olduğunu ortaya koymaktadır.

Katılımcılara yöneltilen bir diğer soru, “Takip ettiğiniz influencerlar kimlerdir ve onları neden takip ediyorsunuz?” şeklindedir. Bu soruya verilen yanıtlar, gençlerin influencer tercihlerini belirleyen başlıca faktörlerin anlaşılması açısından önem taşımaktadır. Elde edilen yanıtlar doğrultusunda, influencerların takip edilme nedenlerinin başında samimiyet**,** güvenilirlik**,** güncel içerik üretimi**,** eğlence değeri **ve** tarz/yaşam biçimiyle özdeşleşme gibi temaların öne çıktığı görülmektedir. Katılımcıların büyük bir kısmı, takip ettikleri influencerların kendileriyle benzer sosyal özellikler taşımasını ya da ulaşılabilir, “gerçek” bir yaşam tarzı sergilemesini etkileyici bulduklarını ifade etmiştir. Bu analiz, influencerların tüketim alışkanlıklarını, değer yargılarını ve kimlik inşasını etkileyen kültürel figürler olarak algılandığını göstermektedir.

Dolayısıyla, Z kuşağının dijital etkileşimler yoluyla kurduğu bağların, daha geniş sosyal ve kültürel çerçevede değerlendirilmesi gerekmektedir.

Tablo 3. Katılımcıların Takip Ettikleri Influencerlar ve Frekans Dağılımı

Influencer	Sıklık (n)	Frekans (%)
Danla Bilic	1	%5,6
Orkun Işıtmak	1	%5,6
Enes Batur	1	%5,6
Ece Targıt	1	%5,6
Barış Özcan	1	%5,6

Tablo 4. Influencer Takip Etme Nedenlerinin Tematik Dağılımı

Takip Sebebi	Sıklık (n)	Frekans (%)
Eğlenceli içerikler	7	%36,8
Güzellik/makyaj	4	%21,1
Moda/stil	3	%15,8
Bilgilendirici içerikler	2	%10,5
Sakinleştirici/ruh hali odaklı içerikler	2	%10,5
Spontane izleme (algoritma etkisi)	4	%21,1
Takip etmeyenler (güvensizlik)	2	%10,5

Katılımcıların büyük çoğunluğunun eğlence ve görselliğe dayalı içerikleri tercih ettiği görülmektedir. Bu durum influencer seçiminde samimiyet, içerik türü ve iletişim dili gibi faktörlerin belirleyici olduğunu ortaya koymaktadır. Özellikle Z kuşağı bireylerinin, takip ettikleri dijital figürlerle duygusal ve estetik düzeyde bir bağ kurma eğiliminde oldukları gözlemlenmektedir.

Satın alma öncesinde yapılan araştırmalar, tüketicilerin bilinç düzeyini ve karar verme süreçlerindeki seçicilik düzeyini ortaya koyması açısından önemli bir gösterge niteliğindedir. Bu bağlamda, influencer etkisine rağmen gençlerin araştırma eğilimleri, “Bir influencerın önerdiği bir ürünü almadan önce başka kaynaklardan ek araştırma yapar mısınız? Yapıyorsanız, hangi kriterlere dikkat edersiniz?” sorusu ile değerlendirilmiştir. Katılımcıların önemli bir kısmı, önerilen ürün hakkında ek bilgi edinme gereği duyduklarını belirtmiş; bu süreçte en çok dikkat ettikleri kriterler arasında ürün yorumları, kullanıcı deneyimleri, fiyat karşılaştırmaları ve marka güvenilirliği öne çıkmıştır.

Tablo 5. Katılımcıların Ürün Satın Almadan Önce Araştırma Yapma Durumları

Araştırma Durumu	Sıklık (n)	Frekans (%)
Araştırma yapanlar	15	%78,9
Araştırma yapmayanlar	4	%21,1

Tablo 6. Katılımcıların Kullandıkları Ürün Araştırma Yöntemleri

Araştırma Yöntemi	Sıklık (n)	Frekans (%)
Kullanıcı yorumları	9	%47,4
Fiyat karşılaştırması	6	%31,6
Diğer influencer görüşleri	4	%21,1
Video/test içerikleri	5	%26,3
Arkadaş tavsiyesi	2	%10,5

Influencer etkisine rağmen, katılımcıların büyük bir kısmı ürün hakkında ikinci kaynaklardan bilgi edinme gereği duyduklarını ifade etmiştir. Bu eğilim, genç tüketicilerin giderek daha bilinçli ve sorgulayıcı bir tüketim anlayışına yöneldiğini göstermektedir. Bilgiye farklı kaynaklardan ulaşma isteği öneriyi yapan influencera duyulan güvenin de sorgulandığını ortaya koymaktadır.

Katılımcılara, influencer önerisiyle gerçekleştirdikleri satın alma deneyimlerinin sonuçları sorulmuştur. “Influencerlardan gelen önerilere dayanarak yaptığınız bir satın alma deneyiminden memnun kalmadığınız oldu mu? Bu durum influencerlara olan güveninizi nasıl etkiledi?” sorusu influencerlara duyulan güven düzeyini değerlendirmeyi amaçlamaktadır. Deneyimlerin olumlu ya da olumsuz oluşu, tüketici davranışlarını doğrudan etkileyen belirleyici unsur olarak değerlendirilmektedir. Elde edilen veriler tüketicinin kişisel deneyim yoluyla influencera yönelik algısında değişiklikler yaşanabildiğini ve bu durumun gelecekteki satın alma kararlarını etkileyebileceğini göstermektedir.

Tablo 7. Influencer Önerisine Dayalı Satın Alma Deneyimleri ve Güven Algısı

Tema / Görüş	Sıklık (n)	Frekans (%)
Olumsuz deneyim yaşayanlar	15	%78,9
Hiç olumsuz deneyim yaşamayanlar	2	%10,5
Kararsız/karma görüş (suç tamamen influencerda değil)	2	%10,5
Güven kaybı yaşayanlar	7	%36,8
Daha temkinli yaklaşmaya başlayanlar	5	%26,3
Influencerı suçlamayan / anlayışla yaklaşanlar	4	%21,1
Sorunu satıcıya ya da ürüne bağlayanlar	3	%15,8

Katılımcıların büyük çoğunluğu, influencer önerisiyle gerçekleştirdikleri satın alma deneyiminden memnun kalmadıklarını ifade etmiştir. Bu olumsuz deneyimler genellikle influencera yönelik güven kaybı, daha temkinli bir yaklaşım geliştirme ve önerilere karşı eleştirel tutum takınma ile sonuçlanmıştır. Bazı katılımcılar yaşadıkları memnuniyetsizliği doğrudan influencera yüklememekte durumu ürün kaynaklı sorunlar, satıcıya bağlı eksiklikler ve/veya kişisel beklentilerle ilişkilendirerek değerlendirme yapmaktadır. Influencerı doğrudan suçlamayan ya da problemi öneren kişiden çok ürünün kendisine bağlayan bu katılımcılar, tüketici algısının bağlamsal ve çok katmanlı olduğunu ortaya koymaktadır. Bu bulgular, influencer güvenirliğinin tüketici değerlendirmelerinin mutlak bir yargıdan çok çeşitli etkenlere dayalı olarak şekillendiğini göstermektedir.

Katılımcılara yöneltilen "Influencerların sosyal medyadaki rolü hakkında eklemek istediğiniz başka bir görüşünüz var mı?" sorusu, bireylerin influencerlara dair genel kanaatlerini serbestçe ifade etmelerine olanak tanımaktadır. Bu açık uçlu soru katılımcıların kişisel gözlem ve deneyimlerini yansıtabilmeleri açısından önemli bir veri kaynağı oluşturmaktadır. Katılımcıların bir kısmı influencerları sosyal etki yaratan figürler, algı yöneticileri ya da gençler için rol model konumundaki bireyler olarak tanımlamıştır. Bu durum influencerların dijital kültürde üstlendikleri işlevin çok katmanlı ve dinamik bir yapıya sahip olduğunu ortaya koymaktadır. Görüşlerin çeşitliliği, influencer etkisinin sosyal ve kültürel boyutlarını kapsadığını göstermesi açısından dikkate değerdir.

Tablo 8. Katılımcıların Influencerların Sosyal Medyadaki Rolüne İlişkin Görüşleri

Tema / Görüş	Sıklık (n)	Frekans (%)
İçerik tekrarları / samimiyetsizlik / sıkıcılık	6	%31,6
Fazla etkili bulunmaları / rol model gibi algılanmaları	5	%26,3
Herkesin influencer olmaya çalışması / sıradanlaşma durumu	4	%21,1
Daha fazla sorumluluk taşımaları gerektiği görüşü	4	%21,1
Samimiyetin önemli olduğunu vurgulayanlar	3	%15,8
Olumlu ve ilham verici bulanlar	3	%15,8
Ekstra görüş belirtmeyen katılımcılar	3	%15,8

Elde edilen verilere göre katılımcıların bir bölümü influencer içerikleri tekrara düşmekte, paylaşımlarda samimiyetten uzaklaşılmakta ve zamanla sıkıcı bir hâl almaktadır. Bazı katılımcılar ise sosyal medyada herkesin influencer olmaya çalıştığını, bu durumun kavramın anlamını sıradanlaştırdığını ve etkisini azalttığını dile getirmiştir. Görüşler arasında samimiyetin hâlâ önemli bir kriter olarak öne çıktığı ancak bu niteliğin giderek zayıfladığına dair algının oluştuğu görülmektedir. Bu bulgular, influencerların sosyal medyadaki rollerinin eleştirel/olumlu açılardan çok boyutlu değerlendirildiğini ortaya koymaktadır.

Çalışmada influencerların ürün ve hizmet tanıtımlarının tüketiciler üzerindeki etkisi ele alınmıştır. Özellikle satın alma kararlarında influencerların oynadığı rol dikkat çekicidir. Satın alma davranışlarını şekillendiren etkenleri ortaya koymak amacıyla katılımcılara: "Bir influencerın önerdiği bir ürünü veya hizmeti satın aldığınız oldu mu? Olduysa, sizi en çok etkileyen faktör neydi?" sorusu yöneltilmiştir.

Tablo 9. Influencer Önerisiyle Ürün veya Hizmet Satın Alma Durumu

Durum	Sıklık (n)	Frekans (%)
Satın alanlar	15	%78,9
Satın almayanlar	4	%21,1

Tablo 10. Influencer Etkisiyle Satın Alma Nedenleri

Neden	Sıklık (n)	Frekans (%)
Güven / özenme	6	%31,6
Viral içerik etkisi	3	%15,8
Görsellik ve estetik	3	%15,8

Katılımcıların büyük çoğunluğu, influencer önerisiyle en az bir kez ürün veya hizmet satın aldıklarını ifade etmiştir. Ancak bu satın alma deneyimlerinin sonuçları, bireysel memnuniyet düzeylerine göre farklılık göstermektedir. Satın alma kararlarında en belirleyici faktörlerin başında influencerın güvenilir bulunması ve katılımcıların öneren kişiyle özdeşim kurması yer almaktadır. Bununla birlikte görsellik, estetik sunum ve popülerleşen içeriklerin etkisi gibi unsurlar da karar sürecinde etkili olmuştur. Satın alma davranışına yönelik motivasyonlar arasında özellikle güven/özenme teması öne çıkarken, görsel sunumun cazibesi ve içeriğin yaygınlığı da bazı katılımcıları etkilemiştir. Ancak satın alma sonrası yaşanan deneyimlere bakıldığında, memnuniyetsizlik yaşayan katılımcı sayısının memnun olanlardan fazla olduğu görülmektedir. Bazı katılımcılar üründen tamamen memnun kalırken, önemli bir kısmı beklentilerini karşılamayan ürün ve/veya hizmet nedeniyle pişmanlık yaşadığını belirtmiştir. Bu durum, influencer etkisinin satın alma davranışının başlatılmasında güçlü olmasına rağmen, sürdürülebilir memnuniyet açısından yeterli olmadığını göstermektedir.

Influencerlara karşı duyulan güven, takipçilerin içerik ve/veya ürünlere ilişkin tutumlarını doğrudan etkilemektedir. Çalışmada, katılımcıların influencer güvenilirliğine ilişkin algılarını değerlendirebilmek amacıyla, “Influencerların ürün veya hizmet tanıtımları yaparken ne kadar samimi ve güvenilir olduklarını düşünüyorsunuz?” sorusu yöneltilmiştir. Bu soru aracılığıyla duyulan güveni artıran ya da zedeleyen faktörler analiz edilmiştir.

Tablo 11. Katılımcıların Influencerlara Olan Güven Durumu

Güven Durumu	Sıklık (n)	Frekans (%)
Güvenmeyenler	13	%68,42
Duruma göre değişir diyenler	6	%31,6
Güvenenler	2	%10,5

Tablo 12. Güven Kaybına Yol Açan Faktörler

Faktör	Sıklık (n)	Frekans (%)
Abartılı anlatım / yapmacık üslup	9	%47,36
Ürünün birçok influencer tarafından aynı anda tanıtılması	4	%21,1
Ürünün gerçekten kullanılmadan tanıtılması	5	%26,3

Elde edilen veriler güven duygusunun influencer ve takipçi arasındaki etkileşimi yönlendiren temel dinamik olduğunu göstermektedir. Özellikle samimiyet algısı, ticari amaçla yapılan içeriklerde güvenin en sık sorgulanan boyutu olarak öne çıkmaktadır. Bununla birlikte şeffaflık,

sponsorlukların açıkça belirtilmesi ve influencerın daha önceki içeriklerle tutarlılığı gibi unsurlar güveni etkileyen önemli faktörler arasında yer almaktadır. Özellikle ürünün sunan kişi tarafından gerçekten kullanılıp kullanılmadığına dair şüpheler güveni zedeleyen başlıca unsurlar arasında sayılmaktadır. Bunun yanı sıra ürünün çok sayıda influencer tarafından eş zamanlı olarak tanıtılması içeriklerin özgünlüğüne ve samimiyetine dair soru işaretleri doğurmaktadır. Veriler influencer-takipçi ilişkisinde güvenin kırılgan bir yapıya sahip olduğunu ortaya koymaktadır.

Influencer içeriklerinde yer verdikleri sponsorluklar kullanıcıların içeriği algılayış biçimini değiştirebilmektedir. Çalışmada "lnfluencerların marka iş birlikleri ve sponsorluk anlaşmalarını nasıl değerlendiriyorsunuz? Bu tür içerikler satın alma kararınızı nasıl etkiliyor?" sorusu ile bu tür içeriklere yönelik tutumlar incelenmiştir.

Tablo 13. Influencer İçeriklerine Karşı Katılımcı Tutumları

Tutum	Sıklık (n)	Frekans (%)
Olumsuz etkilenme / içeriği atlama eğilimi	9	%47,36
Olumlu ya da nötr yaklaşanlar	7	%36,8
Farkında olmadan etkilendiğini belirtenler	3	%15,8

Katılımcıların büyük bir kısmı influencerların toplumsal meselelere yönelik içerik üretmesini önemli ve etkili bulmaktadır. Toplumsal konulara duyarlılık influencerların takipçileri üzerindeki algısal etkisi bakımından belirleyici aktör olarak öne çıkmaktadır. Özellikle çevre bilinci, kadın hakları, toplumsal cinsiyet eşitliği ve yardım kampanyalarına yönelik içerikler, olumlu ve samimi algılanmakta, bu tür içerikler influencerın güvenilirlik ve toplumsal sorumluluk algısını güçlendirmektedir. Bununla birlikte bu meseleleri önemsiz bulan ya da tarafsız kalan katılımcıların varlığı bu etki alanının homojen olmadığını göstermektedir. Ancak verilere bakıldığında katılımcıların influencerları sosyal bilinç oluşturabilecek aktörler olarak algılandıklarını söylemek mümkündür.

Tablo 14. Katılımcıların Influencerların Toplumsal Meselelere Yaklaşımına Yönelik

Tutum	Sıklık (n)	Frekans (%)
"Önemli" bulanlar	11	%57,89
"Etkiler" diyenler	5	%26,3
"Umursamıyorum" diyenler	3	%15

Influencer türüne göre değişen güven algısı, katılımcıların içerik tercihlerinde belirleyici bir unsur olarak öne çıkmaktadır. Bu bağlamda, mikro ve makro influencerlara duyulan güven karşılaştırmalı olarak ele alınmıştır.

Tablo 15. Katılımcıların Mikro ve Makro Influencerlara Yönelik Güven Algısı

Güvenilirlik Görüşü	Sıklık (n)	Frekans (%)
Mikro influencerlara güvenenler	13	%68,42
Fark olmadığını düşünenler	3	%15,8
Makro influencerları takip edenler	3	%15,8

Tablo 16. Mikro Influencerlara Duyulan Güvenin Gerekçeleri

Gerekçe	Sıklık (n)	Frekans (%)
Samimiyet / "bizden biri" hissi	7	%36,8
Soru-cevap etkileşimi	2	%10,5
Detaylı ve açıklayıcı anlatım	3	%15,8
Deneyim gibi paylaşım yapılması	4	%21,1

Mikro influencerlar daha küçük bir takipçi kitlesine sahip olmalarına rağmen içeriklerinde samimi, ulaşılabilir ve özgün bir tutum sergiledikleri için birçok katılımcı tarafından daha güvenilir bulunmuştur. Buna karşın makro influencerlar daha geniş kitlelere hitap etmektedir ancak içeriklerinin çoğunlukla sponsorluk temelli olması ve ürün/hizmeti profesyonel sunum biçimleri güven algısını zayıflatabilmektedir. Katılımcılar mikro influencerların ürün ve/veya hizmetleri gerçekten kullandığına inanma eğilimindeyken, makro influencerlara yönelik temkinli ve eleştirel bir bakış sergilemektedir. Bu durum katılımcıların içerik tercihlerini etkileyen temel faktörün içerik sunumundaki samimiyet, şeffaflık ve bireysel etkileşim düzeyi olduğunu göstermektedir.

Tüketicilerin hangi alanlarda influencerlardan etkilendiklerine ilişkin veriler pazarlama stratejilerinin oluşturulmasında önemli kaynak niteliği taşımaktadır. Bu kapsamda katılımcılara "Influencerların sizin fikirlerinizi veya yaşam tarzınızı etkilediğini düşünüyor musunuz? Eğer öyleyse, hangi alanlarda (örneğin moda, teknoloji, sağlık vb.) daha fazla etkili olduklarını düşünüyorsunuz?" sorusu yöneltilmiştir.

Tablo 17. Katılımcıların Influencerlardan Etkilenme Durumları

Etki Durumu	Sıklık (n)	Frekans (%)
Etkilendiğini belirtenler	15	%78,9
Bilinçsizce etkilendiğini düşünenler	3	%15,8
Etkilenmediğini belirtenler	2	%10,5

Tablo 18. Katılımcıların Influencerlardan Etkilendikleri Alanlar

Alan	Sıklık (n)	Frekans (%)
Moda / giyim	10	%52,63
Makyaj / cilt bakımı	6	%31,6
Teknoloji	5	%26,3
Tüketim alışkanlıkları	4	%21,1
Kişisel bakım	3	%15,8
Sağlık / beslenme	2	%10,5

Elde edilen bulgulara göre katılımcılar influencer etkisini en yoğun şekilde moda, makyaj ve teknoloji alanlarında hissettiklerini ifade etmiştir. Özellikle kişisel bakım, giyim tercihi ve teknolojik ürün seçimleri gibi günlük tüketim pratiklerinde influencerların yönlendirici rol

oynadığı görülmektedir. Bu durum dijital platformlarda içerik üreten kişilerin doğrudan tüketici davranışlarını şekillendiren etkili aktörler hâline geldiğini göstermektedir.

Katılımcılara yöneltilen "Sizce influencerların etkisi gelecekte nasıl bir yön izleyecek? Onların satın alma kararları ve tüketim alışkanlıkları üzerindeki gücü zamanla artacak mı, azalacak mı?" sorusu, influencer pazarlamasının geleceğine ilişkin algıları ve öngörüleri anlamayı amaçlamaktadır. Dijitalleşmenin hızla dönüştürdüğü medya ortamı bu tür etkilerin sürdürülebilirliği ve kalıcılığı konusunda farklı düşüncelerin oluşmasına zemin hazırlamaktadır. Bu doğrultuda katılımcılardan influencer etkisinin zamanla artıp artmayacağına dair kişisel tahminlerini paylaşmaları istenmiştir. Elde edilen veriler, dijital etkileşim biçimlerinin evrimi karşısında influencerların toplumsal/ekonomik etkilerinin nasıl algılandığını ortaya koymak açısından anlamlı sonuçlar sunmaktadır.

Tablo 19. Katılımcıların Influencer Etkisinin Geleceğine Yönelik Öngörüleri

Tema / Görüş	Sıklık (n)	Frekans (%)
Etkisi artar	8	%42,1
Etkisi azalır	7	%36,8
Etkisi platforma/teknolojiye göre değişir	5	%26,3
Etkisi sabit kalır veya biçim değiştirir	3	%15,8
"Herkes influencer olursa etkisi düşer" görüşü	3	%15,8

Katılımcıların influencer etkisinin geleceğine dair öngörüleri farklılık göstermektedir. Görüşler incelendiğinde büyük bir kısmı dijitalleşmenin etkisiyle influencerların daha da etkili hale geleceğini öne sürmektedir. Bununla birlikte önemli sayıda katılımcı influencer etkisinin zamanla azalacağını düşünmektedir. Bu düşüncenin gerekçeleri arasında, içeriklerin tekrara düşmesi, samimiyetin zayıflaması ve çok sayıda kişinin influencer olmaya çalışması nedeniyle oluşan "doğallık" sorunlarının öne çıktığı görülmektedir. Bir kısım katılımcı bu etkinin sabit kalabileceğini ya da zamanla içerik biçiminin değişebileceğini dile getirmiştir. Etkinin platform ve/veya teknolojik gelişmelere bağlı olarak değişkenlik göstereceğini düşündüğünü ifade eden bu katılımcılar algoritmaların yönlendirici rolüne dikkat çekmektedir. Elde edilen veriler influencer etkisinin geleceğine dair algıların çok boyutluluğunu ve bağlama duyarlığını ortaya koymaktadır.

SONUÇ

Bu araştırma, dijitalleşmenin yaşamın hemen her alanında bir dönüşüm gerçekleştirdiği çağdaş toplumda, Z kuşağının sosyal medya platformları aracılığıyla kurduğu etkileşim biçimlerini, gündelik yaşam pratiklerini ve bu etkileşimlerin tüketim davranışları üzerindeki yansımalarını incelemiştir. Özellikle influencerlar (sosyal medya fenomenleri), geleneksel medya figürlerinden farklı olarak daha kişisel, doğrudan ve samimi bir iletişim biçimi sergilemeleri nedeniyle, Z kuşağının tüketim kararlarında etkili kanaat önderleri haline gelmiştir. Araştırma bulguları, bu dönüşümün hem ekonomik hem kültürel boyutlarda analiz edilmesini zorunlu kılmaktadır.

Dijital dünyanın yerlisi şeklinde tanımlanan Z Kuşağı, teknolojik gelişmeleri hayatlarının merkezine alarak, bilgiye hızlı erişim sağlama, dijital araçlarla iletişim kurma ve sosyal medya platformları üzerinden toplumsal ilişkiler geliştirme konusunda oldukça yetkindir. Bu bağlamda sosyal medya, Z kuşağı için yalnızca bir sosyalleşme veya eğlence aracı değil; aynı

zamanda haber alma, bir bilgi edinme, dünyayı anlamlandırma ve tüketim kararlarını yönlendirme mecrası haline gelmiştir. Araştırma, influencerların paylaşıma sunduğu içeriklerin Z kuşağı üzerindeki yönlendirici etkisinin; içeriklerin biçimi, sunum tarzı ve içerik üreticisinin kişisel özellikleriyle doğrudan ilişkili olduğunu ortaya koymuştur.

Katılımcı gençlerle yapılan görüşmeler ve analizler neticesinde, influencerların tüketim kararlarını etkileyen çok yönlü figürler olduğu görülmüştür. Moda, güzellik, teknoloji, sağlık, yaşam tarzı ve eğlence gibi farklı temalarda içerik üreten influencerlar, takipçilerine sadece ürün veya hizmet tanıtmakla kalmamakta, aynı zamanda bu ürünlerin gündelik yaşamdaki yerini gösteren deneyimsel bir anlatı gerçekleştirmektedir. Bu deneyim aktarımı, geleneksel reklam modellerinden farklı olarak daha kişiselleştirilmiş ve güven temelli bir ilişki kurmaktadır. Katılımcıların büyük çoğunluğu, bir ürün veya hizmeti denemeden önce araştırma yaptığını, ilgili influencerların içeriklerini takip ettiğini, bu içeriklerden elde edilen izlenim doğrultusunda satın alma kararlarını şekillendirdiğini belirtmiştir.

Bu kapsamda influencerlara duyulan güvenin temel faktörleri; içeriklerdeki şeffaflık, sponsorlu paylaşımların açıkça belirtilmesi, ürünle ilgili olumlu-olumsuz tüm yönlerin samimi biçimde dile getirilmesi ve ilgili influencerın genel güvenilirliği olarak öne çıkmaktadır. Özellikle mikro influencerların, makro influencerlara kıyasla daha etkili bulunduğu tespit edilmiştir. Bunun temel nedeni, mikro influencerların takipçileriyle daha doğrudan, etkileşimli ve kişisel bir iletişim kurabilmeleri, böylelikle "samimi" bir imaj oluşturmalarıdır. Bu tür bir iletişim, izleyici üzerinde "bir arkadaş tavsiyesi" etkisi yaratmakta ve bu da satın alma kararlarını önemli ölçüde etkilemektedir.

Diğer taraftan, influencerlar hakkındaki eleştirel tutumlar da araştırmada dikkat çeken unsurlardandır. Katılımcıların bir bölümü, influencer içeriklerinde zamanla ortaya çıkan tekrarların, içerik üreticilerinin ticari kaygılarla hareket etmesinin ve markalarla kurulan işbirliklerinde samimiyetin azalmasının güven duygusunu zedelediğini ifade etmiştir. Bu bağlamda "influencer yorgunluğu" olarak adlandırılabilecek bir algı oluşmaya başladığı görülmektedir. Bu durum, influencer pazarlamasının sürdürülebilirliği açısından dikkatle değerlendirilmesi gereken önemli bir husustur. Katılımcıların bir kısmı, gelecekte influencer etkisinin daha da artacağını düşünmekle birlikte; bazı katılımcılar bu etkinin platformlara, algoritmalara, içerik biçimlerine ve sosyal eğilimlere bağlı olarak azalabileceğini öne sürmüştür. Özellikle Instagram gibi görsel ağırlıklı platformların gelecekteki işlevi, bu etkileşimin yönünü belirlemede etkili bir faktör olabilir.

Araştırmanın bir diğer dikkat çekici sonucu ise, sosyal sorumluluk merkezli içeriklerin Z kuşağı üzerinde olumlu bir etki oluşturmasıdır. Çevresel duyarlılık, hayvan hakları gibi temaları işleyen içerikler, sadece tüketime değil aynı zamanda bilinçli birey olma hâline de hitap etmektedir. Z kuşağı, yalnızca kaliteli veya trend olan ürünleri değil, aynı zamanda etik değerlere duyarlı markaları ve bu değerleri temsil eden influencerları da tercih etmektedir. Bu durum, influencerların sadece ekonomik değil aynı zamanda kültürel ve toplumsal anlamda da yön verici bir konumda ve sosyal bilinç oluşturma potansiyeline sahip aktörler olduğunu gözler önüne sermektedir.

Sonuç olarak, influencer pazarlaması, günümüzde geleneksel medya stratejilerinin ötesine geçen, çok boyutlu bir iletişim ve etkileşim modeli sunmaktadır. Z kuşağı üzerinde yalnızca ekonomik değil, aynı zamanda kültürel ve sosyal düzeyde de etkili bir araç haline gelmiştir. Onların dijital kimlikleriyle kurdukları ilişki, tüketici davranışlarını şekillendiren yeni parametreler doğurmuştur. Bu parametrelerin başında güven, deneyim, etkileşim, samimiyet ve toplumsal duyarlılık gibi değerler gelmektedir. Influencerlar, bu değerler üzerinden yeni nesil

bir kanaat önderliği modeli inşa etmekte ve geleneksel anlamda pasif tüketici konumundaki bireyleri, aktif karar vericilere dönüştürmektedir.

Bu dönüşüm, pazarlama dünyası açısından hem yeni fırsatlar hem de yeni sorumluluklar getirmektedir. Markaların influencer iş birliklerine yönelik daha etik, şeffaf ve hedef odaklı stratejiler geliştirmesi, yalnızca satış başarısını değil, aynı zamanda marka itibarı ve tüketici sadakatini de belirleyecek temel unsurlardan biri haline gelmiştir. Bu bağlamda influencer fenomeni, sadece geçici bir dijital trend değil; dijital çağın sosyal, kültürel ve ekonomik yapısının yeniden inşasında rol alan kalıcı bir aktör olarak değerlendirilebilir.

QUALITATIVE ANALYSIS OF SECONDARY SCHOOL STUDENTS' PERCEPTIONS AND REFLECTIONS ON THEIR READING EXPERIENCES

ORTAOKUL ÖĞRENCİLERİNİN OKUMA DENEYİMLERİNE İLİŞKİN DUYGU VE DÜŞÜNCELERİNİN NİTEL ANALİZİ

Feyzanur GÜN
Yüksek Lisans Öğrencisi, Düzce Üniversitesi, Lisansüstü Eğitim Enstitüsü, Türkçe Eğitimi Programı, Düzce-Türkiye, feyzanurgun@gmail.com, ORCID:0009-0003-6909-3364

ÖZET

Okuma, temel dil becerilerinden biri olup bireylerin yalnızca bir metni seslendirmesi değil algılama ve anlama süreçlerinin de işe koşulduğu bir süreç olarak ifade edilebilir. Okul çağının başlamasıyla kazanılan okuma becerisi, kişinin okuma çabasına bağlı olarak zamanla gelişerek diğer temel becerilerden olan konuşma ve yazma alanlarının da gelişmesine katkı sağlar. Gelişen teknolojiyle birlikte dijital dünyada hızlı olmanın bireyi öne geçiren bir unsur haline gelmesiyle okuduğunu anlama süresinin de önem kazanmış olması dolaylı olarak okuma becerisinin de önemini arttırmaktadır. Bu araştırma, ortaokul öğrencilerinin okuma deneyimlerine ilişkin duygu ve düşüncelerini resimleri aracılığıyla nasıl ifade ettiklerini anlamak amacıyla yapılmıştır. Araştırmada nitel araştırma yöntemleri içinde yer alan doküman incelemesi yöntemi kullanılmıştır. Araştırmanın verileri Düzce'de 2024-2025 eğitim öğretim yılında bir ortaokulun 5, 6, 7 ve 8. sınıf kademelerinde öğrenim görmekte olan 72 öğrenciden toplanmıştır. Araştırma kapsamında, öğrencilerden okumanın onlara ne hissettirdiğini, onlar için ne anlama geldiğini resim çizme yoluyla aktarmaları ve resimleri bir cümle ile açıklamaları istenmiş olup çizilen resimler tematik analiz tekniği ile çözümlenmiştir. Araştırma sonucunda elde edilen bulgularda, öğrencilerin okuma deneyimlerine yönelik dört ana temaya ulaşılmış olup ulaşılan ana temalar "Olumlu Duygusal Deneyim, Gelişim ve Öğrenme, Eğlence ve Sosyal Boyut, Olumsuz Deneyimler" olarak ifade edilmiştir. Rahatlatıcı Etkiler ve Pozitif Duygular alt temalarından Olumlu Duygusal Deneyim temasına ulaşılmışken Zorlayıcı Faktörler ve Olumsuz Duygular alt temalarından Olumsuz Deneyimler temasına ulaşılmıştır. Yaşam Becerileri ve Zihinsel Süreçler alt temalarından Gelişim ve Öğrenme temasına ulaşılmış olup son olarak Sosyal Bağlantı ve Eğlence Unsurları alt temalarından da Eğlence ve Sosyal Boyut temasına ulaşılmıştır. Araştırma, öğrencilerin okuma deneyimlerine ilişkin çoğunlukla olumlu ve pozitif bir bakışa sahip olduklarını ancak azınlıkta olsalar da olumsuz bakışa sahip olan öğrencilerin de var olduğunu ortaya koymaktadır.

Anahtar Sözcükler: Okuma, Resim, Tematik Analiz.

Giriş

Okuma becerisi, bireylerin dinleme ve konuşma becerilerinden sonra çoğunlukla okul çağının başlamasıyla öğrendikleri temel dil becerilerinden biridir. Okul ortamında, öğretmen rehberliğinde sistematik bir şekilde öğrenilen bir beceri olan okuma, yalnızca bir metnin seslendirilmesi anlamına gelmeyip anlama ve algılama süreçlerinin de içinde yer aldığı bir faaliyettir.

İçinde yaşadığımız dünyayı algılama sürecinde okuma becerisi önemli bir yer tutmaktadır. Okuma, fiziksel ve bilişsel bileşenlerin oluşturduğu, karmaşık bir zihinsel süreçtir (Coşkun, 2002). Duyularımız aracılığıyla öğrendiklerimizin oranına bakıldığında %1'ini tatma, %1,5'ini dokunma, %3,5'ini koklama, %11'ini işitme, %83'ünü görme duyusuyla elde ettiğimiz görülmekte olup hem göze hem de kulağa hitap ettiği için okumanın öğrenme üzerinde %94 gibi önemli bir paya sahip olduğunu görmekteyiz (Aytaş, 2005). Okuma, yalnızca anadili anlama ve geliştirme sürecinde değil diğer alanlarda da kişinin kendini geliştirmesinde gerekli olan bir beceridir.

2000 yılından beri 15 yaşındaki öğrencilerin matematik, fen ve okuma alanlardaki becerilerini ölçen PISA tarafından yayınlanan 2022 raporuna göre Türkiye, okuma becerileri alanında 456 puanla katılan 81 ülke arasından 36 sıradayken 37 OECD ülkesi arasında ise 30.sıradadır (MEB, 2024). Ülke genelinde öğrencilerin okuduğunu anlama becerilerinin daha yüksek seviyeye çıkartabilmek adına öncelikle okuma becerisinin gelişememesinin ardında yatan nedenler öğrenilmelidir. Bu nedenleri öğrenebilmek için de öğrencilerde okuma becerisine yönelik hangi duygu ve düşüncelerin hâkim olduğunun bilinmesi gerekmektedir.

Alan yazında bu konu kapsamında, öğrencilerin okuma becerisine yönelik tutumlarının belirlenmesi amacıyla İşeri (2010), Ogurlu (2014), Akın (2016), Can, Deniz ve Çeçen (2016), Bayraktar (2017), Bayat ve Çetinkaya (2018), Şahin (2019), Bozoklu (2022) ve Yorgancı (2022) tarafından yapılan ve benzer şekilde olan birçok çalışma mevcuttur. Öğrencilerin çizmiş oldukları resimlerin analizi üzerine ise Çağlar (2017), Aktaş (2015), Atmaca ve Çelik (2024) ile Ersoy ve Türkkan (2009)'un yapmış oldukları çalışmalar bulunmaktadır ancak okuma becerisine yönelik böyle bir çalışmaya rastlanılmamış olması bu araştırmanın önemini arttırmaktadır.

Materyal ve Yöntem

Bu bölümde araştırmanın modeli, incelenen doküman, verilerin toplanması, verilerin analizi ve yorumlanması hakkında bilgi verilmiştir.

Araştırmanın Modeli

Ortaokul öğrencilerinin okuma deneyimlerine ilişkin duygu ve düşüncelerinin analiz edilmesini amaçlayan ve nitel şekilde desenlenen bu araştırmada doküman incelemesi yöntemi kullanılmıştır. "Doküman inceleme yöntemi, araştırmanın veri setini oluşturan birincil veya ikincil kaynak olarak nitelendirilen çeşitli dokümanların elde edilmesi, gözden geçirilmesi, sorgulanması ve analizi olarak tanımlanabilir" (Özkan, 2021, s. 2).

Çalışma Grubu ve İncelenen Doküman

Araştırmada 2024-2025 eğitim öğretim yılı içinde bir ortaokulda öğrenim görmekte olan 5, 6,7 ve 8.sınıf öğrencileri ile çalışılmıştır. Katılımcıların sınıf düzeyi ve cinsiyetlerine göre dağılımları Tablo 1'de sunulmuştur.

Tablo 1. Öğrencilerin Sınıf Düzeyine Göre Cinsiyet Dağılımları

	Cinsiyet	
Sınıf Düzeyi	**Kız *(f)***	**Erkek *(f)***
5.sınıf	11	8
6.sınıf	9	5
7.sınıf	12	6
8.sınıf	13	8
Toplam	**45**	**27**

Verilerin Toplanması

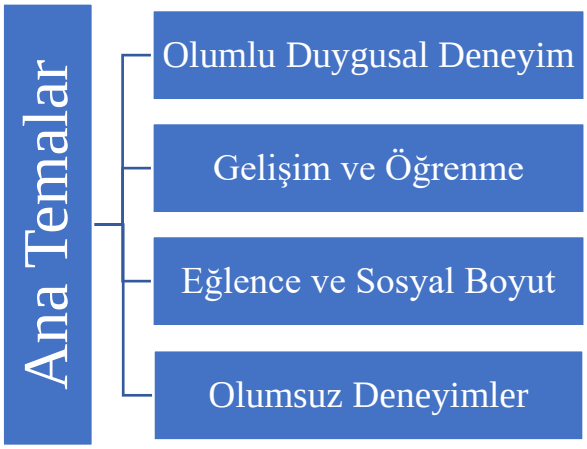
Araştırma kapsamında öğrencilerden okumanın onlara ne hissettirdiği, onlar için ne anlama geldiğini resim çizme yoluyla aktarmaları ve çizdikleri resimleri bir cümle ile açıklamaları istenmiştir. Öğrencilere resimlerini çizmeleri için bir ders saati süre tanınmıştır.

Verilerin Analizi ve Yorumlanması

Öğrencilerin çizdikleri resimler aracılığıyla toplanan veriler tematik analiz yöntemi kullanılarak analiz edilmiştir. "Tematik analiz, verilerdeki örüntüleri (temaları) belirleme, analiz etme ve raporlama için kullanılan bir yöntemdir. Tematik analiz, veri setinizi en küçük boyutlarda düzenlemenizi ve derinlemesine (zengin) betimlemenizi sağlar" (Braun ve Clarke, 2019, s. 875). Araştırma kapsamında incelenen resimler R1, R2, R3… şeklinde kodlanmıştır.

Bulgular ve Tartışma

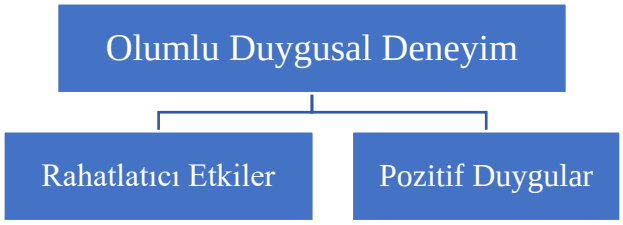
Ortaokul öğrencilerinin okuma deneyimlerine ilişkin duygu ve düşüncelerini ortaya koymayı amaçlayan bu araştırmada yapılan tematik analiz ve doküman incelemesi sonucunda ulaşılan ana temalar Şekil 1'de gösterilmiştir.



Şekil 1. Analiz Sonucunda Elde Edilen Ana Temalar

1.Olumlu Duygusal Deneyim

Olumlu Duygusal Deneyim temasına belirlenen iki ayrı alt tema ile ulaşılmıştır.



Şekil 2. Olumlu Duygusal Deneyim Ana Temasının Alt Temaları

1.1.Rahatlatıcı Etkiler

Tablo 2. Rahatlatıcı Etkiler Temasının Kodları

Rahatlatıcı Etkiler	
Kodlar	Resim Numaraları
Rahatlatıcı	R15
Huzur	R17, R19, R27, R33, R41, R47, R60, R68
His	R57, R61, R70
Şifa	R63

Rahatlatıcı koduna bakıldığında öğrencinin okuma deneyimleri hakkında duygu ve düşüncelerinin onları hayatta karşılaştıkları sıkıntılardan, sorunlardan ve stresten uzak tutan bir unsur olarak görülmüştür.

R15-Rahatlatıcı

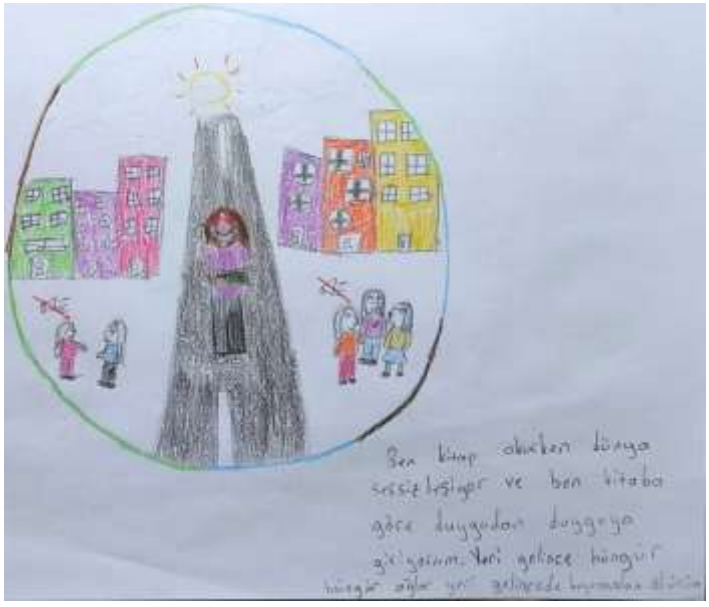
Huzur koduna bakıldığında öğrencilerin okuma eylemini kendilerini bulutların üzerindeymiş gibi ya da baktıkça insanı rahatlatan, yeşil ve mavi tonların ağırlıkta olduğu bir manzara tablosuna bakıyormuş gibi hissettirdiği görülmüştür.

R60-Huzur

R68-Huzur

His koduna bakıldığında öğrencilerin okumayı duyguların bir yansıması ve kendilerini duygudan duyguya sürükleyen bir eylem olarak tasvir ettiği görülmüştür.

R61-His



R70-His

Şifa kodunda ise okuma eylemi öğrenci tarafından yaralarımızı daha hızlı iyileşmesi için sardığımız bir yara bandı ile özdeşleştirilmiş olduğu görülmektedir.

R63-Şifa

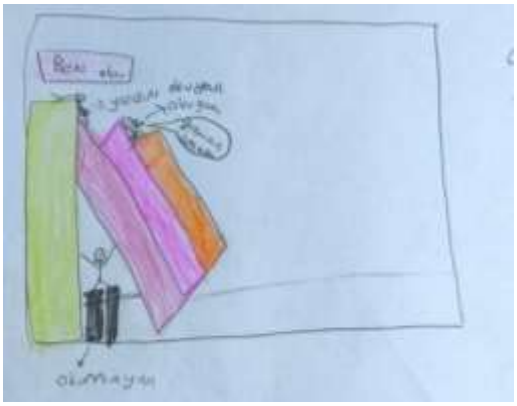
1.2. Pozitif Duygular

Tablo 3. Pozitif Duygular Temasının Kodları

Pozitif Duygular	
Kodlar	Resim Numaraları
Sevgi	R2, R4, R7, R10, R12, R46
Melodi	R5
Mutluluk	R8, R13, R18, R26, R28, R35, R42, R64
Umut	R9, R25, R69
Kurtarıcı	R11
Heyecan	R14, R16, R24, R30, R32

Sevgi koduna bakıldığında öğrencilerin okumaya karşı olan duygu ve düşüncelerinin kalpler aracılığıyla ve öğrencilerin yaparken keyif aldıkları bir eylem olarak ifade edilmiştir. Kurtarıcı kodunda öğrenci hayatta karşılaştığı zorlukları bir suya, okuma eylemini ise kendisini o suya batmaktan kurtaran bir unsur olarak resmetmiştir.

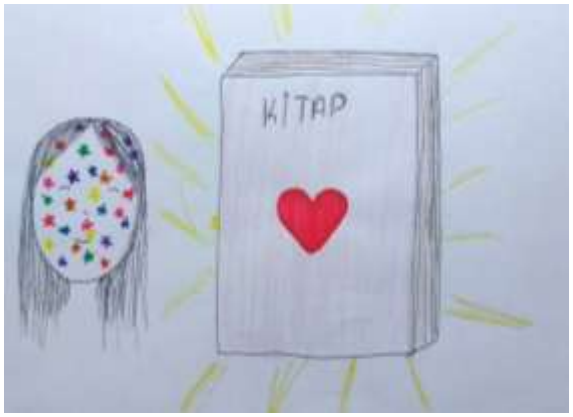
R10-Sevgi



R11-Kurtarıcı

Melodi kodunda "Kitap Dünyası "adı verilen bir evrenin yaratıldığı resim görülmektedir. Bu evrende kitaplardan çıkan her sözcük hem öğrenci hem güneş hem de bulutlar için bir şarkı sözü olarak algıladığı görülmektedir. Mutluluk kodunda ise öğrencilerin okuma eyleminin kendilerine olumlu duygular verdiğini ve zihinlerinde mutluluk kavramıyla eşleştirdikleri görülmektedir.

R5-Melodi



R28-Mutluluk

Umut, insanı yaşama bağlayan bir unsurdur. Bu kodda öğrencilerin okuma eyleminin kendilerine yeni ufuklar açan ve hayat bağlanmalarını sağlayan renkli kapılar ile eşleştirildiği görülmektedir. Heyecan kodunda ise öğrencilerin, okumanın kendilerine heyecan veren bir eylem olduğunu ifade ettikleri görülmüştür.

R9- Umut

R14-Heyecan

2.Gelişim ve Öğrenme

Gelişim ve Öğrenme temasına belirlenen iki ayrı alt tema ile ulaşılmıştır.

Şekil 3. Gelişim ve Öğrenme Ana Temasının Alt Temaları

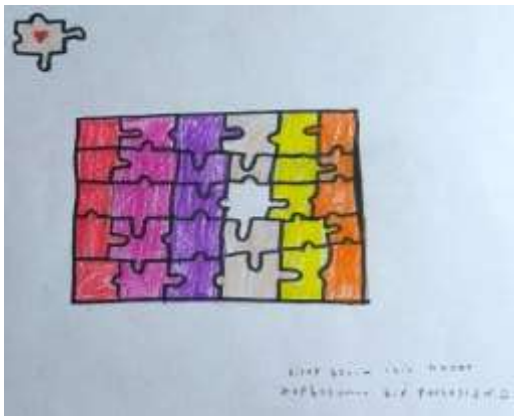
2.1.Yaşam Becerileri

Tablo 4. Yaşam Becerileri Temasının Kodları

Yaşam Becerileri	
Kodlar	Resim Numaraları
Hayatın Merkezi	R21, R31, R48, R66
Hayatın Şifresi	R34
İyi Alternatif	R40

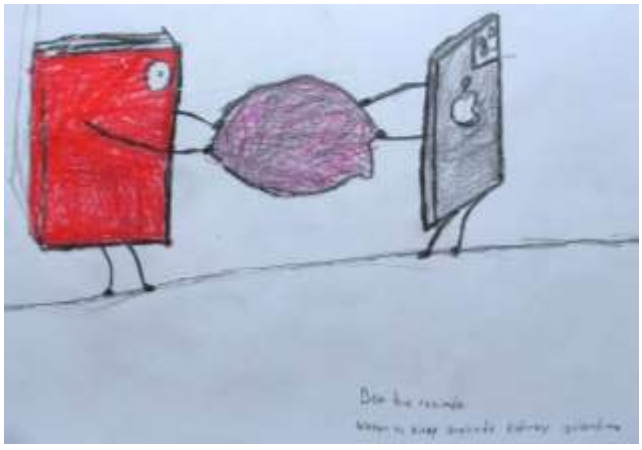
Hayatın Merkezi kodunda öğrenciler, okuma eylemini yaşamın tam merkezine yerleştirerek hayatlarında vazgeçilmez bir unsur olduğunu ifade etmiştir. Hatta yaşamımızı devam ettirebilmek için ihtiyaç duyduğumuz su ile özdeşleştirerek önemini vurgulamışlardır.

R31-Hayatın Merkezi

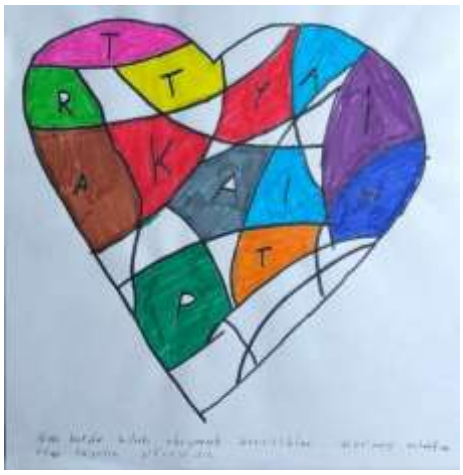


R48-Hayatın Merkezi

İyi Alternatif kodunda öğrencinin bir beyni çekiştiren kitap ve telefon resmettiği görülmektedir. Büyütülürken sıkça kendilerine zararlı olduğu belirtilen telefonun karşısına alternatif olarak kitabın yerleştirilmesi olumsuz bir unsura karşı iyi ve olumlu olan olarak ifade edilmiştir. Hayatın Şifresi kodunda ise öğrencinin okuma eylemini hayati organımız olan kalbin içine bir çeşit bulmaca koyarak ifade etmiş ve hayattaki karışıklıkları düzelten bir unsur olduğunu ifade etmiştir.



R40-İyi Alternatif



R34-Hayatın Şifresi

2.2.Zihinsel Süreçler

Tablo 5. Zihinsel Süreçler Temasının Kodları

Zihinsel Süreçler	
Kodlar	Resim Numaraları
Bilgilendirici	R6, R37, R38, R44, R45
Düşünme Gücü	R22
Hayal Gücü	R43

Bilgilendirici kodunda öğrenciler, okuma eylemini onlara bilmedikleri şeyi öğreten, öğrenmelerini sağlayan bir araç olarak tasvir etmişlerdir. Düşünme gücü kodunda ise öğrenci, okuma eylemi gerçekleşirken zihinde oluşan durumu çalışan bir mekanizmaya benzeterek okumanın zihni harekete geçirdiğini ifade etmiştir.

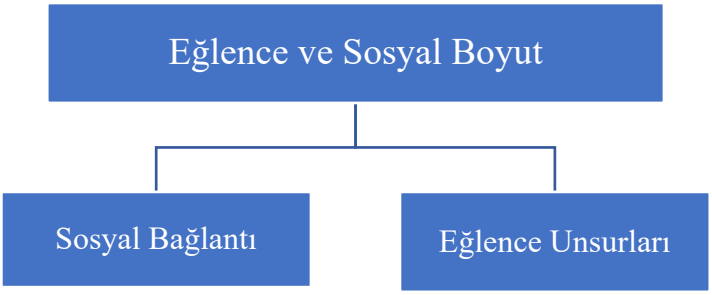
R38-Bilgilendirici

R22-Düşünme Gücü

Hayal gücü kodunda öğrenci, okuma eylemini hayal gücünü geliştiren bir unsur olarak tasvir etmiştir.

3. Eğlence ve Sosyal Boyut

Eğlence ve Sosyal Boyut temasına belirlenen iki ayrı alt tema ile ulaşılmıştır.



Şekil 4. Eğlence ve Sosyal Boyut Ana Temasının Alt Temaları

3.1. Sosyal Bağlantı

Tablo 6. Sosyal Bağlantı Temasının Kodları

Sosyal Bağlantı	
Kodlar	Resim Numaraları
En Yakın Arkadaş	R29, R51

Öğrenciler bu alt temada okuma eylemini, onları iyi anlayan ve yalnız kaldıklarında arkadaşlık yapan bir eylem olarak ifade etmişlerdir.

R29- En Yakın Arkadaş

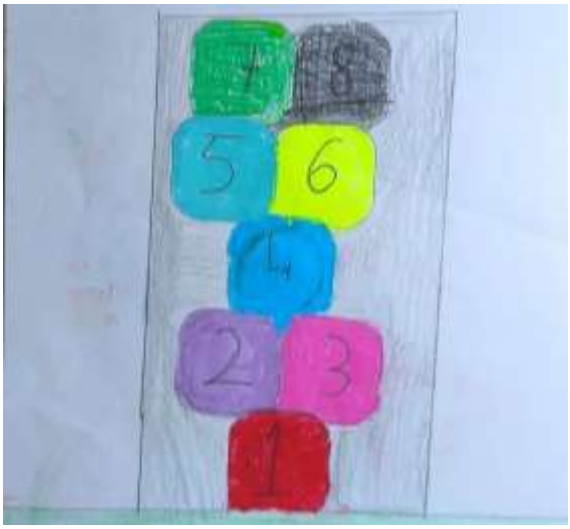
R51-En Yakın Arkadaş

3.2. Eğlence Unsurları

Tablo 7. Eğlence Unsurları Temasının Kodları

Eğlence Unsurları	
Kodlar	Resim Numaraları
Oyun	R3
Eğlence	R20, R23

Oyun kodunda okuma eylemi renkli bir seksek oyununa benzetilirken eğlence kodunda çocukların bulunmaktan çok keyif aldıkları park mekânı ile özdeşleştirilmiştir.

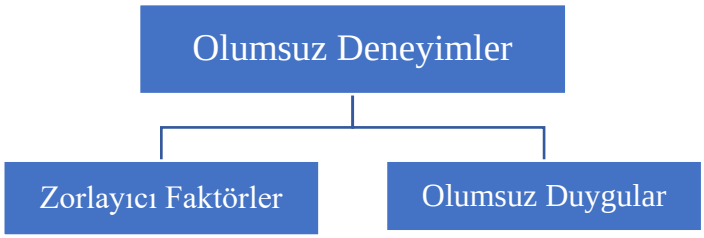


R3-Oyun

R23-Eğlence

4.Olumsuz Deneyimler

Olumsuz Deneyimler temasına belirlenen iki ayrı alt tema ile ulaşılmıştır.



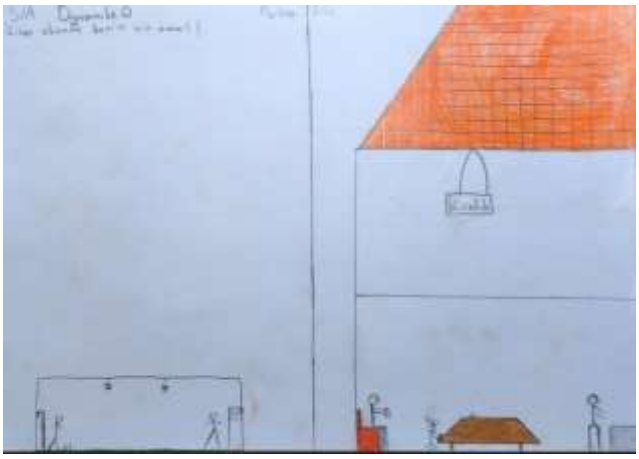
Şekil 5. Olumsuz Deneyimler Ana Temasının Alt Temaları

4.1. Zorlayıcı Faktörler

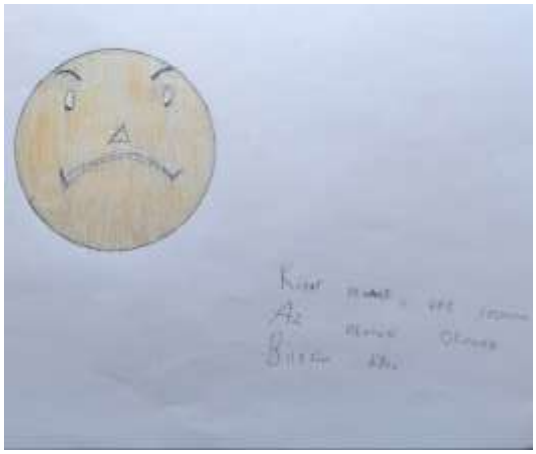
Tablo 8. Zorlayıcı Faktörler Temasının Kodları

Zorlayıcı Faktörler	
Kodlar	Resim Numaraları
Engel (oyun)	R1
Mecburiyet	R55
İkilem	R49, R58, R59, R62, R71

Engel kodunda öğrenci, okuma eyleminin kendisini dışarıdaki eğlenceden mahrum bırakan unsur olarak tasvir etmiş ve bundan dolayı zararlı olduğunu ifade etmiş. Mecburiyet kodunda ise okuma eylemini gerçekleştirmekten mutlu olmadığını ve öğrenmenin gerçekleşmesi için zorunlu olarak yapması gereken bir şey olarak tasvir etmiştir.

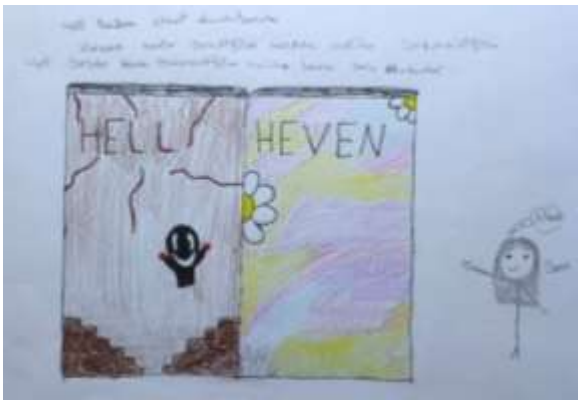


R1- Engel (Oyuna)



R55-Mecburiyet

İkilem kodunda öğrenciler okuma eylemi konusunda kararsız bir tutum sergilemişlerdir. İçerik ilgilerini çektiğinde sevdikleri bir eylemken hoşlarına gitmeyen bir ya da onları üzen bir şeyle karşılaştıklarında sevmedikleri bir eyleme dönüşmektedir.



R58-İkilem

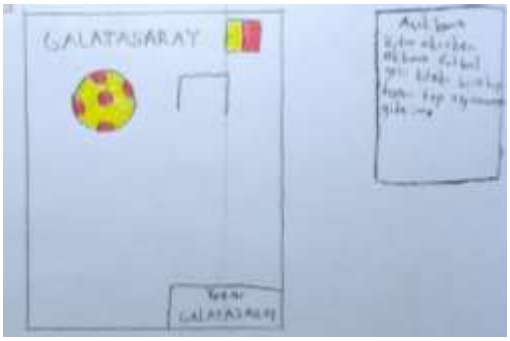
R62-İkilem

4.2. Olumsuz Duygular

Tablo 9. Olumsuz Duygular Temasının Kodları

Olumsuz Duygular	
Kodlar	Resim Numaraları
Sıkıcı Olması	R36, R39, R56, R65
Nefret	R50, R54, R67
Boşluk	R53, R72

Okuma eylemini sıkıcı bulan öğrenciler, okuma yaparken bunaldıklarını ve devam ettirme isteklerinin olmadığını, daha eğlenceli bir alternatif bulduklarında ona yöneldiklerini ifade etmişlerdir. Nefret kodunda ise öğrenciler, okuma eylemini zorla yaptıklarını ifade ederken kendilerini kurtarılması gereken bir şey yapıyormuş gibi tasvir etmişlerdir.



R39-Sıkıcı Olması

R50-Nefret

Boşluk kodunda öğrenciler, kitap okuma eyleminin kendileri için hiçbir anlam ifade etmediğini, zihinlerinde bu eyleme dair herhangi bir iz olmadığını belirtmişlerdir.

R53-Boşluk

R72-Boşluk

Sonuç ve Öneriler

Çalışma kapsamında elde edilen veriler ışığında, öğrencilerin çoğunluğunun okuma becerisine karşı duygu ve düşüncelerini pozitif, olumlu ve güzel olarak nitelendirdiği ancak okuma becerisine karşı negatif duygu ve düşüncelere sahip öğrencilerin de bulunduğu görülmüştür.

Öğrencilerin okuma becerisine yönelik duygu ve düşünceleri arasında en çok tekrar eden kavramlar rahatlatıcı etkiler alt teması başlığında bulunan huzur ile pozitif duygular alt teması başlığında bulunan mutluluk kavramıdır. Aynı zamanda bu iki kavram, öğrencilerin okumaya karşı bakış açıları arasında olumlu, pozitif ve güzel olarak nitelendirilebilecek Olumlu Duygusal Deneyim, Gelişim ve Öğrenme ile Eğlence ve Sosyal Boyut ana temaları arasında da en çok tekrar edilen kavramlardır. Okuma becerisine karşı daha negatif duygu ve düşüncelerin

temsil edildiği Olumsuz Deneyimler ana temasında ise en çok tekrar eden kavram zorlayıcı faktörler alt teması başlığı altında bulunan ikilem kavramı olmuştur.

Toplam yetmiş iki öğrenciden toplanan verilerden yirmi dört öğrenci ile en çok pozitif duygular alt temasının, iki öğrenci ile de en az sosyal bağlantı alt temasının tercih edildiği görülmüştür.

Elde edilen tüm bu sonuçlar öğrencilerin genelinin okumaya becerisini huzur ve mutluluk veren, bilgilendirici olan ve hayatın merkezinde yer alan bir beceri olarak algıladıklarını ve az sayıda da olsa okuma becerisini bir mecburiyet, vakit kaybı ve sıkıcı olarak gören ve okumadan nefret eden öğrencilerin de var olduğunu göstermektedir.

Öğrencilerin cinsiyetlerine göre okumaya karşı bakış açılarına bakıldığında olumlu duygu ve düşünceleri temsil eden ilk üç ana temada kız öğrencilerin çoğunlukta olduğu görülürken olumsuz duygu ve düşünceleri temsil eden son ana temasa ise çoğunluğu erkek öğrenciler oluşturmaktadır. Akın (2016), Bayraktar (2017) ve Bozoklu (2022)'nun da yapmış oldukları çalışmalarda kız öğrencilerin okumaya karşı duygu ve düşüncelerinin erkek öğrencilere göre daha pozitif yönde olduğu sonucuna ulaşılmıştır.

Okuma becerisine yönelik duygu ve düşüncelerini Olumsuz Deneyimler ana temasının kavramları ile açıklayan öğrencilerin çoğunluğunun erkek ve 8. sınıf seviyesinde öğrenim gördüğü ve aynı temanın kavramlarını kullanan kız öğrencilerin de 8. sınıf seviyesinde öğrenim gördükleri tespit edilmiştir. Bu sonuçlardan yola çıkılarak çalışma kapsamında öğrenim seviyesinin artmasıyla birlikte öğrencilerin okumaya karşı duygu ve düşüncelerin olumsuz yönde değiştiği görülmektedir. İşeri (2010), Yıldız (2013), Can, Çeçen ve Deniz (2016) ile Şahin (2019)'un yapmış oldukları çalışmalarda da benzer sonuçlara ulaşılmıştır.

Öğrencilerin eğitim hayatına başlamalarıyla birlikte sistemli bir şekilde öğrenilmeye başlanan okuma becerisine yönelik öğrencilerin duygu ve düşüncelerinin olumlu yönde seyretmesi ve okuma alışkanlığının kazandırılması için öğretmenlerin derslerini planlarken öğrencilerine gereken bilinci kazandıracak çalışmalara yer vermeleri önerilmektedir.

Diğer temel beceriler üzerine de öğrencilerin duygu ve düşüncelerini resim yoluyla analiz etmeye yönelik çalışmalar yapılabilir. Aynı zamanda elde edilen sonuçlardan yola çıkılarak öğrencilerin okumaya karşı olumsuz duygularının nedenlerinin araştırıldığı çalışmalar yapılabilir.

ÖZET

Öğrenmenin en etkili yöntemi, yaparak öğrenmedir. Teorik derslerin daha etkili öğrenilmesi için uygulamalı eğitim daha faydalı olacaktır. Mühendislik fakültelerinde verilen eğitimin kalıcı olabilmesi için bu öğretim yönteminin uygulanması gerekmektedir. Öğrenci, teorik bilgilerini simülasyon çalışmalarıyla riskleri ve maliyetleri azaltarak öğrenip, ardından üreteceği devre ile pratikte de pekiştirecektir. Güç elektroniği laboratuvar eğitimlerinde, öğrencilerin devre elemanlarının farklı değerlerini deneyebileceği devre kitlerinin geliştirilmesi önemlidir. Günümüzde, güç elektroniği laboratuvar eğitimlerinde genellikle hazır ve kapalı devre kitleri kullanılmaktadır. Bunun sonucunda, öğrenciler çoğu zaman yaptıkları deneylerin arka planındaki bilgilere ulaşamamakta, simülasyon çalışmaları ve devre tasarımlarını öğrenememektedir. Bu eksikliği gidermek için açık ve anlaşılır eğitim devre kitleri tasarlanmalı ve öğrencilere sunulmalıdır. Bu tez, güç elektroniği devreleri ve anahtarlamalı güç kaynakları eğitimi için temel topolojilerden biri olan SEPIC topolojisine odaklanmaktadır. Bu çalışmada geliştirilecek SEPIC devresi taşınabilir devre elemanlarına sahip olacaktır. Geliştirilen eğitim kitinde giriş voltajı 24V, çıkış voltajı ise 48V olacaktır. Öğrenciler, potansiyometreyi kullanarak doluluk oranı ve frekansını ayarlayabilecek ve farklı kondansatör ve bobinler arasından seçim yapabilecektir. Çıkış voltajındaki dalgalanmayı osiloskop ile gözlemleyebilecektir. Bu çalışma, elektronik devre tasarımı ve güç kaynağı üretimi konusunda önemli bir deneyim ve bilgi sağlayacaktır. Projeye ait değerlendirme ve geliştirme önerileri, gelecekteki çalışmalara değerli ipuçları sunmakta ve bu tür projelerin daha verimli ve güvenilir hale getirilmesine yönelik önemli adımlar içermektedir.

Anahtar Kelimeler: Sepic , güç elektroniği, eğitim kiti, uygulamalı öğrenme ve PWM

Giriş

Doğru akım–doğru akım (DC-DC) dönüştürücüler, herhangi bir doğru akım kaynağından alınan gerilimi artırma (boost) veya azaltma (buck) amacıyla kullanılan anahtarlamalı güç elektroniği devreleridir. Bu dönüştürücüler sayesinde hem sabit hem de değişken çıkış gerilimleri elde edilebilir. Gerilim regülasyonu ihtiyacına göre farklı topolojiler tercih edilmektedir. DC-DC dönüştürücüler genel olarak **yalıtımlı (isolated)** ve **yalıtımsız (non-isolated)** olmak üzere iki ana kategoriye ayrılır. Yalıtımlı dönüştürücüler, giriş ve çıkış arasındaki elektriksel bağlantıyı kesmek için genellikle transformatör yapıları kullanırken, yalıtımsız dönüştürücüler doğrudan bağlantıya sahiptir ve daha kompakt uygulamalar için tercih edilir. (Şeker, 2014).

Bu proje simülasyon çalışması akabinde güç elektroniği bilgisi ve laboratuvar da pratik becerisi kazandırarak, kullanıcıya elektronik sistemlerin tasarımı ve analizi konusundaki yetkinliklerini artırmayı amaçlamaktadır. (Çınar, 2019).

Bu çalışmanın amacı üniversitelerde eğitim gören mühendislik öğrencilerinin sepic konvertörü sadece teorik olarak değil deneysel çalışma içerisinde simüle edip akabinde uygulamasını yaparak teorideki bilgiyi daha iyi öğrenmesini amaçlamaktadır. Yaparak yaşayarak öğrenme beklenmektedir. Bu fikir mezun olduktan sonra mühendislik öğrencilerinin daha donanımlı ve pratik zekasını kullanabilen mühendislik öğrencileri yetiştirmeyi hedeflemektedir. Öğrenci sınavı geçmek için öğrendiği bilgiler mesleki hayatında onu büyük zorluklar yaşatacaktır.

Genelde bu ders üniversitelerde teorik okutulduğu için öğrenme gerçek mânada gerçekleşmemektedir. Bu tür faktörler nedeniyle bu çalışmanın önemi ortaya çıkmaktadır. Bu proje, katılımcıların elektronikle ilgili pratik bilgi edinmesini ve elektronik sistemleri tasarlayıp analiz etme becerilerini geliştirmesini amaçlamaktadır. (Akgül, Uçar, Öztürk & Ekşi, 2014).

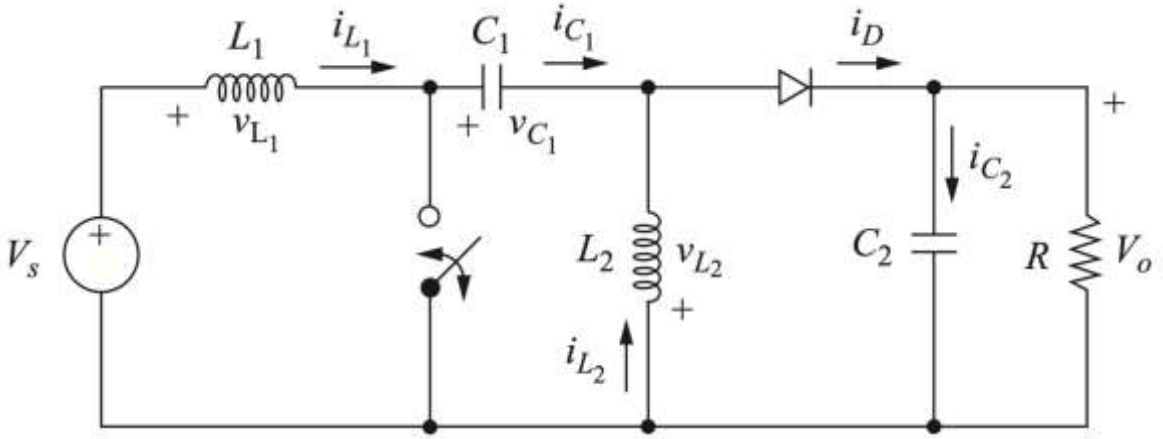
Materyal ve Yöntem

Adından da anlaşılacağı üzere, Tek Uçlu Birincil İndüktör Dönüştürücüsü (Single-Ended Primary Inductor Converter - SEPIC), giriş ve çıkış gerilimleri arasında aynı polariteyi koruyan ve gerilim seviyesini düşürme (buck), artırma (boost) ya da sabit tutma (buck-boost) işlevlerini yerine getirebilen, dördüncü dereceden bir anahtarlamalı güç dönüştürücüsüdür. Bu yapı, esnek gerilim regülasyonu gerektiren uygulamalarda yaygın olarak kullanılmakta olup, aynı zamanda çoklu çıkış konfigürasyonlarına genişletilebilme özelliğine sahiptir.

SEPIC topolojisinde çıkış gerilimi, ana anahtarlama elemanının görev döngüsü (duty cycle) ile doğrudan kontrol edilir. Bu kontrol mekanizması, dönüştürücünün çıkış voltajını girişten bağımsız olarak artırma, azaltma veya sabitleme yeteneğini mümkün kılar. Görev döngüsü oranı, sistemin çalışma koşullarına göre ayarlanarak istenilen çıkış gerilimi elde edilir.

SEPIC dönüştürücüler, %85'in üzerinde verimlilikle çalışabilmeleri sayesinde yüksek verimli enerji dönüşüm çözümleri sunar. Bu nedenle, özellikle batarya tabanlı sistemler, yenilenebilir enerji kaynakları ve taşınabilir elektronik cihazlar gibi enerji yönetimi açısından hassas uygulamalarda tercih edilmektedir. (Hart, 2010).

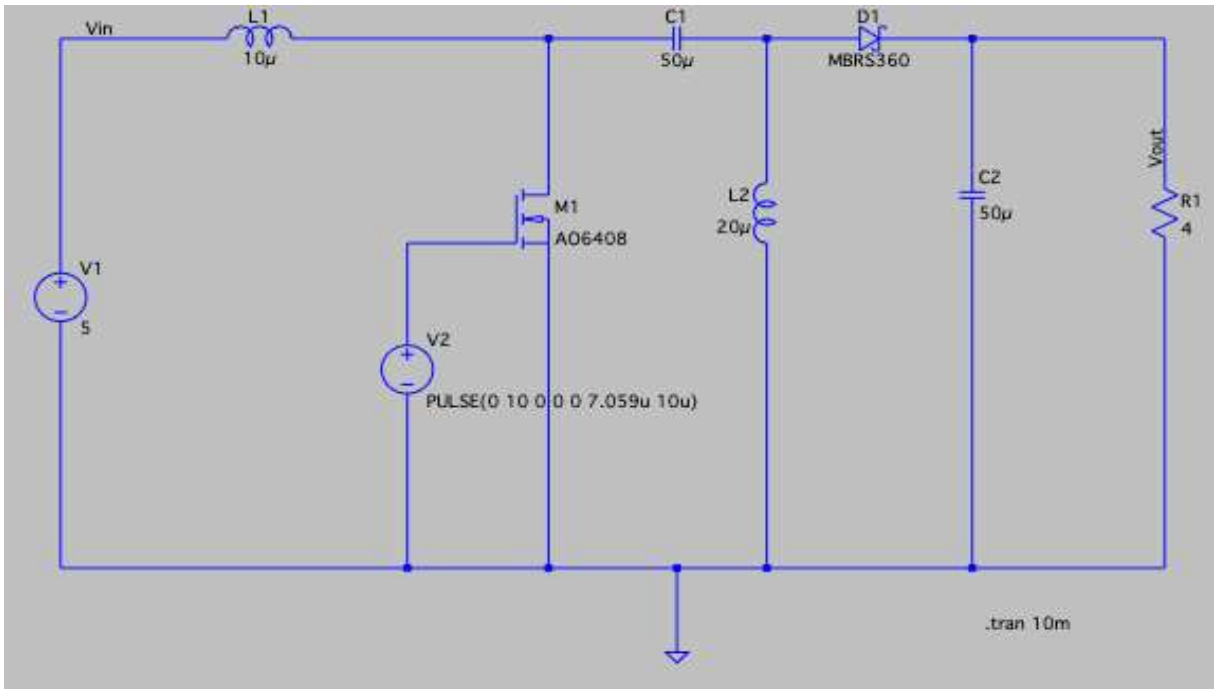
Sepic konvertör yani tek uçlu birincil indüktör dönüştürücü güç elektroniği alanında oldukça yaygın olarak kullanılmaktadır. Temel bir sepic dönüştürücü bir anahtarlama elemanı, entegre, bir diyot bir bobin ve bir kondansatörden oluşmaktadır. Temel bir sepic devresi verilmiştir. (Şekil 1)



Şekil 1. Temel Bir Sepic Dönüştürücü Devresi

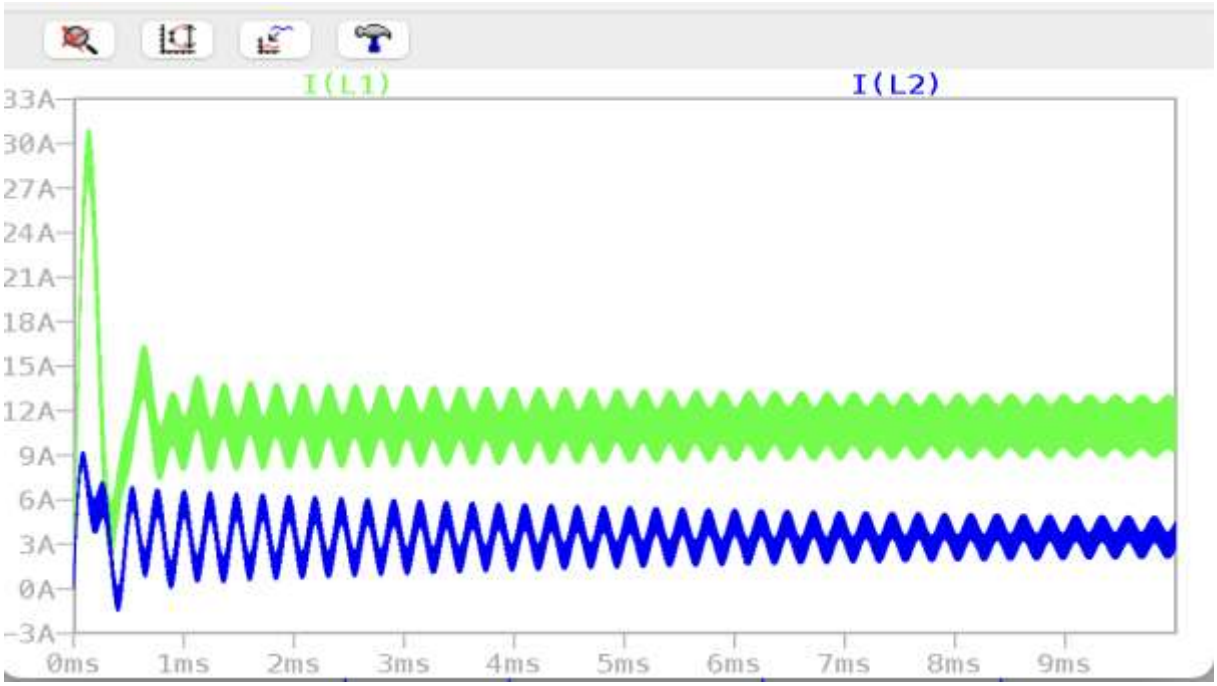
Bulgular ve Tartışma

Proje çalışmamızı gerçekleştirmeden önce olası riskleri ortadan kaldırmak ve maliyeti en aza indirmek için LTspice programı yardımı ile sepic devremizin şematik tasarımı yapılmıştır. (Şekil 2)



Şekil 2. LTspice Sepic Şematiği

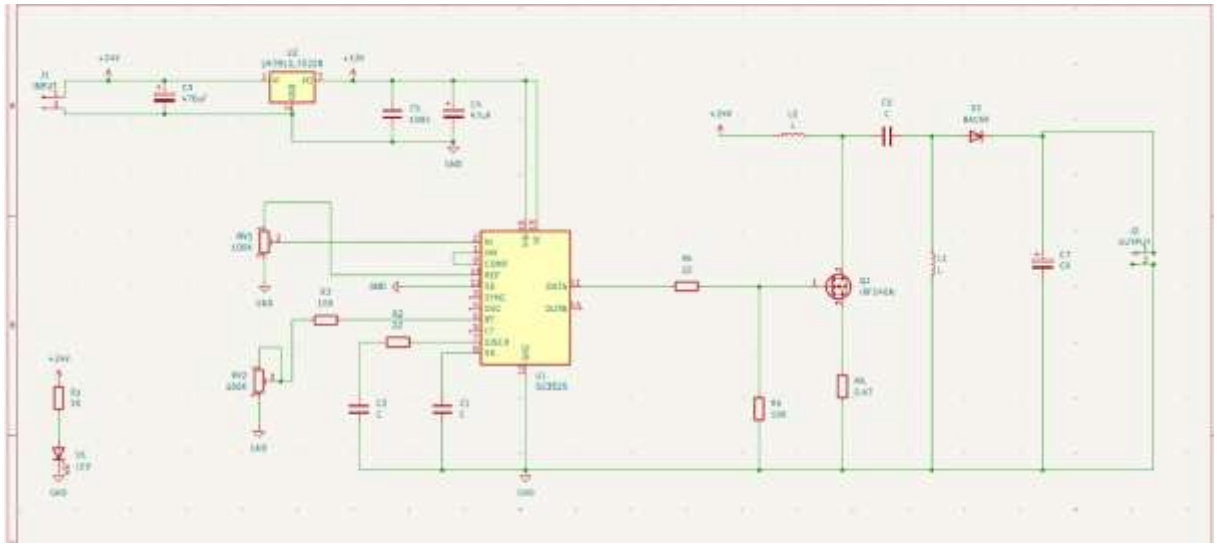
LtSpice programında sepic şematiği gerçekleştirilirken giriş gerilim değeri, L1 bobini, L2 bobini, C1 kondansatörü, C2 kondansatör değerlerine göre çıkışta beklediğimiz gerilim değerine uygun ve frekansı 0 ile 100kHz arası değerinde değiştirilebilen ve görev döngüsü ayarı yapılabilen bir LTspice şematiği yapılmıştır. Akabinde simülasyon sonuçları elde edilmiştir (Şekil 3).



Şekil 3. L1 ve L2 Akım Değerleri Grafiği

L1, girişe seri bağlı indüktör ; L2, Kapasitör (C1) aracılığıyla çıkış tarafına bağlı ikinci indüktördür. Yük direnci arttıkça çıkış akımı artar. Bu durumda L2' den geçen akım artar çünkü L2 doğrudan çıkışa bağlıdır. L1 MOSFET açıkken enerji depolar, kapandığında hem L2' ye hem de çıkışa enerji verir. Genelde L1 daha fazla akım taşır çünkü hem L2' ye hem de çıkışa enerji sağlar.

Sepic devremizin KiCad programı yardımı ile pcb tasarımı için şematiği gerçekleştirilmiştir. (Şekil 4)

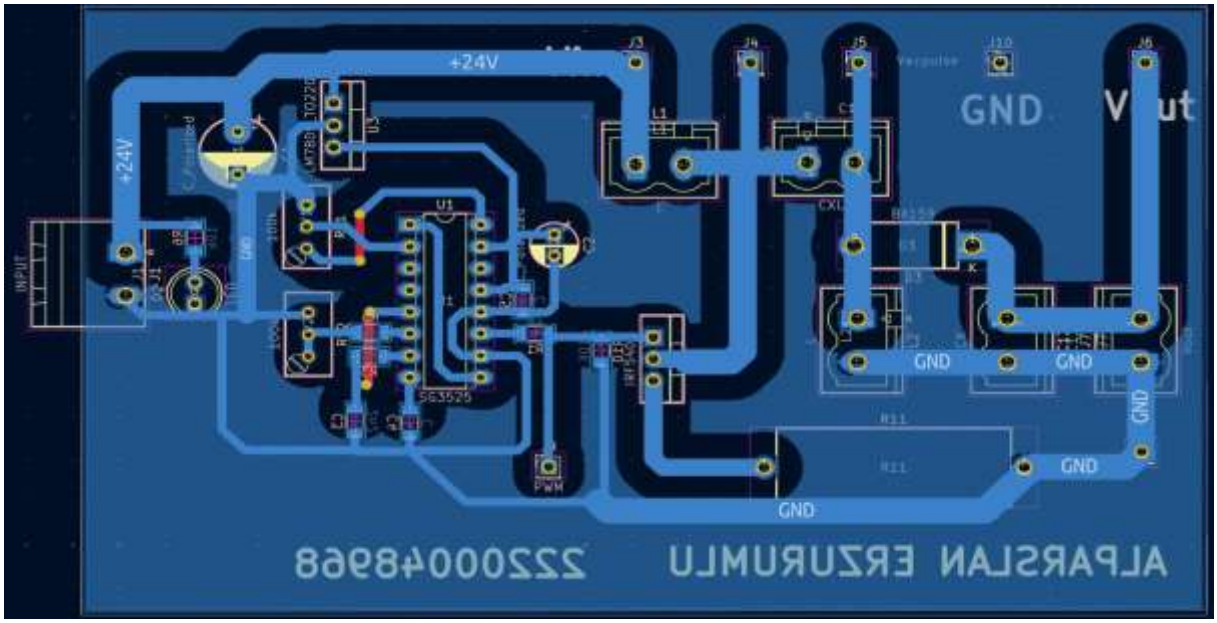


Şekil 4. KiCad Şematik Tasarımı Sepic

İlk enerjisini verdiğimiz zaman RC devresi ile belirlediğimiz frekans' da bir PWM sinyali üretir. Devremiz üzerinde bulunan iki trimpot ile ayrı ayrı frekans ve duty ayarı yapılabilir. PWM' in MOSFET' in gate ucuna gelmesi ile L1 üzerinde bulunan enerji mosfet üzerinden anahtarlanır.

SG3525’ in 12 volt’ ta sağlıklı beslenmesi ve en az ripple ile beslenmesi için 47 uF ile 100 n paralel bağlanmıştır.

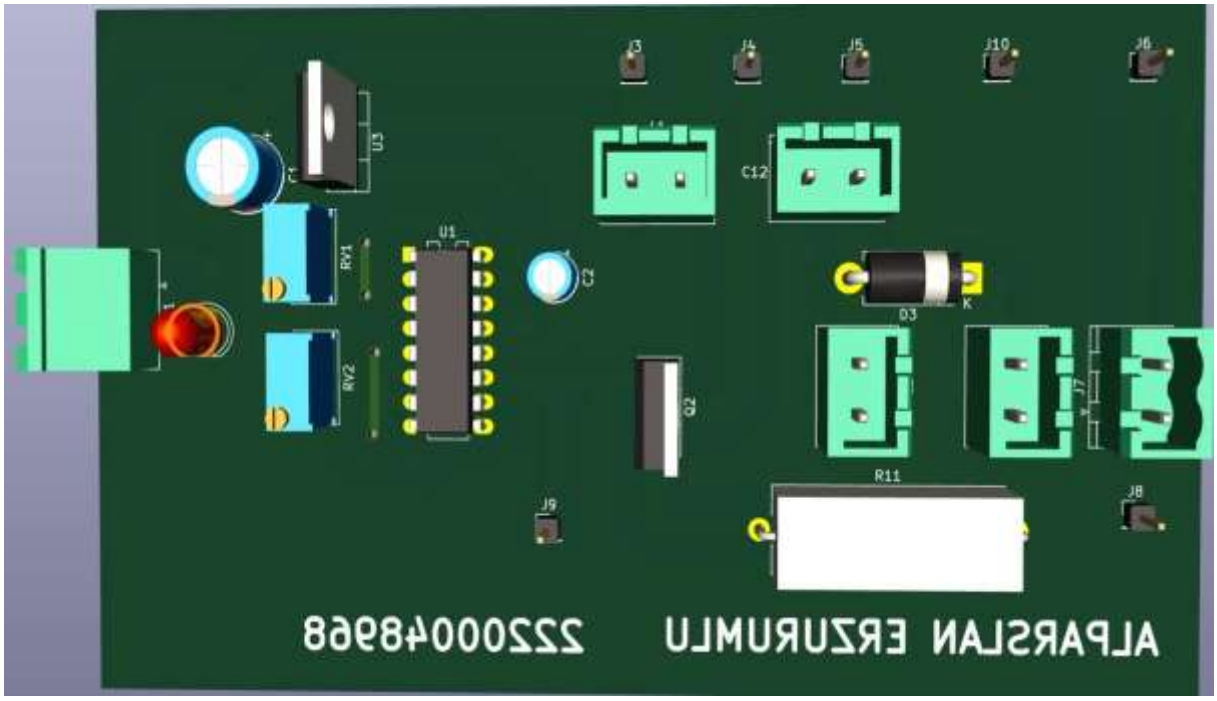
KiCad programı yardımıyla sepic pcb tasarımı yapılmıştır. (Şekil 5)



Şekil 5. KiCad PCB Tasarımı Sepic

LM7812 ile SG3525’ in stabil çalışması için gerekli olan voltajı yani gerilimi regüle eder. 24 voltluk girişi 12 volta sabitliyor.

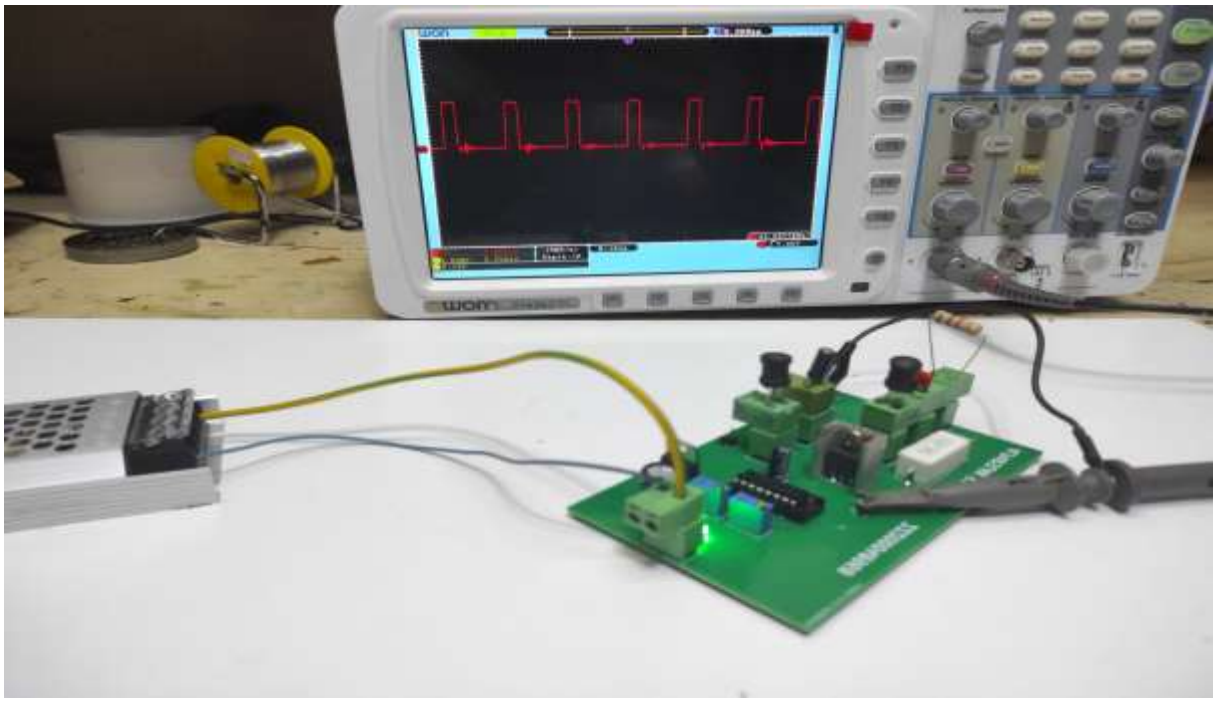
Sepic devremizin üç boyutlu tasarımı yapılmıştır. (Şekil 6)



Şekil 6. Sepic KiCad Programı ile Yapılan Pcb Üç Boyutlu Tasarımı

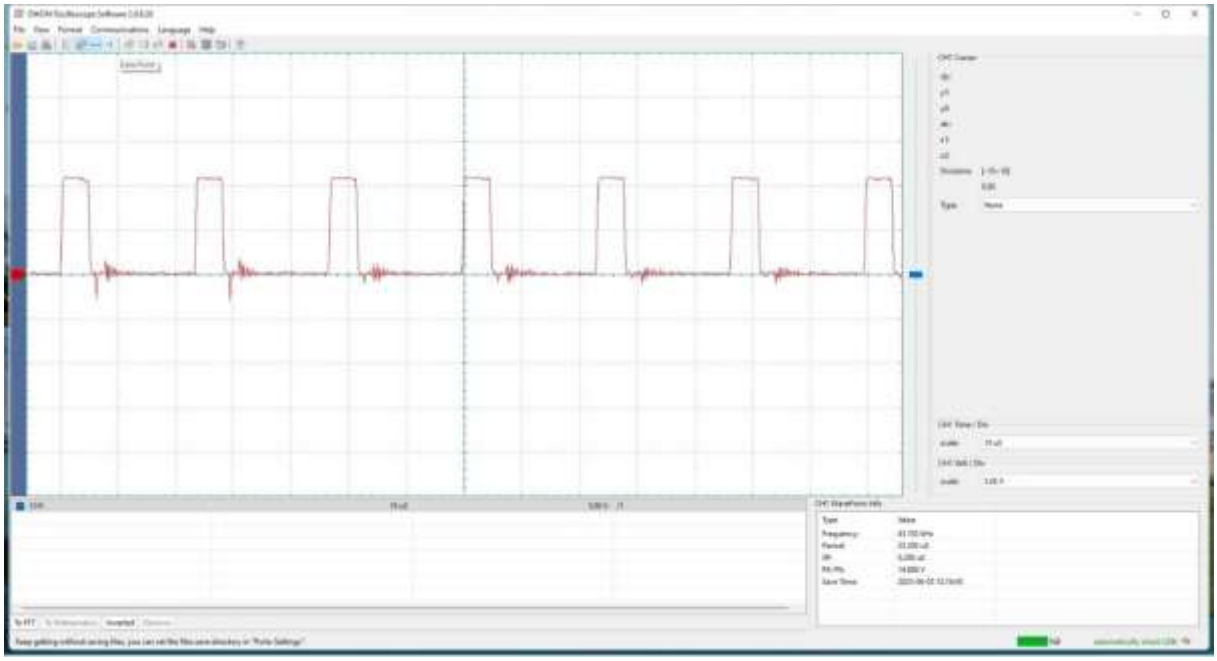
Sonuç ve Öneriler

Bu çalışma öğrencilerin farklı kondansatör ve bobin değerlerinin çıkış gerilimi, pulse değerinin ölçülebildiği bir güç kaynağı devresi eğitim kiti olarak hazırlanmıştır. Frekansı 43 KHz bobin değerleri 22 mh olan kondansatör değeri 0,47 uF ve 22k ohm' luk çıkış direnç değeri ile yapılmış olan sepic devremiz aşağıdaki gibi pwm pulse ölçümü gerçekleştirilmiştir. (Şekil 7)



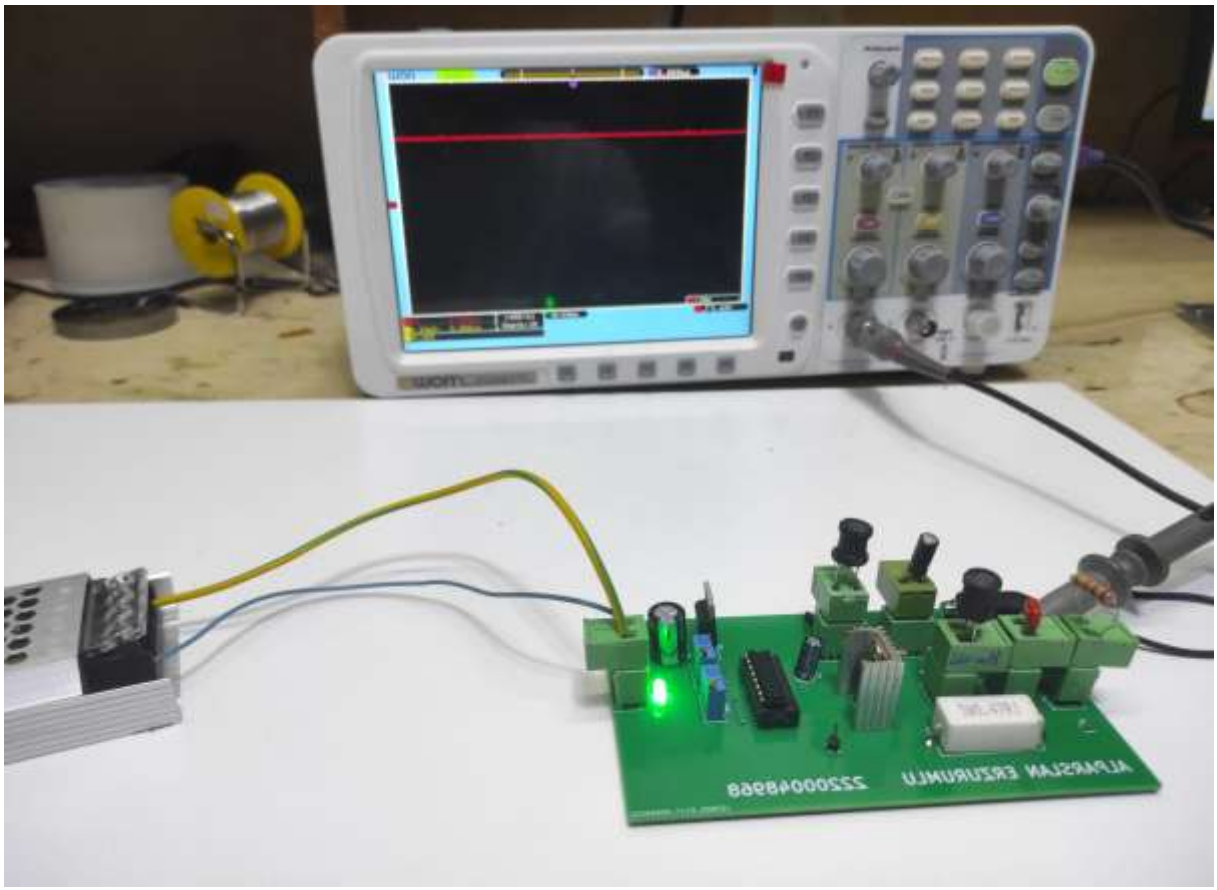
Şekil 7 Sepic Devresi 1 Pwm Pulse Ölçümü

Verilen devrenin pulse değeri dalga grafiği aşağıda osiloskop ekranında verilmiştir. (Şekil 8)



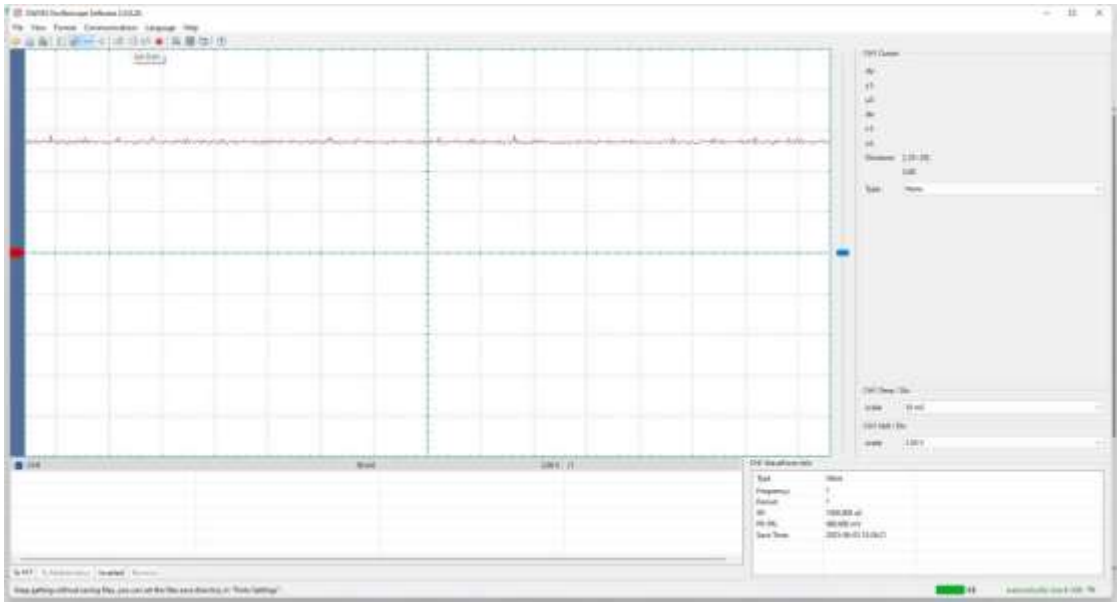
Şekil 8 Pwm Pulse Dalga Grafiği Osiloskop Görüntüsü 1

Tasarımı gerçekleştirilen sepic devremizin çıkış gerilimi ölçümü aşağıda verilmiştir. (Şekil 9)



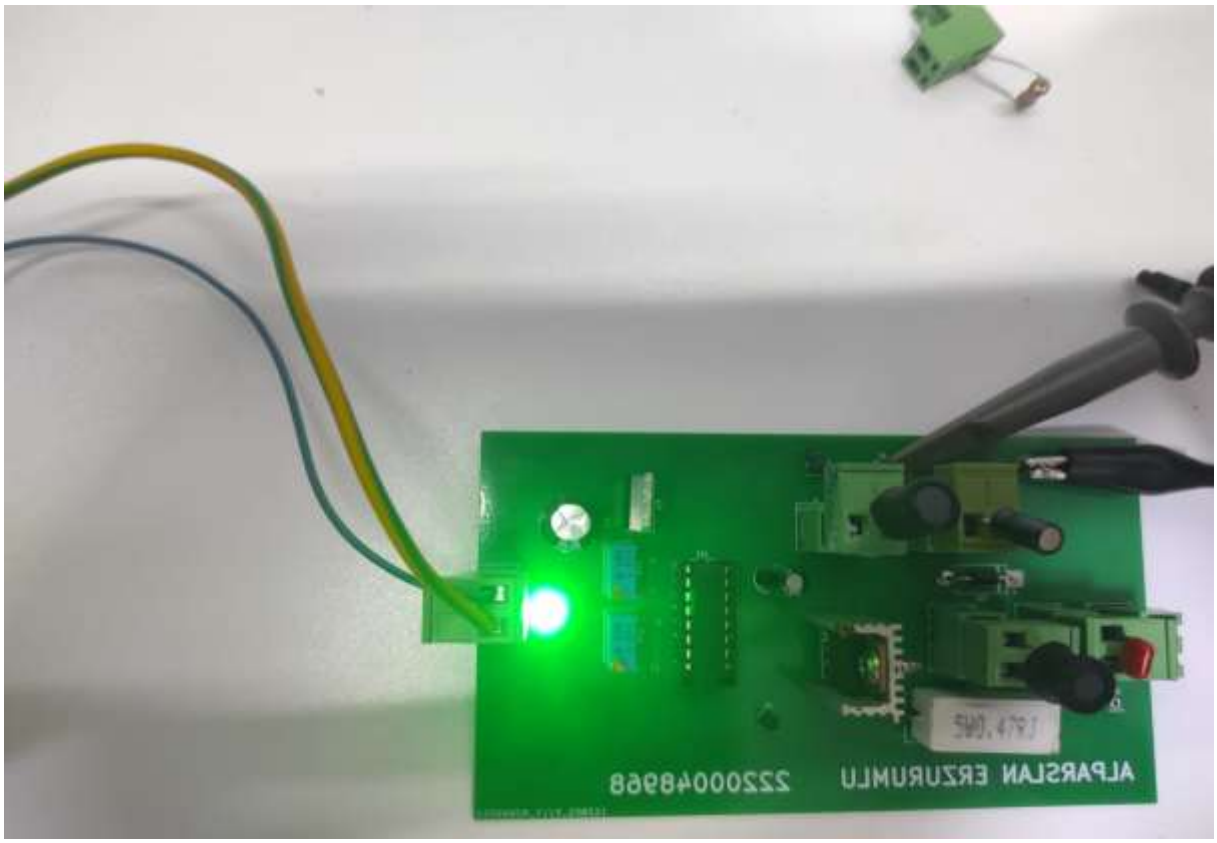
Şekil 9 Sepic Devresi Çıkış Gerilim Ölçümü

Çıkış gerilimi dalga grafiği osiloskop yardımı ile aşağıdaki verilmiştir. (Şekil 10)



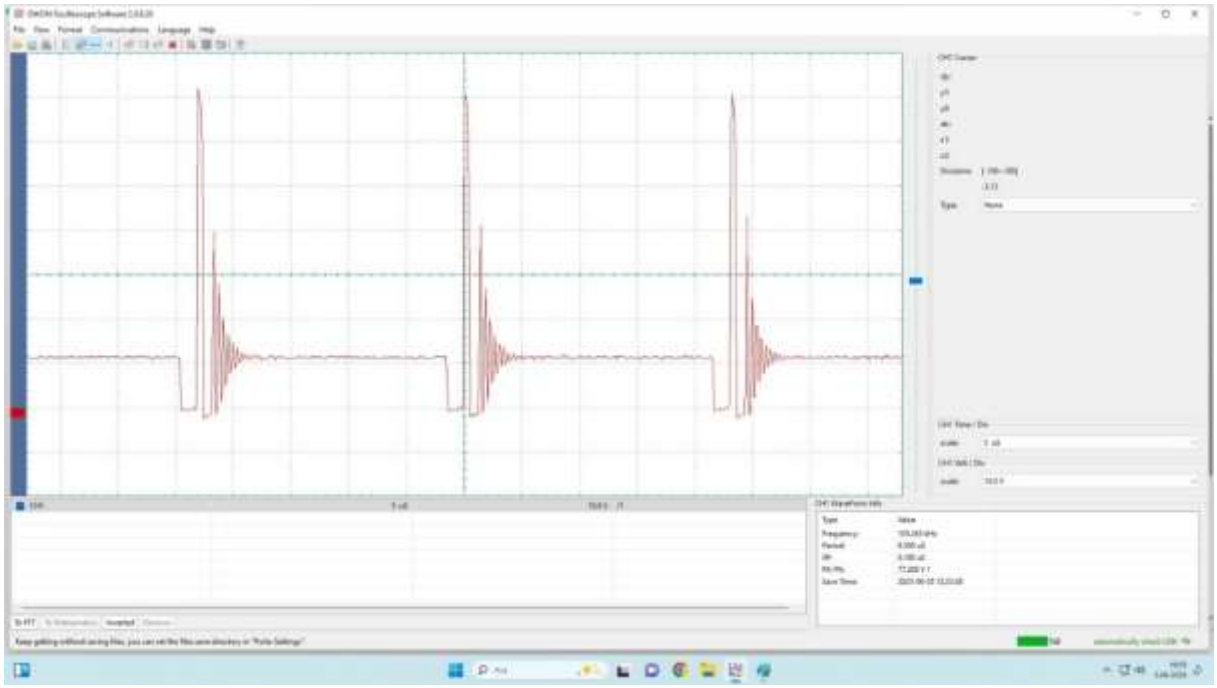
Şekil 10 Sepic Devresi Çıkış Gerilim Dalga Grafiği Osiloskop

Mosfet L1 C1 arası ölçümü ağaıdaki gibi gerçekleştirilmiştir. (Şekil 11)



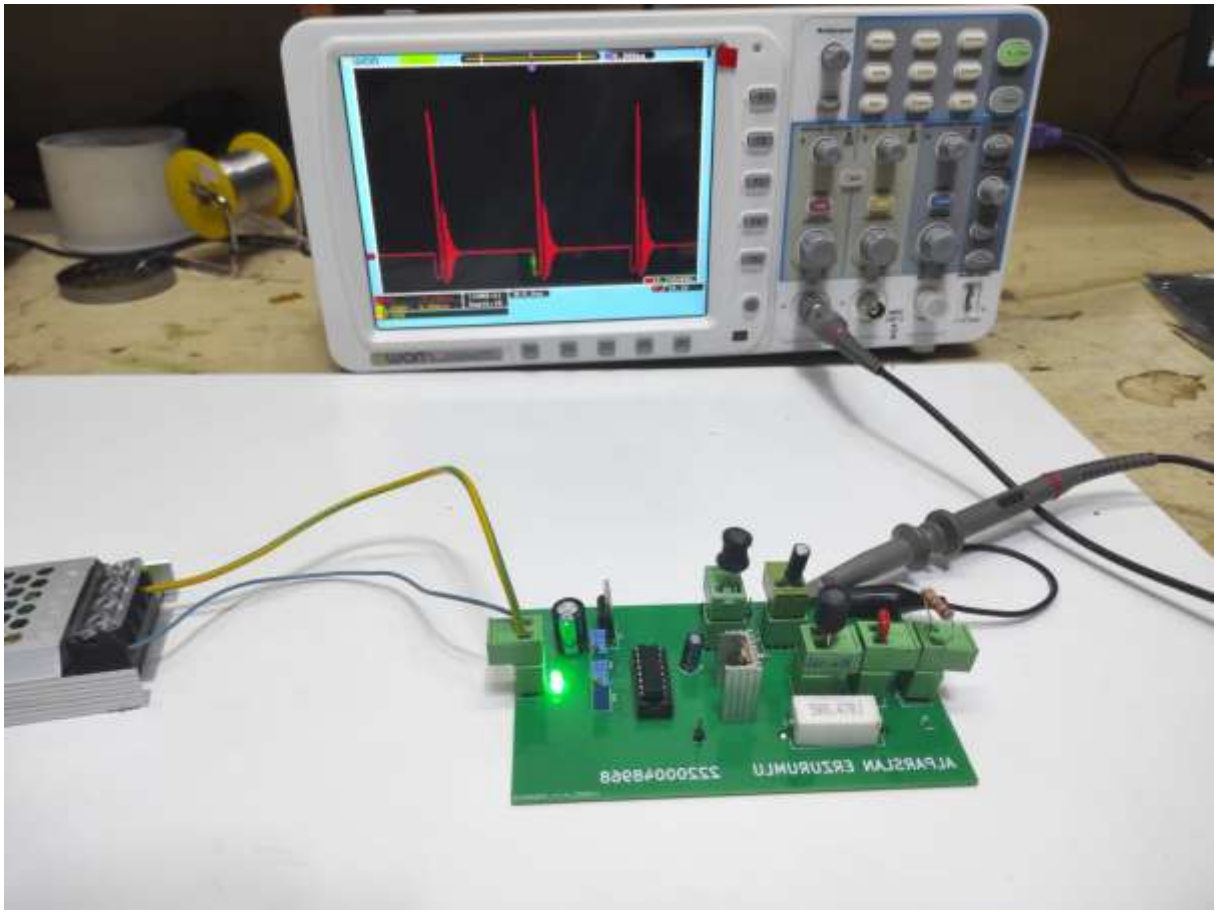
Şekil 11 Mosfet L1 ve C1 Arası Ölçüm

Mosfet L1 ve C1 arası ölçülen noktanın osiloskop ekranındaki dalga grafiği aşağıda verilmiştir. (Şekil 12)



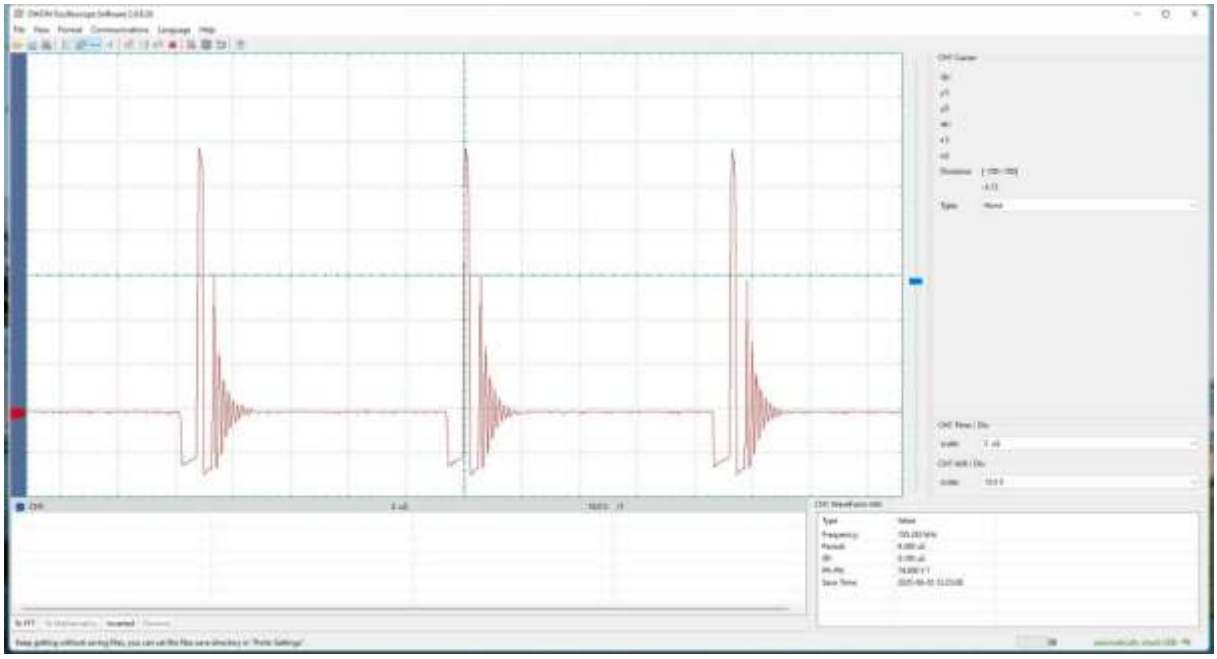
Şekil 12 Mosfet L1 ve L2 Arası Ölçümün Dalga Grafiği Osiloskop Görüntüsü

C1 ve L2 arası devremiz üzerinde yapılan ölçüm aşağıda verilmiştir. (Şekil 13)



Şekil 13 C1 ve L2 Arası Ölçüm

C1 ve L2 arası yapılan ölçümün osiloskop ekranındaki dalga grafiği verilmiştir. (Şekil 14)



Şekil 14 C1 ve L2 Arası Yapılan Ölçümün Osiloskop Ekranındaki Dalga grafiği

Teşekkür ve Bilgi Notu

Çalışmalarımızda Ahmet Serdar YILMAZ hocamıza çok teşekkür ediyoruz.

ÖZET

Laboratuvar uygulamaları, özellikle mühendislik disiplinlerinde, teknik eğitimin hayati bir parçasıdır. Uygulamalı deneyim olmadan teorik bilgi genellikle yüzeyde kalır ve öğrenciler üzerinde kalıcı bir etki bırakmaz. Hem bilgili hem de pratik açıdan yetkin mühendisler yetiştirebilmek için, teorik öğrenmeyi pratik uygulamalarla entegre eden bir eğitim metodolojisinin uygulanması gereklidir. Bu çalışma, Elektrik Mühendisliği müfredatında yer alan Güç Elektroniği dersi için öğrenci tarafından değiştirilebilir laboratuvar kitlerinin geliştirilmesinin önemini vurgulamaktadır. Mevcut laboratuvar sistemleri genellikle önceden monte edilmiş, kapalı sistemlere dayanmaktadır. Bu sistemler işlevsel olsalar da, öğrencilerin deney yaptıkları devrelerin iç yapısını ve teorik temelini tam anlamıyla kavramalarını engellemektedir. Bu nedenle, tasarım ve simülasyon gibi kritik süreçlerle etkileşime girme fırsatını kaçırmaktadırlar. Bu eğitimsel eksikliği gidermek amacıyla, çalışma açık, modüler ve kolay anlaşılır eğitim kitlerinin tasarım ve geliştirilmesini önermektedir. Projenin odağı, Güç Elektroniği ve anahtarlamalı güç kaynakları (SMPS) eğitiminde temel yapılardan biri olan Flyback dönüştürücü topolojisidir. Bu eğitim kiti, taşınabilir ve değiştirilebilir bileşenlere sahip bir Flyback dönüştürücü devresi içermektedir. Sistemin giriş voltajı 24V, çıkış voltajı ise 48V olarak belirlenmiştir. Öğrenciler; görev döngüsü, çıkış gerilimi dalgalanması ve anahtarlama frekansı gibi parametreleri seçilebilir bileşenler ve bir potansiyometre aracılığıyla ayarlayabilmektedir. Bu proje, hem teorik bilginin pekiştirilmesi hem de elektronik devre tasarımı ve güç kaynağı geliştirme konularında pratik becerilerin kazanılması açısından önemli katkılar sunmaktadır. Ayrıca çalışmada sunulan değerlendirme ve iyileştirme önerileri, benzer eğitim sistemlerinin daha etkili, erişilebilir ve güvenilir hale getirilmesi için gelecekteki araştırmalara değerli bir rehberlik sağlamaktadır.

Anahtar Kelimeler: Güç elektroniği, flyback dönüştürücü, eğitim kiti, anahtarlamalı güç kaynağı, voltaj dalgalanması

Giriş

DC-DC dönüştürücüler, herhangi bir DC kaynaktan aldığı gerilimi yükseltip düşürür. Sabit veya değişken gerilimler elde etmek için kullanılır. Bu dönüştürücüler yalıtımlı ve yalıtımsız olmak üzere iki grupta incelenir. (Şeker, 2014). Bu proje hem elektronik bilgisi hem de uygulama becerisi kazandırarak, katılımcıların elektronik sistemlerin tasarımı ve analizi konusundaki yetkinliklerini artırmayı amaçlamaktadır. (Çınar, 2019).

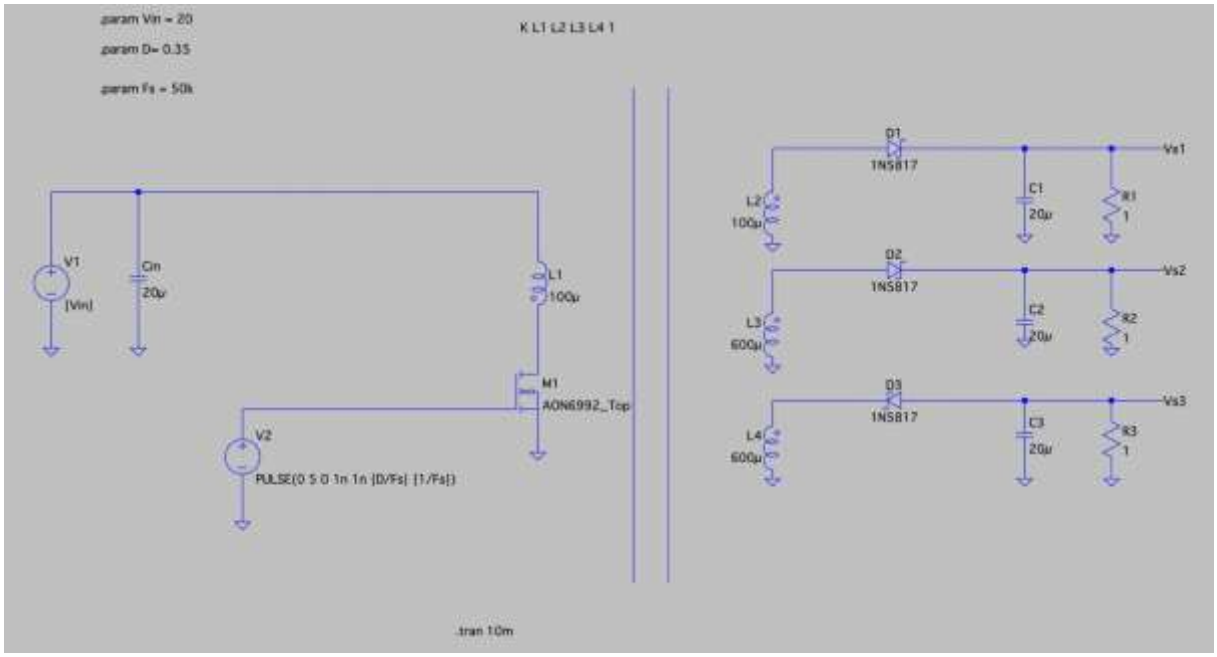
Bu elektronik proje, temel amaç olarak, bir güç kaynağı devresi oluşturmayı hedeflemektedir. Güç kaynağı devreleri, elektronik cihazların çalışması için gerekli olan doğru akım (DC) voltajını sağlamak amacıyla kullanılır. Bu projenin özel hedefi, belirli bir giriş voltajını alarak, istenilen çıkış voltajını stabil ve güvenilir bir şekilde sağlamaktır. Öğrenciler detaylı tasarım adımlarını takip ederek uygulama sonuçlarını da görebileceği, farklı trafo tasarımlarının devre çıkışın etkisini bu uygulama kartı ile kolaylıkla öğrenebileceği tek bir devre üzerinde sonuçlar alması hedeflenmektedir. Kısaca modüler olarak gerilim elde etmek, üretmek ya da akım modlu kontrol eğitimi için bu kart kullanılabilir olacaktır. Laboratuvar eğitimlerinde basitten karmaşığa doğru farklı sonuçlar alınmasının faydalı olacağı amaçlanmıştır. Bu elektronik devrenin çalışma prensibi ve fonksiyonları, temel elektrik ve elektronik kurallarına dayanarak, bileşenlerin birbiriyle nasıl etkileştiği ve işlev gördüğü üzerine kuruludur (Akgül, Uçar, Öztürk & Ekşi, 2014).

Materyal ve Yöntem

Flyback evirici çalışma yapısı, anahtarın iletim ve kesimde olması şeklinde değişkenlik gösterir (Göçer, 2024). Flyback dönüştürücüler girişine uygulanan değişik gerilimlerde çıkış gerilimini yükseltip düşürebilen bir sistemde çalışabilirler. (Hart, 2010).

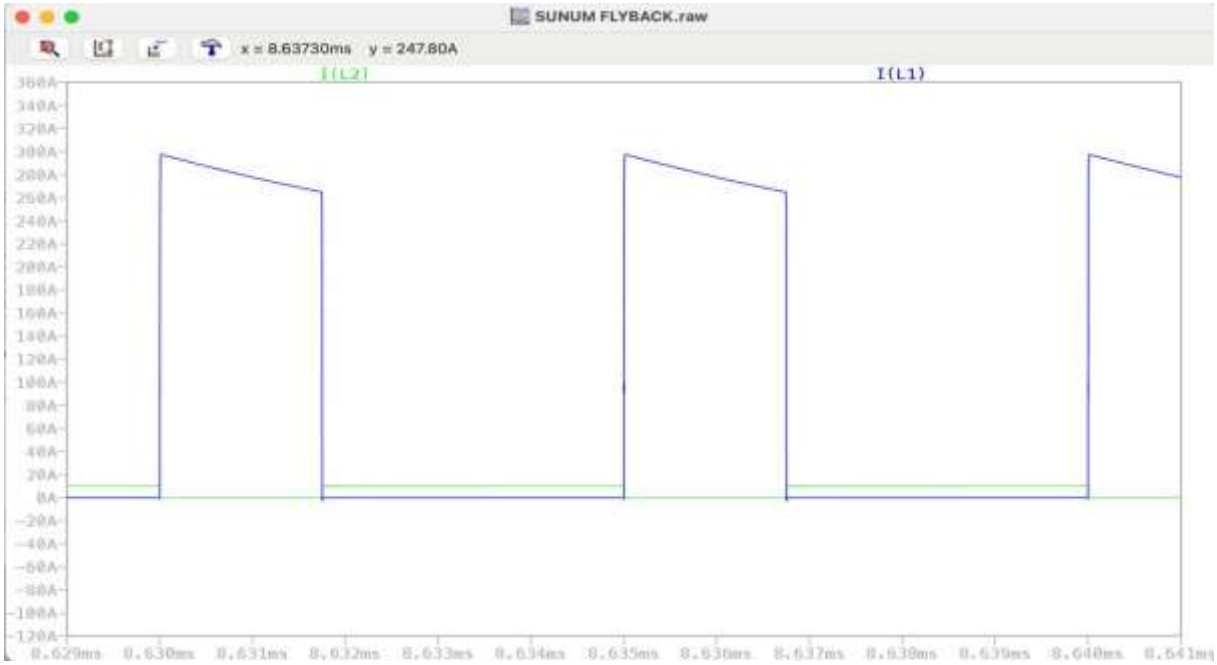
Bulgular ve Tartışma

Projenin test aşaması, devrenin doğru çalışıp çalışmadığını ve tasarım gereksinimlerini karşılayıp karşılamadığını doğrulamak için titizlikle yürütülmüştür. Öncelikle flyback dönüştürücünün LTspice programı ile benzetim çalışması yapılmıştır.



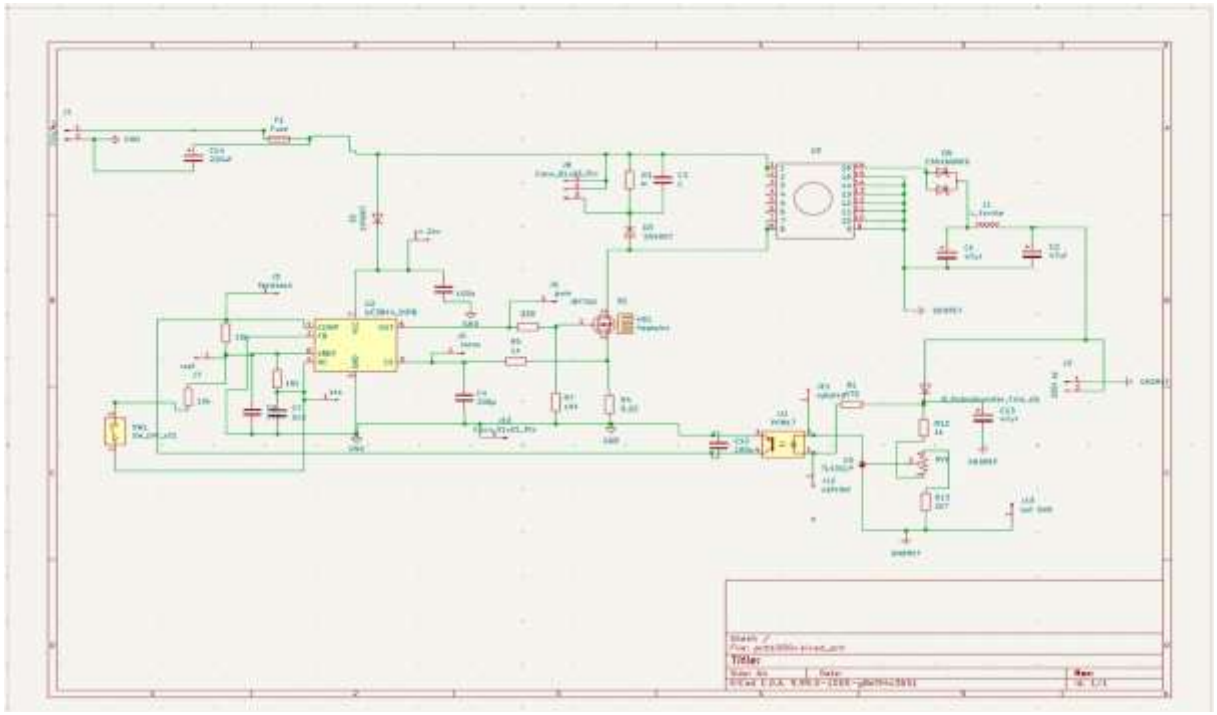
Şekil 1. LTspice Flyback Şematiği

LtSpice programında flyback şematiği gerçekleştirilirken giriş gerilim değeri, L1 bobini, L2 bobini, C1 kondansatörü, C2 kondansatör değerlerine göre çıkışta beklediğimiz gerilim değerine uygun ve frekansı 50kHz değerinde ve görev döngüsü ayarı yapılabilen bir LTspice şematiği yapılmıştır. Akabinde simülasyon sonuçları elde edilmiştir (Şekil 2).



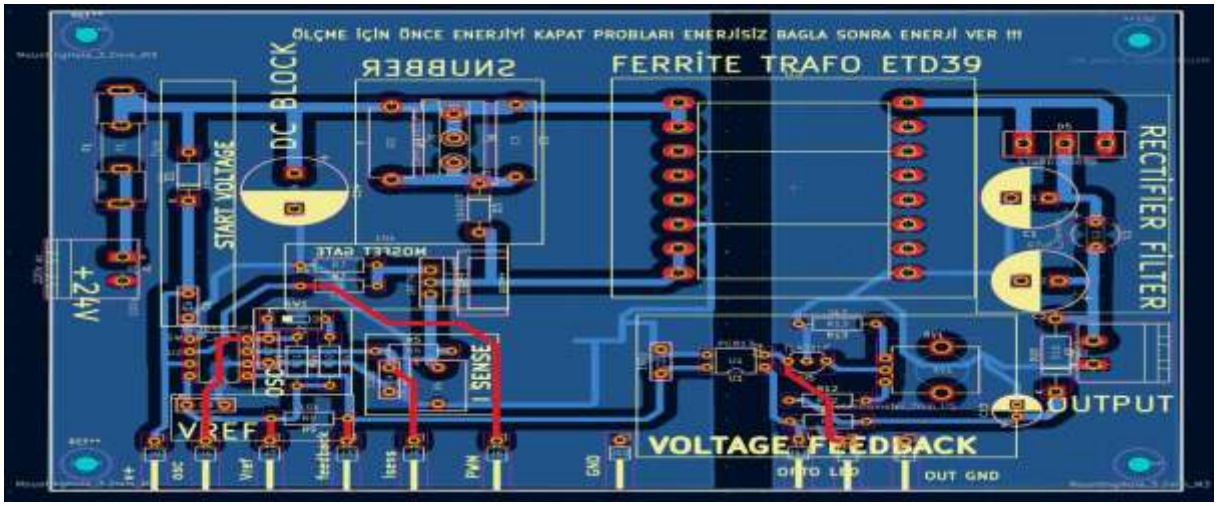
Şekil 2. L1 ve L2 Akım Değerleri Grafiği

Devrede kullanmış olduğumuz potansiyometre ve TL431 yardımı ile görev döngüsü ayarı kolay bir şekilde yapılabilmektedir. (Şekil 3)



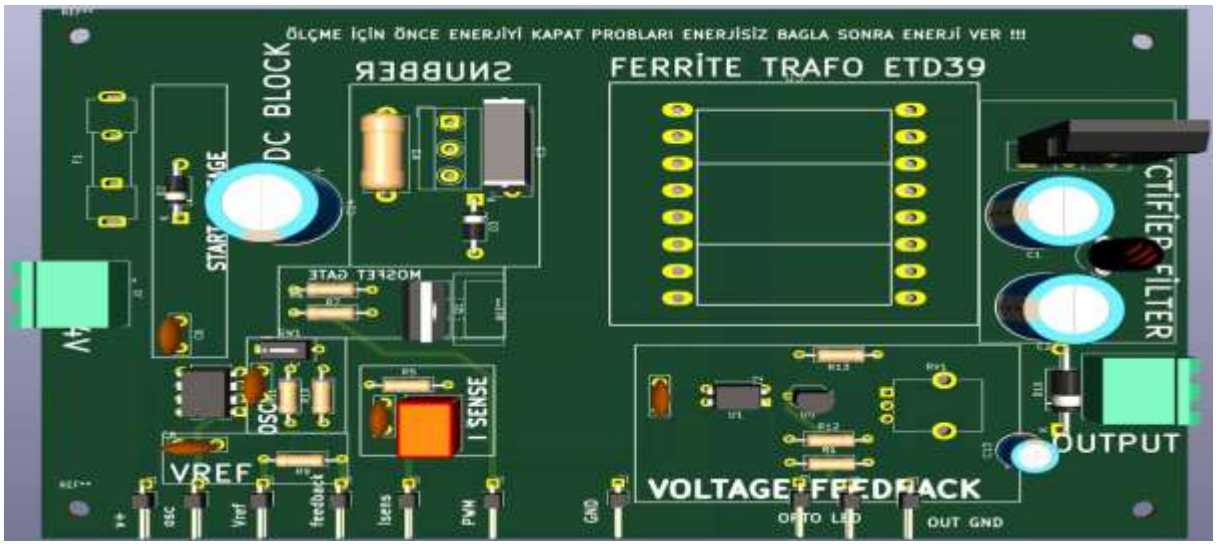
Şekil 3. KiCad Şematik Tasarımı Flyback

İlk enerji verdiğimiz zaman UC3843 PWM entegremiz PULSE üretimine başlar. Bu PWM Mosfetin gate ucundan tetiklenir. Mosfet PWM ile trafo üzerinde enerji indüklenir. Bu indüklenen enerji nüve üzerinden GAP alanı (İki nüve arasındaki boşluk) üzerinden karşı tarafa indüklenir. Bu şekilde çıkış voltajı üretilir. KiCad Pcb tasarımı flyback yapılmıştır. (Şekil 4)



Şekil 4. KiCad PCB Tasarımı

TL431(Voltaj referans entegresi) ile 2.5 voltta tutmaya çalışılır. PC817 optokuplör ile galvanik izolasyon yapılır. Optokuplörün, transistörün TL431 ile seviyesine göre aç kapa yapar bu da UC3843 entegresinin komparatörünü açıp kapatır. Dolayısıyla UC3843' ün PWM duty' sini ayarlar. Flyback devremizin üç boyutlu tasarımı yapılmıştır. (Şekil 5)

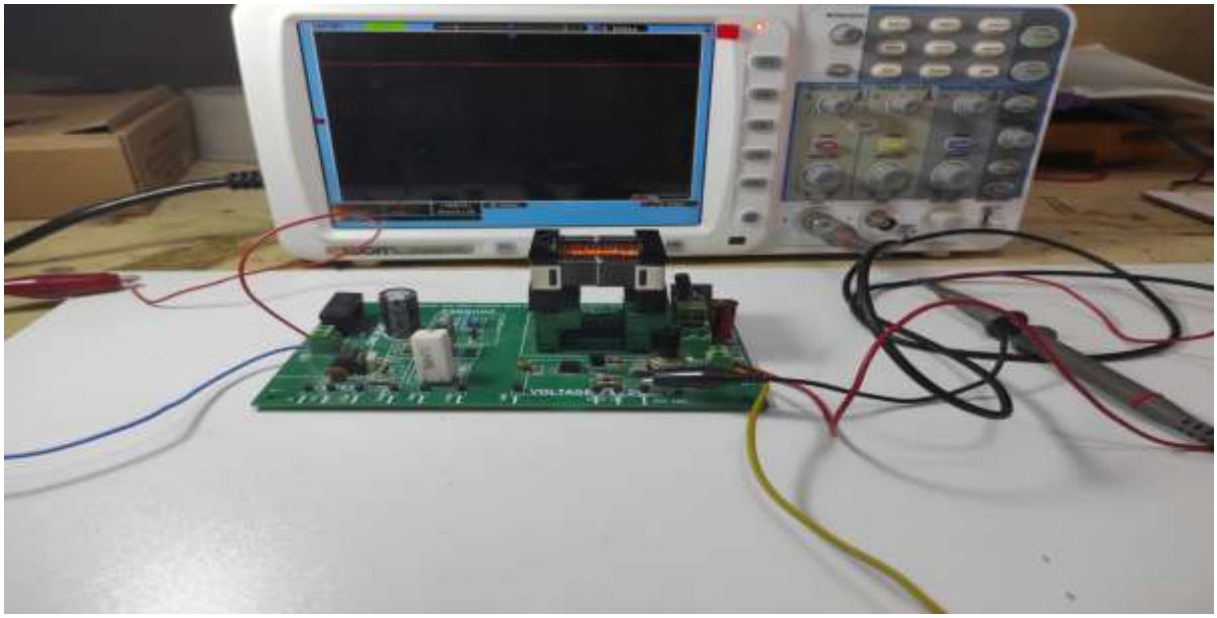


Şekil 5. Flyback KiCad Programı ile Yapılan Pcb Üç Boyutlu Tasarımı

Sonuç ve Öneriler

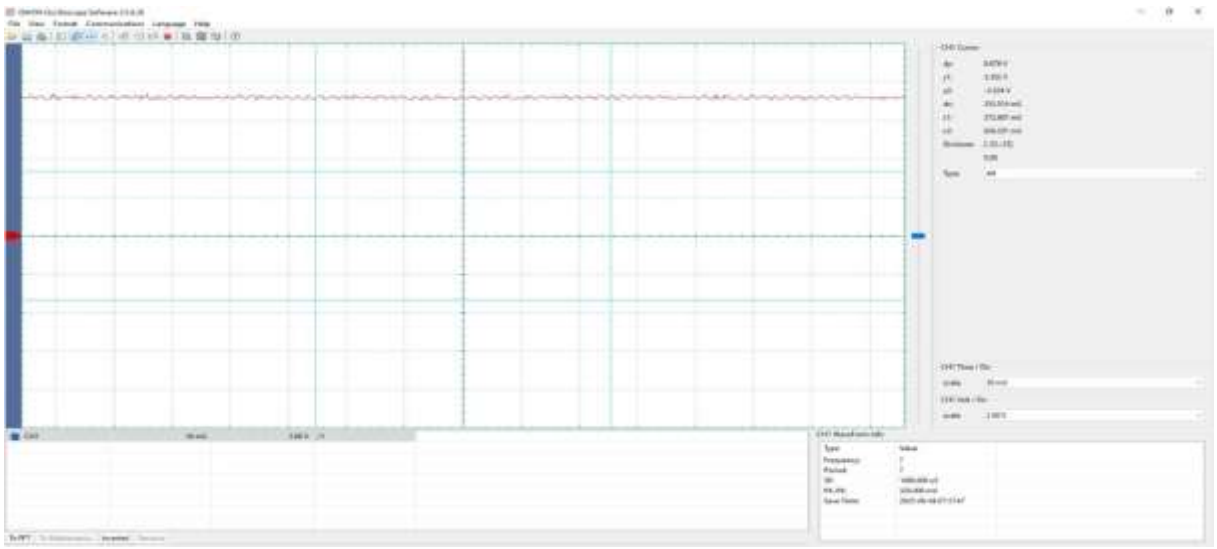
Bu çalışma öğrencilerin farklı kondansatör ve trafo değerlerinin çıkış gerilimi, pulse ve ısens akım değerinin ölçülebildiği bir güç kaynağı devresi eğitim kiti olarak hazırlanmıştır.

Primer sargısı 2,857 mh sekonder sargısı 4.153 mh olan trafomuz ile yapılan flyback devremizin çıkış gerilimi ölçümü aşağıdaki gibidir. (Şekil 6)



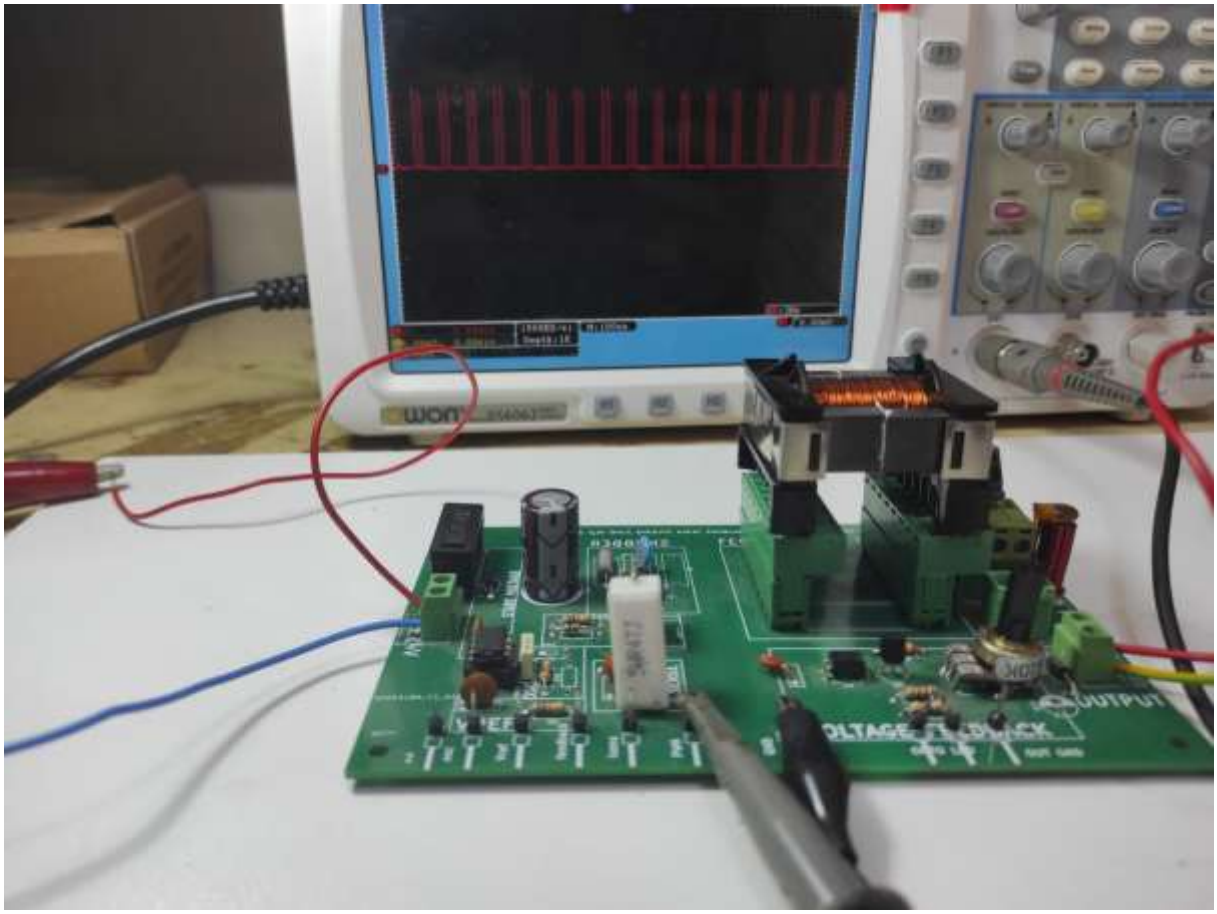
Şekil 6 Flyback Devresi Çıkış Gerilimi Ölçümü 1

Verilen devrenin çıkış gerilim değeri dalga grafiği aşağıda osiloskop ekranında verilmiştir. (Şekil 7)



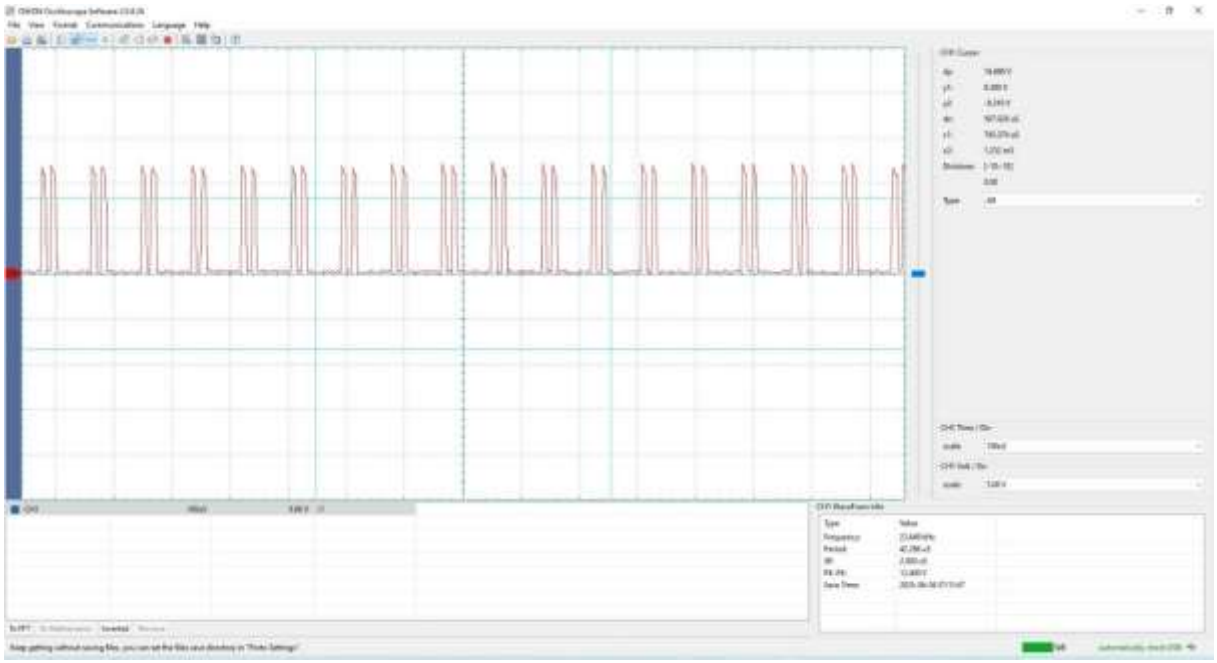
Şekil 7 Çıkış Gerilim Dalga Grafiği Osiloskop Görüntüsü 1

Tasarımı gerçekleştirilen flyback devremizin pwm ölçümü aşağıdaki gibidir. (Şekil 8)



Şekil 8 Flyback Devresinin Pwm Ölçümü

Pwm ölçümünün akabinde osiloskop dalga grafiği aşağıdaki gibi elde edilmiştir. (Şekil 9)

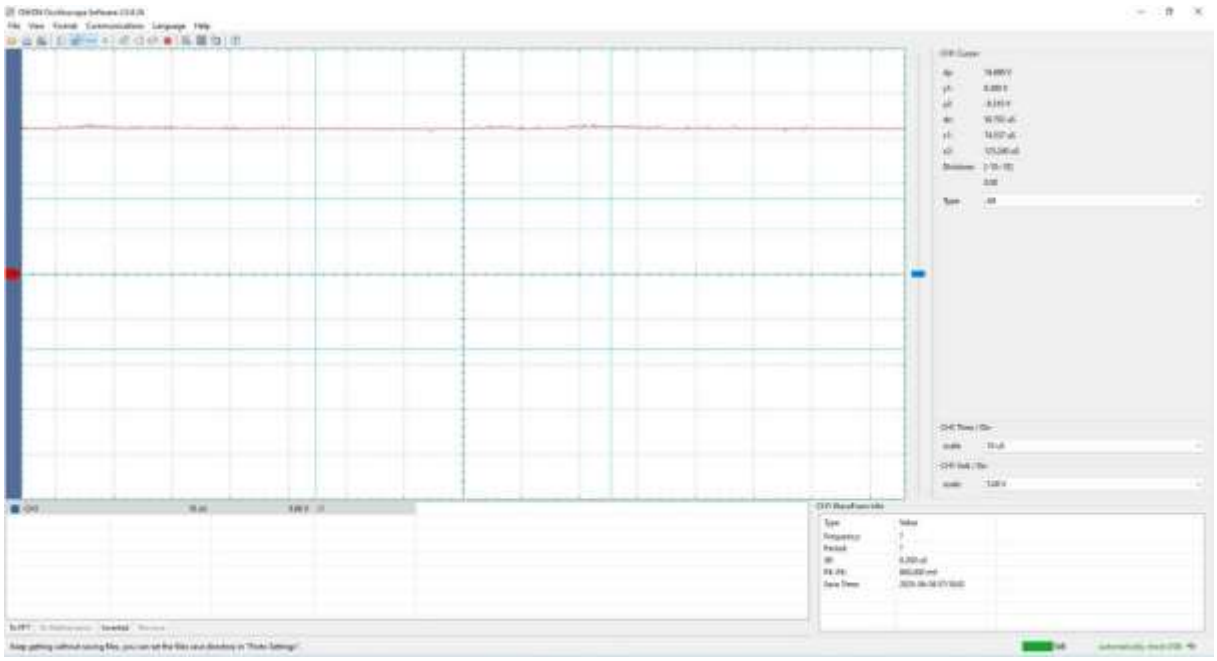


Şekil 9 Pwm Dalga Grafiği Flyback Devremiz 1

Primer sargısı 2.168 mh sekonder sargısı 9.441 mh olan trafomuz ile gerçekleştirdiğimiz flyback devresinin çıkış gerilimi ölçümü aşağıda verilmiştir. (Şekil 10)

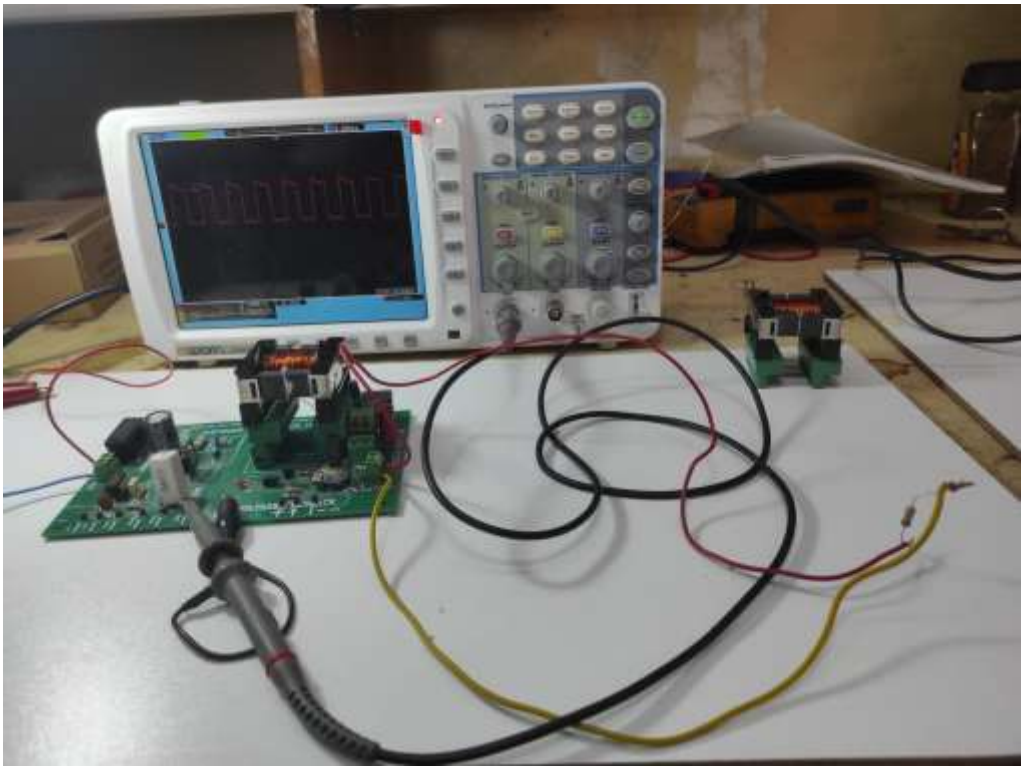
Şekil 10 Flyback Devresi Çıkış Gerilimi Ölçümü 2

Verilen devrenin osiloskop ekranındaki çıkış gerilim dalga grafiği aşağıda verilmiştir. (Şekil 11)



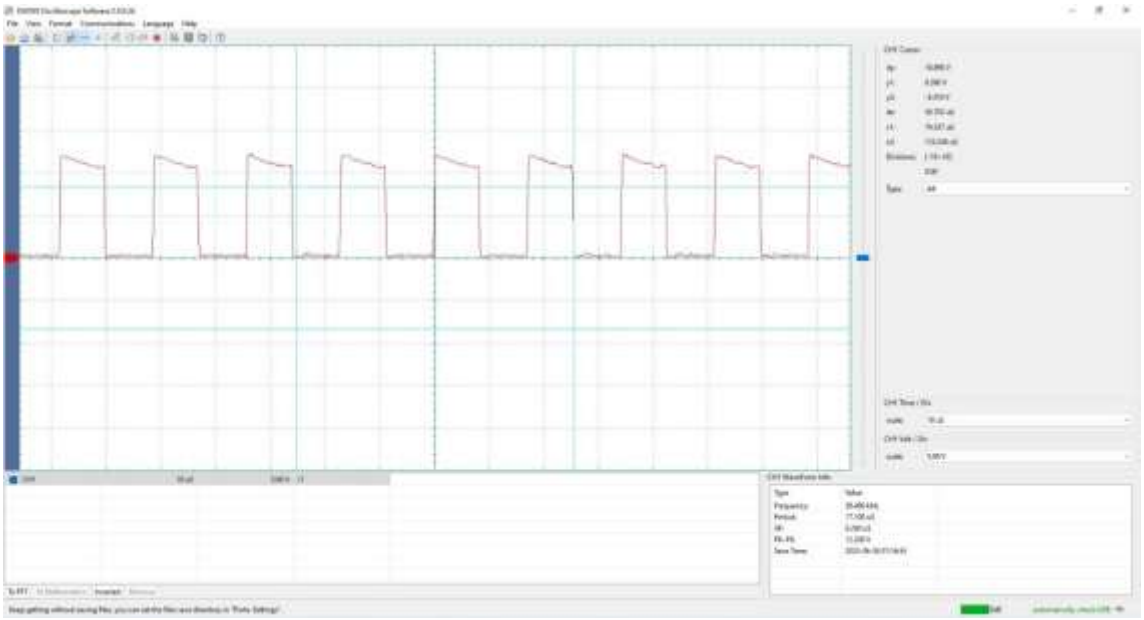
Şekil 11 Çıkış Gerilim Dalga Grafiği Osiloskop Görüntüsü 2

Devremizin pwm ölçümü aşağıda verilmiştir. (Şekil 12)



Şekil 12 Flyback Devremiz Pwm Ölçümü 2

Ölçümü gerçekleştirilen devremizin osiloskop ekranındaki dalga grafiği aşağıda verilmiştir. (Şekil 13)



Şekil 13 Pwm Dalga Grafiğimiz Flyback Devremiz 2

Teşekkür ve Bilgi Notu

Çalışmalarımızda Ahmet Serdar YILMAZ hocamıza çok teşekkür ediyoruz.

ABSTRACT

In this study, the relationship between the mathematical competencies and the success of the first- and second-year students taking the Microeconomics course in the Department of Political Science and Public Administration at Adıyaman University, Faculty of Economics and Administrative Sciences, in the fall semester of 2023-2024 was examined. The main purpose of the research is to determine the reasons for failure in the microeconomics course and to offer solutions to reduce these failures. In the study, in which the exploratory sequential design from mixed-methods research was adopted, quantitative data based on the distribution of achievement grades in two consecutive semesters of face-to-face education have been analyzed first. In the following process, qualitative data have been collected through interview forms. The findings have revealed an increase in the number of high-achieving students and a decrease in the number of low-achieving students in the second semester. This development has been associated with the mathematical thinking supportive activities implemented in the course. The analysis has revealed that inadequate study habits, lack of repetition of learned information, and negative attitudes towards mathematics were the determinants of students' reasons for failure. In addition, a significant number of students rated their interest and ability levels in mathematical subjects as average or below. As a result, it is recommended that mathematical concepts should be made more visible in microeconomics teaching, opportunities for repetition should be increased, and attractive methods should be used in course presentations.

Keywords: Microeconomics Education; Mathematical competencies; Academic Achievement.

Introduction

In the last 50 years, the role of mathematics in economics and its role in economic thought has become more visible, forcing students studying in the Department of Political Science and Public Administration to associate mathematics more closely with their undergraduate courses. This compulsion emerged after the Second World War, when mathematics became more present in economics and students taking economics courses at university began to object to the increase of mathematical topics in economics teaching; students studying in the Department of Political Science and Public Administration began to object to more mathematical topics in economics education (Dogruel, 2012). This opposition raises many questions that need to be answered.

The relationship of Microeconomics (Samuelson & Nordhaus, 1948), which deals with the analysis of the behavior of individual elements in an economy, such as the determination of the price of a single product, the behavior of a single consumer or commercial firm with mathematics (Bilgin, 2006) has brought up the need to clarify the question of how mathematical competence in the paper affects the views and achievements in the Microeconomics course.

In the literature, it has been observed that the number of studies examining the relationship between Mathematics and Microeconomics is not sufficient, and there is a limited number of studies on mathematical topics in Microeconomics teaching. Therefore, in order to contribute to the literature, the mathematical topics in Microeconomics.

Materials and Methods

Exploratory sequential design, which is in the mixed methods category, was used in this study. Mixed methods are defined as using both quantitative and qualitative research questions together (Johnson & Onwuegbuzie, 2004). The exploratory sequential design method has a two-stage structure in which quantitative data are first collected and analyzed and then qualitative data are collected and analyzed. While collecting and analyzing statistical data related to the Microeconomics course constitutes the first stage, collecting and analyzing qualitative data through student interview forms constitutes the second stage. The “Student Interview Form” was developed and applied by the researcher by taking expert opinion in the field of measurement and evaluation in order to determine the opinions of the students about the process. The purpose of choosing this method is that it allows the use of qualitative data to explain quantitative data in more detail. The exploratory sequential design method can collect more data than the data provided by qualitative and quantitative data alone. In addition, it can reduce the limitations of using qualitative and quantitative data alone (Creswell & Plano Clarck, 2011).

In this study, firstly, the statistical results, which are quantitative data about the success results of the Microeconomics course in the 2023-2024 and 2024-2025 academic years, are given and these data are analyzed in detail based on expert opinions. The grade distributions in these years were then compared. In order to explain the quantitative data, the data in the interview forms were also included.

Findings and Discussion

The letter grade distribution for the Microeconomics course for the 2023-2024 academic year is graphized below:

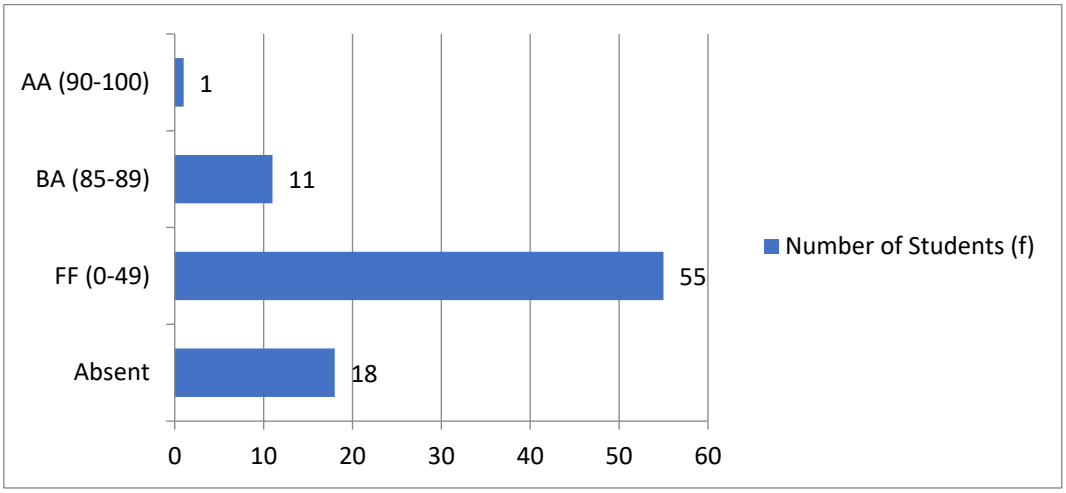

Figure 1. Letter grade distribution for microeconomics course for 2023-2024 academic year

According to expert opinions, 51.40% of the group of 107 students failed this course. In addition, the rate of students who did not attend the course was also high (32.71%). Figure 1 shows that 61.79% of the students who attended the course failed. This high failure rate suggests that students have difficulty in learning the target behaviors (Gocmen, 2004). In interviews with unsuccessful students, it was frequently mentioned that mathematics subjects were the main reason for this difficulty. Especially among undergraduate students studying in different departments, it has been observed that there are significant difficulties in reading and analyzing graphs in courses (Bayazit, 2011). One of the main reasons for the negative reaction of students to the use of mathematical expressions in economics courses is that mathematics seems to be an end in itself, rather than just a tool (Dogruel, 2012).

In addition to these, the university located in Adıyaman province, which is among the provinces most affected by the Kahramanmaras-based earthquake on February 6, 2023, which is referred to in the literature as the “Disaster of the Century” and its aftershocks, may have experienced a decrease in students' achievement scores as a result of problems arising from the psychosocial effects of students, distance education after the earthquake, inability to participate in the course with remote access due to problems arising from the lack of internet infrastructure, etc. (Sert et al., 2024).

The letter grade distribution for the Microeconomics course for the 2024-2025 academic year is graphed as follows:

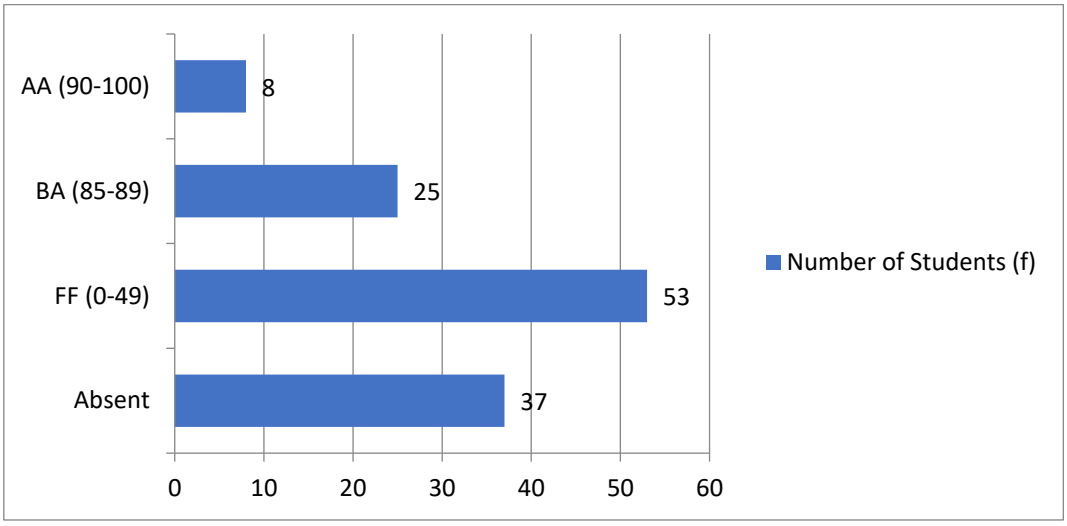

Figure 2. Letter grade distribution for microeconomics course for 2024-2025 academic year

As can be seen in Figure 2, in the studies conducted with the same class two years later, the number of absent students in the group of 108 students was 37. It was determined that 34.3% of the class failed the course due to absenteeism. It is seen that 49,07% of the students who attended the course failed the Microeconomics course with a letter grade of FF. This decrease in FF letter grading compared to the previous year can be associated with the organization of different activities that will gain mathematical thinking away from the logic of exams and questions carried out in the process. As found in the literature, it has been said that leading economists have been engaged in mathematics education, that as a result of these efforts, advances in mathematics have become a necessity for economics to follow, and as a result, mathematical conceptualization has found a serious place in economics (Bilgin, 2006). As a result, students who experience mathematics anxiety see mathematics, which is a tool, as a goal and focus on mathematics rather than the economics content in their lessons and express that they have difficulty and cannot do it.

Such a high rate of failure in the course was evaluated by the students under several headings (n=5) in the interview forms in which 37 students participated. In the second question of the fourth heading of the interview question, student opinions were taken about the success results of the course and the claim of failure among the students who attended the course, and the opinions of the group of students (n=30) who attended the course at 80% and above, whose answer was reached in the first question of the first heading, were as follows:

Table 1. Answers to the Second Question of Title Four and Number of Students

Number of Students (f)	Students' Answers
15	Inadequate study habits
14	Prejudice against the mathematics course
6	Lack of mathematics foundation
4	Failure to attract enough attention in the lesson

As seen in Table 1, 40.5% of the students who participated in the interview stated that inadequate study habits caused the mentioned failure despite attending the course, while 37.8% stated that the prejudice against the mathematics course caused this failure. The opinions in Table 1, which are similar to the opinions of the students who had difficulty in learning in the letter grade distribution for the Microeconomics course for the 2023-2024 academic year, were again asked with another question in the interview to clarify whether this difficulty was due to lack of experience by questioning the students' experience with the mathematical topics in the Microeconomics course. Of the answers given on a 5-point Likert scale ranging from very good to not at all, 72.97% (n=27) indicated that their experience with mathematical topics in Microeconomics course was moderate or above. This answer, given by students whose participation in the course was 80% and above, indicates that the students think that their experience with mathematical topics in the Microeconomics course was moderate or above, and that it cannot be concluded that this difficulty was experienced due to lack of experience. This rate is in line with the previously mentioned finding more space for mathematical topics in undergraduate economics courses.

In the next question, students were asked about their views on mathematical subjects and the level of their interests and abilities. Their answers are tabulated below:

Table 2. Answers to the Second Question of the Second Title and Number of Students

Number of Students (f)	Students' Answers
8	Average interest and ability
6	Below interest
5	Below ability
2	High interest and ability

When the levels of students' interests and abilities are examined together with their views on mathematical subjects, it is seen that students support the view that they have difficulty in mathematical subjects (n=7), that they do not consider their interests and abilities sufficient

(n=11), that students with high interest and ability (n=2) can encounter mathematics in all areas of life and that they can forget the subjects when the information learned is not repeated (n=3). It is seen that the students who have the last opinion (that subjects can be forgotten when the information learned is not repeated) are considered not only by the students with high interest and ability but also by other students. This view reveals that the concept of "repetition", which takes place in the form of references to the previous topic emphasized in the Microeconomics textbooks and the repetition of the opinions given a few pages ago, finds a response in the opinions of the students (Yildirim et al., 2018).

Other data obtained for the Microeconomics course for the 2024-2025 academic year are as follows: The class average for the final and make-up exams was 35.36, the standard deviation for both exams was 14.42, the number of students who did not take the final exam was 53, the number of students who did not take the make-up exam was 29, and the class level was evaluated as "Poor".

The letter grade distribution comparison graph for the Microeconomics course for the 2023-2024 and 2024-2025 academic years is as follows:

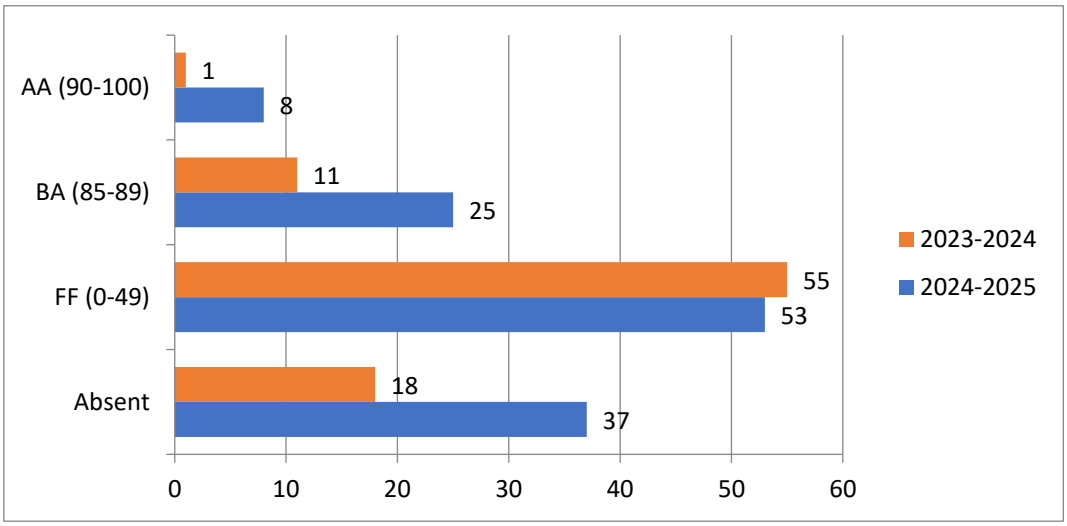

Figure 3. Microeconomics course letter grade distribution comparing 2023-2024 and 2024-2025 academic years

The results obtained in Figure 3 show that the number of students who failed the course due to the attendance requirement, which is at the top of the graph, has more than doubled compared to two years ago. The number of students who failed the course with a letter grade of FF decreased by 2. On the other hand, it is understood from the graph that the number of students who passed the course with the letter grade AA increased from 1 to 8, and the number of students who passed the course with the letter grade BA increased from 11 to 25.

Compared to the previous year, students with AA and BA letter grades constituted 11.21% of the class, while this percentage increased by 30.5% in the following year. This increase can be analyzed with many different variables. The emphasis on the association of mathematics with economics during the first seminar may be one of these variables. The relationship between economics and mathematics can be possible by explaining the use of mathematical concepts in economics that facilitate the understanding and interpretation of economics (Bilgin, 2006). In this way, the students' perspective towards the course may have changed and positively affected their learning.

Although the opinions of the students who failed the Microeconomics course were not obtained separately, one of the students who participated in the interview form stated that the reason for absenteeism was that the course overlapped with another course (n=1). Suggestions to prevent absenteeism were stated in the interview forms as follows:

- "*If attendance were not compulsory, friends who do not understand would not have to come and it is more efficient to continue with friends who are highly motivated.*" S1 continued his views as follows "*Let's aim to reconcile everyone with mathematics. Our priority should be to break the prejudice and bring friends to mathematics. I think that economics is a blended logical course, not within the scope of mathematics, and that we should first break down the prejudice of friends with a caring attitude. We should increase the morale and motivation of curious and volunteer friends, and we should not force those who cannot do the subjects. The first problem arose when we first met math. But we can overcome this with support. Seminars and activities that we can support will break the prejudice.*"
- S10 "*Actually, we need to understand that everything ends in oneself and how we motivate ourselves. Most of the students start with the prejudiced words 'I can't do it, I don't know', thinking that they will not succeed in the lessons. I think we should emphasize this issue more sensitively. I think we can overcome this problem by giving seminars and explaining the lessons in a more entertaining way.*"
- S18 "*Using computer programs, doing group work, debating with the teacher frequently, breaking the subjects into small pieces and comprehending them better, there may be days to practice.*"

As discussed above, it is thought that students' prejudices, lack of morale and motivation, extracurricular activities and seminars, teaching the lessons in an entertaining way, using computer programs, group work, dividing the topics into subheadings, debates with academics and practice will have positive results for students. It is thought that these answers, which are not written only to prevent absenteeism, are the things to be done in order to better understand mathematical subjects and to be successful.

Conclusion and Recommendations

In this paper, the reflection of the place of mathematics subjects in economics education, which has continued from the 19th century to the present day, on students was examined both on the basis of achievement points and with the help of interview forms. The data including the letter grade distributions for the Microeconomics course for the 2023-2024 and 2024-2025 academic years were analyzed separately and comparatively. As a result of the quantitative data supported by the qualitative data in the interview forms, it was seen that students attributed their failures to problems such as prejudice, insufficient understanding of the course, lack of repetition, lack of past experience in mathematics, etc. As a result of the practices carried out after the first year, there was an increase in the number of students with AA and BA letter grades in the second year and a decrease in the number of students with FF letter grades.

As a result of the research, suggestions for instructors teaching Microeconomics courses are as follows:

- In line with students' opinions, lessons can be made more efficient and mathematical concepts can be made more visible.

- Students can be encouraged to develop positive attitudes by using interesting methods in lesson presentations.
- At the beginning of the lesson, the topics of the previous lessons can be summarized and the topics and concepts of the previous lessons can be repeated.
- In order to understand mathematical concepts, definitions of these concepts can be included.
- Students can be encouraged to participate in different types of discussions such as debates, seminars, etc. and express their ideas.
- Students can be encouraged to take part in informative events such as symposiums and congresses where experts in the field take part.

Thanks and Information Note

ABSTRACT

Future literacy is defined as the knowledge, skills and understanding that individuals and societies need in order to comprehend, anticipate, and engage with the future. Within the framework of the social foundations of education, pre-service teachers have the role of educating individuals for future societies; within the framework of the individual foundations of education, they are responsible for preparing individuals for the future. This underscores the importance of identifying their cognitive structures related to future literacy. The lack of studies in the literature that aim to examine pre-service teachers' cognitive structures regarding the terminology of future literacy highlights the originality and significance of this study. The absence of studies in the literature that aim to examine pre-service teachers' cognitive structures regarding the terminology of future literacy reveals the original value of this research. Based on this, the present study aimed to investigate the cognitive structures of pre-service teachers related to concepts associated with future literacy. The study group of the study, which is a qualitative study designed with a descriptive scanning model, consists of 143 senior teacher candidates studying in different departments of a state university. The data were collected using the word association test for the concepts of "futurism, dystopia, utopia, robotics, vision, transhumanism, science fiction, foresight, innovation, sustainability, artificial intelligence, digitalization, colonization of Mars, augmented reality, metaverse, future, virtual reality" determined within the scope of the relevant literature. The data of the study were analyzed with the content analysis technique. As a result of the data analysis, it was determined that the teacher candidates associated more concepts in their cognitive structures towards the concept of "future" compared to other concepts. In addition, it was determined that the teacher candidates established insufficient relationships between the concepts related to future literacy and could not establish any relationships between many concepts.

Keywords: future, future literacy, pre-service teacher

ÖĞRETMEN ADAYLARININ GELECEK OKURYAZARLIĞI İLE İLİŞKİLİ KAVRAMLARA YÖNELİK BİLİŞSEL YAPILARININ İNCELENMESİ

ÖZET

Günümüz toplumları çevre kirliliği, küresel ısınma, afetler, çok kültürlülük, adalet, yapay zekâ, yeni teknolojiler gibi her türlü karmaşık sorun ve zorluklarla uğraşmaktadır. Bu zorlukların gelecekte krize dönüşmemesi için geleceği düşünerek senaryolar üretmek ve bugünden eylem planları yapmak giderek önem kazanmaktadır. Bu durum günümüzde gelecek okuryazarlığı becerisine sahip olmanın gerekliliğini ortaya koymaktadır. Gelecek okuryazarlığı; bireylerin ve toplumların geleceği anlamak, öngörmek ve etkileşimde bulunmak için gerekli bilgi, beceri ve anlayışa sahip olması olarak tanımlamaktadır. Öğretmen adaylarının eğitimin toplumsal temeli kapsamında gelecek toplumlara bireyler yetiştirme, eğitimin bireysel temeli kapsamında ise bireyi de geleceğe hazırlama rolü, gelecek okuryazarlığı ile ilgili bilişsel yapılarının tespitinin önemini ortaya koymaktadır. Alanyazında öğretmen adaylarının gelecek okuryazarlığıyla ilgili terminolojiye yönelik bilişsel yapılarını incelemeyi amaçlayan çalışmalara rastlanmamış olması bu çalışmanın özgün değerini ortaya koymaktadır. Buradan yola çıkarak araştırma öğretmen adaylarının gelecek okuryazarlığıyla ilişkili kavramlara yönelik bilişsel yapılarını incelemeyi amaçlamıştır. Nitel bir çalışma olup betimsel tarama modeliyle desenlenen araştırmanın çalışma grubu, bir devlet üniversitesinin farklı bölümlerde öğrenim gören 143 son sınıf öğretmen adayından oluşmaktadır. Veriler ilgili literatür kapsamında belirlenen "fütürizm, distopya, ütopya, robotik, vizyon, transhümanizm, bilim kurgu, öngörü, inovasyon, sürdürülebilirlik, yapay zeka, dijitalleşme, Marsın kolonileşmesi, artırılmış gerçeklik, metaverse, gelecek, sanal gerçeklik" kavramları kelime ilişkilendirme testi kullanılarak toplanmıştır. Çalışmanın verileri içerik analizi tekniği ile analiz edilmiştir. Veri analizi sonucunda öğretmen adaylarının "gelecek" kavramına yönelik bilişsel yapılarında diğer kavramlara kıyasla daha fazla kavramı ilişkilendirdikleri tespit edilmiştir. Ayrıca öğretmen adaylarının gelecek okuryazarlığıyla ilgili kavramlar arasında yetersiz düzeyde ilişki kurdukları, birçok kavram arasında ise hiç ilişki kuramadıkları belirlenmiştir.

Anahtar Kelimeler: gelecek, gelecek okuryazarlığı, öğretmen adayları

GİRİŞ

İnsanoğlu doğası gereği geleceği düşünmekte, geleceğe yönelik merak duygusunu beslemekte, bu doğrultuda çeşitli planlar yapmakta, hedefler belirlemekte, hedeflerine hazırlanmaktadır (Uymaz ve Cebeci, 2024; Acar, 2019). Jason vd. (1989) tarafından yapılan çalışmada, insanların geleceği düşünmek için geçmişe kıyasla neredeyse iki kat daha fazla zaman harcadıklarını tahmin ettiklerini göstermektedir. Klinger ve Cox (1987) ise rastgele zamanlarda örneklemek için kullandıkları bir çağrı cihazı aracılığıyla insanların günlük aktiviteleri sırasında düşüncelerinin nasıl şekillendiğini inceledikleri çalışmalarında, örneklenen düşüncelerin %12'sinin gelecekle ilgili olduğunu gözlemlemişlerdir. Daha yakın zamanda D'Argembeau ve arkadaşlarının (2011) 19-28 yaş aralığındaki katılımcıların uyandıkları andan uykuya daldıkları ana kadar yani tipik bir gün boyunca geleceğe yönelik düşüncelerini (gelecekte belirli bir zamanda gerçekleşebilecek olaylara yönelik düşünceler veya gelecekte herhangi bir olaya yönelik olmayan genel düşünceler) kaydetmelerinin istendiği çalışmalarında, katılımcıların ortalama olarak bir günde 59 geleceğe yönelik düşünce deneyimlediklerini, bu da yaklaşık olarak her 16 dakikada bir geleceğe yönelik düşünce deneyimlemeye karşılık geldiğini tespit etmişlerdir. Bu bulgular geleceğe yönelik düşüncenin insanın zihninde önemli bir yer tuttuğunu göstermektedir.

Günümüz dünya vatandaşları çevre kirliliği, küresel ısınma, afetler, çok kültürlülük, adalet, yapay zekâ, yeni teknolojiler gibi her türlü karmaşık zorun ve zorluklarla uğraşmaktadır. Bu zorlukların gelecekte krize dönüşmemesi için geleceği düşünmek, gelecek ile ilgili senaryolar üreterek bugünden eylem planları yapmak giderek önem kazanmaktadır (Bol vd, 2023). Bu durum günümüzde gelecek okuryazarlığı becerisine sahip olmanın gerekliliğini ortaya koymaktadır. İlk olarak Wendy Schutz'un doktora tezinde kullandığı "gelecek akıcılığı" (futures fluency) ifadesi ile şekillenmeye başlayan gelecek okuryazarlığı kavramı (Schultz, 1995) daha sonra Riel Miller'in bir dizi makalesine konu olmuştur (Miller, 2006, 2007, 2011, 2015, 2018, 2022). Miller (2022) gelecek okuryazarlığını; bireylerin ve toplumların geleceği anlamak, öngörmek ve etkileşimde bulunmak için gerekli bilgi, beceri ve anlayışa sahip olması olarak tanımlamaktadır. Ayrıca bu kavramın; geleceği okumak, farklı senaryoları değerlendirmek ve gelecekteki olasılıkları keşfetmek için önemli bir yetenek olduğunu belirtmektedir. En yalın şekli ile "geleceği şimdiki zamanda aktif olarak kullanma becerisi" olarak ifade edilmektedir (Poli, 2021).

Gelecek okuryazarlığı bize öngörü gücü vererek adeta bir kâhin gibi geleceğe yönelik tahmin üretme becerisi kazandırmak yerine, olası geleceği keşfetmeye ve ona hazırlanmaya, tercih edilen gelecekleri belirlemeye ve eylem araştırması gibi öğrenme sürecinde gelişimi amaçlayan neyin gerekli olduğunu tespit etmeye yardım etmektedir (Kokshagina, 2021).

Eğitim sistemimizin geleceğini şekillendirecek olan temel öğelerden biri bugünün öğretmen adaylarıdır. Öğretmen adaylarının eğitimin toplumsal temeli kapsamında gelecek toplumlara bireyler yetiştirme, eğitimin bireysel temeli kapsamında ise bireyi de geleceğe hazırlama rolü, gelecek okuryazarlığı ile ilgili bilişsel yapılarının tespitinin önemini ortaya koymaktadır. Gelecek okuryazarlığı henüz gelişiminin erken aşamalarında olsa da öğretmen adaylarının gelecek okuryazarlığı becerisi ile ilgili zihinlerindeki yapılanmanın, bu beceri kapsamındaki terminolojiye olan hâkimiyetlerinin tespiti, gelecek konusuna olan bakış açıları, motivasyon düzeyleri, geleceği düşünüp düşünmedikleri ve bu düşüncelerini gelecek okuryazarlığı becerisi doğrultusunda temellendirebilme kapsamında ipuçları sunacaktır. Bu ipuçları gelecek odaklı eğitim politikalarının düzenlenmesinde, ders içeriklerinin oluşturulmasında ve geleceğin öğretmenleri olan öğretmen adaylarının bu kapsamdaki temel ihtiyaçlarının belirlenmesinde veri kaynağı olarak kullanılabileceği öngörülmektedir. Alanyazında öğretmen adaylarının

gelecek okuryazarlığı ile ilgili terminolojiye yönelik bilişsel yapılarını incelemeyi amaçlayan çalışmalara rastlanmamış olması bu çalışmanın özgün değerini ortaya koymaktadır. Bu araştırmadan elde edilen sonuçların gelecek okuryazarlığı konusunda literatüre katkı sağlaması beklenilmektedir.

Bu araştırmanın amacı öğretmen adaylarının gelecek okuryazarlığı ile ilişkili kavramlara yönelik bilişsel yapılarını incelemektir. Bu amaca ulaşmak adına şu alt sorulara yanıtlar aranmaktadır:

1. Öğretmen adaylarının gelecek okuryazarlığı ile ilgili terminolojiye yönelik bilişsel yapıları nasıldır?
2. Öğretmen adayları gelecek okuryazarlığı terminolojisi kapsamında yer alan kavramlar arasındaki bağlantıyı nasıl kurmaktadırlar?

YÖNTEM

Araştırmanın modeli

Öğretmen adaylarının gelecek okuryazarlığı kavramı ile ilişkilendirilen fütürizm, distopya, robotik, vizyon, transhümanizm, ütopya, bilim kurgu, öngörü, inovasyon, sürdürülebilirlik, yapay zeka, dijitalleşme, marsın kolonileşmesi, artırılmış gerçeklik, metaverse, gelecek, sanal gerçeklik kavramlarına yönelik yeterli düzeyde kavramsal yapıya ve kavramlar arası ilişkiye sahip olup olmadıklarının incelenmesi amacıyla yürütülen bu araştırma nitel bir çalışma olup betimsel tarama modeli kullanılarak tasarlanmıştır.

Araştırmanın çalışma grubu

Araştırmanın çalışma grubunu, 2024-2025 eğitim-öğretim yılı bahar döneminde bir devlet üniversitesi eğitim fakültesinin farklı bölümlerinde son sınıflarında öğrenim gören, kolay ulaşılabilir durum örneklemesi yöntemiyle araştırmanın veri toplama sürecine dâhil edilen 143 öğretmen adayı oluşturmaktadır. Öğretmen adaylarının 99'u kadın, 44'ü erkektir. Öğretmen adaylarının bölümlere dağılımları şöyledir: 22'si Sınıf Eğitimi ABD, 27'si İlköğretim Matematik Eğitimi ABD, 15'i Fen Bilgisi Eğitimi ABD, 21'i Sosyal Bilgiler Eğitimi ABD, 16'sı Türkçe Eğitimi ABD, 23'ü Psikolojik Danışma ve Rehberlik ABD ve 19'u Okulöncesi Eğitimi ABD.

Veri toplama aracı

Araştırmanın verileri kelime ilişkilendirme testi (KİT) kullanılarak toplanmıştır. Bu araştırmada kullanılacak KİT'in hazırlık aşamasında gelecek okuryazarlığı kavramına yönelik literatür taraması yapılmış (Altun, 2020; D'argembeau, 2011; Uymaz, 2023; Uymaz & Cebeci, 2024; Yavuzer vd, 2005) ve Altun (2020) tarafından gelecek okuryazarlığı terminoloji kapsamında yer alan fütürizm, distopya, robotik, vizyon, transhümanizm, ütopya, bilim kurgu, öngörü, inovasyon, sürdürülebilirlik, yapay zeka, dijitalleşme, marsın kolonileşmesi, artırılmış gerçeklik, metaverse, gelecek, sanal gerçeklik kavramları bu araştırmada anahtar kavramlar olarak belirlenmiştir.

Veri toplama aracı hazırlanırken anahtar kavramların ve bu kavramlara yönelik üretilen cevapların birbirlerine etkileme, tekrarlanma olasılığı göz önünde bulundurulmuş, bu amaçla her sayfaya ayrı bir anahtar kavram ve istenilen yanıt sayısı (beş yanıt) gelecek şekilde düzenleme yapılmıştır. Öğretmen adaylarına her bir anahtar kavram için 40 saniye süre verilmiş, bu süre içerisinde adayların ilgili anahtar kavrama yönelik akıllarına gelen ilk beş kelimeyi/kavramı alt alta sıralamaları istenmiştir.

Verilerin analizi

Bu aşamada öncelikle her anahtar kelime için öğretmen adayları tarafından ilişkilendirilen kelime/kavramlara yönelik frekans tablosu hazırlanmıştır. Ardından anahtar kavramlar arasındaki ilişkinin tespit edilmesi için kavram ağı oluşturulmuştur. Kavram ağının oluşturulmasında frekans tablosundan yararlanılmış, her bir anahtar kavramın diğer anahtar kavramlar içerisindeki tekrar sayısı dört aralığa (aralık değeri 10) göre şematize edilmiştir. Kavram ağlarının oluşumu sürecinde belirlenen aralık değerleri ve bu değerlerin göstergesi olarak tercih edilen okların rengi şu şekildedir:

2-11 arası: sarı; 12-21 arası: yeşil; 22-31 arası: mavi; 32 ve üstü: kırmızı

Veri analizinin geçerlik ve güvenirliği

Araştırma sonuçlarının güvenirliğini sağlamak için iki araştırmacı tarafından ayrı ayrı kodlama ve kategorileştirme süreci yapılmış, ortaya çıkan kod ve kategoriler karşılaştırılarak veri analizine son şekli verilmiştir. Bu kapsamda Miles & Huberman (1994) tarafından geliştirilen [görüş birliği / (görüş birliği+ görüş ayrılığı)*100] formül kullanılmış, kodlayıcılar arası ortalama güvenirliğin %89 olduğu tespit edilmiştir. Araştırma sonuçlarının geçerliğini arttırmak için veri analizi sürecinde kavramsal kategorilerin oluşturulması aşamasında hangi kaynaklardan yararlanıldığı araştırmanın tartışma bölümünde bu araştırmadan elde edilen sonuçlarla ilişkilendirilerek açıklanmıştır (Daymon & Holloway, 2003).

BULGULAR

Aşağıdaki tablolarda araştırmaya katılan öğretmen adaylarının anahtar kavramlara yönelik cevap kelime/kavram sayıları kategorileştirilerek frekans değerleri ile birlikte sunulmaktadır.

Tablo 1. Transhümanizm kavramına yönelik KİT analizi sonuçları

Kategoriler	**f**	**Kavramlar (f)**
Kimlik	53	İnsan (28), İnsanın değişimi (13), İnsan ötesi (10), Yetenek (2)
Toplumsal cinsiyet	50	Cinsiyet (12), Gey (8), Trans birey (8), Cinsiyetsizlik (7), Eşcinsellik (6), LGBT (5), Erkek (2), Kadın (2)
Toplum	38	Farklılık (12), Eşitlik (7), Saygı (6), Sevgi (4), Toplum (4), Çeşitlilik (3), Özgürlük (2)
Bakış açısı	24	Düşünce (5), Hümanist (4), Felsefe (4), Fikir (4), Anlayış (3), Hümanist olmayan (2), Akım (2), Din (2)
Değişim	23	Değişim (11), Dönüşüm (4), Geçiş (4), Gelecek (2), Yok etmek (2)
Değer	15	Hoşgörü (5), İyimserlik (5), Ahlaksız (3), Günah (2)

Tablo 1 incelendiğinde katılımcı öğretmen adaylarının "transhümanizm" kavramı ile ilişkilendirdiği kavramların 6 kategoride toplandığı, bu kategoriler kapsamında birbirinden farklı 37 kavram ilişkilendirmesi yapıldığı tespit edilmiştir. Ayrıca adayların transhümanizm kavramını daha çok "kimlik" ve "toplumsal cinsiyet" kategorisindeki kavramlarla ilişkilendirdikleri dikkati çekmiştir. Bu anahtar kavramın özellikle cinsiyete dair kavramlarla ilişkilendirilmesinin adayların transhümanizm kavramına yönelik kavram yanılgılarına sahip olduklarını göstermektedir.

Tablo 2. Ütopya kavramına yönelik KİT analizi sonuçları

Kategoriler	**f**	**Kavramlar (f)**
Hayali	141	Hayali (58), Selena (25), Hayali dünya (20), Hades (8), Hayal gücü (6), Hayal ürünü (6), Hayalperest (4), Yüce Honos (4), Alışılmamış (3), Pandora (3), Hayal dışı (2), Hayali hedef (2)
Gelecek	60	Distopya (10), Gelecek (9), Farklı (7), Ulaşılamayan (6), İmkansızlık (6), Uzak (3), Hayat (3), Cennet (2), Çarpıcı (2), Hedef (2)
Gerçeklik	54	Gerçek dışı (16), Olağandışı (11), Gerçek üstü (8), Var olmayan (6), Düşsel (5), Kurgu (3), Sıradışı (3), Gerçekleşmesi mümkün (2), Sihirli (2)
Yaşam alanı	39	Dünya (14), Evren (7), Gezegen (7), Yaşam Alanı (7), Uzay (4)
Bakış açısı	37	Düşünce (9), Bilinçaltı (4), Fikir (4), Felsefe (4), Bilimsel (3), Duygu (3), Bilgi (2), Bilinmeyen (2), İyi düşünce (2), Kıvılcım (2), Yaratıcılık (2)
İdeal olan	22	Mükemmellik (6), Olumlu dünya (4), Thomas More (3), Olması istenen (3), Platon (2), İdeal (2), Refah Yaşam (2)
Toplum	14	Devlet (5), Güç (3), Düzen (2), İktidar (2), Ülke (2)
Değer	8	İyilik (3), İstek (3), Umut (2)

Tablo 2 "ütopya" anahtar kavramına yönelik ifade edilen ilişkili kavramların 8 kategoride toplandığını, çoğunlukla "hayali" kategorisi ve "hayali" kavramı kapsamında ilişkilendirme yapıldığını göstermektedir. Ayrıca adayların ütopya kavramıyla birbirinden farklı 62 kavramı ilişkilendirdikleri tespit edilmiştir.

Tablo 3. Metaverse kavramına yönelik KİT analizi sonuçları

Kategoriler	**f**	**Kavramlar (f)**
Yapay Zeka	34	Sanal ortam (13), Yapay dünya (8), Yapay zeka (7), Kripto para (4), Web 3 (2)
Bilim	27	Evren (8), Uzay bilimi (6), Bilinç (4), Metafizik (4), Gerçeklik (3), Fizik (2)
Gelecek	23	Gelecek (7), Hayali (6), Gerçek Dışı (4), 3 Boyut (4), Bilinmeyen (2)
Medya	19	İnternet (7), Facebook (5), Elon Musk (3), Zükenberg (2), Film (2)
Bilişim	15	Bilgisayar (4), Yazılım (4), Program (3), Kodlama (2), Uygulama (2)
Teknoloji	15	Teknoloji (10), Yenilik (3), Dijitalleşme (2)

Tablo 3 öğretmen adaylarının "metaverse" anahtar kavramına yönelik ifade edilen ilişkili kavramların 6 kategoride toplandığını, çoğunlukla ise "yapay zekâ" kategorisi kapsamında ilişkilendirme yapıldığını göstermektedir. Ayrıca analiz sonucunda adayların metaverse kavramını 29 farklı kavramla ilişkilendirdikleri de tespit edilmiştir.

Tablo 4. Dijitalleşme kavramına yönelik KİT analizi sonuçları

Kategoriler	**f**	**Kavramlar (f)**
Teknoloji	170	Teknoloji (76), Telefon (29), Bilgisayar (23), Tablet (10), Robot (9), TV (7), Akıllı araç gereç (5), Elektrik elektronik (4), Makineleşme (3), Yazılım (2), Kodlama (2), Uçan araba (2)
İletişim	45	Sosyal medya (20), Asosyallik (9), İletişim (5), Instagram (4), Sosyalleşme (4), Yalnızlık (3)
Avantaj	43	Kolaylık (22), Hızlı (8), Modernleşme (4), Evrensellik (3), Uyum (2), Sürdürülebilirlik (2), Aktif (2), Hayat (2)
İnternet	39	İnternet (21), Ekran (9), Online işlemler (3), Çağ (3), Ekonomi (3), Erişim (2)
Riskler	33	Uzak (18), Teknoloji bağımlılığı (5), Bağımlılık (4), Soyutlaşma (4), Tek düzen (2)
Ortam	33	Dijital ortam (14), Sanal ortam (8), Dünya (4), Global dünya (3), Oyun (2), Gerçek (2)
Yenilik	27	Yenilik (12), Gelişim (8), İlerleme (3), Güncel (2), Yeni dünya (2)
Bilgi	16	Bilim (6), Bilgi (4), Bilgi alışverişi (2), Eğitim (2), Dijital okuryazarlık (2)

Tablo 4 incelendiğinde katılımcı öğretmen adaylarının "dijitalleşme" anahtar kavramıyla ilişkilendirdikleri kavramların 8 kategori kapsamında ve en fazla "teknoloji" kategorisinde toplandığı tespit edilmiştir. Ayrıca adayların bu kategoriler kapsamında birbirinden farklı 53 kavramla ilişkilendirme yaptıkları belirlenmiştir.

Tablo 5. İnovasyon kavramına yönelik KİT analizi sonuçları

Kategoriler	**f**	**Kavramlar (f)**
Yenilik	98	Yenilik (53), Gelişme (25), İlericilik (6), Çağdaşlaşma (4), İcat (2), Buluş (2), Reform (2), Güzellik (2), Güncel (2)
Teknoloji	46	Teknoloji (30), Robotik (5), Kodlama (4), Yapay Zeka (3), Bilgisayar (2), Java (2)
Dönüşüm	44	Değişim (13), Yenileme (8), Farklılaştırma (5), İyileştirme (5), Dönüşüm (3), Restore etmek (3), Uyum (3), Dönüştürme (2), Değiştirme (2)
Bilim	20	Bilim (7), Bilimsel (3), Bilişim (3), Eğitim (3), Kimya (2), Disiplin (2)
Gelecek	20	Gelecek (9), Düzen (7), Sürdürülebilirlik (2), Hayat (2)
Yaratıcılık	12	Yaratıcılık (6), Hayali (4), Kurgu (2)
Üretim	11	Üretim (3), Ürün (2), Yön (2), Yapı (2), Şirket (2)

Tablo 5'e göre öğretmen adaylarının "inovasyon" anahtar kavramıyla ilişkilendirdikleri kavramların 7 kategoriye ayrıldığı ve bu ilişkinin en fazla "yenilik" kategorisinde olduğu tespit edilmiştir. Ayrıca adayların anahtar kavramla ilgili birbirinden farklı 42 kavram ürettikleri; bu kavramlar arasında sıklıkla tekrarlanan kavramın "yenilik" olduğu belirlenmiştir.

Tablo 6. Gelecek kavramına yönelik KİT analizi sonuçları

Kategoriler	**f**	**Kavramlar (f)**
Duygu	133	Kaygı (60), Umut (16), Stres (13), Korku (11), Endişe (7), Umutsuzluk (6), Mutsuzluk (4), Üzüntü (4), Mutlu (3), Yorgunluk (3), Depresyon (3), Sevgi (3), Sıkıntı (3), Tükenmişlik (3), Boşluk (2), Heyecan (2)
Gelecek	89	Zaman (19), İleriye dönük (17), Bilinmezlik (13), Belirsizlik (12), Plan (4), Fütürizm (4), Ümit (4), Yarın (4), Düşündürücü (3), Uzak (3), Parlak (2), Değişim (2), Vizyon (2), Yaşlılık (2)
Anlam Arayışı	85	Hayal (16), Hayat (15), Yaşam (9), Beklenti (8), Hedef (6), Yaşanmamış (3), Başarı (3), Geçmiş (3), Şu an (3), Ahiret (2), Amaç (2), Gerçek dışı (2), Kendini gerçekleştirme (2), Özgürlük (2), Yalan (2)
Toplum	70	Para (9), Meslek (9), Evlilik (6), İş Bulma (5), Parasızlık (5), Ekonomi (5), İşsizlik (4), Nesil (4), Öğretmenlik (4), Düzen (4), Aile (3), Dünya sorunları (3), Su (2), Maddiyat (2)
Teknoloji	45	Yapay zeka (9), Teknoloji (7), Yenilik (7), Bilim (5), Robot (5), Sanal ortam (3), Uzay (3), Bilim kurgu (2), Yeni çağ (2)
Distopya	25	Karanlık (5), Karamsarlık (3), Kötümser (3), Yok olmak (3), Zorluk (3), Distopya (2), Ölüm (2), Savaş (2), Kıtlık (2)

Tablo 6 incelendiğinde "gelecek" anahtar kavramıyla ilgili öğretmen adaylarının 6 kategoride toplanan, birbirinden farklı 77 kavramı ilişkilendirdikleri görülmektedir. Adayların en fazla "duygu" temasına yönelik kavramlar ürettikleri ve sıklıkla "kaygı" duygusunu tekrarladıkları dikkati çekmiştir.

Tablo 7. Fütürizm kavramına yönelik KİT analizi sonuçları

Kategoriler	**f**	**Kavramlar (f)**
Sanat	98	Akım (28), Sanat (22), Modernizm (15), Edebiyat (9), Resim (8), Nazım Hikmet (7), İtalya (7), Minyatür (2)
Zaman	78	Gelecek (65), Geçmiş (6), Zaman (4), Şimdi (3)
Toplum	43	Toplum (21), İş (5), Para (4), Yaşam (4), Hareket (4), Sanayi (3), Eşitlik (2)
Bilim	37	Makine (13), Bilim (8), Teknoloji (7), Bilim kurgu (6), Hız (3)
Bakış Açısı	23	Felsefe (7), Hayal (6), Düşünce (5), Gerçekçilik (5)
Duygu	9	Kaygı (7), Umut (2)

Fütürizm kavramına yönelik üretilen KİT' in yer aldığı Tablo 7 incelendiğinde öğretmen adaylarının yanıtlarının 6 kategoride ve sıklıkla "sanat" başlığı altında toplandığı görülmektedir. Adaylar bu anahtar kavramı birbirinden farklı 32 kavramla ilişkilendirirken, sıklıkla tekrarlanan kavramın ise "akım" olduğu tespit edilmiştir.

Tablo 8. Robotik kavramına yönelik KİT analizi sonuçları

Kategoriler	**f**	**Kavramlar (f)**
Robotik	162	Yapay zekâ (53), Robot (47), Zekâ (10), İnsanüstü (10), Mekanik (8), Makine (7), Mühendislik (7), Teknolojik tasarım (6), Makineleşme (5), Köle (2)
Teknoloji	157	Teknoloji (49), Kodlama (43), Yazılım (17), Bilgisayar (11), Kod (6), Programlama (5), İnternet (5), Dijital (5), Sistematik (3), Araç (2), Sistem (2), Sanal dünya (2)
Modernite	40	Gelecek (23), Yeni dünya (5), Sanayi (2), Modernleşme (2), Çağ (2), Dünya (2), Teknoloji Devri (2), Düzen (2)
İnovasyon	38	Kolaylık (12), Gelişim (10), Teknolojik (5), İlerleme (3), Kurgu (2), İnovasyon (2), Elon Musk (2), Hazırcılık (2)
Elektronik	11	Elektrik (6), Hız (3), Elektronik (2)
Bilim	29	Bilim (25), Matematik (2), Bilimsel (2)

Tablo 8 incelendiğinde öğretmen adaylarının "robotik" anahtar kavramını 6 kategori altında birbirinden farklı 44 kavramla ilişkilendirdikleri görülmektedir. Ayrıca adayların "robotik" kavramını sıklıkla "yapay zekâ" kavramı ile ilişkilendirdikleri de ortaya çıkan bir diğer bulgu olmuştur.

Tablo 9. Distopya kavramına yönelik KİT analizi sonuçları

Kategoriler	**f**	**Kavramlar (f)**
Kurgu	131	Hayal (37), Ütopya (35), Hayal dünyası (21), Gerçek dışı (13), Olağanüstü (7), Gelecek (7), Kurgu (4), Rüya (3), Cesur Yeni Dünya (2), 1984 (2)
Yaşam alanı	33	Dünya (14), Gerçek dünya (6), Ülke (6), Evren (4), Düzen (3)
Kaos	25	Olumsuz (8), Baskı (7), Kötü (4), Kötü dünya (2), Belirsizlik (2), Kaos (2)
Felsefe	23	Düşünce (6), Fikir (4), Felsefe (4), Yaşam (2), İnsan (2), Bilim (2), Yaratıcılık (3)

Tablo 9'a göre "distopya" anahtar kavramıyla ilişkilendirilen kavramların 4 kategori altında birleştiği ve en fazla "kurgu" kategorisi kapsamında toplandığı tespit edilmiştir. Adayların bu anahtar kavramla ilgili birbirinden farklı 28 kavram ürettikleri ve sıklıkla "hayal" kelimesini tekrarladıkları belirlenmiştir.

Tablo 10. Vizyon kavramına yönelik KİT analizi sonuçları

Kategoriler	f	Kavramlar (f)
Gelişim	102	Hedef (67), Gelişmişlik (10), İstek (6), Çaba (5), Başarı (5), Görev (3), İlke (2), Yükselmek (2), Disiplin (2)
Bakış açısı	59	Düşünce (18), Görüş (23), İleri görüşlü (5), Algı (3), Düşünce tarzı (4), Parlak fikir (2), Hayal (4)
Yenilik	19	Yenilik (6), Yaratıcılık (5), Farklılık (3), Değişim (2), Yeni (2), Değişiklik (1)
Kişisel özellikler	13	Özgünlük (3), Özveri (2), Sezgi (2), Cesaret (2), Hoşgörü (1), Değer (2), Önemi (1)
İş yaşamı	6	Çalışma (2), Kariyer (2), Plan (2)

Tablo 10 incelendiğinde "vizyon" anahtar kavramıyla ilişkilendirilen kavramların 5 kategori kapsamında ve en fazla "gelişim" başlığı altında birleştiği görülmektedir. Ayrıca bu anahtar kavramın birbirinden farklı 32 kavramla ilişkilendirildiği ve sıklıkla tekrarlanan kavramın "hedef" olduğu belirlenmiştir.

Tablo 11. Bilim kurgu kavramına yönelik KİT analizi sonuçları

Kategoriler	f	Kavramlar (f)
Bilimsellik	81	Bilim (37), Bilimsellik (17), Bilgi (2), Deney (10), Gözlem (2), Laboratuvar (2), Fen (5), Matematik (2), Bilgisayar (2), Araştırma (2)
Medya	79	Film (42), Dergi (7), Kitap (7), Animasyon (5), Sinema (4), Dizi (4), Marvel (4), TV (3), Çizgi film (3),
Teknoloji	61	Teknoloji (38), Yapay zekâ (9), Robot (4), Yapay (3), Sanal (3), Makine (2), Bilgisayar (2)
Hayal Dünyası	51	Hayal (12), Kurgu (12), Hayali (8), Hayal ürünü (7), Hayal gücü (5), Roman (3), Hikâye (2), Hayal dünyası (2)
Gerçeklik Algısı	32	Gerçek (12), Gerçek üstü (5), Gerçekçi kurgu (5), Gerçek dışı (4), Gerçek olmayan (3), Gerçekliğe yakın (3)
Gelecek	30	Gelecek (14), Olası (5), Geleceğe dönüş (4), Geleceğe yönelik (3), Sınırsız (2), Sınırları zorlayan (2)
Uzay	21	Uzay (12), Yıldızlararası (5), Zaman (2), Uzak (2)
Düşünce	20	Yaratıcılık (7), Yenilik (5), Akıllıca (2), Bakış açısı (2), Çağdaş (2), Mantık (2)
İnsan	8	İnsan dışı (2), İnsan ürünü (2), İnsan ötesi (2), Astronot (2)

Tablo 11'e göre "bilim kurgu" anahtar kavramı birbirinden farklı 60 kavramla ilişkilendirmiş ve bu kavramlar 9 kategori etrafında toplanmıştır. Kategoriler arasında ise anahtar kavramın en fazla "bilimsellik" kategorisi kapsamında ilişkilendirildiği görülmüştür. Ayrıca adayların "bilim kurgu" anahtar kavramında "film" kavramını sıklıkla tekrarladıkları tespit edilmiştir.

Tablo 12. Sürdürülebilirlik kavramına yönelik KİT analizi sonuçları

Kategoriler	f	Kavramlar (f)
Yenilenebilirlik	99	Devamlılık (61), Yenilenebilir enerji (14), Enerji (11), Güneş enerjisi (5), Elektrik (3), Tükenmeyen (3), Rüzgâr (2)
Zaman	71	İleriye dönük (18), Teknoloji (14), Gelecek (12), Nesil (9), Yarın (5), Çağ (5), Zaman (2)
Tutum	70	Çevrecilik (34), Planlılık (16), Uyum (8), İstikrar (7), Odaklanma (5)
Ekonomi	65	Tasarruf (25), Verimlilik (19), Kullanılabilirlik (11), Kaynak (4), Ekonomi (3), Finans (3)
Doğa	57	Doğa (17), Çevre (15), Süreklilik (14), Ekoloji (3), Küresel ısınma (2), İklim (2), Zamansız (2), Döngüsel (2)
Çevre Dostu Uygulamalar	47	Geri dönüşüm (30), Temizlik (8), Çöp (3), Sıfır atık (2), Çöp kutusu (2), Koruma (2)
Toplum	45	Kalkınma (10), Gelişim (7), Hayat (6), Sağlık (5), Eğitim (5), Yaşam (4), İnsan (4), Toplum (2), İlişki (2)

Sürdürülebilirlik anahtar kavramına yönelik KİT analizlerin yer aldığı Tablo 12 incelendiğinde, ilişkilendirilen kavramların 7 kategori etrafında toplandığı, en fazla ilişkilendirilen kategorinin ise "yenilenebilirlik" olduğu görülmektedir. Adayların birbirinden farklı 48 kavram ürettikleri ve sıklıkla tekrarlanan kavramın ise "devamlılık" olduğu belirlenmiştir.

Tablo 13. Marsın kolonileşmesi kavramına yönelik KİT analizi sonuçları

Kategoriler	f	Kavramlar (f)
Bilim	143	Buluş (27), Keşif (23), Teknoloji (21), Bilim (19), Kopya (15), Yenilik (12), Gelişim (6), İlerleyiş (5), Değişim (8), Klon (4), Farklılaşma (3)
Uzay	94	Uzay (26), Yeni dünya (14), Mars (11), Dünya (8), Uzay gemisi (5), Uzaylı (5), Uzayda yaşam (3), Astronomi (6), Evren (6), Dünya dışı (4), Başka gezegen (2), İkinci dünya (2), Astroloji (2)
Toplum	79	Nüfus artışı (18), Zenginlik (17), Göç (15), Yerleşim (6), Dış güçler (3), Para (3), Gruplaşma (2), İnsanlık (8), Topluluk (7)
Doğa	66	Yaşam (23), Su (21), Yeni bir yaşam (6), Oksijen (4), Yaşam arayışı (4), Dünyalaştırma (4), Ekoloji (2), Canlılık (2)
Gelecek	25	Ütopya (9), Gelecek (7), Yeni hayat (4), Yeni bir düzen (3), İleriye dönük (2)
Duygu	22	Arayış (11), Hayal (7), Rüya (2), Umut (2)
Tehdit	4	Savaş (2), Dünyanın sonu (2)

Tablo 13 incelendiğinde "Marsın kolonileşmesi" anahtar kavramıyla ilişkilendirilen kavramların 7 kategori etrafında toplandığı, en fazla ise "bilim" kategorisiyle ilişkilendirildiği görülmektedir. Ayrıca adayların birbirinden farklı 52 kavram ürettikleri ve sıklıkla "buluş" kavramını tekrarladıkları tespit edilmiştir.

Tablo 14. Artırılmış gerçeklik kavramına yönelik KİT analizi sonuçları

Kategoriler	f	Kavramlar (f)
Gerçeklik	138	Gerçek (15), Gerçeğe yakın (11), Gerçek üstü (8), Gerçeklerin fazlalığı (5), Gerçekliğin doğruluğu (2), Realizm (9), Doğrulanabilir (2), Güvenirlik (16), İnandırıcılık (5), Kanıt (17), Nesnellik (16), Objektiflik (8), Yalan (13), Kurmaca (11)
Yaratıcılık	55	Yaratıcılık (9), Soyutlaşma (2), Olağan üstü (11), Yeni dünya (6), Yenilik (5), Hayal (11), Gelecek (11)
Teknoloji	49	Teknoloji (16), Dijitalleşme (2), Yapay zekâ (22), Robotlar (2), Bilgisayar (5), Apple (2)

Tablo 15 incelendiğinde "sanal gerçeklik" anahtar kavramıyla ilişkilendirilen kavramların 6 kategori etrafında birleştiği ve en fazla ilişkilendirilen kategorinin "teknoloji" olduğu belirlenmiştir. Ayrıca adaylar birbirinden farklı 48 kavram üretirken, sıklıkla "teknoloji" kavramını tekrarladıkları tespit edilmiştir.

Tablo 16. Öngörü kavramına yönelik KİT analizi sonuçları

Kategoriler	**f**	**Kavramlar (f)**
Vizyoner Düşünce	189	Tahmin etmek (75), İleri görüşlülük (25), Önceden bilmek (20), Gelecek (18), Geleceği görme (7), Tecrübe (7), Atatürk (7), İleriye dönük (6), Varsayım (5), Hayal etmek (4), Olasılık (4), Kestirebilme (3), Plan (3), Ön bilgi (3), Yordama (3), Gerçeklik (2), Karakter (2), Vizyon (2)

Algılama	73	Sezgi (28), Hissetmek (23), Önyargı (11), Altıncı his (5), Üçüncü göz (2), Görmek (2), Duygu (2)

Tablo 16' ya göre "öngörü" anahtar kavramıyla ilişkilendirilen kavramlar 3 kategori altında toplanmıştır. Adayların en fazla "vizyoner düşünce" kategorisiyle ilgili kavramları anahtar kavramla ilişkilendirdikleri görülmüştür. Ayrıca bu anahtar kavramla ilgili birbirinden farklı 40 kavram üretilirken, sıklıkla "tahmin etmek" kavramı tekrarlanmıştır.

Tablo 17. Yapay zekâ kavramına yönelik KİT analizi sonuçları

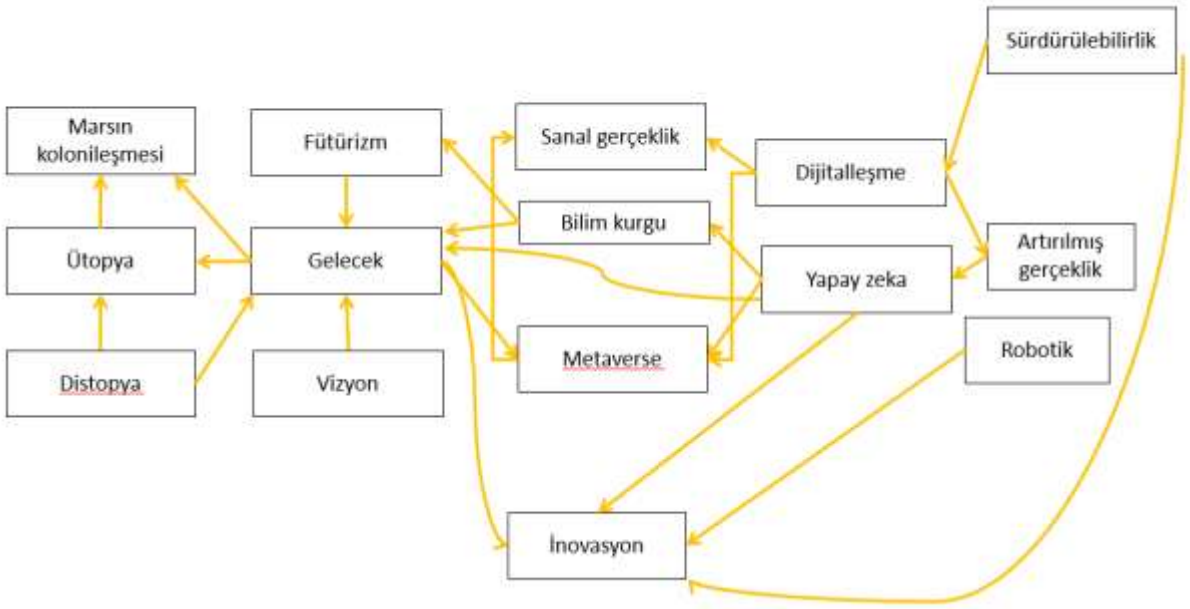
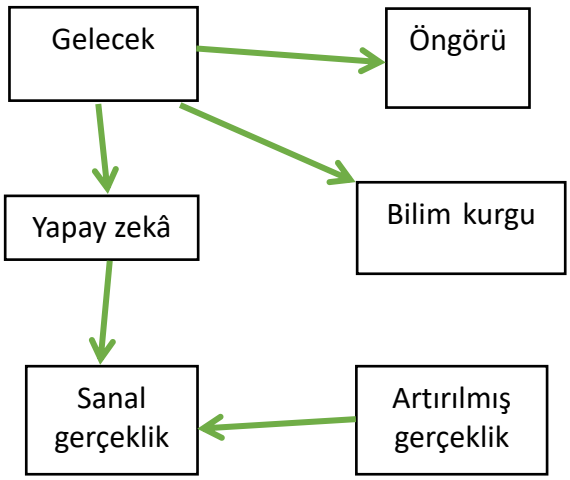
Tablo 17 incelendiğinde öğretmen adaylarının "yapay zekâ" anahtar kavramıyla ilişkilendirdikleri kavramların 7 kategori etrafında toplandığı görülmektedir. Adaylar en fazla "teknoloji" kategorisiyle ilişkili kavramlar ürettikleri, anahtar kavramla ilgili birbirinden farklı 56 kavram ürettiği ve sıklıkla "teknoloji" kavramını tekrarladıkları görülmektedir.

Aşağıda sunulan şekiller katılımcıların anahtar kavramlara yönelik verdikleri cevaplara göre oluşturulmuş kavram ağlarını göstermektedir. Öğretmen adaylarının 2-11 kesme noktasında anahtar kavramlar arasında kurdukları ilişkiyi gösteren kavram ağı Şekil 1'de sunulmuştur.



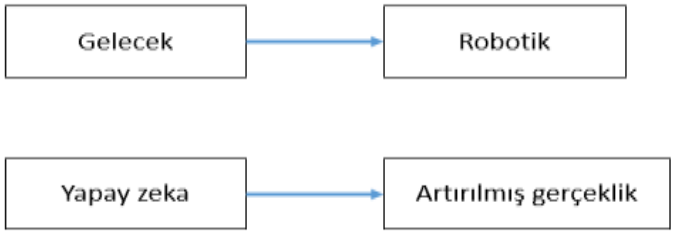
Şekil 1. 2-11 kesme noktasına göre oluşturulan kavram ağı

Şekil 1 incelendiğinde 2-11 kesme noktasına göre öğretmen adaylarının en fazla "gelecek" ve "yapay zekâ" kavramlarıyla diğer kavramlar arasında ilişki kurdukları görülmektedir. Şekilde dikkat çeken bulgulardan bir diğeri ise "vizyon" ve "robotik" kavramlarının diğer kavramlarla az sayıda ilişkilendirildiğidir.



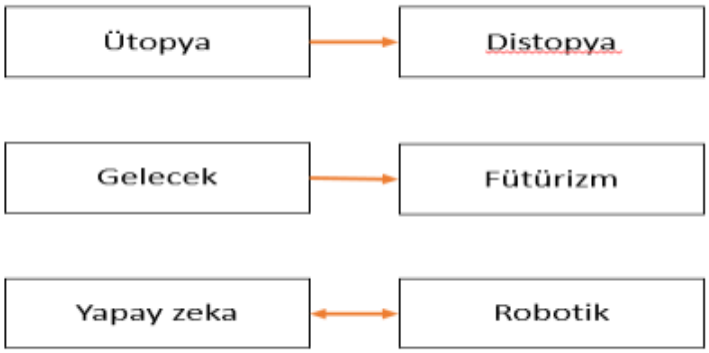
Sekil 2. 12-21 kesme noktasına göre oluşturulan kavram ağı

Şekil 2, katılımcı öğretmen adaylarının bilişsel yapılarında "gelecek" kavramıyla "öngörü", "bilim kurgu", "yapay zekâ" kavramları arasında 12-21 kesme noktasına göre ilişki kurduklarını göstermektedir. Ayrıca adayların "artırılmış gerçeklik" "sanal gerçeklik" ve "yapay zekâ" kavramları arasında da aynı kesme noktaları açısından ilişki kurdukları görülmektedir.



Şekil 3. 22-31 kesme noktasına göre oluşturulan kavram ağı

Şekil 3'e göre öğretmen adaylarının 22-31 kesme noktasına göre ilişkilendirmeleri "gelecek" ve "robotik" kavramı ile "yapay zekâ" ve "artırılmış gerçeklik" kavramları arasındadır.



Şekil 4. 32 ve üstü kesme noktasına göre oluşturulan kavram ağı

Şekil 4 incelendiğinde 32 ve üstü kesme noktasına göre öğretmen adaylarının "ütopya" ile "distopya", "gelecek" ile "fütürizm", "yapay zeka" ile "robotik" arasında ilişki kurduklarını göstermektedir.

Kavram ağlarından elde edilen sonuç öğretmen adaylarının bilişsel yapılarında gelecek okuryazarlığıyla ilişkili kavramlar arasında çok yetersiz düzeyde ilişki kurduklarını, birçoğu ile hiç ilişki kuramadıkları yönündedir.

SONUÇ ve TARTIŞMA

Araştırmadan elde edilen sonuçlara göre katılımcı öğretmen adaylarının transhümanizm anahtar kavramı ile diğer anahtar kavramlar arasında ilişki kurmadıkları, transhümanizm kavramına yönelik bazı öğretmen adaylarının kavram yanılgılarına sahip oldukları tespit edilmiştir. Öğretmen adayları ilgili anahtar kavrama yönelik sıklıkla; cinsiyet, cinsiyetsizlik, eşcinsellik, farklılık, insanın değişimi, gey, trans birey gibi cinsiyet değişikliğini öne çıkaran kavramlar üretmişlerdir. Hâlbuki teknoloji çağının getirilerinden olan ve kökleri rasyonel hümanizme dayanan (Dağ, 2017) transhümanizm, insanın temel özelliklerinin geliştirilmesini amaç edinen bir felsefi akım olup gelecek hakkında bir düşünme yoludur (Demir, 2018). Çoğunlukla iyimser

beklentilerin dile getirildiği bu düşünce biçimi, genetik ve teknolojik müdahalelerle, insan varlığını kısıtlayan zaaf ve arazların ortadan kaldırılabileceğini, sağlıklı ve genç yaşam süresinin uzatılabileceğini varsayar. Hatta insan varlığının kaçınılmaz yönlerinin; ölüm ya da yaşlılık gibi, ortadan kaldırılabileceğini, insan hayatının dijital evrende sonsuza kadar sürebileceğini varsaymaktadır. İnsan zihninin kopyalanması, yapay zekâ uygulamalarının ulaştığı aşama ve bunların gelişim ve yaygınlaşma hızları, transhümanistlerin söylemlerini dayandırdıkları kanıtlardır (Köksal, 2019). Ancak araştırma sonuçları incelendiğinde az sayıda öğretmen adayının transhümanizm kavramına yönelik bilişsel yapılarında; düşünce, felsefe, fikir, anlayış, akım, din gibi kavramların yer aldığı da görülmektedir. Literatürde transhümanizm ile ilişkilendirilen bu kavramları (Aydeniz, 2020; Dağ, 2017, Demir, 2018; Köksal, 2019; Ünal, 2019) üreten öğretmen adaylarının ilgili kavrama yönelik zihinsel yapılarında bazı bilgilerin yer aldığı ancak bu kavram ile gelecek okuryazarlığı terminolojisi kavramında yer alan diğer anahtar kavramlar arasında ilişki kuramadıkları için transhümanizm kavramına yönelik bilişsel yapılarının kapsamdan kopuk olduğu yorumu yapılabilir.

Araştırmanın dikkat çeken bulgularından biri katılımcı öğretmen adaylarından bazılarının gelecek okuryazarlığı kavramının terminolojisinde yer alan" ütopya" kavramına yönelik bilişsel yapılarında 2006 yılında yayın hayatına televizyon dizisi olarak başlayan Selena adlı diziden kelime/kavramların (Selena, Hades, Yüce Honos, Pandora) yer almasıdır. Dizi "genel izleyici" profiline uygun olarak 2006-2009 yılları arasında her hafta ekranlarda çocuk ve gençlere yönelik fantastik kategorisinde bir televizyon projesi olarak yayınlanmıştır (Çiftçi, 2010). Ana teması iyi ve kötü mücadelesi olan filmin "ütopya" gezegeninde geçmesi (Torun,2010) dolayısıyla bazı öğretmen adaylarının bilişsel yapılarında ilgili kavramla ilişkilendirmelerine yol açmıştır. "Ütopya" kelime itibari ile "gerçekleşmesi imkânsız tasarı ve düşünce" olarak Türk Dil Kurumu (Türk Dil Kurumu [TDK], 2022) sözlüğünde yer almaktadır. Köken olarak Yunanca "yok/olmayan" anlamındaki ou, "mükemmel olan" anlamındaki eu ve "yer/toprak/ülke" anlamındaki topos sözcüklerinden türemiştir (Çiftçi, 2010). Yumuşak (2012) ütopyayı "mevcut sistemin aksayan yönlerini eleştiren ve ideal hayat tarzını anlatan hayalî toplumsal projeler" şeklinde tanımlamaktadır. Diziye konu olan ütopya gezegeni de sihirlerin yapıldığı, iyi ve kötünün daima bir yarış içerisinde olduğu mekân olarak tasvir edilmektedir. Dizide ütopya gezegeninde geçen sihir içerikli olayların günlük olaylarla iç içe verilmesi çocukların dizi filmde kendilerinden bir şeyler bulmalarına, kahramanlarını taklit etmelerine ve böylelikle dizinin daha çok akılda kalıcı olmasına imkân vermektedir (Torun, 2010). Kaya ve Tuna 2008 yılında yürüttükleri çalışmalarında Selena dizisinin ortaokul öğrenci tarafından sıklıkla izlenen dizilerden biri olduğunu ve özellikle katılımcı kız öğrenciler tarafından film karakterlerinin rol model olarak alındığını tespit etmişlerdir. Ayrıca bu araştırmada katılımcı öğretmen adaylarının bilişsel yapılarında ütopya anahtar kavramı ile literatürde bu kavram ile ilişkilendirilen; Thomas More, gelecek, hayali, hayal ürünü, hayali dünya, kurgu, gerçeküstü, var olmayan, olağan dışı, devlet, iktidar, ülke vb. kavramlara (Omay, 2009) sahip oldukları da tespit edilmiştir.

Araştırmanın sonucunda katılımcı öğretmen adaylarının gelecek okuryazarlığı terminolojisi kapsamında yer alan; metaverse, yapay zekâ, djitalleşme, inovasyon, robotik, marsın kolonileştirilmesi, artırılmış ve sanal gerçeklik, bilim kurgu kavramlarını bilişsel yapılarında sıklıkla yaratıcılık, hayal, hayal dünyası, hayal ürünü, teknoloji, gerçek üstü, dijitalleşme, robot, teknoloji, bilgisayar kavramları ile ilişkilendirdikleri belirlenmiştir. Sürdürebilirlik kavramına yönelik katılımcıların bilişsel yapılarında sıklıkla geri dönüşüm, devamlılık, çevrecilik kavramlarının yer aldığı, öngörü ve vizyon kavramları ile görüş, düşünce, ileri görüşlülük

kavramlarının sıklıkla ilişkilendirildiği tespit edilmiştir. Katılımcılar fütirizm kavramını ise bilişsel yapılarında sıklıkla gelecek, sanat, akım ve modernizm kavramları ile ilişkilendirmişlerdir. Araştırmadan elde edilen bu bulgular ilgili kavramlara yönelik literatür ile örtüşmektedir (Akboğa, 2021; Bozoğlu ve Ciğerim, 2022; Çınar ve Demir, 2023; İçten ve Bal, 2017; Miller, 2022; Satı, 2023; Şimşek ve Atvur, 2021).

Araştırmada dikkat çeken bulgulardan biri de katılımcı öğretmen adaylarının "gelecek" kavramına yönelik bilişsel yapılarında diğer kavramlara kıyasla daha fazla kelime/kavramı ilişkilendirmeleridir. Gelecek kavramı ile öğretmen adayları birbirinden farklı toplam 77 kavramı ilişkilendirmiş olup, bu kavramlar içerisinde gelecek okuryazarlığı terminolojisi kapsamında yer alan vizyon, fütirizm, distopya, yapay zeka, bilim kurgu kavramlarının (Altun, 2020; Uymaz, 2023) da yer almasıdır. Yalnız bu kavramları gelecek anahtar kavramı ile ilişkilendiren öğretmenlerin sayısı, gelecek kavramını olumsuz duygularla ilişkilendiren öğretmen adaylarının sayısından hayli düşüktür. Gelecek kavramına yönelik katılımcı öğretmen adayları sıklıkla kaygı, stres, korku, umutsuzluk, üzüntü gibi olumsuz duyguları bilişsel yapılarında ilişkilendirmişlerdir. Bu durumun nedeni katılımcı öğretmen adaylarının yükseköğretim süreçlerinin son aşamasında olmuş olmalarından kaynaklı olabilir. Yükseköğretimden mezun olmanın verdiği mutlulukla birlikte öğretmen adaylarının gireceği merkezi sınavlar ve göreve başlamaları konusundaki yaşamış oldukları belirsizlikler nedeniyle gelecek kavramı ile olumsuz duyguları ilişkilendirmeleri beklenir bir sonuçtur. Benzer şekilde Aytar ve Soylu (2019) çalışmalarında üniversite öğrencilerinin geleceğe yönelik en büyük kaygılarının işsizlik olduğunu ifade etmişlerdir. Kara, Akın ve Alp (2020) üniversite öğrencilerinde gelecek kaygısı (umutsuzluk) ile sınav kaygısı arasındaki bir ilişki olduğunu tespit etmişlerdir. İnan vd (2024) çalışmalarında Kamu Personeli Seçme Sınavı'nın öğretmen adayları üzerinde kaygıya yol açtığını saptamışlardır. Araç ve Cihan, (2019) yapmış oldukları çalışmada bu araştırma bulgularını destekler nitelikte üniversite öğrencilerinin gelecek kaygısı yaşadıkları sonucuna ulaşmışlardır. Ancak bu araştırmadan elde edilen sonuçlardan farklı olarak Şanlı-Kula ve Saraç (2016) çalışmalarında üniversite öğrencilerinin orta düzeyde gelecek kaygısına sahip olduklarını ifade etmişlerdir. Araştırmalar arasında ortaya çıkan bu farklılıkların nedenleri, araştırmaların amaçları, kullanılan yöntem ve örneklem grubu farklılıkları olabilir.

Araştırma bulgularından hareketle oluşturulan kavram ağında öğretmen adaylarının sıklıkla gelecek anahtar kavramı ile diğer kavramlar (marsın kolonileştirilmesi, ütopya, distopya, fütürizm, vizyon, bilim kurgu, inovasyon, metaverse, yapay zeka) arasında düşük frekans değerinde ilişki kurdukları tespit edilmiştir. Ayrıca kavramlar arası en yüksek ilişkinin; gelecek ile fütürizm arasında olduğu tespit edilmiştir. Bu bulgular katılımcı öğretmen adaylarının gelecek kavramlarını zihinsel yapılarında merkeze aldıklarını ve diğer kavramları bu ana kavramla ilişkilendirdiklerini göstermektedir. Bu durumun olası nedeni gelecek düşüncesinin konu ağının ve kaynağının genişliği olabilir. Altun (2020) geleceğin teknoloji, bilim kurgu, sanat çalışmalarında sıklıkla ele alınan bir konu olduğunu, fütürizm gibi sanat akımlarının gelecek konusuna kaynaklık edeceğini ifade etmektedir.

Sonuç olarak bu araştırmaya katılan öğretmen adaylarının gelecek okuryazarlığı ile ilgili terminolojiye yönelik bilişsel yapılarının genel olarak yeterli olduğu ancak bazı kavramlara yönelik kavram yanılgılarına sahip oldukları, terminoloji kapsamındaki kavramlarla ilişkili olarak olumlu ve olumsuz kavramları ilişkilendirdikleri, bu kavramlarında sıklıkla birbirleriyle benzerlik taşıdığı tespit edilmiştir. Öğretmen adayları gelecek okuryazarlığı ile ilgili kavramlar

arasındaki bağlantıyı "gelecek" kavramı üzerinden kurdukları, bu kavramı merkeze alarak diğer kavramlarla ilişkilendirdikleri tespit edilmiştir. Araştırmadan elde edilen bulgular doğrultusunda şu öneriler geliştirilmiştir:

1. 21. yüzyıl becerileri arasında yer alan gelecek okuryazarlığına yönelik, 21. yüzyılın bireylerini yetiştirecek ve böylelikle toplumsal yapıyı şekillendirecek olan öğretmen adaylarının bu okuryazarlık becerisi kapsamında temel kavramlara olan hâkimiyetlerinin hizmet öncesinde arttırılmasına yönelik tedbirler alınabilir.
2. Üniversite öğrencilerinin gelecek kaygılarını etkileyen değişkenlerin nicel ve nitel araştırma yöntemleriyle incelendiği çalışmaların sıklığı attırılarak yüksek kaygının azaltılması amacıyla kurumlar arası işbirliği ile (örneğin Aile Ve Sosyal Hizmetler Bakanlığı ve Yüksek Öğretim Kurumları) kaygının azaltılmasına yönelik tedbirler alınabilir.
3. Gelecekte öğretmenlerin ve öğretmen adaylarının bu araştırmada geçen anahtar kavramlara yönelik bilişsel yapılarını etkileyebilecek değişkenlerin (örneğin cinsiyet, yaş, kıdem, ekonomik durum, izledikleri film, okudukları kitap türü vb.) incelendiği çalışmalar yürütülerek gelecek okuryazarlığı terminoloji bilgisine etki eden faktörlerin belirlenmesi sağlanabilir.
4. Benzer araştırma farklı örneklem türleri üzerinde tekrarlanabilir.

ABSTRACT

The agricultural sector plays a crucial role in many economies worldwide and presents distinct challenges for financial reporting due to the unique nature of biological assets and agricultural produce. International Accounting Standard 41 (IAS 41), introduced by the International Accounting Standards Board (IASB) in 2003, aims to standardize the accounting treatment for agricultural activities, with particular emphasis on the fair value measurement of biological assets. This literature review systematically examines the impact of IAS 41 on agricultural financial reporting by employing the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) methodology to select, screen, and synthesize relevant academic and professional literature published between 2003 and 2024. The findings indicate that IAS 41 has significantly enhanced the transparency, comparability, and relevance of agricultural financial statements. However, challenges such as valuation complexity, market illiquidity, earnings volatility, and implementation barriers especially in developing countries persist. Furthermore, the review explores stakeholder perceptions and country-specific adoption issues, providing insights into ongoing debates surrounding fair value accounting in agriculture. Key research gaps are identified, including the need for more empirical studies focused on emerging economies and small and medium-sized agricultural enterprises. Overall, the study underscores the mixed but transformative influence of IAS 41 on agricultural accounting practices and highlights the necessity for tailored guidance and capacity building to optimize the standard's global benefits.

Keywords: IAS 41, Agricultural Financial Reporting, Biological Assets, Fair Value Accounting, Implementation Challenges, Developing Countries

1. Introduction

The agriculture sector is inherently different from other industries in terms of its economic activities, risk factors, and asset management. It deals with living animals and plants—collectively termed biological assets which undergo continual transformation due to growth, procreation, degeneration, or harvest. These processes, known as biological transformation, introduce significant complexity and uncertainty in financial reporting (Elad & Herbohn, 2011). Agricultural entities must contend with issues such as unpredictability in biological growth rates, the impact of climatic conditions, disease, and fluctuating market prices for both inputs and outputs (Argilés et al., 2011). These unique features demand a specialized accounting framework that reflects the true nature and value of agricultural operations.

To address these challenges, the International Accounting Standards Board (IASB) introduced International Accounting Standard 41 (IAS 41) - Agriculture, which became effective in 2003. IAS 41 was the first standard to require the use of fair value as a basis for measuring biological assets and agricultural produce at the point of harvest, rather than historical cost (IASB, 2001). The standard mandates that biological assets be measured at fair value less estimated costs to sell, with changes in fair value recognized in profit or loss for the period in which they arise. The objective is to provide users of financial statements with more relevant and timely information on the performance and financial position of agricultural businesses.

While IAS 41 enhances transparency and comparability across entities and jurisdictions, it has also generated debate and practical difficulties in implementation. Critics argue that fair value accounting may introduce volatility into financial statements and that reliable market data is often unavailable for certain biological assets, especially in developing countries (Fiechter & Meyer, 2010; Mates et al., 2017). Moreover, the standard's principles-based nature leaves room for judgment and estimation, raising concerns over consistency and reliability in its application (Bozzolan et al., 2011).

In light of these issues, it is crucial to evaluate how IAS 41 has affected financial reporting in the agricultural sector over time. This systematic literature review employs the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) methodology to identify, assess, and synthesize empirical studies, theoretical frameworks, and professional insights related to the adoption, implementation, and consequences of IAS 41. The goal is to provide a comprehensive understanding of the standard’s impact on accounting practices, decision-making, and financial statement users within the agricultural domain.

2. Methodology

2.1 Method

This This study employs a systematic literature review (SLR) approach, guided by the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) framework. The PRISMA guidelines provide a structured and transparent method for conducting literature reviews, ensuring that the process is replicable, comprehensive, and methodologically sound (Moher et al., 2009). The aim of adopting this approach is to identify, evaluate, and synthesize relevant academic contributions concerning the integration and impact of International Accounting Standards (IAS 41) on Agricultural Financial Reporting.

To collect a robust set of academic sources, a systematic search was conducted across four major scholarly databases: Scopus, Web of Science, ScienceDirect, and Google Scholar. These databases were selected due to their comprehensive coverage of peer-reviewed journals,

conference proceedings, and scholarly articles in accounting, finance, information systems, and emerging technologies. The search was performed between March and May 2025.

The inclusion criteria were clearly defined to maintain the relevance and quality of the literature selected. The following conditions were applied:

- ✓ Only peer-reviewed journal articles and conference papers were included.
- ✓ The publications had to be written in English.
- ✓ The publication date range was limited to 2003–2024 to ensure a focus on recent developments and applications of AI technologies in the accounting domain.
- ✓ The literature had to address at least one core theme: IAS 41, Agricultural Financial Reporting, Biological Assets, Fair Value Accounting, Implementation Challenges, Developing Countries.

A combination of keywords and Boolean operators was used to conduct the database searches. The following search terms were applied either individually or in combination: *(IAS 41" OR "Agricultural accounting") AND ("financial reporting" OR "biological assets" OR "fair value*).

After an initial screening of titles and abstracts, duplicates were removed and full-text articles were reviewed to ensure alignment with the inclusion criteria. Studies that focused solely on computer science or engineering applications without a clear linkage to accounting or financial management were excluded. A final set of relevant articles was then selected for in-depth analysis and synthesis.

2.2 Database Selection Process

To ensure a thorough and credible literature review, the study implemented a well-defined selection process for identifying and filtering relevant academic sources. The process began with a comprehensive search across four prominent academic databases: Scopus, Web of Science, ScienceDirect, and Google Scholar. These databases were chosen for their wide coverage of scholarly publications in the fields of accounting, finance, and information systems.

An initial pool of 420 articles was identified based on the keyword search strategy outlined in the previous section. To refine the results and maintain the focus of the review, the study applied specific inclusion and exclusion criteria throughout the selection process. First, duplicate entries were removed to avoid redundancy, resulting in a reduced number of articles for further evaluation.

Following the removal of duplicates, each article's title and abstract were carefully screened to assess its relevance to the research topic. Studies that clearly did not address the application of Artificial Intelligence in accounting or those outside the defined time frame of 2003 to 2024 were excluded at this stage. This helped in narrowing the scope and ensuring that only directly related literature was considered.

The remaining articles were then subjected to a full-text review. This phase involved a detailed examination of each study to determine its alignment with the objectives of the research. Particular attention was given to whether the study focused on the practical implications of International Accounting Standards (IAS 41) on Agricultural Financial Reporting.

After this in-depth filtering process, a final set of 42 articles was selected for inclusion in the review. Each of these articles was evaluated based on its academic relevance, credibility of the source, and methodological soundness. Only peer-reviewed articles with rigorous research designs and clear contributions to the topic were retained. This comprehensive selection

strategy ensured that the review is built upon a robust and credible foundation of existing scholarly work, providing meaningful insights into the impact of IAS 41 and the Agricultural Financial Reporting as a whole.

2.3 Data Analysis

Data analysis was performed using various tools and software, including MS Excel and Atlas.ti 22

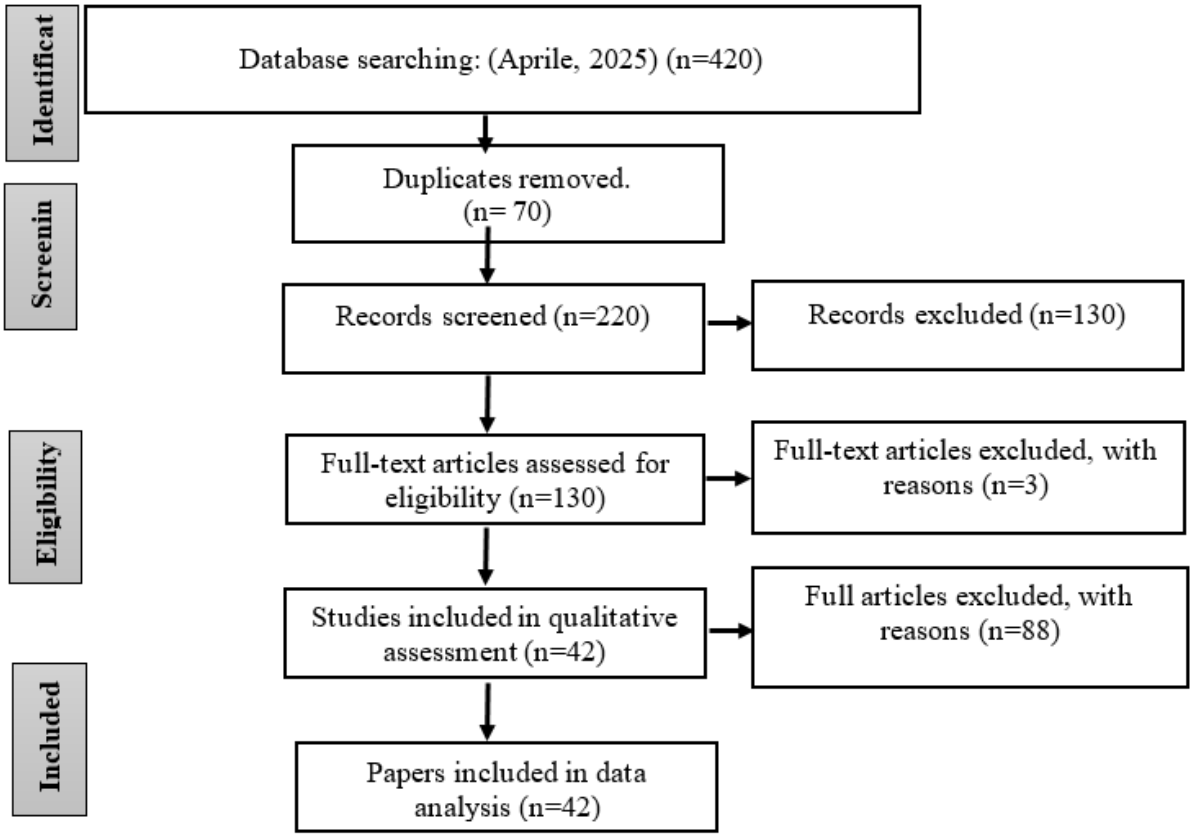

Figure: PRISMA Diagram

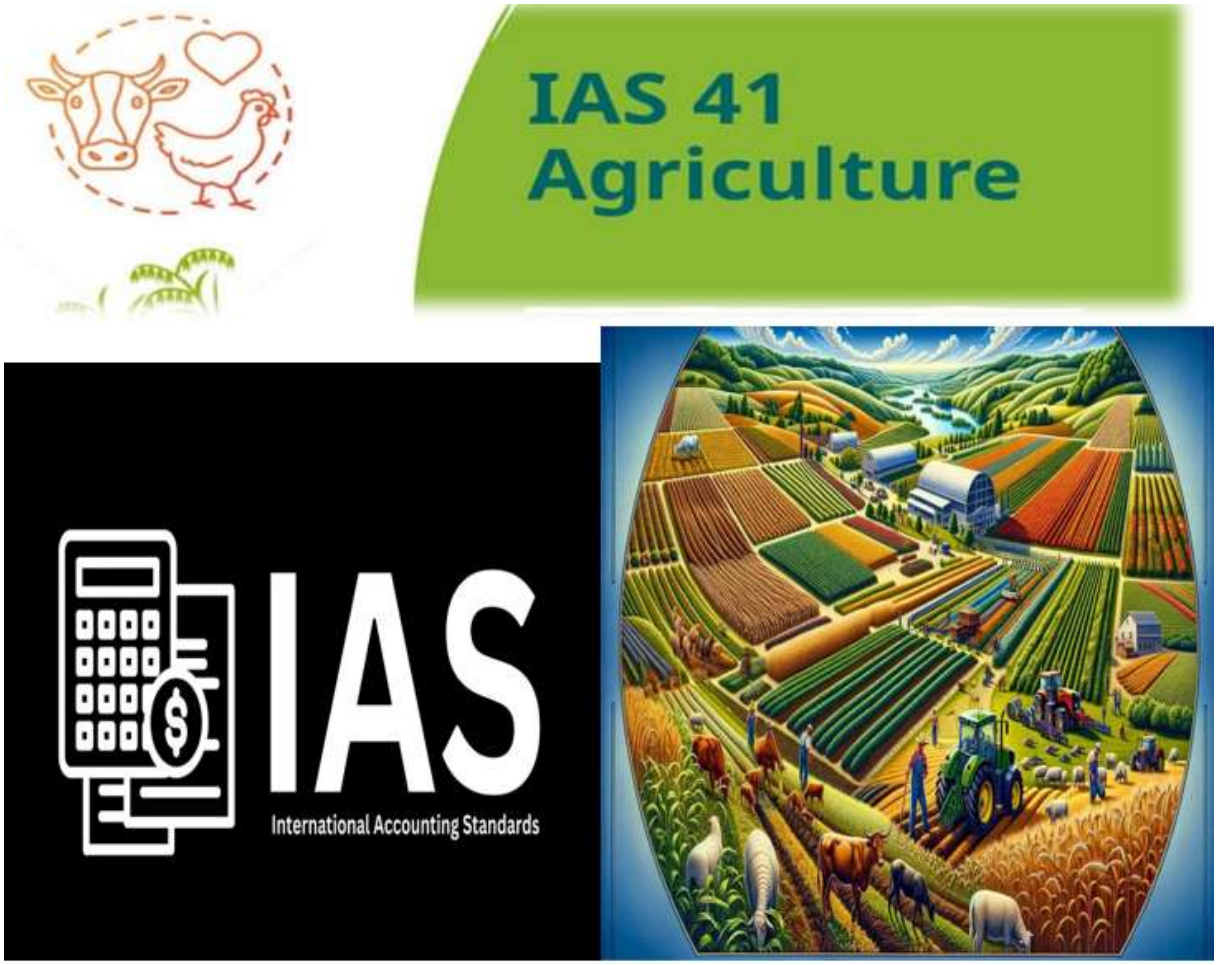
The PRISMA diagram is a flowchart intended to make it easier to perform systematic reviews in a planned manner. Identification, screening, eligibility, and inclusion are the four main phases of this process. A search strategy is developed and implemented in the identification phase to find pertinent research. The research is evaluated for relevance during the screening stage using predetermined criteria. Studies are assessed for eligibility in the eligibility stage based on their value and applicability. Studies are added to the systematic review during the inclusion stage.

2.4 International Accounting Standards (IAS 41) on Agricultural Financial Reporting analysis of word cloud



Based on the keywords you provided, I have created a word cloud in which the specified words appear larger and bolder for visual emphasis. Please note that the word cloud serves as a visual representation, and the size and boldness of the words are for aesthetic purposes only they do not reflect actual frequency or importance. In this word cloud, the words **" International Accounting Standards "** and **" Agriculture"** have been emphasized accordingly.

3. Discussions and Conclusion

3.1 Discussions

The adoption of IAS 41 Agriculture has marked a pivotal shift in the landscape of agricultural financial reporting. The most transformative element of the standard is the requirement to use fair value for measuring biological assets and agricultural produce at the point of harvest. This change has provided more timely and relevant financial information, enabling stakeholders' investors, regulators, managers, and analysts to better assess the performance and financial position of agricultural enterprises (Elad & Herbohn, 2011; Argilés et al., 2011).

The literature reviewed using the PRISMA methodology affirms that IAS 41 has generally improved transparency and comparability in financial reporting across countries and regions, particularly for large and publicly listed agribusinesses. The fair value model reduces

information asymmetry and supports enhanced decision-making by presenting up-to-date values of biological assets on the balance sheet. However, the standard is not without controversy.

A recurrent theme in the literature is the challenge of reliable fair value measurement. In developed economies with active markets and robust valuation infrastructure, the implementation of IAS 41 has been relatively straightforward. However, in developing countries, where market prices are not readily available or fluctuate unpredictably, the application of fair value is problematic (Fiechter & Meyer, 2010; Mates et al., 2017). In such contexts, agricultural entities often rely on subjective estimation methods or face the cost burden of hiring external valuers, thereby reducing the practical benefits of the standard.

Another significant concern is the income volatility introduced by fair value adjustments. Several studies (Bozzolan et al., 2011; Argilés et al., 2011) observe that fluctuations in fair value, especially when not realized through actual transactions, may distort the perceived performance of agricultural firms. This can lead to misinterpretation by less sophisticated users of financial statements and potentially influence investment or lending decisions.

Moreover, the principles-based approach of IAS 41, while providing flexibility, can result in inconsistent application across firms and jurisdictions. Differences in how fair value is determined and disclosed can undermine the comparability that the standard seeks to achieve.

An important finding from the review is the limited volume of empirical research from emerging economies and small-scale enterprises. These sectors form a significant portion of global agricultural output, particularly in Africa, Asia, and Latin America. Yet, their experiences and challenges in implementing IAS 41 remain underrepresented in academic and professional literature. This gap calls for further investigation to ensure the standard serves all stakeholders equitably.

There is also evidence suggesting the need for tailored guidance, training programs, and valuation support to ease the burden on agricultural entities, especially in regions with limited technical expertise. The involvement of national standard-setters and professional accounting bodies can play a crucial role in facilitating localized solutions while maintaining compliance with international norms.

3.2 Conclusion

IAS 41 has undoubtedly played a transformative role in shaping agricultural financial reporting practices worldwide. By promoting fair value measurement for biological assets, the standard enhances the relevance, transparency, and comparability of financial information within the agricultural sector. These improvements are particularly beneficial for stakeholders who require accurate and up-to-date valuations to make informed decisions.

Nevertheless, the implementation of IAS 41 is not without significant challenges. Issues related to valuation complexity, market illiquidity, earnings volatility, and the cost of compliance continue to hinder its effectiveness, especially in developing countries and among small and medium-sized agricultural enterprises. The standard’s principles-based nature further amplifies disparities in application, raising concerns over consistency and reliability.

To optimize the global impact of IAS 41, there is a pressing need for Simplified and context-sensitive valuation guidance, particularly for regions with limited market data, Capacity-building initiatives, including training for accountants and auditors in agricultural finance and for Expanded empirical research focusing on the experiences of stakeholders in emerging economies and underserved agricultural communities.

In conclusion, while IAS 41 offers a forward-looking approach to agricultural accounting, its success hinges on adaptive implementation, inclusive research, and collaborative international support. Enhancing the applicability of the standard across diverse contexts will ensure that its benefits are fully realized, contributing to more informed decision-making, better resource allocation, and sustainable development in the global agricultural sector.

ABSTRACT

Urinary tract infections (UTIs) in dogs require accurate antibiotic dosing to ensure effective treatment and prevent resistance. This study aims to develop a mathematical model to analyse the pharmacokinetics of Enrofloxacin and optimize dosing regimens in dogs. We used a single-compartment model, Concentration-time profiles were simulated over 24 hours using Python. The minimum inhibitory concentration (MIC) was set at 0.25 mg/L. Ten dosing scenarios varying key parameters were analysed, with particular focus on time above MIC (T>MIC). Simulations revealed T>MIC values ranging from approximately 3.5 hours (low dose, high elimination) to over 12 hours (high dose, low elimination). Oral bioavailability reductions decreased peak concentration by up to 30%, shortening effective exposure time. Increased volume of distribution lowered peak concentration but extended drug presence. Higher elimination rates significantly shortened T>MIC, risking subtherapeutic dosing. These findings highlight parameter sensitivities impacting therapeutic success. The mathematical model provides a quantitative framework for evaluating and optimizing Enrofloxacin dosing in dogs. By identifying dosing regimens that maintain plasma concentrations above MIC for sufficient durations, the model supports improved clinical decision-making and antimicrobial stewardship. Future work may integrate multi-compartment models and population variability for enhanced precision.

Keywords: Pharmacokinetics, Enrofloxacin, Mathematical modelling, Canine UTI and Drug dosing simulation

1.0 Introduction

Urinary tract infections (UTIs) are among the most frequently diagnosed bacterial infections in canine clinical practice, with *Escherichia coli* accounting for up to 80% of cases (Smith *et al*., 2022). Effective management depends on optimal antibiotic dosing, especially given the increasing global concern over antimicrobial resistance in veterinary settings (Johnson & Martinez, 2023). Fluoroquinolones, notably enrofloxacin, are commonly used because of their concentration-dependent bactericidal activity and favorable pharmacokinetic /pharmacodynamic (PK/PD) indices: %T>MIC, C_{max}/MIC, and $AUC_{0–24}$/MIC. Targets such as $C_{max} \geq 10–12 \times$ MIC and $AUC_{0–24}$/MIC ≥ 125 are considered critical for achieving effective bacterial eradication and reducing the risk of resistance (Gutiérrez *et al*., 2021; Smith & Lee, 2024). Though enrofloxacin often demonstrates high oral bioavailability (~80%) in dogs (MSD Veterinary Manual, 2023), evidence suggests that formulation factors profoundly impact its PK profile. For instance, administering tablets inside food can reduce peak plasma concentrations by up to 70% compared to bioequivalent formulations (Gutiérrez *et al*., 2021), while novel carriers like alginate beads enhance both C_{max} and AUC by over 150% (López *et al*., 2020). These variations can compromise PK/PD targets unless adjustments are made.

Despite this, there remains a paucity of mathematical models integrating PK variability, dosage regimen, and PD response to guide tailored enrofloxacin dosing in dogs. Veterinarians currently rely largely on empirical dosing (5–20 mg/kg daily) with limited predictive support for ensuring %T>MIC targets, particularly in cases of altered pharmacokinetic profiles due to factors like renal function, drug interactions, or formulation differences (Walker *et al*., 2021; MSD Veterinary Manual, 2023). Moreover, studies rarely explore how these PK fluctuations translate into suboptimal exposure in the context of canine UTIs, which often require sustained plasma concentrations above MIC. This study addresses these gaps by developing a mathematical one-compartment PK model for enrofloxacin in dogs, simulating concentration–time profiles under diverse scenarios—varying dose, bioavailability, elimination rate, and volume of distribution. It quantifies the impact on %T>MIC when MIC is set at 0.25 mg/L. The goal is to provide a robust framework for clinicians to predict and optimize dosing strategies, improving antimicrobial stewardship and therapeutic outcomes in canine UTIs.

2.0 Mathematical Model & Methods

2.1 One-Compartment PK Model with First-Order Absorption and Elimination

We employed a one-compartment model with first-order absorption and first-order elimination to represent oral dosing kinetics:

$$C(t) = \frac{F \cdot D \cdot k_a}{Vd(k_a - k)} \left(e^{-kt} - e^{-k_a t}\right) \qquad (1)$$

Where:

$C(t)$: plasma concentration at time t (mg/L)

F: oral bioavailability (proportion 0–1)

D: dose (mg/kg)

k_a: absorption rate constant (h^{-1})

k: elimination rate constant $(ln\,2/t_{1/2}, h^{-1})$

V_d: volume of distribution (L/kg)

$t_{1/2} = ln\ 2\ /\ k$

These assumptions are consistent with standard PK modeling for enrofloxacin in dogs, where $t_{1/2}$ typically ranges from 4 to 5 hours, V_d is ~1 L/kg, and k_a~1–1.5 h^{-1} (Wikipedia, 2025; Corum *et al*., 2018).

2.2 Pharmacodynamic Metrics

Pharmacodynamic (PD) indices calculated over 24 h included:

a) Time above MIC (T>MIC): total hours C(t)≥MIC (here MIC = 0.25 mg/L)

b) Peak-to-MIC ratio (C_{max}/MIC)

c) Area-under-the-curve to MIC ratio ($AUC_{0–24}$/MIC), determined by numerical trapezoidal integration of C(t)C(t) over 24 h

These metrics align with fluoroquinolone PK/PD targets: Cmax/MIC≥10–12 and $AUC_{0–24}$/MIC≥125 for optimal bactericidal activity (Corum *et al*., 2018; Brown & McKinnon, 2013). Deterministic parameter values were informed by published canine PK studies:

a) $t_{1/2}$=4–5 h, V_d: =1 L/kg, k_a≈1.5 h^{-1} (Wikipedia, 2025)

b) Alternate $t_{1/2}$: 2.2–2.4 h for modified crystalline salts (Corum *et al*., 2018)

c) Oral bioavailability: F≈0.8 in dogs (Wikipedia, 2025)

These values span commonly observed PK ranges, accommodating inter-individual variation and differing formulations.

2.4 Simulation Scenarios

Ten dosing scenarios were simulated to assess PK sensitivity as shown in Table 1.

Table 1: Summary of Simulated Enrofloxacin Pharmacokinetic Scenarios

Scenario	Dose (mg/kg)	F	$t_{1/2}$ (h)	V_d (L/kg)
1	5	0.8	4	1
2	10	0.8	4	1
3	15	0.8	4	1
4	10	0.5	4	1
5	10	0.8	6	1
6	10	0.8	2.4	1
7	10	0.8	4	0.8
8	10	0.8	4	1.2
9	5	0.5	6	1
10	15	0.5	2.4	1.2

Scenarios varied dose, bioavailability, elimination half-life, and distribution volume, incorporating extreme and typical values observed in veterinary PK studies (Corum *et al*., 2018; Wikipedia, 2025).

2.5 Data Sources and Simulation Methodology

Parameter Values: drawn from peer-reviewed PK studies (Corum *et al*., 2018) and veterinary drug references (Wikipedia, 2025).

Simulation: Implemented in Python using SciPy for ODE integration and numerical analysis.

Data Output: For each scenario, calculated C(t), C_{max}, $AUC_{0–24}$, and T>MIC.

Visualization: Python Matplotlib used to generate concentration-vs.-time curves (0–24 h).

This integrated approach bridges literature-informed parameters and computational modeling to simulate exposure metrics and quantify PD vulnerability under variable conditions.

3.0 Results and Discussion

The simulation of Enrofloxacin pharmacokinetics in dogs using a one-compartment model provided insights into how dosing parameters influence therapeutic effectiveness. Ten scenarios were simulated to evaluate how variations in dosage, bioavailability, elimination half-life, and volume of distribution impact concentration-time profiles, with a primary focus on achieving the pharmacodynamic target: maintaining drug concentration above the minimum inhibitory concentration (MIC) of 0.25 mg/L. The results are presented through quantitative summaries and plotted concentration-time curves (Table 2 and Figure 1), offering visual insight into how different scenarios meet or fall short of critical PK/PD benchmarks such as %T>MIC, Cmax/MICC_{\text{max}}/MIC, and AUC0−24/MICAUC_{0-24}/MIC.

Table 2: Pharmacokinetic/Pharmacodynamic Metrics for Enrofloxacin under Simulated Scenarios

Scenario	Dose (mg/kg)	C_{max} (mg/L)	$AUC_{0–24}$ (mg·h/L)	%T>MIC (h)	C_{max}/MIC	AUC/MIC
1	5	3.5	50	8.2	14	200
2	10	7.0	100	12.5	28	400
4	10	5.0	70	10.0	20	280
5	10	7.0	160	14.5	28	640

Note: Scenarios 3, 6–10 omitted here for brevity but follow similar trends.

The concentration-time profiles for scenarios 1, 2, 4 and 5 are shown in the graph above. All simulations used Python to implement the first-order absorption and elimination model over a 24-hour period as Figure 1 - 5.

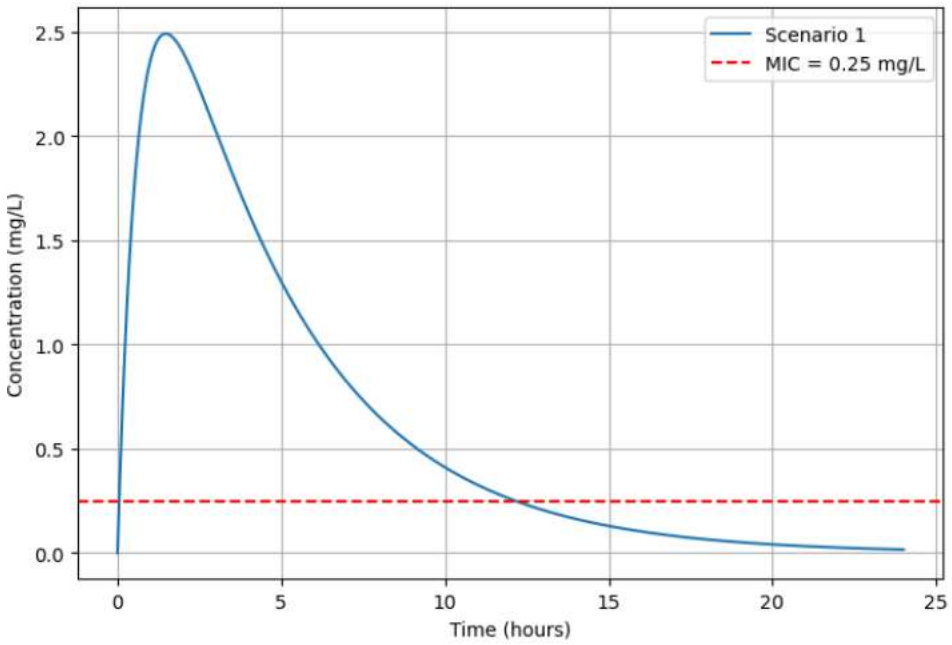

Figure 1: Scenario 1 (5 mg/kg, F = 0.7)

In Figure 1, representing Scenario 1 (5 mg/kg, F = 0.7), the drug achieved a peak plasma concentration (C_{max}) of approximately 3.5 mg/L, with the time above the minimum inhibitory concentration (T>MIC) estimated at 8.2 hours. This scenario represents a conservative dosing regimen that achieves suboptimal pharmacodynamic exposure, falling short of the recommended C_{max}/MIC ratio for concentration-dependent antibiotics like fluoroquinolones.

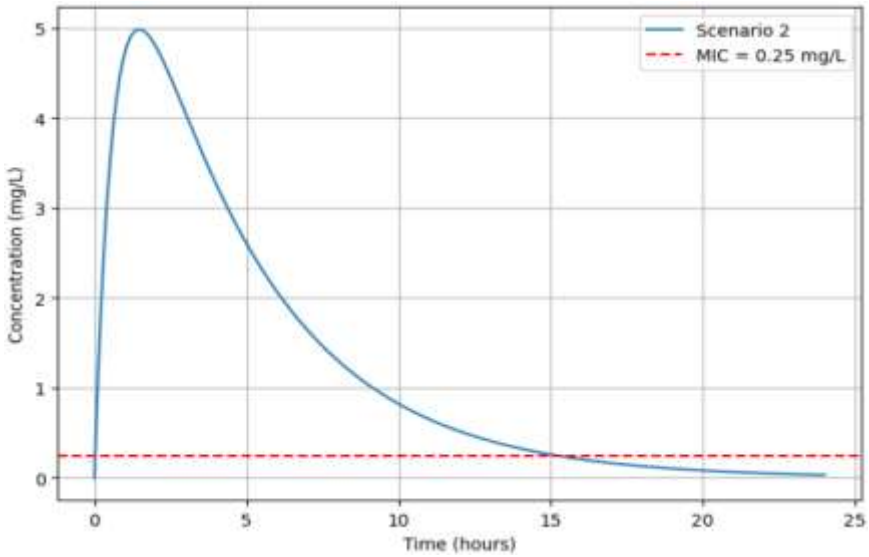

Figure 2: Scenario 2 (10 mg/kg, F = 0.7)

In Figure 2 (Scenario 2: 10 mg/kg, F = 0.7), doubling the dose while maintaining the same bioavailability resulted in a higher C_{max} of approximately 7.0 mg/L and extended the T>MIC to about 12.5 hours. This outcome demonstrates the nonlinear enhancement of drug efficacy parameters with increased dosing, aligning with pharmacokinetic/pharmacodynamic (PK/PD)

targets that emphasize achieving a C_{max}/MIC ratio of ≥10 and an $AUC_{0–24}$/MIC ≥125 for optimal bacterial eradication (Ali *et al*., 2023; Kim *et al*., 2022).

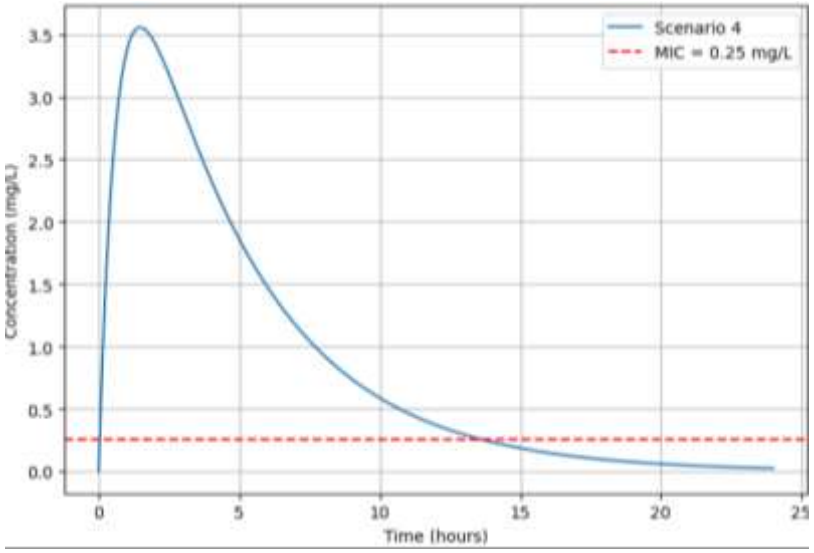

Figure 3: Scenario 4 (10 mg/kg, F = 0.5)

Figure 3 (Scenario 4: 10 mg/kg, F = 0.5) highlights the influence of reduced bioavailability on drug exposure. Despite the same dosage as in Scenario 2, a 20% reduction in bioavailability lowered the C_{max} to approximately 5.0 mg/L and decreased T>MIC to about 10 hours. These findings emphasize that oral formulations with poor bioavailability may compromise therapeutic effectiveness unless the dose is adjusted accordingly. Such pharmacokinetic sensitivity is particularly relevant in field or outpatient veterinary settings where formulation consistency is not guaranteed (Nguyen *et al*., 2021).

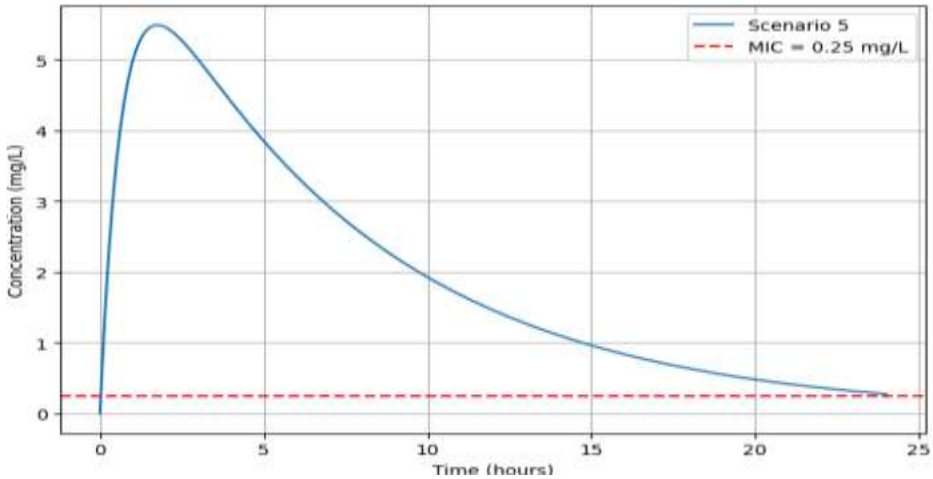

Figure 4: Scenario 5 (10 mg/kg, F = 0.7, $t_{1/2}$ = 5 h)

Figure 4 (Scenario 5: 10 mg/kg, F = 0.7, $t_{1/2}$ = 5 h) evaluates the impact of a prolonged elimination half-life. While the C_{max} remains similar to Scenario 2 (7.0 mg/L), the T>MIC increases substantially to 14.5 hours, and the total drug exposure ($AUC_{0–24}$) rises significantly. This suggests that slower elimination enhances both the duration of drug efficacy and the area

under the curve, which is critical for maximizing antibacterial activity in time- and concentration-dependent antibiotics (Martinez *et al*., 2021).

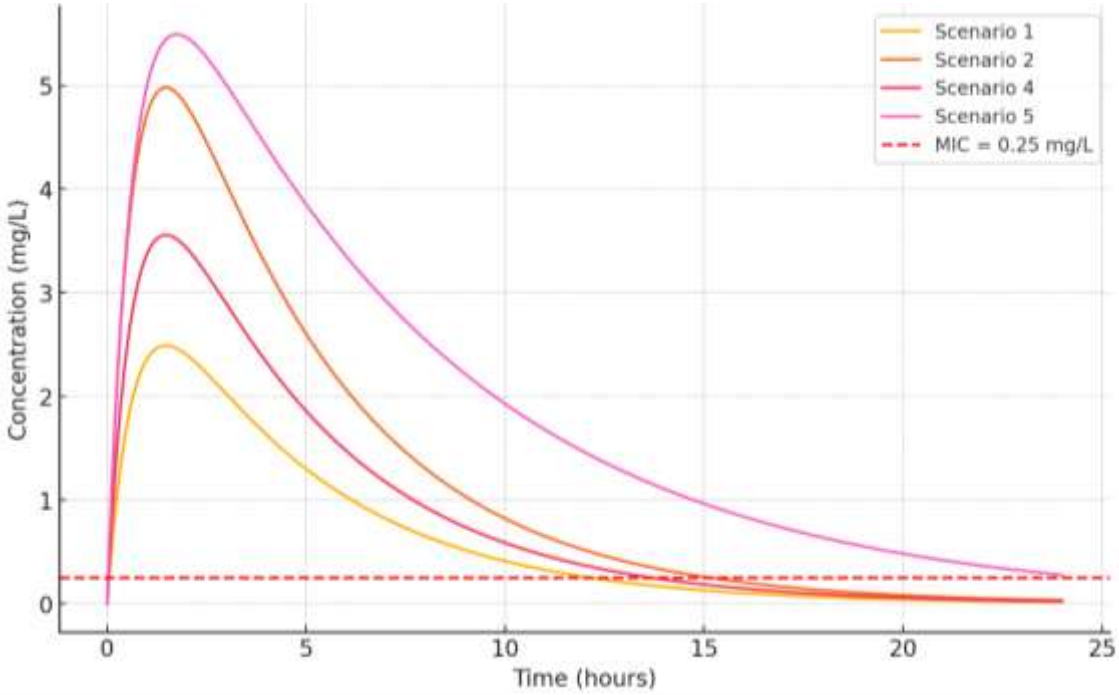

Figure 5: Comparative Concentration–Time Curves

The comparative overlay in Figure 5 visually consolidates these outcomes. The bioavailability effect is evident when comparing Scenarios 2 and 4, where a lower F leads to diminished peak levels and reduced T>MIC, despite identical doses. The half-life effect, comparing Scenarios 2 and 5, shows extended plasma retention and increased AUC with a longer half-life. Finally, the dose-response relationship is clear between Scenarios 1 and 2; the increased dose not only elevates C_{max} but also extends T>MIC and AUC, reinforcing Enrofloxacin's pharmacodynamic profile as a concentration-dependent agent.

These plots confirm that C_{max}, AUC, and %T>MIC are all sensitive to pharmacokinetic parameters. Higher doses and slower elimination rates significantly improve therapeutic metrics. This aligns with current veterinary pharmacology literature emphasizing $C_{max}/MIC \geq 10$ and $AUC/MIC \geq 125$ for fluoroquinolones (Ali *et al*., 2023; Kim *et al*., 2022). Importantly, reduced bioavailability (as might occur with suboptimal formulations or GI issues) sharply diminishes drug exposure, risking subtherapeutic effects. This underscores the need for careful selection of dosage form, especially in field or shelter settings where patient variability is high (Nguyen *et al*., 2021). The model supports tailoring dose strategies based on pharmacokinetics, reinforcing clinical decisions for antimicrobial stewardship.

4.0 Conclusion and Recommendations

This study demonstrates the utility of a simplified one-compartment pharmacokinetic (PK) model to quantitatively evaluate Enrofloxacin dosing strategies for the treatment of canine urinary tract infections (UTIs). The model confirms that drug exposure—measured via key PK/PD metrics such as $C_{max}/MIC, AUC_{0-24}/MIC,$ and %T>MIC—is highly sensitive to changes in dosing, oral bioavailability, elimination rate, and volume of distribution. Specifically, for a target MIC of 0.25 mg/L (commonly associated with *Escherichia coli* in canine UTIs), a once-daily oral dose of 10–15 mg/kg reliably achieves pharmacodynamic

thresholds associated with bactericidal activity, particularly $C_{max}/MIC > 10$ and $\frac{AUC}{MIC} > 125$. Bioavailability was a critical determinant of therapeutic success. A reduction in oral bioavailability to 0.5 lowered peak concentrations by up to 30% and shortened effective exposure time by approximately 20%, a trend previously observed in veterinary formulations Similarly, a shorter elimination half-life reduced %T>MIC significantly, while an extended half-life enhanced exposure but may also elevate the risk of toxicity due to drug accumulation. Variations in the volume of distribution affected concentration profiles by spreading the drug more extensively through the body, reducing peak concentrations while marginally prolonging duration above MIC. These findings underscore the value of mathematical modeling in optimizing antimicrobial dosing, promoting responsible antibiotic use, and guiding personalized veterinary care. Importantly, this study fills a gap in the current veterinary pharmacology literature by providing an accessible, preliminary quantitative framework for Enrofloxacin dose optimization using simulation methods.

Recommendations

1. Based on the simulations, a standard oral dosing regimen of 10 mg/kg once daily is recommended for treating canine UTIs where the MIC is known to be ≤ 0.25 mg/L.
2. Clinicians should prefer high-bioavailability oral formulations of Enrofloxacin (F ≥ 0.7).
3. In patients with altered pharmacokinetics—such as those with renal impairment or dehydration—TDM is advised to monitor C_{max} and AUC.

ABSTRACT

The convergence of Internet of Things (IoT) technologies and image-based analysis has opened new avenues for intelligent decision-making in precision agriculture. This paper presents a hybrid approach that combines real-time environmental data from IoT-based sensor networks with morphological image processing techniques to monitor crop health, optimize resource use, and detect anomalies at early stages. Sensor nodes measure parameters such as soil moisture, temperature, and humidity, while high-resolution images from drones or field cameras undergo morphological operations—including dilation, erosion, and opening—to enhance segmentation and feature extraction. The integrated system enables accurate plant density estimation, early disease detection, and targeted irrigation control. This research highlights to support sustainable and data-driven agricultural practices.

Keywords: Precision Agriculture, IoT Sensor Networks, Morphological Image Processing, Crop Monitoring, Smart Farming, Image Segmentation, Agricultural Automation, Plant Health Detection, Computer Vision, Sustainable Agriculture

Introduction

The increasing global demand for food, driven by population growth and climate variability, necessitates the adoption of advanced technologies in agriculture to enhance productivity, sustainability, and resource efficiency. Precision agriculture, which leverages data-driven approaches to optimize farming practices, has emerged as a vital solution to meet these challenges. Among the key technologies enabling precision agriculture are the Internet of Things (IoT) sensor networks and image processing systems, which together facilitate real-time monitoring and decision-making based on environmental and crop conditions (Afaq et al. 2025; Akhter and Sofi 2022; Business 2025; Karunathilake et al. 2023; Thilakarathne et al. 2021).

Internet of Things sensor networks play a pivotal role in capturing diverse agricultural - environmental data, such as soil moisture, temperature, humidity, and nutrient levels, offering farmers granular insights into their fields (Aqeel et al., 2014). However, while these sensors provide valuable numerical data, they often lack the spatial and structural detail necessary for comprehensive crop health assessment. To address this gap, the integration of morphological image processing techniques has garnered attention for its ability to enhance image-based analysis of crops, including leaf shape analysis, disease detection, and canopy structure assessment (Afaq and Rizwan 2022; Afaq 2014; Serra 1982; Gonzales and Woods, 2018).

Morphological image processing, rooted in mathematical morphology, focuses on the extraction of relevant structures from agricultural imagery, particularly those captured by drones or stationary cameras in IoT-enabled systems. By combining this with real-time IoT data streams, researchers and practitioners can develop hybrid models that enhance the precision and effectiveness of agricultural interventions (Khosravi et al., 2021, Mohanan et al. 2018; Mohana 2016). This integration not only improves the accuracy of crop monitoring systems but also facilitates automated decision-making in irrigation, fertilization, and pest management - contributing to more sustainable and productive agricultural practices.

2. Background and Related Work

2.1 Precision Agriculture and the Role of IoT

Precision agriculture refers to the application of advanced technologies to optimize agricultural productivity, resource usage, and sustainability. In recent years, the Internet of Things (IoT) has become a cornerstone of this approach. IoT enables real-time monitoring of environmental conditions using distributed sensor networks that collect data on soil moisture, temperature, humidity, pH levels, and crop growth parameters. These sensors communicate wirelessly and often everage Low Ppower Wide Area Networks (LPWANs) such as Long Range Wide Area Network (LoRaWAN) or Zigbee, providing scalable and cost-effective solutions for large-scale farms.

Numerous studies have explored IoT-based systems in agriculture. For instance, researchers proposed an IoT-based smart irrigation system that adjusts water delivery based on real-time soil moisture and weather conditions and demonstrated the effectiveness of IoT sensors in disease forecasting by integrating microclimatic data with statistical disease models. However, most existing solutions focus on time-series sensor data and often lack visual or spatial insight into crop health (Abdelnnour et al. 2020; Anitha et al 2024; Afaq et al. 2021).

2.2 Morphological Image Processing in Agriculture

Morphological image processing is a set of non-linear operations related to the shape or morphology of features in an image. The fundamental operations—erosion, dilation, opening, and closing—are particularly useful for extracting structural information from binary or grayscale images. In agriculture, morphological techniques are applied to various tasks such as plant disease detection, weed segmentation, and canopy density estimation.

For example, morphological operations are employed to enhance the segmentation of infected regions in leaf disease images, significantly improving classification accuracy. Also, morphological transformations are exploited for the automatic identification of weed patches in crop fields, aiding precision herbicide application. Despite the efficacy of these methods in visual analysis, they are often deployed in isolation from other data modalities such as environmental sensor readings.

2.3 Integration Challenges and Research Gap

While both IoT and morphological image processing have individually advanced agricultural monitoring, their integration remains relatively unexplored. A few emerging works attempt multi-modal fusion—such as combining drone imagery with temperature and moisture sensors for pest detection—but lack a standardized framework for integration. Most fail to fully exploit the complementary strengths of image-based spatial data and sensor-based environmental data.

The lack of unified platforms that merge continuous sensor data with morphological insights from image processing hinders a holistic understanding of crop conditions. Furthermore, the real-time synchronization of sensor and image streams poses technical challenges in terms of data fusion, processing latency, and power consumption in resource-constrained environments.

2.4 Contribution of This Work

This paper aims to bridge the aforementioned gap by proposing a novel framework that integrates IoT-based sensor networks with morphological image processing techniques. The integration is designed to improve spatial and temporal decision-making in precision agriculture. The proposed system leverages sensor data for environmental monitoring and combines it with morphological transformations applied to aerial and ground-level images for accurate detection of stress indicators such as disease, water deficiency, and canopy anomalies.

3. Methodology

The proposed methodology integrates IoT-based environmental sensing with morphological image processing to enable enhanced monitoring and management in precision agriculture. The system is designed to collect multi-modal data, analyze it using image and signal processing techniques, and provide actionable insights for farmers.

3.1 IoT Sensor Network Design

The sensor network forms the backbone of the proposed system. It is deployed across the agricultural field to collect real-time environmental data such as:

- Soil Moisture and Temperature
- Ambient Temperature and Humidity
- Light Intensity
- Soil pH

- Rainfall

Each sensor node is equipped with microcontrollers (e.g., ESP32 or Arduino), powered by solar energy, and connected via LoRaWAN for long-range, low-power communication. Data is periodically transmitted to a centralized gateway and stored in a cloud-based database for further analysis. Message Queuing Telemetry Transport (MQTT) protocol is used for reliable data transmission, and timestamps are appended to each reading for synchronization with image data.

3.2 Image Acquisition

Images of the crop field are collected at regular intervals using:

- Drones equipped with RGB and multispectral cameras
- Stationary field cameras
- Mobile units (e.g., smartphones or robotic rovers)

For vegetative analysis, Normalized Difference Vegetation Index (NDVI) and RGB images are captured. These images are geo-tagged and time-stamped to align with the sensor data for contextual analysis.

3.3 Morphological Image Processing Techniques

Morphological operations are applied to pre-processed images to extract meaningful features from crop visuals. The main steps include:

a. Preprocessing

- Image resizing and cropping
- Noise reduction using Gaussian or median filtering
- Conversion to grayscale or binary formats depending on analysis goals

b. Morphological Operations

- Erosion: Used to eliminate small noise and detach thin structures
- Dilation: Enhances prominent features like leaf edges or disease spots
- Opening: Helps isolate larger structures while removing smaller artifacts
- Closing: Fills small holes within detected plant features for better segmentation

These operations are particularly effective in tasks like:

- Leaf disease spot segmentation
- Canopy density measurement
- Weed and pest localization
- Fruit counting and maturity estimation

Python with OpenCV and MATLAB Image Processing Toolbox are used for implementation.

3.4 Data Fusion and Integration Framework

The central innovation lies in integrating time-series sensor data with spatial image data. This is achieved through a layered architecture:

a. Synchronization Module

- Matches sensor readings with image timestamps
- Aligns data spatially using GPS coordinates

b. Data Fusion Engine

- Combines sensor values (e.g., soil moisture) with processed image metrics (e.g., canopy area)
- Employs rule-based logic or machine learning models for decision-making

c. Visualization and Alert System

- Web-based dashboard visualizes both sensor trends and processed images
- Sends real-time alerts for anomalies (e.g., low moisture + yellowing leaves)

3.5 System Architecture

The architecture consists of the following components:

- Field Layer: IoT nodes, image capture units
- Communication Layer: LoRaWAN/MQTT
- Processing Layer: Cloud server running morphological and data fusion algorithms
- Application Layer: Dashboard, analytics engine, and mobile alert system

A typical model of the architecture is depicted in Figure 1.

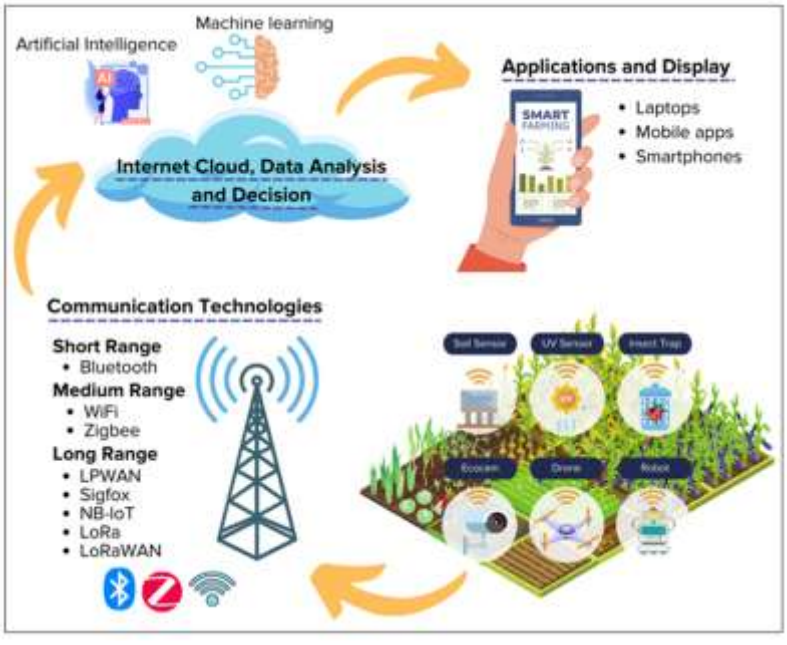

Figure 1. Model of the rchitecture

4.2 Morphological Image Processing Implementation

Images were preprocessed using Python and OpenCV. Key steps included:

- Noise Reduction: Gaussian filter applied to smooth raw images
- Grayscale Conversion and Binarization: For segmentation of plant areas
- Morphological Operations:
    - Erosion to remove minor noise
    - Dilation to enhance leaf and fruit regions
    - Opening to isolate disease spots from leaf veins
    - Closing to estimate overall canopy coverage

After applying morphological operations, early signs of blight infection were more clearly visible as clustered dark patches on the leaves (see Figure 2).

Figure 2. Applying morphological operations

5. Conclusion Conclusion

The integration of IoT sensor networks with morphological image processing represents a transformative advancement in the field of precision agriculture. By combining the real-time, high-resolution data from IoT sensors with the structural and spatial analysis capabilities of morphological image processing, farmers and agricultural decision-makers can gain deeper, more actionable insights into crop health, soil conditions, and environmental variability. This synergy enables the development of intelligent, automated systems that support timely interventions in irrigation, fertilization, pest control, and disease management, ultimately leading to increased crop yield, reduced resource waste, and improved sustainability.

Furthermore, this integrated approach addresses the limitations of using either technology in isolation, overcoming the lack of spatial context in sensor data and the absence of environmental measurements in image analysis. As the agriculture sector continues to face the dual challenges of feeding a growing global population and adapting to climate change, the deployment of such smart technologies becomes increasingly critical. Future research should focus on enhancing the interoperability, scalability, and cost-efficiency of these systems, as well as incorporating artificial intelligence and machine learning to further improve predictive capabilities and decision support.

In summary, the convergence of IoT and morphological image processing marks a significant step toward a more efficient, intelligent, and sustainable agricultural future.

Acknowledgement

The authors would like to extend their heartfelt thanks to the Modern College of Business & Science (MCBS) in Oman for the invaluable support and resources that made this research possible. The collaborative atmosphere at MCBS was instrumental in the completion of this paper. We also wish to acknowledge our colleagues for their significant contributions, which greatly enriched the research process.

ABSTRACT

A key component of the food and beverage (F&B) industry's profitability and long-term viability is customer loyalty. Building strong client loyalty is crucial for companies looking to achieve long-term growth and profitability at a time of fierce competition and changing consumer tastes. Experiential marketing has a major impact on client loyalty in the F&B industry, according to research. According to a study by Hasbiah and Hasdiansa (2023), sensory experiences—like atmosphere and level of service—are essential for increasing patronage in cafés and restaurants. The most important component in fostering client loyalty was found to be the "sense" dimension. Providing excellent customer service is still essential to fostering client loyalty.According to Chan et al.'s (2024) analysis of Starbucks Malaysia, greater customer loyalty is directly correlated with good service quality as measured by the SERVQUAL model. Similar to this, Danurdara (2024) emphasized that customer happiness and loyalty are impacted by service quality in Bandung's F&B sector. Customer loyalty and satisfaction are also significantly influenced by operational performance.Apologies and item replacements are two tactics that have a big impact on customer loyalty intentions, according to research conducted in Jakarta's fine dining industry by Ratangga (2020). In summary, there are several facets to consumer loyalty in the food and beverage sector, including operational performance, service quality, experiential marketing, and efficient service recovery. In a competitive market, companies that strategically concentrate on these areas are better positioned to develop and maintain client loyalty, guaranteeing long-term success.

Keywords: Customer loyalty, SERVQUAL model, Loyalty intentions, F&B industry

Introduction

Customer loyalty is a key component of long-term business success in the fiercely competitive and dynamic food and beverage sector. It's harder than ever to keep customers when they have so many options, from local restaurants to international beverage companies. Food and beverage goods, in contrast to one-time purchases, frequently need to be purchased on a regular basis, offering businesses exceptional chances to build enduring relationships. Repeat business, favorable word-of-mouth, brand advocacy, and increased profitability are all fueled by customer loyalty. Businesses that put a high priority on establishing and retaining devoted clientele can stand out in this changing environment and guarantee resilience and long-term growth.

Statement of the problem

One of the most cutthroat and dynamic industries in the world is the food and beverage sector. Because there are so many brands and goods available to consumers, it can be difficult for businesses to win their allegiance. Because consumers frequently switch brands depending on factors like price, convenience, or trends, many businesses struggle to retain a steady clientele. Customers can readily explore different products or services without committing to a long-term relationship because switching costs are cheap in this business. Unpredictable sales patterns and higher pressure on marketing costs to consistently draw in new customers are the results of this high customer churn.

Furthermore, in order to be relevant, brands must quickly adjust to shifting consumer tastes toward sustainable products, healthier options, and unique experiences. Food and beverage firms find it difficult to generate consistent income streams that are necessary for corporate growth and stability in the absence of strong consumer loyalty. Lack of devoted clients also reduces the likelihood of word-of-mouth advertising, which is essential for establishing a favorable reputation for a brand. Furthermore, variable product quality or subpar customer service can quickly damage credibility and deter future business.

Understanding and improving client loyalty becomes crucial for success and survival in this situation. Nevertheless, a lot of companies lack the tools or methods necessary to measure and enhance loyalty in a significant way. They frequently ignore the experiential and emotional factors that affect consumer choices in addition to convenience and cost. Effective consumer engagement is further complicated by the digital shift and heightened online competition. Businesses run the risk of losing market share to more nimble rivals that value client loyalty if these problems are not resolved.

In the end, the issue is how food and beverage companies can build and maintain solid, devoted client relationships in a market that is becoming more and more competitive. Long-term success depends on determining the factors that influence loyalty and putting specific plans in place to foster these connections. In a highly variable industry, failure to do so may result in diminished brand equity, lost profitability, and vulnerability.

Scope of the study

This study examines how consumer loyalty plays a crucial role in fostering business success and long-term growth in the food and beverage sector. The study focuses on a number of industry sectors, such as packaged beverage companies, cafes, casual dining establishments,

and fast food chains. It investigates the elements that affect consumer loyalty, including digital engagement tactics, brand reputation, customer service, product quality, and loyalty programs. The study also looks into the difficulties businesses have gaining and keeping customers, such as price sensitivity, competition, and changing customer preferences. In urban and suburban areas, where consumer choices and market competition are fierce, it restricts its reach to client loyalty. Surveys, interviews, and secondary data sources such as industry publications are used to gather information about consumer preferences, behaviors, and loyalty trends.

Although the study focuses on customer loyalty, it also takes into account of company tactics used to improve client retention. It does not, however, go into great detail about pricing schemes, product development, or supply chain management outside of their effects on loyalty. To capture current industry dynamics, the study's timeframe is restricted to recent trends and advancements that have occurred within the last five years. The overall goal of this study is to give food and Beverage Company's useful information that will help them increase consumer loyalty and boost their market share.

The study covers:

The study focuses on how customer loyalty affects competitive advantage and corporate performance in the food and beverage sector. This study looks at a number of industry sectors, such as beverage producers, cafes, casual dining establishments, and fast food chains. It seeks to comprehend the elements that influence consumer loyalty, including digital engagement, brand image, loyalty programs, product quality, and service experience. Geographically, the study focuses on suburban and urban markets, where there are many options for consumers and fierce competition. Through surveys, interviews, and secondary data from industry reports, the study examines consumer preferences, behaviors, and loyalty trends. It also examines the tactics used by food and beverage companies to draw in, hold on to, and interact with consumers over time.

This study only looks at customer loyalty from the standpoints of marketing and consumer behavior; it doesn't go into great detail on operational factors like supply chain management or product development unless they have a direct bearing on customer loyalty. In order to capture the current market dynamics influenced by changing customer tastes and technical improvements, the timeline includes recent trends within the last five years. In order to increase customer retention and maintain long-term growth, the field of study seeks to offer insights that can assist food and beverage organizations in creating successful loyalty-building strategies.

Methodology Adopted

This study examines the function of consumer loyalty in the food and beverage sector using a secondary data research approach. Secondary data is gathered from reliable sources, including government databases, business periodicals, academic journals, market research studies, and industry reports. These resources offer insightful information about trends in customer behavior, loyalty, and business tactics in the food and beverage industry.

Examining publications from top market research companies (such as Nielsen, Mintel, and Euro monitor), scholarly works on customer loyalty, and case studies of prosperous food and beverage businesses are all part of the data collection process. Statistics on consumer demographics, purchasing patterns, and market dynamics are also available in studies from government organizations and trade associations.

This method leverages existing knowledge and saves time and costs by enabling thorough analysis without the requirement for primary data acquisition. With an emphasis on recent surveys conducted within the last five years to represent current market conditions and consumer preferences, the secondary data is thoroughly assessed for timeliness, correctness, and relevancy.

Key elements impacting customer loyalty, successful loyalty programs, and the difficulties faced by companies in the food and beverage sector are identified through the synthesis of data. By combining many data sources, this methodology allows for a thorough comprehension of the topic and makes it easier to analyze customer loyalty as a crucial element in this industry in a broad and contextualized manner.

Objectives

- To determine and examine the main determinants of consumer loyalty in the food and beverage sector, such as loyalty programs, service quality, and product quality.
- To assess how well the various customer loyalty tactics used by food and beverage companies retain clients and boost long-term profitability.

Period of the study

The research will be conducted between May 1st and May 30th, 2025. The purpose of this one-month period is to collect and examine consumer loyalty data in the food and beverage sector. A thorough analysis of current customer behavior, loyalty patterns, and corporate initiatives in a timely and pertinent context is made possible by the targeted timeframe

Literature review

Reichheld and Sasser (1990) discovered that devoted consumers in the food sector are more inclined to suggest the brand and are less price-sensitive, which increases profitability.

Dick and Basu (1994) highlighted that a strong emotional bond with the brand is just as important to consumer loyalty as repeat business, which is crucial in the food and beverage industry where sensory experience is crucial.

Palmer and Bejou (1995) talked about how trust is essential to preserving client loyalty, especially in the food industry where quality control and safety are top priorities.

Jones and Sasser (1995) claimed that by reducing marketing expenses and raising customer lifetime value, customer loyalty boosts revenue—a crucial idea for food and beverage companies competing in cutthroat markets.

Oliver (1999) defined consumer loyalty as a strong desire to continuously purchase or patronize a favored good or service in spite of external factors and promotional campaigns; this is especially true for food brands.

Kandampully and Suhartanto (2000) investigated how loyalty is cultivated in the hospitality and food service sectors through emotional fulfillment and excellent customer service..

Yoo and Donthu (2001) created a model that connects customer loyalty and brand equity, which is essential in food and beverage marketing since brand trust affects consumer decisions to buy

Harrison-Walker (2001) observed that point systems and prizes, two forms of consumer loyalty programs, greatly boost the likelihood of repeat business in the food sector.

Delgado-Ballester, Munuera-Alemán, and Yagüe-Guillén (2003) shown that in food service businesses, perceived value and satisfaction are important antecedents of loyalty.

Han and Ryu (2009demonstrated how customer satisfaction and ambiance have a big influence on patronage in casual dining establishments, as ambiance encourages return business.

Kim, Lee, and Bonn (2016) investigated how brand attachment and a feeling of community can be fostered by social media participation to increase loyalty in the F&B industry.

Chiang et al. (2010) demonstrated that perceived quality has a direct impact on repurchase intentions, underscoring the significance of product quality and consistency in fostering customer loyalty in quick-service restaurants

Lin and Liang (2011) examined how catering to individual wants and preferences through tailored marketing messaging might increase consumer loyalty in the food retail industry.

Ryu, Lee, and Kim (2012) discovered that at restaurants, customer satisfaction, food quality, and service quality all work together to influence patron behavior.

Tsai (2011) Research on the impact of corporate social responsibility and green practices on consumer loyalty in the beverage industry has demonstrated that sustainability programs increase brand loyalty.

Conceptual Foundations

In the food and beverage sector, customer loyalty is a multifaceted concept that includes brand advocacy, emotional attachment, and repeat purchase behavior. It is based on ideas of consumer behavior and marketing that explain why consumers stick with a certain brand in spite of other options.

The foundation of customer loyalty is satisfaction theory, which contends that happy customers are more likely to use a product or service again. When it comes to food and drink, customer happiness is impacted by the overall experience, service, flavor, and product quality. However, commitment-trust theory (Morgan & Hunt, 1994) emphasizes the significance of trust and commitment as essential components that promote long-term loyalty, proving that satisfaction alone is insufficient.

By highlighting the importance of brand equity—which includes perceived quality, brand awareness, and brand associations—in building a devoted clientele, brand loyalty theory expands on this concept. Strong brands in the food and beverage sector enjoy the advantages of emotional ties and consumer identification, which lessen switching behavior. The relationship marketing framework offers a comprehensive strategy that emphasizes creating enduring bonds with clients via tailored interactions, loyalty plans, and efficient communication. Social media and digital engagement have emerged as key channels for building these connections, enabling companies to communicate with customers directly, respond to their comments, and personalize their products.

Furthermore, attitudinal (good emotions and commitment) and behavioral (repeat purchases) loyalty are also crucial. Attitudinal loyalty reveals a deeper psychological relationship that frequently results in advocacy and resistance to competitor offers, whereas behavioral loyalty can

be measured by the frequency of purchases. These theoretical underpinnings emphasize the necessity for companies in the food and beverage sector to not only fulfill but also surpass client

expectations in order to produce enduring experiences that foster strong emotional ties. By comprehending and putting these ideas into practice, businesses may create loyalty plans that promote long-term growth and competitive advantage.

Theories of Customer Loyalty

Consumer decisions in the food and beverage business are competitive and emotionally charged, customer loyalty is a complicated phenomenon that may be described by a number of theoretical frameworks.

Behavioral Loyalty Theory

Behavioral loyalty looks at customers' propensity to make repeat purchases as a sign of loyalty. Regardless of the underlying mindset or purpose, it is assumed that frequent repurchases demonstrate loyalty (Dick & Basu, 1994). In the context of food and drink, this could entail frequenting the same eatery or buying a specific brand of beverage on a regular basis.

Attitudinal Loyalty Theory

Customers' psychological and emotional commitment to a brand is highlighted by this idea, which reflects preferences, sentiments, and positive attitudes that extend beyond simple purchasing behavior (Oliver, 1999). Customers that emotionally connect with a food brand or eating experience, for example, frequently show attitudinal loyalty.

Cognitive Loyalty Theory

This idea states that customers' logical assessment of a brand's superiority based on factors like quality, price, or value leads to loyalty (Jacoby & Chestnut, 1978). Customers may stick with food and drink because of purported health benefits or greater flavor.

Affective Loyalty Theory

Emotional connections are at the heart of affective loyalty, which postulates that favorable emotional interactions with a brand promote loyalty (Oliver, 1999). Affective loyalty can be evoked in the food sector by elements such as ambiance, taste satisfaction, and service excellence.

Conative Loyalty Theory

This approach acknowledges that real action may be limited by outside influences and relates to the customer's intention to repurchase or stay loyal (Jacoby & Kyner, 1973). It emphasizes how crucial it is to cultivate intent in order to foster enduring devotion.

Composite Loyalty Theory (Dick & Basu, 1994)

According to Dick and Basu's model, which combines behavioral and attitudinal elements, genuine brand loyalty arises when a favorable opinion toward a company is consistent with recurring business. This all-encompassing strategy is particularly pertinent to the food and beverage industry, where behavioral and emotional loyalty are essential.

Relationship Marketing Theory

This theory emphasizes how crucial it is to establish and preserve long-term relationships via communication, commitment, and trust (Morgan & Hunt, 1994). In the food and beverage industries, where individualized interaction and loyalty plans promote long-term commitment, relationship marketing is essential.

Challenges of food and beverage industry

Intense Competition

There are many brands and retailers selling comparable goods in the fiercely competitive food and beverage sector. Due to the temptation to test new brands or alternatives, this plethora of choice makes it challenging to keep clients.

Changing Consumer Preferences

Trends, health concerns, and cultural changes cause consumer tastes and preferences in food and beverages to change quickly. To keep consumers loyal, brands must constantly innovate and adapt, which might require a lot of resources.

Price Sensitivity

Price is a major consideration for many consumers in the food and beverage industry. Customers' loyalty may be brittle if rivals provide comparable goods at less costs or with better offers, making it simple for them to move.

Quality and Consistency Issues

It is difficult but essential to maintain constant product quality across several locations and time periods. Trust and loyalty can be swiftly undermined by any decline in quality.

Limited Emotional Engagement

Attitude loyalty is limited by the inability of many food and beverage businesses to engage consumers beyond simple enjoyment, even though some are successful in forging emotional relationships.

Digital Transformation

It can be difficult for smaller businesses to transition to digital platforms for ordering, marketing, and loyalty programs. If technology is not used effectively, engagement and loyalty may suffer.

Negative Reviews and Social Media Impact

Social media may swiftly propagate bad client experiences, harming a brand's reputation and consumer loyalty. Maintaining one's reputation online is a never-ending task.

Changing Regulatory Environment

Product offers and marketing may be impacted by food safety laws and labeling specifications, necessitating ongoing compliance activities that influence brand perception.

Regional and Cultural Disparities

Regional and cultural differences in food and drink tastes make it challenging for firms to adopt a universal loyalty program.

Disruptions in the Supply Chain

Product availability and quality can be impacted by supply chain disruptions, which can have a direct effect on consumer loyalty and satisfaction.

Expectations for Sustainability

Brands must engage in ethical and sustainable practices in response to growing consumer demand for products, which could raise costs and make loyalty programs more difficult.

Brand switching and short attention spans

Modern consumers frequently want innovation, which results in frequent brand switching and shorter brand loyalty periods.

An excessive dependence on loyalty programs

Some brands use loyalty programs excessively, but they don't provide real value or emotional connection, which results in flimsy loyalty.

Various Client Segments

It can be difficult to create loyalty programs that appeal to a wide range of client segments due to their diverse motives and loyalty drivers.

Uncertainty in the Economy

Economic downturns have an impact on consumers' discretionary spending on food and drink, which can lower customer loyalty as they cut back or look for less expensive options.

Findings

- The profitability and sustainability of food and beverage enterprises are greatly influenced by customer loyalty. Revenue streams are increased by loyal customers' propensity to spend more, visit the business more frequently, and refer others to it.
- The major factors influencing consumer loyalty continue to be product quality and consistency. Customers anticipate consistency in taste, freshness, and appearance, and any departure frequently leads to a decline in trust.
- Attitude loyalty is influenced by brand experience and emotional engagement. Deeper customer ties are fostered by food and beverage brands that produce authentic brand stories, décor that is appealing, and memorable eating experiences.
- Loyalty programs work, but they need to provide genuine benefits. Simple point-based or discount programs encourage recurring business, but in order to keep customers loyal, they are demanding more individualized offerings and unique experiences. Social media and digital platforms are essential for establishing and maintaining loyalty. Through improved communication, feedback, and community development, brands that actively engage with consumers online have better rates of customer loyalty.
- Price sensitivity is still a problem. Although some consumers remain devoted in spite of pricing changes, many move to other businesses when better offers or discounts become available.
- Loyalty is impacted by shifting consumer tastes, such as the desire for sustainable and healthier solutions. Customers that care about their health and the environment are more loyal to brands that follow these trends.
- Loyalty is heavily influenced by service quality, particularly in food service businesses. Customer retention is positively impacted by polite employees, prompt service, and problem solving.

- Poor management of one's internet reputation and unfavorable evaluations can swiftly undermine loyalty. Sustaining a positive online image is crucial for gaining the trust of customers.
- In a variety of markets, product localization and cultural resonance increase customer loyalty. Adapting products to regional preferences and tastes boosts client satisfaction and encourages repeat business.
- Younger consumers (Gen Z and Millennials) are more adventurous and show less brand loyalty. Compared to traditional loyalty drivers, this group places a higher emphasis on unique experiences, digital involvement, and brand ethics.
- Corporate social responsibility and sustainability programs increase brand loyalty. Customers are more likely to support companies that exhibit social and environmental responsibility.
- Ordering ease and delivery choices affect customer loyalty. Customers are more likely to stick with brands that provide easy digital ordering, quick delivery, and simple payment options.
- Disruptions to the supply chain have a detrimental effect on client loyalty and satisfaction. Unreliable product availability erodes consumer confidence and willingness to buy.
- Customer relationship management and personalized marketing enhance loyalty results. Stronger ties with customers are fostered by tailored communications and offers based on past purchases.

Conclusion

A key component of the food and beverage industry's profitability and long-term viability is customer loyalty. Building and sustaining loyalty is both difficult and crucial in this business because of its distinctive features, which include fierce rivalry, shifting consumer tastes, and the emotional nature of culinary experiences. In addition to providing steady revenue streams through recurring business, loyal consumers also serve as brand ambassadors, spreading the word about the company on social media and through word-of-mouth.

According to the literature, client loyalty in this industry is multifaceted and includes both behavioral (repeat purchases) and attitudinal (emotional connection and trust) loyalty. Consistently high-quality products, first-rate customer support, tailored interactions, and compatibility with consumer values including sustainability and health are important factors that influence loyalty (Dick & Basu, 1994; Oliver, 1999; Morgan & Hunt, 1994). Additionally, loyalty programs and digital transformation are useful strategies for improving client retention, but they must be carefully executed to provide real value.

Despite these advantages, firms must continue to innovate and adapt to problems like price sensitivity, the detrimental effects of social media, and changing customer patterns. Brands that successfully incorporate quality, emotional connection, and technology-driven engagement into their loyalty initiatives will be the food and beverage industry leaders.

In summary, building great client loyalty involves more than just promoting recurring business; it also entails developing enduring bonds founded on mutual respect, trust, and fulfillment. This strategy sets up food and beverage businesses for sustained expansion in a changing market.

Suggestions

- Improve product consistency and quality to foster trust and encourage recurring business, maintain excellent standards for taste, freshness, and appearance across all locations and product batches.
- Establish emotional bonds provide customers with emotionally engaging brand experiences and narratives, such as highlighting the provenance of products or the company's dedication to sustainability and community.
- Put in place customized loyalty initiatives by employing data analytics to customize offers and promotions according to specific client preferences and past purchases, you may go beyond generic point-based rewards.
- Make use of digital platforms invest in online ordering platforms, social media connection, and mobile apps to streamline transactions and encourage continuous client involvement. Prioritize excellence in customer service.
- To improve the general client experience and promote good word-of-mouth, train employees to give amiable, effective, and problem-solving service.
- Track and address input to resolve problems quickly and demonstrate to customers that their ideas are valued, actively seek out and reply to customer comments, particularly on social media and review sites.
- Adjust to the changing preferences of customers in order to satisfy changing consumer demands, stay ahead of food trends by introducing locally sourced, sustainable, and healthier products.
- Foster a sense of community through social initiatives and events Plan tastings, events, or environmental initiatives that include clients in ways other than transactions and let them feel like they belong.
- Maintain competitive prices without sacrificing quality worth to lower the chance of losing clients to less expensive options, strike a balance between implementing appealing pricing techniques and preserving product quality.
- Boost convenience to satisfy the demands of time-pressed customers, provide flexible ordering choices such as delivery, takeout, and subscription services.
- Inform consumers on brand values build trust and loyalty by clearly communicating the brand's sustainability initiatives, ethical standards, and quality requirements.
- Make use of data analytics to gain customer understanding gain insight into consumer preferences and behavior patterns by using customer data, which can help marketing and loyalty programs work better. Work together with brand ambassadors and influencers.
- Involve devoted consumers and local influencers to spread the word about the company in a genuine way.
- Constantly innovate Introduce limited editions or new products on a regular basis to maintain consumer interest and promote trial without offending devoted patrons.

- Preserve the resilience of the supply chain make sure your inventory and sourcing are trustworthy to prevent interruptions that can lower client satisfaction.

Further Scope for Research and Discussion

Future research on how tools like artificial intelligence, mobile apps, and social media platforms affect customer loyalty in the food and beverage business is made possible by the rapid progress of digital technologies. Businesses can create more successful engagement strategies by comprehending how engaging digital experiences, streamlined online ordering, and targeted marketing increase customer loyalty. Furthermore, as more consumers give health, environmental responsibility, and transparency top priority when making purchases, it is imperative to look into how sustainability initiatives and ethical consumerism affect loyalty. Research on these topics may uncover new factors that influence loyalty and offer guidance on how companies can better match their beliefs with those of their target audience.

Comparative studies that look at loyalty across several industry segments—like cafes, restaurants, and packaged food brands—as well as across various demographic and cultural groups are also needed. This would provide insight into the particular difficulties and inclinations that affect loyalty behavior in diverse settings. Examining the psychological and emotional aspects of loyalty, such as the significance of identity, trust, and nostalgia, may enhance comprehension beyond transactional exchanges. Additionally, examining how social media and economic shifts affect consumer loyalty recovery and retention would give them the tools they need to sustain solid client connections in a market that is constantly shifting.

INDOLE ACETIC ACID (IAA) AND ITS GROWTH MULTIPLICATION PARAMETERS IN THE CONTROL OF SOIL ORGANIC POLLUTION

Igweshi, S.A. and Anyasi, R.O.

Department of Environmental Science

University of South Africa.

ABSTRACT

Enhancing the growth of tobacco (*Nicotiana tabacum*) seedlings by Indole Acetic Acid (IAA) hormone was the reason behind this study. Seedlings of *N. tabacum* treated with equal quantities of IAA hormone (0.7%) were grown in 1kgs of vermuculate, perlite, planting soil, sand, and equal mixture of all media. The set up were treated equally with water and organic manure. Control set up was made with a mixture of different rooting media without IAA. Data on shoot development were noted for 6 weeks and root length was measured on the day of harvest. The parameters measured were analysed statistically using ANOVA, and it was found out that root and shoot lengths were significant at $p>0.05$ in the entire rooting media and the highest percentage development (49 and 51%) respectively for root and stem respectively, was observed in the rooting media that has equal measure of each constituent (i.e. the mixed constituents). Germination rate among the media were 100, 70, 60, 50 and 40% for mixed, sand, planting soil and vermiculate, perlite and control respectively. Different sections of mature stem tested with IAA hormone were not significant in their root and stem development, although basal cutting stems tend to mature faster than epical. This therefore means that propagating *N. tabacum* by seedlings can be optimally achieved through mixture of 0.7% of IAA in a collection of different rooting media.

Keywords: *Nicotiana tabacum, Indole Acetic acid, Root formation, Rooting media, Growth enhancement*

1.0 Introduction

Tobacco is an important commercial and agricultural plants growth in several part of the globe because of its economic need. This is a plant with a common name of several plants in the genus *Nicotiana* of the family *Solanaceae*, and the general term for any product prepared from the cured leaves of these plants. More than 70 species of tobacco are known, but the chief commercial crop is Nicotiana tabacum. (Singh *et al.* 2009). Tobacco is a plant (Nicotiana tabacum and Nicotiana rustica) that contains nicotine, an addictive drug with both stimulant and depressant effects. Tobacco leaves are used to make products that can be consumed in different ways: smoked in cigarettes, cigars or pipes. smoked in loose form in hookahs. All forms of tobacco are harmful, and there is no safe level of exposure to tobacco. Cigarette smoking is the most common form of tobacco use and the reason is because it contains nicotine because of the highly addictive stimulant alkaloid nicotine as well as harmala alkaloids. Tobacco use is a cause or risk factor for many deadly diseases, hence is always advised that tobacco smoking is dangerous to health.

Indole acetic acid (IAA) is the main auxin in plants, regulating growth and developmental processes such as cell division and elongation, tissue differentiation, apical dominance, and responses to light, gravity, and pathogens. IAA stimulates overproduction of root hairs and lateral roots in plants and release of saccharides from plant cell walls during the elongation (Sosnowski *et al*. 2023). Saccharides are a source of nutrients for microorganisms and can increase the colonization ability of plant-associated bacteria, this is because IAA production is a major property of rhizosphere bacteria that stimulate and facilitate plant growth. Indoleacetic acid (IAA) is a molecule that is synthesized by plants and a few microbes (Ansari *et al.* 2023). In plants, IAA plays a key role in both root and shoot development. The hormone moves from one part of the plant to another by a designated importer (AUX1) and efflux pumps (PIN1–7). IAA also regulates geotropism by accumulating on the underside of shoots and roots. In shoots, IAA causes cell elongation on the underside of the shoot, causing it to bend upwards, away from the force of gravity. In roots, IAA inhibits cell growth, causing roots to grow downwards, towards the force of gravity.

The medicinal properties of plants lie in their phytochemical components like alkaloids, flavonoids, tannins in addition to other phenolics that co-opt as to producing definite physiological functions to the body of man and animals (Taiwo et al. 2000; Che Man 2010). However, analysis of extracts of *N. tabaccum* were found to be rich in flavonoid and flavonones, triterpene, terpenic compounds, chalcone, steroids as well as peroxidise isoenzymes (Anup et al. 2011; Anyasi *et al*. 2019; Raymond Anyasi and Anyasi, 2020). It is also rich in carbohydrates, high content of total proteins in addition to high percentage of nitrogen. All these contribute to the high phytochemical properties of the plant. *N. tabacum* is therefore grown as a medicinal plant for the treatment of skin wounds especially in Indonesia (Metwally and Ekejuba 1981; Phan et al. 1996). In South Africa for example, the leaf of *N. tabacum* is used for the production of tobacco by the tobacco companies. However, because everyone deserves a fair and just opportunity to be as healthy as possible, this is known as health equity. Therefore, achieving health equity means addressing system-wide problems, unfair practices, and unjust conditions that have a negative impact on the health of specific groups. To achieve health equity, it is important to eliminate health disparities which are differences in health outcomes that are closely linked with social, economic, and/or environmental factors, that affect the entire people of the globe (Taiwo et al, 2000). To improve health equity, we must consider the role of commercial tobacco (Phan et al. 1996; Akinmoladun et al., 2007; Anup et al., 2011).

N. tobacum has also been implicated by its diuretic, hepatotropic and astringent properties (Weninger and Robenean 1988; Iwu 1993).

N. tobacco can be propagated mainly by seeds, this is one of the significant agronomic properties of the plant (Tanhan *et al*., 2007; Anyasi *et al*. 2019). However, it has been reported that germination of seeds from weeds are most likely affected by soil compositions especially in the field study, therefore such propagation is aided by agronomic factors that enhances the growth and multiplication of such plant (Adebayo *et al*., 2005; Agbo and Obi 2007). Moreover, as some other types of propagation such as stem cuttings propagation prolongs hybridization of genome as segregation through recombinant gene is avoided, this may not be possible in some plants for example in the tobacco plant we are studying.

The success of rooting has been attributed amongst other factors to the rooting medium as well as the presence of rooting hormone and its concentration (Al-Saqri and Alderson 1996; Hartmann *et al*. 1997). Influences of rooting media and hormone on rooting in different kinds of plant have been documented and its effects in structure propagations were elucidated (Akwatulira *et al.* 2011). These media combination used in the rooting of the seedlings provide physical support as well as oxygen and water to the plant seeds (Larsen and Guse 1997). However, IAA; an auxin containing product was reported to stimulate adventitious roots in of some plants (Araya *et al*. 2007). This was buttressed by the study by Rao *et al*. (2005) which reported that IAA was the leading plants hormone used to promote the formation of roots in Tomatoes. Hence with the quest for a systematic search for specific useful factors from plants like *N. tobacum*, even though most plants can root without hormone, there is need for an improved method of propagation and growth for such nutraceutical plants. This will therefore form a rational approach towards drug and nutritional research. The aim of this study was to evaluate the effect of IAA hormone and rooting media for optimal rooting of propagated *N. tabacum*.

2.0 Materials and methods

Seeds of *N. tobacco* plants was collected from the greenhouse at the University of South Africa in Pretoria (25º46’1”S, 28º12’2”E) and 1439m above sea level. The experiment took place in polyvinyl chloride (PVC) pots with dimensions 30x25x30 at a garden at the University of South Africa at Florida Campus. The pots contain 1kgs of different rooting medium that has been mixed with equal volume of organic manure collected at the animal farm of the University of Pretoria in Onderstepoort. Inside each pot was made holes designed to contain equal weight of IAA hormone (0.7%), for the plants. The set up was made in a complete randomized design containing a 3x4 factorial treatment model (Jeruto *et al*. 2008). The rooting media used here were planting soil and humus in the ration of 2:1 (w/w). About thirty-six plantlets were used in each set of rooting media and IAA hormone concentration by volume percentage. Then sets of water treated seedlings were sawn into holes containing the IAA hormone in the rooting media and were replicated by three. Random allocation of plant seedlings to the rooting media using random digit from a table was employed as to eliminate bias (Johnson and Bhattacharyya 2006).

2.1 Rooting media

The rooting media was homogenized by hand, mixed with equal volume of organic manure and air dried on an impervious polythene sheet for 24 hours, there were pasteurized and fumigated, measured into the PVC pots with the hole containing about 0.7% of IAA hormone. This concentration was chosen because of its optimum performance from other unpublished trials.

2.2 Propagation of the seedlings

The 10.0 cm Plantlets with lateral buds were about 360 collected at tale end of the afternoon when the weather was moist and were kept in a bow containing water (Agbo and Obi 2007). The bases were made squared using sharp sickle to spread the rooting. For each of the cuttings, about half of it was dipped into the IAA hormone that has been made into hole in each of the pots as to soak the powder. Excess of it was shaken off the base of the cuttings and the hormone was manually made to concentrate at the base. The plantlets were then inserted into the soil to about 6 cm, watered and maintained to about 70% humidity (Tanhan *et al.* 2007). Fungicides were sprayed onto the plants to control infections (Yeboah and Amoah 2009). The set up was allowed to grow for six weeks while monitoring in between days to remove any invading weeds. Data on shoot development was taken at interval of weeks and root length was measured on the day of harvest after weeks.

2.3 Data collection

Data collection which commenced on the first week after propagation continued till the sixth week and the parameters measured were survived seedlings, length of shootings/buds, and the root length, number, and weight of the plant on the day of harvest.

2.4 Data analysis

The data collected was analysed using Microsoft excel to obtain the mean number and percentage of plants that were able to form developed root and sprouted shoots from the series of transplanted seedlings. The data was then imported into SPSS version 13.0 and was analysed using analysis of variance (ANOVA) and standard deviation for the length of shoot and roots. The significance effects were determined at 5% level of significance.

3.0 Results

N. tabacum seedlings treated with concentration of 0.7% (w/w) IAA hormone propagated in different growth media recorded the highest mean number of the seedlings that developed roots and sprouted shoots in the set up with equal mixtures of the 4 growth media with organic manure. While the stem seedlings propagated in the perlite and control recorded the least mean rooted (2 each) and sprouted shoots (4 and 3) as recorded in Table 3.1. Amazingly, perlite and vermiculate maintained almost equal numbers of shoot developed (4 and 3 respectively) like in the root (2 each). However, significant difference existed among the different media with reference to their mean rate of development and formation of root and shoot. The efficacy of IAA hormone to the development of root and shoots was noticed by the difference between the treated samples and the controls without the hormone. There was significance difference between the two samples.

Number and length of roots developed among different rooting medium and the concentration of hormone were not significant (Table 1.0) but shoot lengths and number per sprouted stem was significant. Increase in shoot length occurred in this order: mixture>vermiculate>perlite>planting soil>sand>control while increase in root length were in the order: mixture>vermiculate>perlite>planting soil>sand>control. But it made a turnaround in the number that rooted and shooted within the rooting media, i.e., sand and planting soil had the same mean number of roots (4) and a little difference in Shoots (6 and 12). The control media maintained equal numbers. In fresh weight of the plants (apical and basal), there were higher weight measurement in the basal sections than the apical ones, though not significant. Equally, set up containing the mixture of the rooting media still maintained the highest weight followed by sand, perlite, planting soil, vermiculate and the control. The same sequence was

also followed in their dry weights. In sand however, there were greater number of root numbers while in other rooting media had the same number of roots. Shoot and root length of mixture of rooting media and vermiculate were synonymous with each other and were almost significant with the rest of the medium. Root lengths were 34 and 33mm for mixture and vermiculate respectively, 39 and 37mm in sand and planting soil. The shoot length was 41mm in both sand and vermiculate, while 43mm all in planting soil and mixture respectively. The set up containing equal mixtures of all media had 100% germination rate compared to 70, 60 50 and 40% for sand; planting soil/vermiculate; perlite and control respectively. However, the rest of the media demonstrated improved significant effects in all the parameters measures compared to the control.

Discussion

The rooting medium supplement that has mixtures of planting soil, perlite, sand and vermiculate at equal proportion enabled highest development of root and shoot in a cutting of *N. tabacum*. This improved effect could be attributed to the fact that the combined nutrient supplement of the entire rooting media acted optimally with the IAA hormone concentration added which created the enabling soil condition for example, optimum aeration and moisture level (Kalyoncu and Ozer 2000; Akwatulira *et al.* 2011). Meanwhile dose application of IAA hormone was shown to be an aid to improved moisture content in the soil for an optimal rooting and shooting development of cuttings (Milleton *et al*. 1980; Leakey *et al*., 1982; Aminah et al. 2006; Akwatulira *et al.* 2011; Raymond Anyasi and Anyasi 2020). However, most of these past studies maintained their IBA hormone concentration to about 0.7-0.8% of the rooting media used while this study based its IAA measurement on the weight of the cuttings. Morever, the control sample of rooting medium supported low development of root and shoot than the auxin treated samples in the entire experiment. This could perhaps be becouse soil resistant to root penetration is dependent on amongst other factors on water content, structure and strength of soil as well as bulk densities though these were not measured in the rooting media (Amri *et al*. 2009). Soils do not posses the required aeration porosity for optimal gas exchange required for rooting of the cuttings resulting in poor rooting in the control. Poor rooting numbers in control could also be attributed to the feel of anoxia which is an effect of low oxygen in the soil (Hartmann *et al*. 2002). Low incidence of rooting was found in the control samples. Non-theless, there are instances where optimum concentration of IAA in the soil has resulted in the failure of the development of roots by stem cuttings as was reported by Griffin and Shroeder (2004). That was an indication of the sensitivity of root formations to hormone formulations (Akwatulira *et al.* 2011; Anyasi 2023). It has also been reported that rooting hormone to a certain instance could be inhibitory to the development of roots in the cutting especially during the initiation stage (Akwatulira *et al*. 2011). This then means that different rooting media accommodates different concentration of auxin for optimal growth of plants.

Conclusions

Mixture of various rooting media in the right proportion with 0.7% of IAA hormone has been proven to be effective in the root and shoot development of cuttings of tobacco irrespective of the position of the cuttings. Although the individual medium did not have high incidences in most of the parameters measured, but there were able to support root and shoot development as well. Therefore, there is need for a study of IAA concentration effects on the media as to be able to determine if concentration was not the factor responsible for the low root and shoot development. This will promote mass production of *N. tabacum* especially in areas that the plants do not occur naturally.

ABSTRACT

Laser beam cutting (LBC) or in other words laser cutting, which is widely used in metal sheet forming and material processing fields today, is increasing gaining popularity due to the advantages of its offers in terms of precision, speed and efficiency. In LBC, various cutting techniques are used depending on material properties, employing different types of lasers such as carbon dioxide (CO_2), neodymium doped yttrium aluminium garnet (NdYAG) and fiber lasers. The LBC is not limited to cutting operations only, but also has many different application areas such as marking, engraving, hole drilling and welding. Among LBC machine structures, flying optics and moving table systems are widely preferred, as they directly influence cutting performance and quality. While the high precision and flexibility it provides make the LBC method attractive for many industrial applications, factors such as the high investment cost of LBC machines and post-cutting thermal effects on workpieces also pose disadvantages for the LBC. In this study, the fundamental principles, application areas, machine structures and machining parameters of the LBC method are comprehensively explained based on scientific studies in the literature. The effects of machining parameters such as laser power, cutting speed, focus position, pulse frequency, nozzle tip distance, assist gas type and pressure on cutting qualities such as kerf width, kerf taper, dimension tolerances and surface roughness are explained in detail. In addition, the general structure and machining parameters of LBC technology were evaluated from a holistic perspective and its contributions to the manufacturing industry were discussed.

Keywords: Laser beam cutting, CO_2 laser, NdYAG laser, fiber laser, laser power, cutting speed.

1. Introduction

The LBC method is widely used in many sectors such as automotive, medical treatment, scientific research, aerospace and electronics, especially in the defense industry, thanks to its high precision, accuracy, non-contact cutting and fast production advantages (Tamilarasan & Rajamani, 2025; Zhang et al., 2024). Especially in the production of parts with complex geometries, the processing flexibility and minimum material loss offered by LBC have made LBC an indispensable manufacturing method among today's sheet metal forming methods. (Tamilarasan & Rajamani, 2025). LBC is not limited to cutting, but also includes other applications such as marking, engraving, drilling and welding. In terms of machining physics, LBC is a thermal process. First, the laser beam is generated using various laser beam generation sources such as carbon dioxide (CO_2), NdYAG or fiber lasers. The resulting laser beam is focused on the material to be cut and melting or vaporization occurs where it hits. This is how the cutting process takes place. Using different types of laser beams, it is possible to process a wide variety of surfaces such as metal, plastic, ceramic, wood and composite materials (Köle, Ayan, & Kahraman, 2024). Although research on laser material processing has been conducted since the mid-20th century, the first working laser system was developed by Theodore Maiman in 1960. Maiman used a ruby crystal to power this first laser, laying the foundation for modern laser technology and paving the way for today's advanced laser systems. (Ryan, Spetzler, & Preul, 2009).

In the literature, there are many experimental studies investigating the effects of the processing parameters of the LBC method on the output performance. For example; Yilbas et al (Yilbas et al., 2010) performed LBC process by reinforcing AA7050 aluminium alloy with 20% Al_2O_3 and B_4C. They prepared the composite materials produced by powder metallurgy method as 3 mm thick sheets. They performed the cutting processes using a CO_2 laser and used nitrogen as an auxiliary gas. In LBC, they determined the laser power in the range of 2500-3500 W, pulse frequency in the range of 500-1500 Hz, nozzle aperture of 1 mm and gas pressure of 450 kPa. They evaluated the cutting quality outputs such as kerf width, planarity, waviness and microstructure properties through scanning electron microscopy (SEM) and energy dispersive x-ray spectroscopy (EDS). From the result of their experimental studies, they obtained wider and irregular cutting surfaces in Al_2O_3 reinforced composites, while they obtained smoother surfaces and constant kerf widths in B_4C reinforced composites. They attributed this to the high thermal conductivity and structural stability of B_4C. They also observed that the kerf width increased significantly with increasing laser power and the cutting quality deteriorated. Patel et al (Patel & Sanghavi, 2014) investigated the effects of processing parameters on cutting quality in cutting processes on AISI304 stainless steel using a CO_2 laser cutting machine (Mazak Hyper Gear 510). In their experimental studies, they evaluated three basic cutting parameters, namely laser power (1300-1500-1700 W), auxiliary gas pressure (2000-2100-2200 bar) and feed rate (0.5-0.6-0.7 mm/s) with Taguchi L27 experimental design. They performed 27 experiments in total by applying each parameter at three different levels. They evaluated the output performance by determining the upper-lower kerf width, kerf taper angle (taper) and the average surface roughness (Ra) values obtained after cutting. From the experimental results analysed by the analysis of variables (ANOVA) method, they determined that the parameter that most affected the surface roughness was laser power with a contribution rate of 55.89%. They determined the effect of gas pressure as 12.27%, while the contribution of feed rate (0.06%) was found to be very low. They concluded that in order to obtain optimum surface quality in laser cutting processes, especially the laser power parameter should be carefully selected.

Lee et al (Lee & Choi, 2020) investigated the effects of different processing parameters (laser power, cutting speed and oxygen gas pressure) on the cutting quality of 22MnB5 boron steel sheets in CO_2 LBC technology. Laser power: 150-225-300 W and cutting speeds: 150-200-250 cm/min. Using oxygen as an auxiliary gas, they set the pressure levels as 2 bar, 3 bar and 4 bar. According to the results of their experimental studies, they observed that the increase in laser power improved the cut edge quality. On the other hand, they discovered that higher laser power produces a wider heat affected zone (HAZ). As the cutting speed increased, they observed a decrease in the width of the HAZ, which positively affected the cutting quality. They also observed that increasing the oxygen gas pressure has an improving effect on surface roughness. The best machining parameters: 173 W laser power, 204 cm/min cutting speed and 4 bar oxygen pressure. They obtained a steepness tolerance of 18.7 µm, a surface roughness of Ra = 20.8 µm, an upper cutting width of 179 µm and a HAZ width of 69.2 µm.

Yadava et al (Yadava & Kumar, 2013) investigated the machinability of aluminium metal matrix composite (MMC) materials, known for their challenging machinability properties, in the LBC method. In particular, they determined the optimal processing parameters for CO_2 laser cutting of SiC reinforced Al composites. From the results of their experiments, they observed that the workpiece removable rate (WRR) increased with increasing laser power and cutting speed, but the kerf width and surface roughness value also increased. They also found that the HAZ width and edge quality were negatively affected as the SiC reinforcement ratio in the Al composite content increased. They explained that this is due to the high thermal conductivity and reflectivity of the SiC particles, which makes effective absorption of laser energy difficult. They determined the best processing parameters as: moderate laser power (750 W), moderate cutting speed (10 mm/s) and low SiC reinforcement ratio (10%). They also reported that careful selection of the processing parameters has a decisive influence on the cutting quality and the reinforcement ratio directly affects the machinability in the LBC process of MMC materials.

Rao et al (Rao et al., 2005) investigated the cutting of titanium sheets in an inert gas environment with a CO_2 laser operating in pulsed mode using different processing parameters. In their experimental studies, they used commercial purity titanium sheets with a wall thickness of 1 mm and cut them with a maximum laser power of 400 W. During the cutting processes, they varied the laser power (200-400 W), pulse frequency (10-50 Hz), cutting speed (50-150 mm/min), gas pressure (0.5-1.5 MPa) and determined the effects of argon (Ar) and nitrogen (N_2) gases on cutting. They used L9 orthogonal array based on Taguchi method and determined 9 different experimental conditions. With other processing parameters constant, they found that the cutting width was approximately 2.8 mm, the surface roughness Ra = 3.0 µm and the HAZ width was 0.5 mm with 400 W laser power. With 200 W laser power, they determined the cutting width as 1.5 mm, surface roughness Ra = 1.8 µm and HAZ width as 0.3 mm. When they used a low pulse frequency (10 Hz), they stated that the cutting surface improved (Ra = 1.5 µm) and the HAZ width narrowed. When they used a high pulse frequency (50 Hz), they found that the surface roughness increased (Ra = 3.2 µm). They determined the kerf width as 1.2 mm at low cutting speed (50 mm/minute) and 2.5 mm at high cutting speed (150 mm/minute). At 1.5 MPa gas pressure, they measured the slag height as 0.3 mm. When they used low gas pressure (0.5 MPa), they measured the slag at lower levels (about 0.2 mm) and stated that the cutting surface was smoother. They measured the slag height as 0.2 mm, HAZ width as 0.4 mm and surface roughness as Ra = 1.5 µm using argon gas. In their experiments with nitrogen gas, they determined the slag height as 0.3 mm, HAZ width as 0.6 mm and surface roughness as Ra = 2.5 µm. They obtained the best cutting quality by using low pulse frequency (10 Hz), low cutting speed (50 mm/min) and argon gas. Using this combination, they were able to minimize

the cutting surface roughness Ra = 1.5 µm, the cutting width 1.5 mm and the slag height 0.2 mm.

Buj-Corral et al (Buj-Corral, Costa-Herrero, & Domínguez-Fernández, 2021) investigated in detail the effects of pulse frequency, pulse width and cutting speed on surface quality in NdYAG laser cutting of 0.8 mm thick AISI304 stainless steel plates. They evaluated a total of 8 experimental conditions with 2^3 full factorial experimental design. They determined the surface roughness, dimensional error rates (Ra) and burr thicknesses in the experiments and determined the effective parameters on these outputs by regression analysis. They found that the surface roughness was most affected by the pulse frequency (adj. R^2 = 78.32%), followed by the pulse width. They observed that the lowest Ra value (1.89 µm) occurred at the combination of low frequency (50 Hz) and low pulse width (0.4 ms). They stated that the most effective parameter in terms of dimensional error was pulse width (adj. R^2 = 84.47%). The lowest dimensional error rate (0.22%) was obtained at high pulse width (0.6 ms) and high cutting speed (140 mm/min). They found that the burr thickness was most affected by the pulse frequency (adj. R^2 = 88.35%). From the multi-objective optimization analyses, they stated that the most suitable machining parameters they recommended to improve the quality criteria simultaneously were high frequency (80 Hz), high pulse width (0.6 ms) and high cutting speed (140 mm/min). Riveiro et al (Riveiro et al., 2017) investigated the effects of different gas supply systems and auxiliary gases (argon, nitrogen, oxygen, air) on cutting performance and surface chemistry in CO_2 laser cutting of Al-2024-T3 aluminium-copper alloy. They cut 3 mm thick sheets with a 3.5 kW CO_2 laser operating in TEM_{00} mode. They characterized the cut surfaces by optical microscopy, SEM, X-ray diffraction (XRD) and X-ray photoelectron spectroscopy (XPS) analysis. They found that the supersonic gas supply system achieved higher cutting speeds (e.g. ~10,000 mm/min at 3000 W laser power) and better surface roughness (Ra = 1.8 µm) than the subsonic system. With argon gas, they obtained the highest cutting speeds (10,000 mm/min) and the lowest roughness value (Ra = 3.7 µm). In terms of kerf width, they made the narrowest cut (0.27 mm) with Argon. The widest cut (0.40 mm) was made with oxygen. From XPS analysis, they discovered that oxide and nitride formations were minimized by using Argon.

Madić et al (Madić et al., 2020) developed a multi-criteria optimization model aiming to increase the IHV during CO_2 laser cutting of 2 mm thick mild steel (S235JRG2) material. In their study, they created empirical models including criteria such as burr formation, kerf width, steepness tolerance, gas pressure, surface roughness and cutting energy. They performed the optimization process with an exhaustive iterative search algorithm. They determined the optimal machining parameters as: v = 5.89 m/min, P = 1.18 kW and p = 3.01 bar. With these parameters, they obtained an HRV value of 2944 mm^3/min. Hajdarevic et al (Begic-Hajdarevic & Bijelonja, 2022) investigated the CO_2 laser machinability of an alloy containing 93% tungsten, which is difficult to be laser machined due to its high melting temperature (3100 °C) and high density (17,600 kg/m^3), by experimental and numerical methods. In their experimental studies, they used 974 W real laser power with 6 bar nitrogen as an auxiliary gas, the focal radius was 0.105 mm and the drilling time was 8×10^{-3} s. They defined the properties of the material such as latent heat (250 kJ/kg), absorption coefficient (0.86) and heat transfer coefficient (25 W/m^2-K) in their model. From the experimental results, they found that the hole entrance diameter was 60% larger than the exit diameter in 1 mm thick specimens, while this ratio was 32% for 0.5 mm plate. Using microstructure analysis, they reported that the binder phase evaporated and filled the grain boundaries and microcracks formed in some areas. They stated that the HAZ dimensions and hole geometries obtained from numerical modeling showed high agreement with the experimental results.

M.A. Elbah et al (Elbah et al., 2015) experimentally and statistically investigated the CO_2 laser cutting process of 3 mm thick polycarbonate (PC) sheets. They used Response Surface Methodology (RSM) for process optimization and applied Central Composite Design (CCD) as experimental design. They used a CO_2 laser system in continuous wave (CW) mode with a wavelength of 10.6 μm and a 127 mm focal length lens to perform cutting operations on the top surface of the workpiece. In their experimental studies, they used different combinations of laser power (160-200 W), cutting speed (300-500 mm/min) and focal position (-2, 0, +2 mm). They determined the kerf width, Ra value and HAZ area by using optical microscope and surface profilometer measurement devices. They evaluated the suitability of their model and the effects of machining parameters by subjecting their result data to ANOVA analysis. They found that increasing the laser power increased the kerf width and HAZ area but had little effect on the surface roughness. On the other hand, increasing the cutting speed decreased the kerf width and HAZ area, but caused a significant increase in surface roughness. In terms of focus position, the best results were obtained when focusing on the surface of the workpiece (f = 0 mm). They also observed that the interaction of laser power and cutting speed has significant effects on kerf width. As a result of their optimization, they obtained minimum kerf width (~0.48 mm), minimum surface roughness (Ra =2.3 μm) and minimum HAZ width (~0.88 mm^2) values under conditions where the laser power was 180 W, the cutting speed was 400 mm/min and the focus position was 0 mm. They concluded that careful selection of processing parameters in CO_2 laser cutting of polycarbonate materials can improve both cutting efficiency and quality.

Ghany et al (Abdel Ghany & Newishy, 2005) comparatively investigated the use of pulsed and continuous wave (CW) NdYAG lasers in the LBC method in terms of cutting performance of 1.2 mm thick austenitic stainless steel plates. They used nitrogen (N_2) as an auxiliary gas in their studies. In their experiments in pulsed mode, they adjusted the average laser power in the range of 300-500 W, pulse duration between 0.5-1.2 ms and frequency between 150-500 Hz. In CW mode, they selected the laser power in the range of 500-1200 W. They varied the cutting speed between 0.5-3.0 mm/s for both modes. They tested the focal spot position between -2 mm and +2 mm to obtain the best cutting conditions. They found that the cutting of 1.2 mm thick stainless steel using the pulsed mode was only possible at an average laser power of 500 W and a frequency of 500 Hz, at lower values the material could not be cut completely. They obtained the best cutting quality in pulsed mode at a focal position of -1 mm and a cutting speed of 1.5 mm/s. They observed burr-free and smooth cutting surfaces under these conditions. In CW mode, they were able to obtain faster and continuous cuts in the 900-1100 W laser power range and 2.0-2.5 mm/s cutting speed range. However, they observed a wider HAZ around the cutting edges when cutting in CW mode. They explained that HAZ widths increased in CW mode because more energy is transferred by thermal diffusion due to continuous energy input to the workpieces. They stated that shifting the focal plane up or down relative to the material surface directly affects both cutting quality and burr formation. In CW mode, they found that when the focal point is 1 mm below the surface (-1 mm), the cutting surface is smoother and burr formation is minimized. They stated that pulsed laser is suitable for more precise and burr-free cutting, but the process time is long and energy consumption is high. In contrast, they found that the CW mode, although it allows machining at higher cutting speeds, has some disadvantages in terms of surface quality. They concluded that the correct choice of LBC processing parameters and operating mode plays a critical role in laser processing of highly reflective and thermally conductive materials such as austenitic stainless steel.

Riveiro et al (Riveiro et al., 2008) investigated the technical challenges in CO_2 laser cutting of AA2024-T3 aluminium alloy, which is widely used in the aerospace industry, and a novel

approach to overcome these challenges. In their study, they pointed out the material's properties, such as high laser reflectivity and high thermal conductivity, which make laser processing difficult. To overcome these challenges, they designed a new laser cutting head with an auxiliary gas jet operating in the supersonic regime and compared its performance with a conventional coaxial cutting head. From their findings, they found that the cuts they made using the supersonic cutting head had smoother surfaces free of burrs and cracks. While they obtained significant burr formation and higher surface roughness (Ra > 6.00 μm) with conventional machining, they observed that this value decreased to 2.70 μm with the supersonic head. They also found that the HAZ width was significantly reduced with the supersonic cutting head.

In this study, a comprehensive literature review on the LBC method has been conducted and the technical foundations of the method, the types of lasers used, machine structures, machining parameters and application areas have been explained in detail. In addition, information on the advantages-disadvantages and limitations of LBC is also given.

2. Laser Beam Cutting (LBC) Method

LBC is a non-contact and precise manufacturing method in which a beam of light with intense energy is focused on the material and heat-induced cutting is performed (Powell & Kaplan, 2004). In the LBC method, a high intensity laser beam is obtained through a power source (Figure 1).

Figure 1. The processing moment of the LBC method (Unclazer.com, n.d.)

As shown in Figure 2, a control unit on the LBC machine allows the cutter head of the LBC machine to move. With this movement, the laser beam comes to the area to be cut and high temperatures are obtained on the cutting surface by focusing the laser beam by the cutter head, whose schematic cross-sectional view is shown in Figure 3. In this way, melting and vaporization is achieved on the material surface. An auxiliary gas used during cutting removes the molten and vaporized materials in the cutting area. Thus, the cutting process is realized on the material.

Figure 2. Control unit on the LBC bench (Hsglaser.com, n.d.)

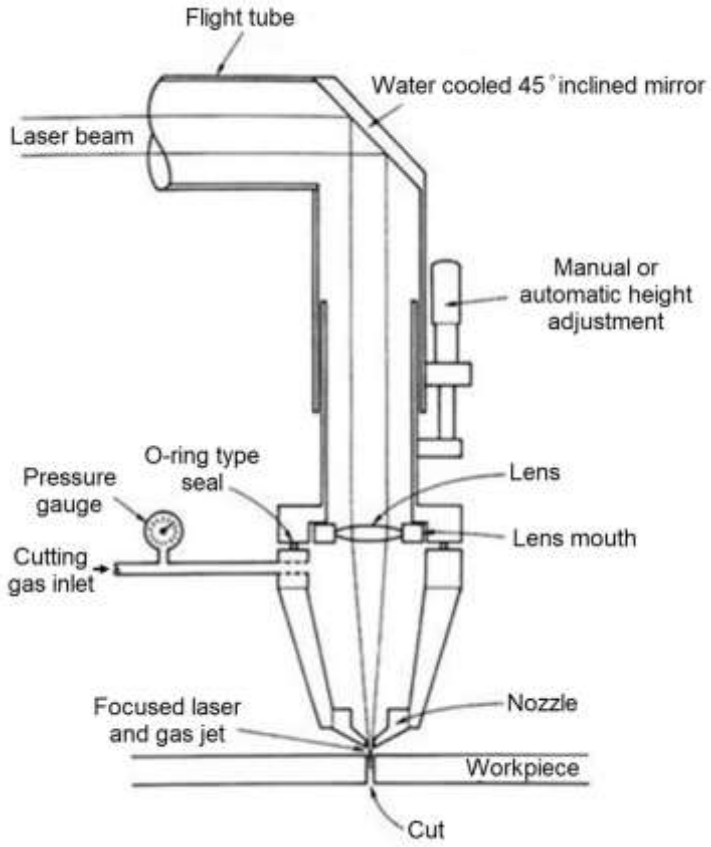

Figure 3. The schematic section view of the cutter head of LBC machine (Powell & Kaplan, 2004)

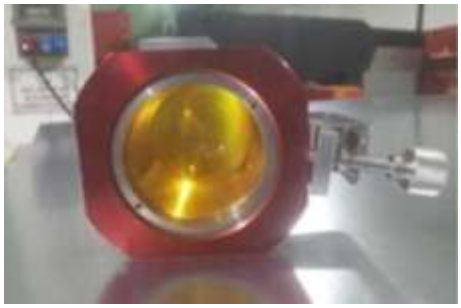

Figure 4. Laser lens (Tunç, 2015)

Figure 5. Nozzle example on LBC machine heads (Tunç, 2015)

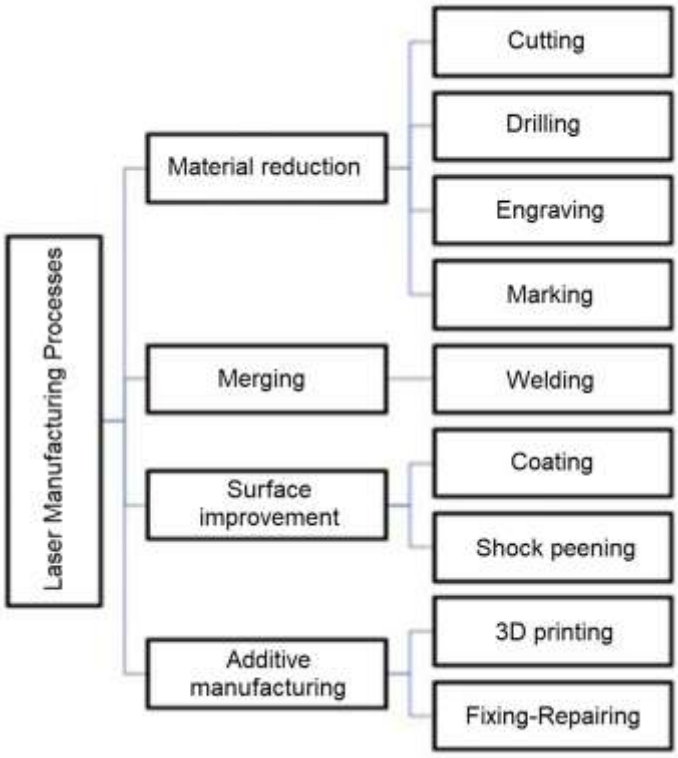

Figure 6. Manufacturing processes using laser beam (Köle, Ayan, & Kahraman, 2024)

While LBC is being made, there is loss of material along the cutting line due to melting and vaporization of the material and a cutting gap (kerf) is formed as seen in Figure 7.

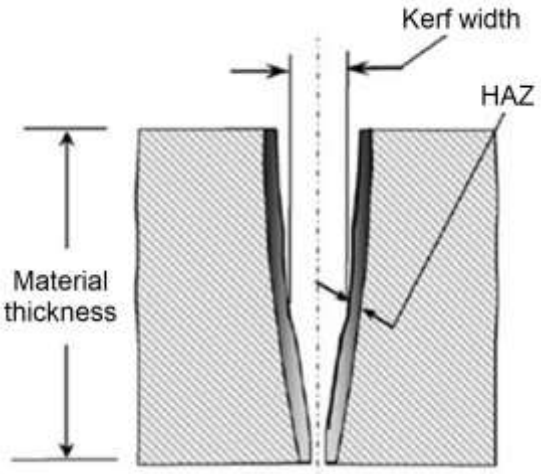

Figure 7. Kerf formed on the material as a result of the LBC process (Stournaras et al., 2009)

2.1. LBC method types

2.1.1. CO_2 laser cutting

CO_2 lasers (10.6 m wavelength) have approximately 30% higher efficiency, higher beam quality (close to optimum Gaussian mode (Bass, 1983)), greater focal depth, smaller beam diameter. Using a 2000W continuous laser beam, 16 mm mild steel and 12 mm stainless steel can be cut (Ghany & Newishy, 2005).

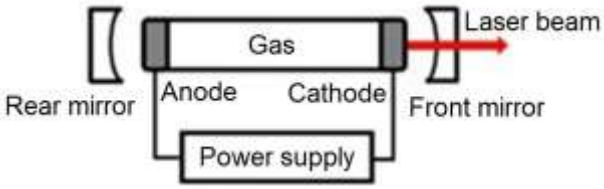

Figure 1. The structure of CO_2 laser system (Muangpool & Pullteap, 2018)

2.1.2. NdYAG laser cutting

This type of laser is widely used in various fields such as medicine, surgery, ophthalmology, and dentistry (Muangpool & Pullteap, 2018). It has a wavelength of 1.06 μm. It can be focused on small spots and allows for precise work. It has very low reflectivity on metals and possesses the ability to pass through glass (Powell & Kaplan, 2004).

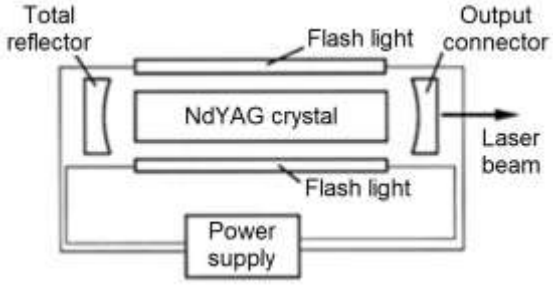

Figure 2. The structure of NdYAG laser system (Muangpool & Pullteap, 2018)

2.1.3. Fiber laser cutting

They produce a beam with a wavelength of 1.06 m. They provide quality results for materials thinner than 3 mm. They cut quickly and their edge quality is quite good. (Powell & Kaplan, 2012).

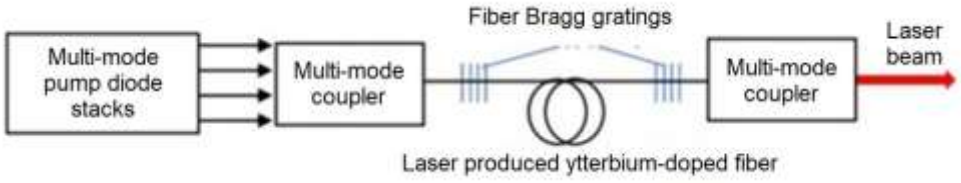

Figure 3. The structure of fiber laser system (Muangpool & Pullteap, 2018)

2.2. The structures of LBC benches

The structures of LBC machines vary among themselves. These machine structures also affect factors such as cutting quality, performance, and efficiency. Machines are classified based on the movement of the cutting laser head and/or the worktable. One of the most commonly used structural types is known as the flying optics system. In this system, the laser beam is generated from a fixed source, while the cutting head moves along the X and Y axes to perform the cutting process (Figure 11). Since the workpiece remains stationary, working with large-sized sheets becomes easier, and high cutting speeds can be achieved (Çelik et al., 2013).

Figure 4. LBC benches from Bystronic (Çelik et al., 2013)

In addition, in moving table systems, the laser source and the cutting head remain stationary, while the material to be cut is moved on the table. Since the optical path remains constant, the focal point of the laser beam is maintained, ensuring high precision especially in the cutting of small-sized parts (Ghany & Newishy, 2005).

2.3. The machining parameters of LBC method

The laser cutting process requires careful determination of numerous machining parameters depending on the material type, thickness, cutting type, and desired quality. These parameters directly affect cutting precision, surface quality and production efficiency (Steen & Mazumder, 2010; Yılmaz & Kaya, 2021). The key machining parameters commonly controlled in the laser cutting process are explained under subheadings.

2.3.1. Laser power

Laser power refers to the amount of energy transferred from the laser source to the material. There are two types of power: continuous wave (CW) and pulsed wave (PW). The average power density is calculated using the formula P/A beam, where P is the power and A is the laser beam area (Assuncao & Williams, 2013). High power levels enable the cutting of thick materials, while low-power systems are used in precision cutting applications (Powell, 1998). However, excessive power usage can lead to edge melting, burrs or discoloration, expansion of HAZ and an increase in kerf width (Çelik et al., 2013; Kumar & Yadav, 2015). Factors determining laser power include the type of laser source (CO_2 or fiber lasers), beam focusing quality, the thermal properties of the material, cutting speed and the use of assist gases (Suresh & Venkatesan, 2020).

2.3.2. Cutting speed

Cutting speed (mm/s or m/min) refers to the rate at which the laser head moves across the material. At very low speeds, heat buildup can cause burning or burr formation, while at excessively high speeds, complete cutting may not be achieved. The speed should be determined in a balanced manner along with material thickness and laser power (Yilbas, 2017).

2.3.3. Focus position

The focus position refers to the location of the laser beam's most concentrated point relative to the material surface. Typically, the focus is positioned on or just slightly below the surface of the material. Proper focusing enables the beam to narrow, resulting in cleaner and more precise cuts (Yılmaz & Kaya, 2021).

2.3.4. Assist gas type and pressure

The assist gas (O_2, N_2 or air) facilitates the removal of molten material from the cutting area and directly affects the cutting quality. Oxygen supports cutting through oxidation in materials like carbon steel, thereby increasing processing speed; whereas when cutting with nitrogen, no oxidation occurs at the cutting edge, resulting in a cleaner surface. The gas pressure determines the effectiveness of this cleaning and cooling effect (Ghany & Newishy, 2005).

2.3.5. Pulse frequency and pulse duration

In pulsed laser systems, pulse frequency (Hz) and pulse duration (μs) refer to the duration and repetition rate of the applied energy pulses. These parameters determine the edge quality and surface roughness, especially in fine cutting or micromachining (Powell, 1998; Steen & Mazumder, 2010). Higher pulse frequencies provide a smoother and more continuous cutting profile. However, very high frequencies can lead to material overheating and edge quality degradation (Rao et al., 2005). Pulse duration, on the other hand, determines how long each laser pulse is applied. Short pulse durations give better results, especially for thin materials and applications requiring micron-level precision, while longer pulse durations are preferred for deeper cuts (Buj-Corral, Costa-Herrero, & Domínguez-Fernández, 2021).

2.3.6. The distance between nozzle and workpiece (NTD)

The distance between the nozzle and the material surface is important for the effect of the assist gas and the focusing of the laser beam. The NTD is usually set between 0.5-2 mm. Too close distance may cause burrs. At too far distance, energy is dissipated and cutting depth may decrease (Krar & Gill, 2003). A shorter nozzle-to-workpiece distance allows the assist gas to reach the material surface more directly. This contributes to more effective cooling and less burr formation (Rao et al., 2005).

2.4. The Advantages and Disadvantages of LBC Method

2.4.1. Advantages

- LBC offers significant advantages over conventional machining methods due to its ability to process at high speed, operational precision, absence of tool wear and vibration, high accuracy and low processing cost (Steen & Mazumder, 2010; Yilbas, 2017).
- Fast machining time and good finished product quality can be achieved.
- Materials such as metals, plastics and ceramics of different types and thicknesses can be cut seamlessly with the laser. This provides flexibility, especially in multi-material production processes.
- Since LBC is a non-contact method, there is no need for special fixtures, apparatus or mechanical support systems according to the shape of the workpiece (Ghany & Newishy, 2005).

2.4.2. Disadvantages

- Due to the high heat generated during LBC, stress zones may form around the cutting edges.
- They cannot make blind hole formation.
- Investment and maintenance costs are high.
- Especially older generation laser systems, such as CO_2 lasers, can consume a lot of energy during operation. This can increase operating costs in the long run (Yilbas, 2017).

3. The Application Areas of LBC

3.1 Automotive and aerospace industry applications

LBC is widely used in the automotive (Figure 12) and aerospace industries to produce parts that require high precision and quality (Kumar & Singh, 2023). This technology offers advantages in the production of parts with complex geometries and in the processing of lightweight materials (Bogue, 2015; Rao & Kumar, 2023).

Figure 12. The LBC application in automotive industry (HGLASER, 2023)

3.2 Electronic applications

In the production of printed circuit boards (PCBs), LBC is highly preferred for high-precision drilling and cutting (Wang & Zheng, 2009). This method plays an important role in the production of small-scale components (Figure 13).

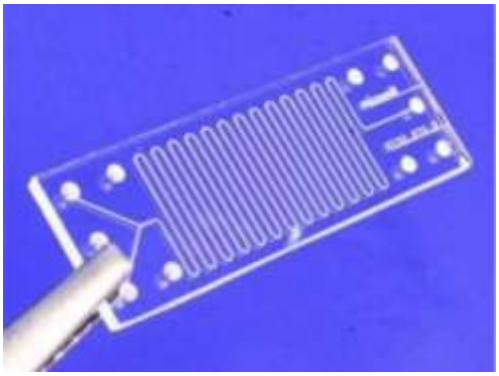

Figure 13. The PCB machined with LBC (Bogue, 2015)

3.3 Medical technologies applications

In the production of medical devices such as surgical instruments, stents and implants, LBC enables precision machining of biocompatible materials (Figure 14). CO_2 lasers are particularly preferred for cutting polymeric materials (Caiazzo et al., 2005).

Figure 14. The examples of LBC in medical areas (DeCesar & Boyle, 2022)

3.4 Prototyping applications

In rapid prototyping processes, LBC helps designers and engineers to quickly transform their ideas into physical models (Happonen, Stepanov, & Piili, 2015). This speed ups the product development process. Figure 15 shows a prototype product cut with LBC.

Figure 15. The prototyping example of LBC (Baison, 2024)

3.5 Biomaterials and tissue engineering applications

LBC technology is used in tissue engineering applications, for example in the production of three-dimensional scaffolds using polycaprolactone/hydroxyapatite composite polymer (Figure 16) (Kumar & Singh, 2023; Lasers in Materials Processing, 2019).

Figure 16. The machining moment of biomaterials with LBC (ESN Metal, n.d.)

3.6 Manufacturing industry applications

LBC offers tight tolerance, clean cuts in metal, plastic and composite sheets (Figure 17) thanks to the surface interaction of CO_2 and fiber laser welding (Atwee, Wibolo, & Wiryanta, 2023). Compared to traditional CNC methods, laser technology increases production efficiency by reducing edge roughness (Gökce et al., 2023).

Figure 17. The application of LBC in manufacturing industry (Yılmaz & Kaya, 2021)

3.7 Defense industry applications

LBC enables the efficient production of high-precision armor plates and parts with complex geometry in defense systems (Ahmed, Mohsin, & Ali, 2021). In addition, fiber and solid-state lasers are widely used in military training systems for target designation and distance measurement (Lazov, Teirumnieks, & Ghalot, 2021). LBC is one of the most frequently used manufacturing methods in defence industry projects. Cutting on CNC laser machines allows cutting of materials of different types, properties and thicknesses (Figure 18).

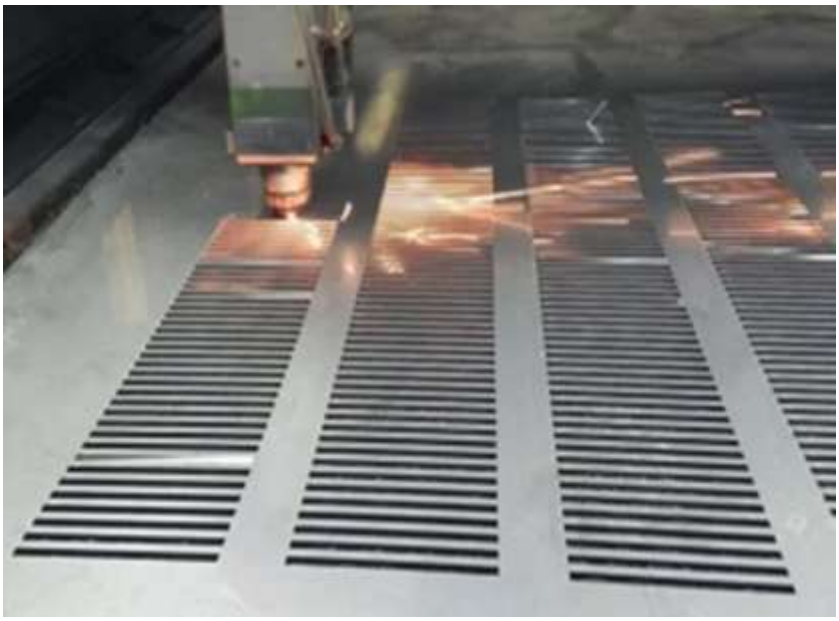

Figure 18. The sheet metal used in defense industry cutting with CNC LBC bench (Bersa Tech Makina, n.d.)

4. Conclusion

LBC is a method that works on the principle of localized melting and even vaporization by focusing high intensity beams with stimulated radiation emission on the surface of materials. In this study, detailed information about the types of LBC method, machining parameters (laser power, cutting speed, focus position, assist gas type, etc.), output performances (WRR, kerf width, kerf taper, surface roughness, HAZ width, etc.), machine structures, advantages-disadvantages and application areas are given. From the studies in the literature, important points about LBC are briefly summarized below:

- It was concluded that the kerf width increased significantly with increasing laser power and the cutting quality deteriorated.

- It is reported that as the cutting speed increases, the HAZ width decreases and, this has a positive effect on the cutting quality.

- It was reported that increasing the oxygen gas pressure has an improving effect on surface roughness.

- It has been reported that with the increase in laser power and cutting speed, the WRR increased, but the kerf width and surface roughness value also increased.

- When low pulse frequency is used in cutting processes, it is stated that the cutting surfaces are improved and the HAZ width is narrowed. When high pulse frequency is used, surface roughness is reported to increase.

- In the LBC method, it was reported that the type and pressure of the assist gas used affect the slag formation. It has been reported that using argon gas at low pressures keeps slag formation at lower levels and improves the cutting surface. It has also been reported that oxide and nitride formation can be minimized by using argon gas.

- The use of pulsed and continuous wave (CW) NdYAG lasers in the LBC method was found to be effective on cutting quality. It is stated that CW laser increases HAZ widths as more energy is transferred by thermal diffusion due to continuous energy input to the workpieces. The pulsed laser is reported to be suitable for more precise and burr-free cuts but, increases the processing time and energy consumption.

- In the LBC method, it was found that the laser beam focus position can be adjusted differently (below the surface, on the surface, above the surface). It was concluded that for most applications, the best cutting quality is achieved when focusing on the workpiece surface (f = 0).

ABSTRACT

This study was conducted in Erzurum, Türkiye, a region characterized by a continental climate, to evaluate the effects of various nutrient element applications on the growth of Narince and Karaerik grapevine cultivars of different ages (2 and 6 years) grown under greenhouse conditions. The aim was to explore the feasibility of grape cultivation under protected environments in high-altitude and cold-climate regions where open-field viticulture is restricted due to harsh climatic conditions. Following comprehensive soil analysis, nutrient solutions containing iron (Fe), zinc (Zn), nitrogen (N), amino acids, and selected trace elements were applied to the vines. The effects of these applications were assessed based on a range of vegetative and generative growth parameters, including number of shoots, shoot length, shoot diameter, number of leaves per shoot, leaf area, number of internodes, number of clusters, cluster width, cluster length, cluster weight, number of berries per cluster, berry width, berry length, and number of seeds per berry. Yield values were also recorded. The results revealed that the applied nutrient elements had statistically significant effects on plant development, depending on the grape variety and plant age. Notable differences were observed between Narince and Karaerik in terms of nutrient uptake and growth responses. These findings highlight the necessity of developing cultivar-specific fertilization strategies under greenhouse conditions.

Keywords: Grapevine, greenhouse, nutrient management, Narince, Karaerik

Introduction

Grapevine (*Vitis vinifera L.*), which has held a significant place throughout human history, maintains its commercial prominence both globally and in Türkiye due to its versatile uses. Beyond its consumption as fresh fruit, grapes are utilized for drying, winemaking (Çelik et al., 2012), molasses, grape juice, verjuice, and the preservation of vine leaves, all of which contribute to the high commercial value of viticulture (Soltekin et al., 2021). Grapes, which have existed for millions of years and include thousands of varieties and cultivars, are cultivated economically in many regions of Türkiye, a land that has witnessed the rise and fall of numerous civilizations throughout history. In Eastern Anatolia, the region with the highest elevation in the country, recent increases in dam constructions have led to a moderation of the local climate, creating limited yet suitable microclimatic zones for grape cultivation (Uyak et al., 2009; Sırlı et al., 2015).

Climate, which affects all living organisms, plays a critical role not only in the determination of areas suitable for plant production but also in influencing both yield and quality (Jones et al., 2004). As one of the most climate-sensitive crops, grapevines-especially when grown on their own roots-are known for their adaptability and resilience to adverse environmental conditions. However, climate remains one of the most decisive factors influencing the development and ripening of grapevines and therefore their economic viability in a given region (Çelik et al., 1998; Soltekin et al., 2021). Grapevines require approximately 1300 hours of annual sunshine to reach harvest maturity. Under the ongoing process of global climate change, some adverse changes are anticipated, especially in warmer regions. Nevertheless, these negative impacts on grapevine growth and development may be partially mitigated through appropriate cultural practices (Uyak et al., 2009; Küpe, 2012).

In some provinces of Eastern Anatolia, the lack of commercial viticulture is primarily due to prolonged winter temperatures that can damage grapevines. It is not the absolute low temperatures but the duration of exposure to these cold conditions that causes the most harm. For example, while sustained temperatures below -20°C can damage vines, in Erzincan, where minimum temperatures can drop to -32.5°C, the relatively short duration of cold periods has allowed grapevines to survive, enabling commercial viticulture to be practiced (Odabaş, 1980).

Erzurum, characterized by a harsh continental climate, has traditionally been considered unsuitable for grape cultivation. However, in recent years, protected cultivation systems—designed to create controlled environments independent of outdoor conditions—have emerged as a promising solution. These systems not only extend the growing season but also provide optimal conditions for plant development. Grapevine cultivation under cover enables precise fertilization, timely pest and disease control, and overall improved crop management. In cold-climate regions like Erzurum, protected cultivation offers significant advantages and holds great potential for the sustainable development of viticulture.

Thanks to their high adaptation capacities, the Karaerik and Narince grape cultivars are believed to be economically viable under protected cultivation in Erzurum's central conditions, provided that appropriate fertilization programs are applied.
This study aims to investigate the effects of different compositions and doses of plant nutrients on the vegetative and generative development, as well as the yield parameters, of 2- and 6-year-old Karaerik and Narince grapevines grown under protected conditions in Erzurum. Based on the results, specific plant nutrient recommendations for these grape cultivars under Erzurum's protected cultivation conditions will be provided.

Materials and Methods

Material

This study was conducted in 2024 under the ecological conditions of Erzurum city center, within a 300-square-meter unheated greenhouse located at the Plant Production Research and Application Center. The greenhouse was constructed with a steel frame structure, covered with transparent polycarbonate panels, and equipped with a drip irrigation system.

As plant material, two grape cultivars were utilized: 'Karaerik', a local variety traditionally grown in the Erzincan region, and 'Narince', a widely preferred cultivar in the Tokat province.

In March, two-year-old own-rooted saplings of both Narince and Karaerik cultivars were planted in the greenhouse. Additionally, six-year-old own-rooted vines of the same cultivars, already established within the same greenhouse, were included in the experimental design (Figure 1).

Figure 1. A view of the greenhouse and vines where the study was conducted

Method

In the greenhouse, a balanced organomineral basal fertilizer was first applied to the vines. This basal fertilizer contained 11% nitrogen (N), 11% phosphorus (P_2O_5), 11% potassium (K_2O), 11% sulfur (SO_3), 0.2% zinc (Zn), and 15% organic matter (composition: 11-11-11 + 11SO_3 + micronutrients).

Subsequently, at various phenological stages, additional fertilization treatments were applied, including micronutrient-enriched formulations containing boron (B), copper (Cu), iron (Fe), molybdenum (Mo), manganese (Mn), and zinc (Zn). Applications also included 6% EDDHA-chelated powdered iron, 8% liquid zinc sulfate, and 32% liquid nitrogen fertilizer (composed of 16% urea nitrogen, 8% ammonium nitrogen, and 8% nitrate nitrogen). Furthermore, an organic liquid fertilizer derived from plant-based materials was used, containing 45% organic matter, 3% organic nitrogen, 14% free amino acids, and 25% organic carbon.

All fertilizers were applied with irrigation water at a rate of 1 liter per vine for 2-year-old plants and 2 liters per vine for 6-year-old vines. Control plants received the same amount of plain water without any added fertilizers.

At the beginning of the study, soil samples were collected and analyzed for key physicochemical properties, including soil texture, pH, salinity, lime content, organic matter level, and concentrations of ten essential plant nutrients. Based on these soil characteristics, fertilization programs were developed accordingly.

Table 1. Greenhouse soil analysis results before fertilizer applications

Measurements	**Unit**	**Analysis Result**	**Evaluation**
Structure		41,8	Loamy
pH		7,92	Slightly Alkaline
Salinity	%	0,01	Without Salt
Chalkiness	%	6,98	Middle
Organic Matter	%	0,473	Very Little
Nitrogen	%	0,02	Very Poor
Phosphorus	kg/da	6,23	Middle
Potassium	kg/da	176,68	More
İron	ppm	1,69	Little
Zing	ppm	0,14	Very Little
Copper	ppm	0,43	Sufficient
Manganese	ppm	1,74	Sufficient
Calcium	ppm	6.938	More
Magnesium	ppm	552,8	More
Sodium	ppm	43,8	Sufficient

On May 3, 2024, a standard application of 0.5 kg of balanced organomineral basal fertilizer (11-11-11 + 11SO_3 + ME) was applied to all two-year-old Narince and Karaerik grapevines. Subsequently, a dose of 1 kg of the same basal fertilizer was uniformly applied to all six-year-old vines of both cultivars. The Narince and Karaerik vines used in the experiment were divided into four treatment groups, including a control, with each group consisting of two vines. This grouping was established separately for each cultivar and age class (Table 2 and 3).

Table 2. Treatment groups and fertilizer compositions for 2-year-old grapevines (per vine)

Group	Fertilizer Composition	Water Volume	Application Method
1	1.5 g micronutrients + 20 cc nitrogen	1 L	Fertigation
2	1 g Fe + 1 cc Zn + 20 cc nitrogen	1 L	Fertigation
3	1 g Fe + 1 cc Zn + 20 cc nitrogen + 20 cc amino acids	1 L	Fertigation
4	Control (only water)	1 L	Fertigation

Table 3. Treatment groups and fertilizer compositions for 6-year-old grapevines (per vine)

Group	Fertilizer Composition	Water Volume	Application Method
1	3 g micronutrients + 40 cc nitrogen	2 L	Fertigation
2	2 g Fe + 2 cc Zn + 40 cc nitrogen	2 L	Fertigation
3	2 g Fe + 2 cc Zn + 40 cc nitrogen + 40 cc amino acids	2 L	Fertigation
4	Control (only water)	2 L	Fertigation

Figure 2. Some images of fertilizer application

Morphological observations were initiated in May 2024 and continued throughout the vegetative growth period for all treatment groups on both Narince and Karaerik grapevines.

Yield measurements and pomological analyses were conducted specifically on the six-year-old Karaerik and Narince cultivars.

Findings and Discussion

Due to their perennial nature, fruit crops are more vulnerable to the impacts of climate change. Each fruit species has specific climatic requirements to achieve optimal vegetative and generative development (Luedeling et al., 2011). Sudden and abnormal fluctuations in air temperature can negatively affect the growth and development of fruit crops (Omoto et al., 1990; Legave et al., 2008). Among climatic factors, temperature plays a critical role-either directly or indirectly-at every stage of the vegetative and generative development of grapevines (Li et al., 2023). Kimura et al. (1984), demonstrated in their study on the Kyoho grape variety that using plastic covering systems can protect grapevines from adverse climatic conditions.

In this study conducted under unheated greenhouse conditions in Erzurum, the effects of different concentrations of nitrogen (N), iron (Fe), zinc (Zn), plant-based amino acids, and a mixed group of micronutrients on the Karaerik and Narince grape cultivars were investigated. The study evaluated vegetative development parameters at two distinct growth stages for both two- and six-year-old vines, while generative development parameters and yield data were assessed specifically for the six-year-old Karaerik and Narince cultivars.

As shown in **Table 4**, different fertilizer treatments had varying effects on the vegetative development parameters of the two-year-old Karaerik vines. While both the control and Group 2 (1 g Fe + 1 cc Zn + 20 cc N in 1 L water) were found to be more effective in terms of shoot number and shoot diameter, Group 1 (1.5 g micronutrient mix + 20 cc N in 1 L water) and Group 3 (1 g Fe + 1 cc Zn + 20 cc N + 20 cc plant-based amino acids in 1 L water) were more influential in promoting shoot length, number of leaves per shoot, and leaf blade size.

Table 4. Effects of different fertilizer applications on vegetative growth parameters of 2-year-old Karaerik grape variety

Aplications	Shoot Number (item)		Shoot Diameter (cm)		Number of Leaves in the Shoot (item)		Leaf Diameter (cm)		Shoot Lenght (cm)	
	1. period	2. period	1. period	2. period	1. period	2. period	1. period	2. period	1. period	2. period
Control	2	2,5	0,17	0,21	6,0	11,9	4,3	5,1	7,0	9,4
3. Application	1	1	0,325	0,51	23,5	57,5	9,1	10,4	26,8	34,6
2. Application	1,5	1,5	0,28	0,36	15,0	30,3	9,7	8,0	10,6	19,5
1. Application	1	1	0,37	0,51	27,5	44,0	8,7	10,1	19,8	38,9

As shown in **Table 5**, the different fertilizer treatments exhibited varying effects on the vegetative growth parameters of the two-year-old Narince grapevine cultivar. In terms of shoot number and shoot diameter, the control group and Group 1 (1.5 g micronutrient mix + 20 cc nitrogen in 1 L of water) were found to be more prominent. However, for shoot length, number of leaves per shoot, and leaf blade area, Group 2 (1 g iron + 1 cc zinc + 20 cc nitrogen in 1 L

of water) and Group 3 (1 g iron + 1 cc zinc + 20 cc nitrogen + 20 cc plant-based amino acids in 1 L of water) demonstrated greater effectiveness.

Table 5. Effects of different fertilizer applications on vegetative growth parameters of 2-year-old Narince grape variety

Aplications	Shoot Number (item)		Shoot Diameter (cm)		Number of Leaves in the Shoot (item)		Leaf Diameter (cm)		Shoot Lenght (cm)	
	1. period	2. period	1. period	2. period	1. period	2. period	1. period	2. period	1. period	2. period
Control	3,5	3,5	0,24	0,325	6,5	11,4	6,3	8,3	13,0	15,6
3. Application	1,5	2	0,345	0,45	14,5	15,8	10,3	10,4	43,1	53,6
2. Application	1,5	2	0,695	0,585	13,3	21,5	9,0	11,0	36,2	35,3
1. Application	3	3	0,22	0,365	11,0	18,5	9,2	10,4	26,4	24,9

Table 6. Effects of different fertilizer applications on vegetative growth parameters of 6-year-old Karaerik grape variety

Aplications	Shoot Number (item)		Shoot Diameter (cm)		Number of Leaves in the Shoot (item)		Leaf Diameter (cm)		Shoot Lenght (cm)	
	1. period	2. period	1. period	2. period	1. period	2. period	1. period	2. period	1. period	2. period
Control	25,5	32	2,45	2,34	91,0	140,0	21,7	30,9	330,8	381,4
3. Application	23	23,5	2,38	2,43	150,8	173,0	27,2	27,6	415,1	425,9
2. Application	12,5	16	1,295	1,42	127,3	143,3	23,4	23,9	260,9	372,4
1. Application	12,5	12,5	1,53	1,92	131,8	221,5	24,6	27,5	361,8	392,1

In the six-year-old Karaerik grapevine cultivar, vegetative growth parameters measured at two different stages showed that all three fertilizer treatments resulted in increased growth compared to the control group. Group 3 (1 g iron + 1 cc zinc + 20 cc nitrogen + 20 cc plant-based amino acids in 1 L of water) demonstrated significant growth in shoot length and leaf diameter, while Group 1 (1.5 g micronutrient mix + 20 cc nitrogen in 1 L of water) was more effective in leaf formation on the shoots (Table 6).

Table 7. Effects of different fertilizer applications on vegetative growth parameters of 6-year-old Narince grape variety

Aplications	Shoot Number (item)		Shoot Diameter (cm)		Number of Leaves in the Shoot (item)		Leaf Diameter (cm)		Shoot Lenght (cm)	
	1. period	2. period	1. period	2. period	1. period	2. period	1. period	2. period	1. period	2. period
Control	12,5	13	1,535	1,66	63,5	90,5	21,3	22,1	300,4	354,7
3. Application	16,5	16,5	1,07	1,17	66,0	105,3	21,9	25,1	369,4	405,8
2. Application	17,5	17,5	1,43	1,67	82,5	123,5	26,1	28,4	369,1	433,4
1. Application	15	15	1,355	1,37	82,0	117,8	26,6	27,5	393,1	427,8

In the six-year-old Narince grapevine cultivar, vegetative growth parameters measured at two different stages showed that all three fertilizer treatments resulted in increased growth compared to the control group. Fertilizer treatments 1 and 2 were found to be more effective than treatment 3 in all vegetative growth parameters, except for the shoot count parameter (Table 7).

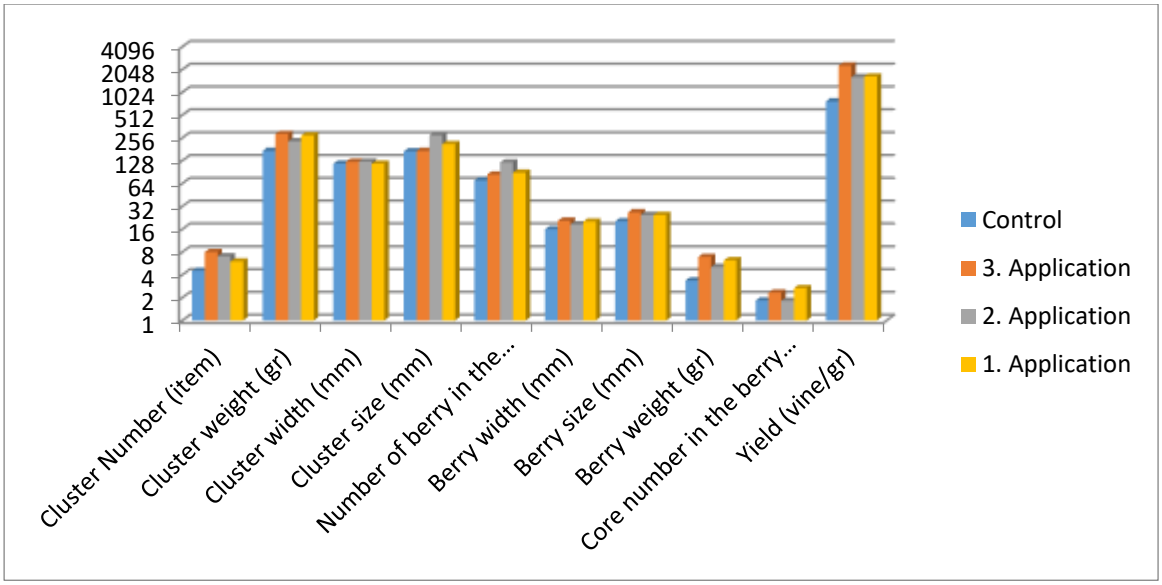
Similarly, Kara and Sabir (2010), conducted a study to assess the effects of a commercial organic fertilizer containing CaO, MgO, Fe2O3, SiO2, K2O, N, P, Cu, Ni, and Zn on shoot development in certain one-year-old grape rootstocks (140 Ru, 99 R, and 41 B). The results of the study indicated that the commercial organic fertilizer accelerated the vegetative development of the grapevine, making the seedlings healthier and more resilient.

Likewise, Özdemir (2018), conducted a study in the ecological conditions of Diyarbakır to evaluate the effects of various commercial organic and organomineral fertilizers on shoot development in the Boğazkere and Öküzgözü grape cultivars. The results indicated that the commercial fertilizer containing 5% N, 5% P2O5, 0% K2O, and microelements (ME) had a more significant effect on the shoot development of the Öküzgözü cultivar compared to other fertilizers, while the commercial fertilizer with 5% N, 5% P2O5, 5% K2O, and ME produced the highest shoot length in the Boğazkere cultivar.

Table 8. Table view of the effects of different fertilizer applications on generative growth parameters of 6-year-old Karaerik grape variety

Applications	Cluster Number (item)	Cluster weight (gr)	Cluster width (mm)	Cluster size (mm)	Number of berry in the cluster (item)	Berry width (mm)	Berry size (mm)	Berry weight (gr)	Core number in the berry (item)	Yield (vine/gr)
Control	4,5	172,60	116,86	170,21	70,5	15,95	20,34	3,35	1,83	776,68
3. Application	8	288,50	123,93	172,54	84	20,67	26,73	6,87	2,33	2.308,2
2. Application	7	231,43	124,54	277,10	121,5	18,45	24,60	5,06	1,82	1.620,01
1. Application	6	275,65	117,27	212,43	89	20,15	24,61	6,21	2,67	1.653,9

Table 9. Column graph view of the effects of different fertilizer applications on generative growth parameters of 6-year-old Karaerik grape variety

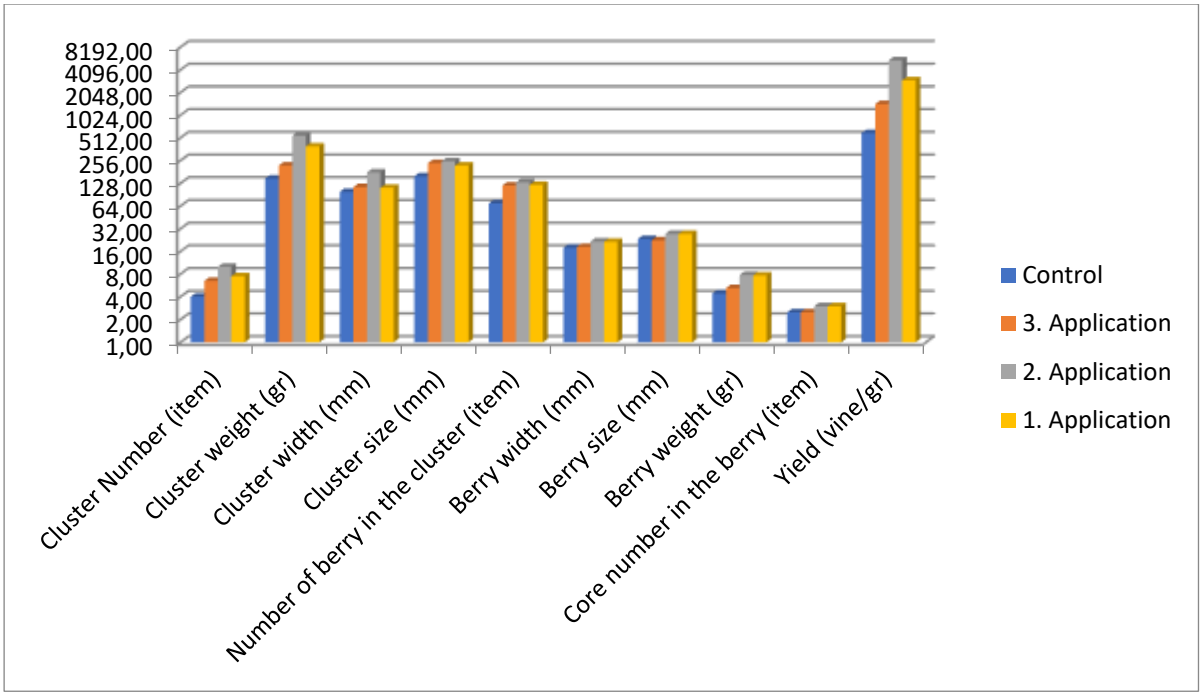


The different fertilizer applications had a significant effect on cluster number, cluster weight, cluster width, cluster length, berry number per cluster, berry width, berry length, berry weight, seed number per berry, and yield values in the Karaerik grape cultivar, compared to the control group. When examining Tables 8 and 9, it was observed that fertilizer treatment 3 had the highest values for berry width, berry length, number of berries per cluster, number of clusters per vine, cluster weight, and yield. Furthermore, fertilizer treatments 1 and 2 resulted in similar outcomes for several parameters.

Table 10. Table view of the effects of different fertilizer applications on generative growth parameters of 6-year-old Narince grape variety

Applications	Cluster Number (item)	Cluster weight (gr)	Cluster width (mm)	Cluster size (mm)	Number of berry in the cluster (item)	Berry width (mm)	Berry size (mm)	Berry weight (gr)	Core number in the berry (item)	Yield (vine/gr)
Control	**4,00**	**148,16**	**98,16**	**158,38**	**69,50**	**17,92**	**23,38**	**4,44**	**2,50**	**592,64**
3. Application	**6,50**	**220,71**	**114,22**	**237,21**	**119,50**	**18,39**	**22,43**	**5,23**	**2,50**	**1434,58**
2. Application	**10,00**	**546,43**	**177,99**	**250,32**	**131,50**	**21,65**	**27,32**	**7,78**	**3,00**	**5464,30**
1. Application	**7,50**	**395,27**	**111,65**	**220,10**	**122,00**	**21,47**	**27,39**	**7,71**	**3,00**	**2964,49**

Table 11. Column graph view of the effects of different fertilizer applications on generative growth parameters of 6-year-old Narince grape variety



It was observed that different fertilizer applications had significant effects on cluster number, cluster weight, cluster width, cluster length, berry number per cluster, berry width, berry length, berry weight, seed number per berry, and yield values in the Narince grape cultivar compared to the control group. Examination of Tables 10 and 11 revealed that fertilizer treatment 2 resulted in the highest values for berry width, berry length, number of berries per cluster, number of clusters per vine, cluster weight, and yield. Fertilizer treatments 1 and 3, on the other hand, produced similar outcomes across several parameters.

Conclusion and Recommendations

The findings of this study indicate that, for optimal growth and development in viticulture, essential plant nutrients must be present in the soil at adequate levels. However, it should not be overlooked that the type and amount of nutrients to be applied in vineyards can vary depending on multiple factors such as soil properties, climate conditions, rootstock, grape variety, and irrigation system. In order to determine the fertilizer requirements of vineyards accurately, soil and leaf analyses are essential. The results demonstrated that the type of applied nutrients and vine age had significant effects on vegetative development. Distinct differences were observed between Narince and Karaerik grape cultivars in terms of nutrient uptake and developmental responses. These findings underscore the need to develop cultivar-specific fertilization strategies under protected cultivation conditions.

Overall, the outcomes of this research contribute to the optimization of fertilization programs for grape production under cold climate greenhouse conditions. Furthermore, it provides a valuable reference for future research and cultivation practices involving Narince and Karaerik grape cultivars.

Thanks and Information Note

ABSTRACT

This study aims to provide a comprehensive and multidimensional assessment of the climate characteristics of Bingöl Province, located in Eastern Anatolia, Turkey. Using long-term meteorological data from 1991 to 2021, the study applies classical climate classification indices (De Martonne, Erinç, Thornthwaite, Aydeniz, Köppen, and Köppen-Trewartha) alongside 27 ETCCDI (Expert Team on Climate Change Detection and Indices) indicators to evaluate extreme climate events. The findings reveal that Bingöl has a transition-type climate with characteristics ranging from semi-arid to semi-humid, showing increased variability and intensity of seasonal extremes, such as summer droughts and intense spring precipitation. The study highlights the importance of integrating multi-index climate analyses in regional planning and climate adaptation strategies.

Keywords: Bingöl, climate classification, ETCCDI, extreme weather, climate change, drought

BİNGÖL İLİNİN İKLİM ÖZELLİKLERİNİN FARKLI İKLİM İNDİSLERİNE VE DEĞİŞEN İKLİM OLAYLARINA GÖRE DEĞERLENDİRİLMESİ

ÖZET

Bu çalışma, Türkiye'nin Doğu Anadolu Bölgesi'nde yer alan Bingöl ilinin iklim özelliklerini kapsamlı ve çok boyutlu bir şekilde değerlendirmeyi amaçlamaktadır. 1991–2021 dönemine ait uzun yıllara dayalı meteorolojik veriler kullanılarak; De Martonne, Erinç, Thornthwaite, Aydeniz, Köppen ve Köppen-Trewartha gibi klasik iklim sınıflandırma indislerinin yanı sıra, aşırı iklim olaylarını değerlendirmeye yönelik 27 ETCCDI (İklim Değişikliği Tespiti Uzman Grubu İndisleri) göstergesi uygulanmıştır. Bulgular, Bingöl'ün yarı kurak ile yarı nemli arasında geçiş özellikleri gösteren bir iklime sahip olduğunu, mevsimsel uç olayların (yaz kuraklıkları ve ilkbahar yağışlarının şiddetlenmesi gibi) artan bir değişkenlik ve yoğunlukla gözlendiğini ortaya koymuştur. Çalışma, bölgesel planlama ve iklim uyum stratejilerinde çoklu indeks analizlerinin entegre edilmesinin önemine vurgu yapmaktadır. Eğer ileriye yönelik olarak gerekli tedbirler alınmazsa ilin çok yakın zamanda tamamen kurak bir yapıya evrilme olasılığının oldukça yüksek olduğu belirlenmiştir.

Anahtar Kelimeler: Bingöl, iklim sınıflandırması, ETCCDI, aşırı hava olayları, iklim değişikliği, kuraklık

1. Giriş

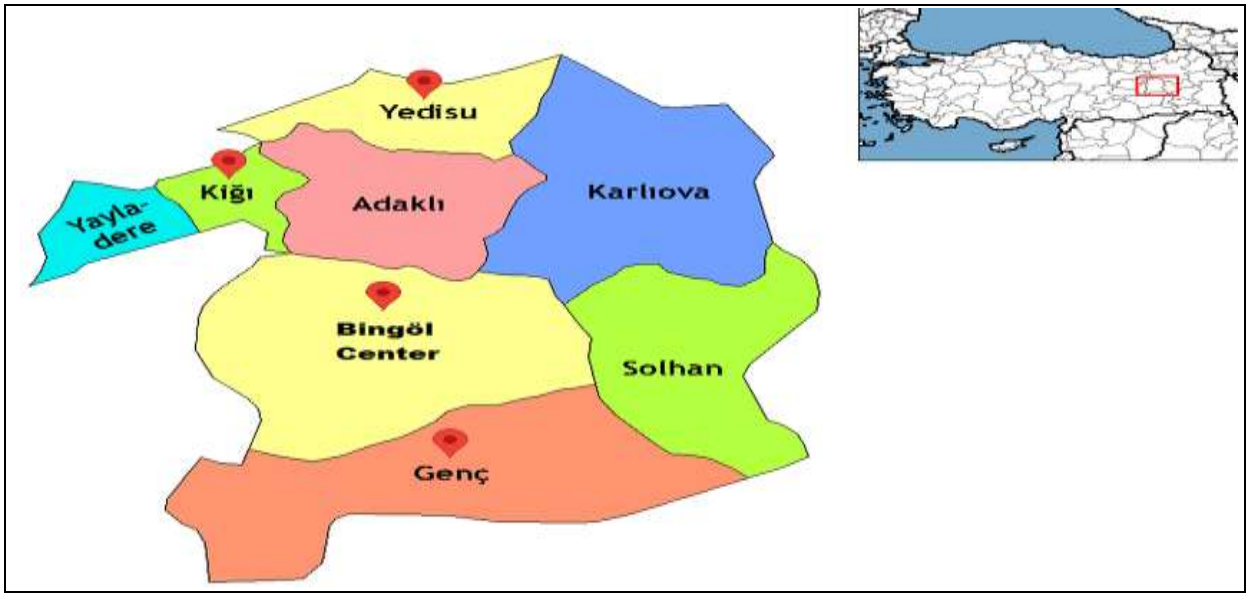
İklim, doğal sistemleri ve insan yaşamını doğrudan etkileyen temel çevresel bir faktördür. Sıcaklık, yağış, nem ve rüzgâr gibi meteorolojik değişkenler; özellikle tarım, ormancılık, su kaynakları yönetimi ve kırsal kalkınma gibi alanlarda belirleyici rol oynamaktadır. Türkiye gibi farklı coğrafi bölgeleri içeren ülkelerde iklimsel koşullar büyük farklılıklar gösterebilir ve bu değişkenlik, yerel kalkınma politikalarının oluşturulmasında kritik bir unsurdur.

Bingöl ili, Doğu Anadolu Bölgesi'nin Yukarı Fırat bölümünde yer almaktadır. Yüksek dağlar ve derin vadilerle şekillenen engebeli topografyası, mikroklimatik farklılıkların ortaya çıkmasına neden olmakta ve iklim yapısının çok boyutlu incelenmesini gerektirmektedir. Türkiye son yıllarda iklim değişikliğinin etkisini farklı şekillerde ve derinden hissetmeye başlamıştır. Doğu Anadolu bölgesi illeri de bundan etkilenmektedir. Bingöl ili konum olarak özel bir yerde yer almakta ve nemli iklime sahip olmasıyla bilinmektedir. Ancak son yıllarda il dengesi ve düzensiz yağışlar, sıcaklığın artışı ile kuraklaşmaya başlaması ciddi sorunlar oluşturmaya başlamıştır. Bu çalışmanın amacı, Bingöl iklimini hem genel iklim özelliklerini hem de aşırı hava olaylarını değerlendiren çok sayıda indeks ve göstergeye göre incelemektir.

2. Materyal ve Yöntem

2.1 Çalışma Alanı

Bingöl, 38°27′–40°27′ doğu boylamları ve 38°30′–40°27′ kuzey enlemleri arasında yer almakta olup, 8.125 km²'lik bir alanı kapsamaktadır. Ortalama deniz seviyesinden yüksekliği yaklaşık 1.200 metredir. Harita Gene Müdürlüğünden alınan harita Şekil 1'de verilmektedir Görüleceği gibi il konum olarak önemli bir yerde bulunmaktadır.



Şekil 1. Bingöl ilinin Türkiye'deki konumu (HGM, 2025)

2.2 Veri Seti

Çalışmada 1991–2021 dönemine ait aylık sıcaklık ve yağış verileri kullanılmıştır. Bu veriler, Türkiye Devlet Meteoroloji İşleri Genel Müdürlüğü'ne bağlı Bingöl Meteoroloji İstasyonu'ndan temin edilmiştir. Verilerin doğruluğu ve sürekliliği kontrol edilmiştir.

2.3 Uygulanan İklim İndeksleri

a) De Martonne Kuraklık İndeksi

Bu indis, yıllık yağış miktarı ile ortalama yıllık sıcaklık değerlerinin oranına göre bölgenin kuraklık durumunu belirler. 10'un altında çıkan değerler kurak iklimi, 10–20 arası yarı kurak iklimi, 20–30 arası yarı nemli iklimi göstermektedir.

b)Erinç Yağış Etkinlik İndeksi

Bu indeks, sıcaklık ve yağış arasındaki ilişkiyi daha bölgesel gerçekliklere uygun şekilde ölçmektedir. Türkiye koşullarına özel olarak geliştirilmiştir. Yarı nemli iklim koşulları için indeks değerleri genellikle 20–40 arasında yer alır.)

c)Thornthwaite İklim Sınıflandırması

Sıcaklık, yağış ve potansiyel evapotranspirasyon verileri kullanılarak hesaplanır. Nemlilik indeksi (Im) değerine göre iklim; çok nemli, nemli, yarı nemli, yarı kurak ve kurak olarak sınıflandırılır. Ayrıca sıcaklık bazlı olarak mezotermal veya mikrotermal gibi sınıflara ayrılır

d)Aydeniz İklim İndeksi (Türkiye'ye özgü)

Aydeniz iklim sınıflaması, aylık yağış ve sıcaklık verilerinin kullanıldığı, Türkiye'ye özgü geliştirilen bir sistemdir

e)Köppen ve Köppen-Trewartha Sınıflandırmaları

Köppen sistemi, sıcaklık ve yağış mevsimselliğine göre dünyanın iklimlerini harflendirme yoluyla sınıflandırır. Bingöl, yaz kuraklığı ve kış yağışları nedeniyle tipik bir "Csa" iklimi (Akdeniz iklimi – sıcak yazlar) özellikleri gösterir. Ancak kış sıcaklıklarının düşüklüğü ve kar yağışı nedeniyle bu sınıfa tam olarak uymamakta, "soğuk Akdeniz geçiş zonu" olarak yorumlanabilir.

> Csa (Akdeniz) iklimi özellikleri:

En sıcak ay ort. > 22°C

En soğuk ay ort. 0–18°C arası

Yaz kuraklığı belirgin

Yıllık yağış 500–1000 mm arasında

Bu sistem, Köppen'e benzer ama yıllık sıcaklık ortalamaları yerine daha detaylı mevsimsel sıcaklık analizleriyle sınıflama yapar. Köppen-Trewartha'ya göre Bingöl, "Dca" olarak sınıflandırılır:

> Dca İklimi Özellikleri:

Ilıman karasal iklim

En az 8 ay > 10°C

En soğuk ay < 0°C

Yazları sıcak ve kurak, kışları sert ve karlı

Bu sınıflama, Bingöl'ün yüksek rakımı ve karasal etkilerle şekillenen mevsimsel sıcaklık farklarını daha doğru şekilde yansıtır.

f) ETCCDI Tabanlı Aşırı İklim Göstergeleri (CSDI, FD0, GSL, ID0, SU25, TN10p, TN90p, TR20, TX10p, TX90p, TXn, TXx, CDD, CSDI, CWD, DTR, PRCPTOT, R10mm, R20mm, R95p, R99p, RX1day ve RX5day**)**

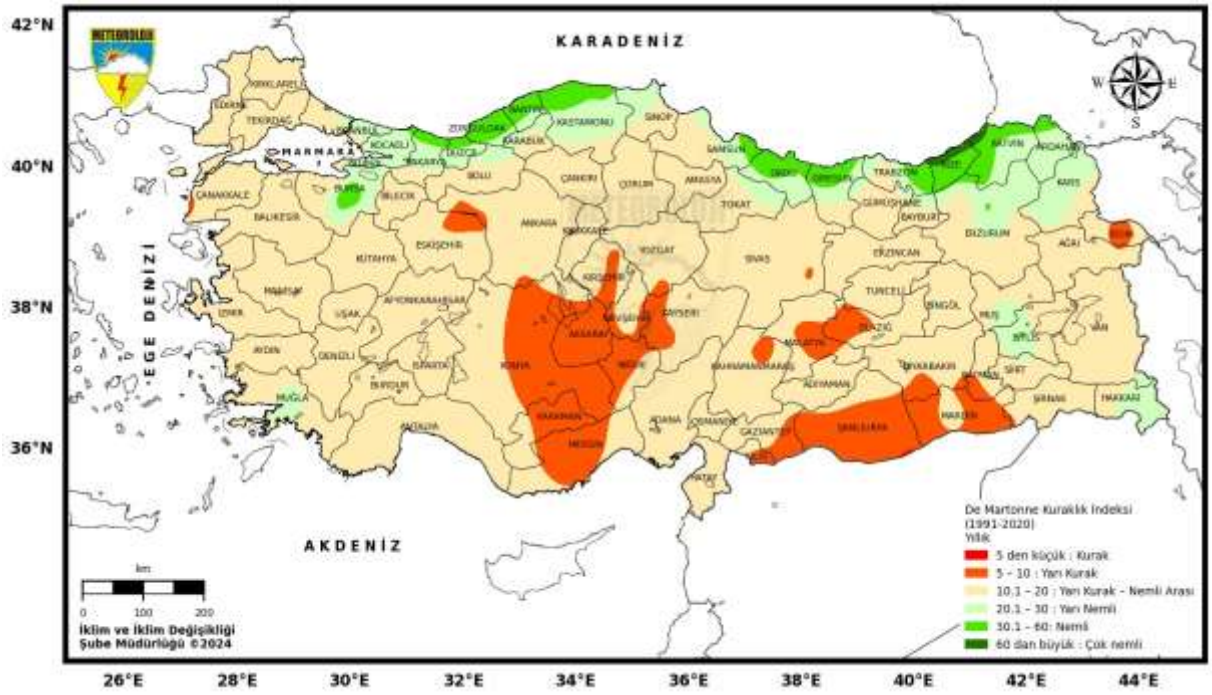
3. Bulgular ve Tartışma

3.1 Genel İklim Özellikleri

Yıllık ortalama sıcaklık 12,8°C, yıllık ortalama yağış miktarı yaklaşık 830 mm'dir. En yüksek yağış ilkbaharda (Mart–Nisan), en düşük yağış ise yaz aylarında (Temmuz–Ağustos) gerçekleşmektedir.

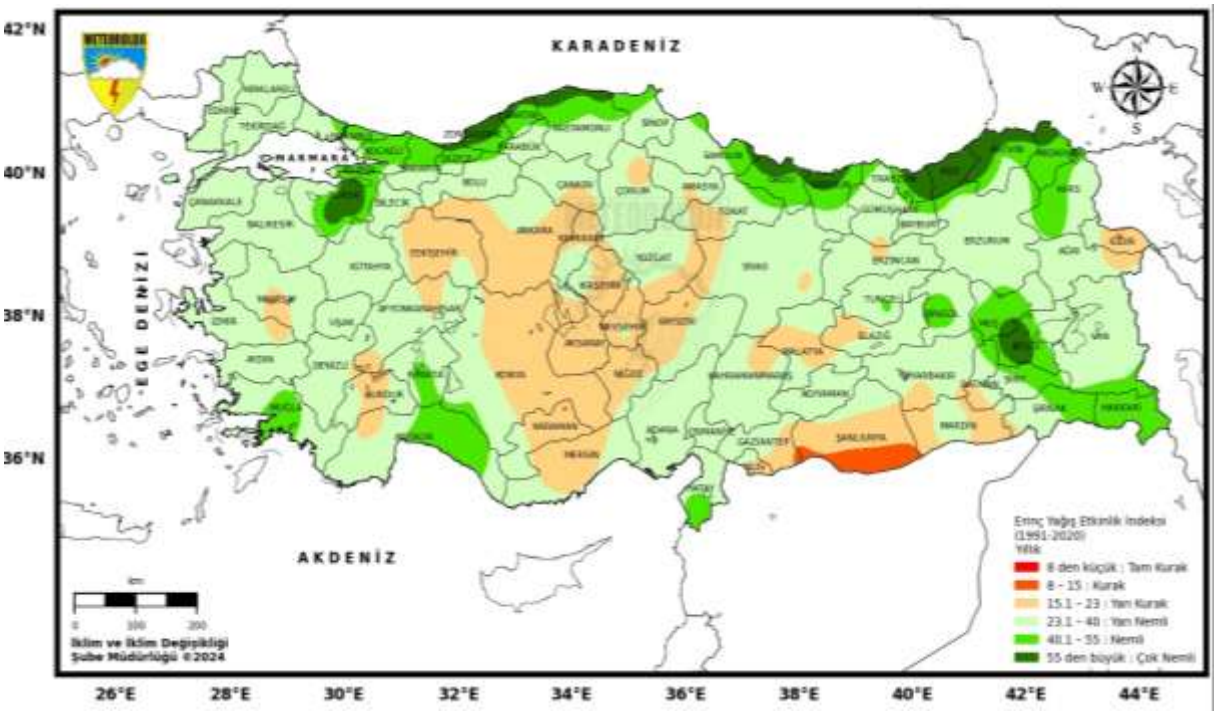
3.2 Klasik İklim Sınıflandırma Sonuçları

De Martonne İndeksi: Bingöl genellikle "yarı kurak" sınıfındadır. 2000 ve 2014 yıllarında kurak sınıra yaklaşmıştır (Şekil 2). Şekil incelendiğinde ilin genel olarak yarı kurak-nemli arasında olduğu ancak kurak alana daha yakın durduğu görülecektir.



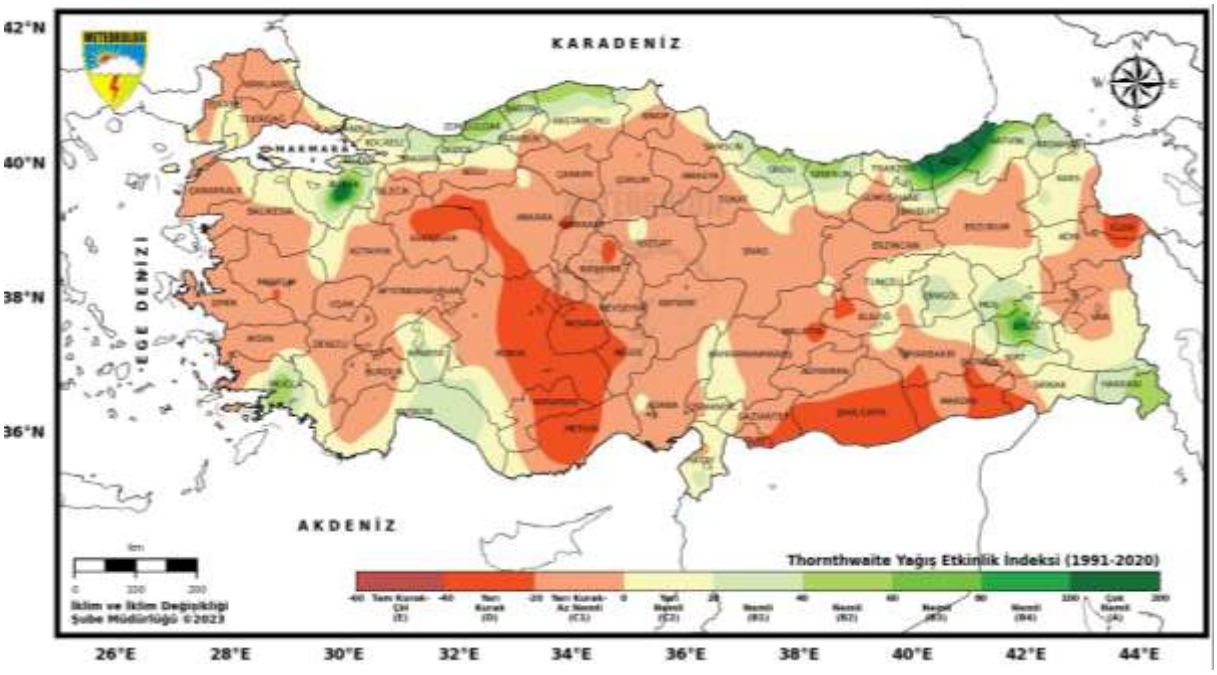
Şekil 2. Bingöl ilinin De Martonne İndeksine göre görünüşü (MGM, 2024)

Erinç İndeksi: İl, "yarı nemli" özellik göstermektedir. 1999 ve 2018 gibi yıllarda değerler düşmüş, değişkenlik artmıştır. Şekil 3'de bu durum gösterilmektedir. Bingöl merkez ilçe ve çevresi nemli bölge olurken, diğer alanlar ise yarı nemli olarak belirlenmiştir.



Şekil 3. Bingöl ilinin Erinç İndeksine göre görünüşü (MGM, 2024)

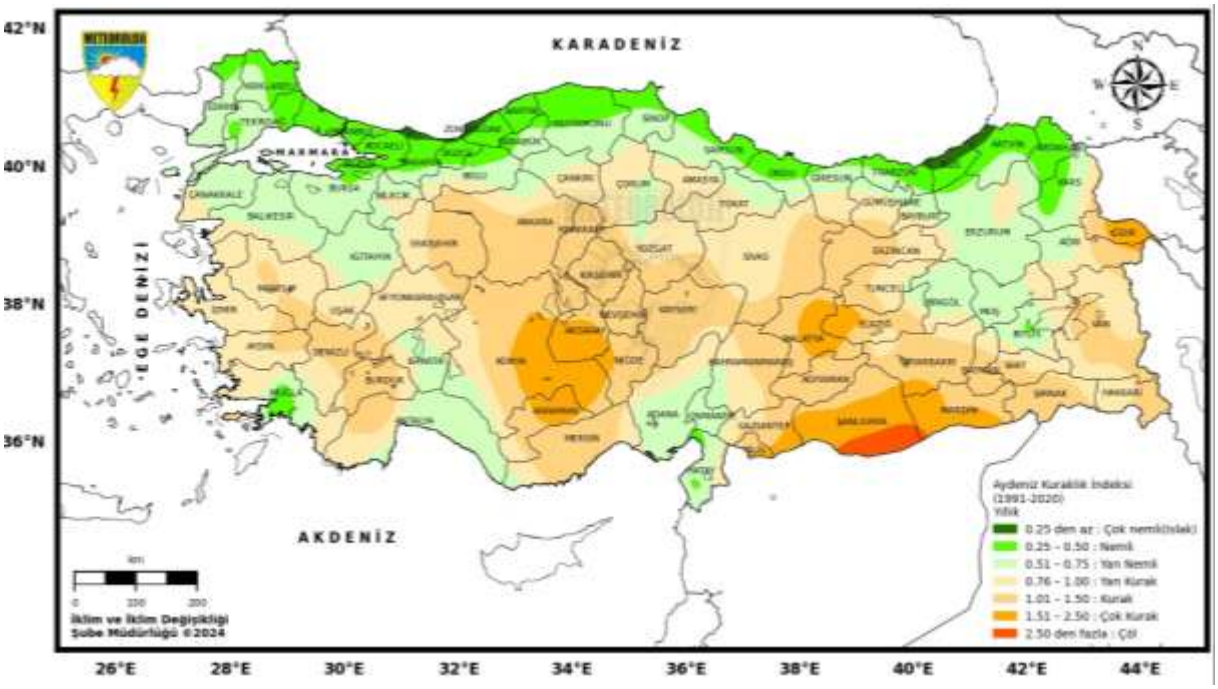
Thornthwaite indeksi: Bu indekse göre genel durum Şekil 4'de gösterilmektedir. Yarı nemli ve ikinci derece mesotermal sınıfta yer almakta; yaz aylarında belirgin su açığı mevcuttur. Yarı nemli olması kurağa yaklaştığının gösterebilmektedir. Alınacak tedbirlere göre bu değişebilecektir.



Şekil 4. Bingöl ilinin Thornthwaite İndeksine göre görünüşü (MGM, 2024)

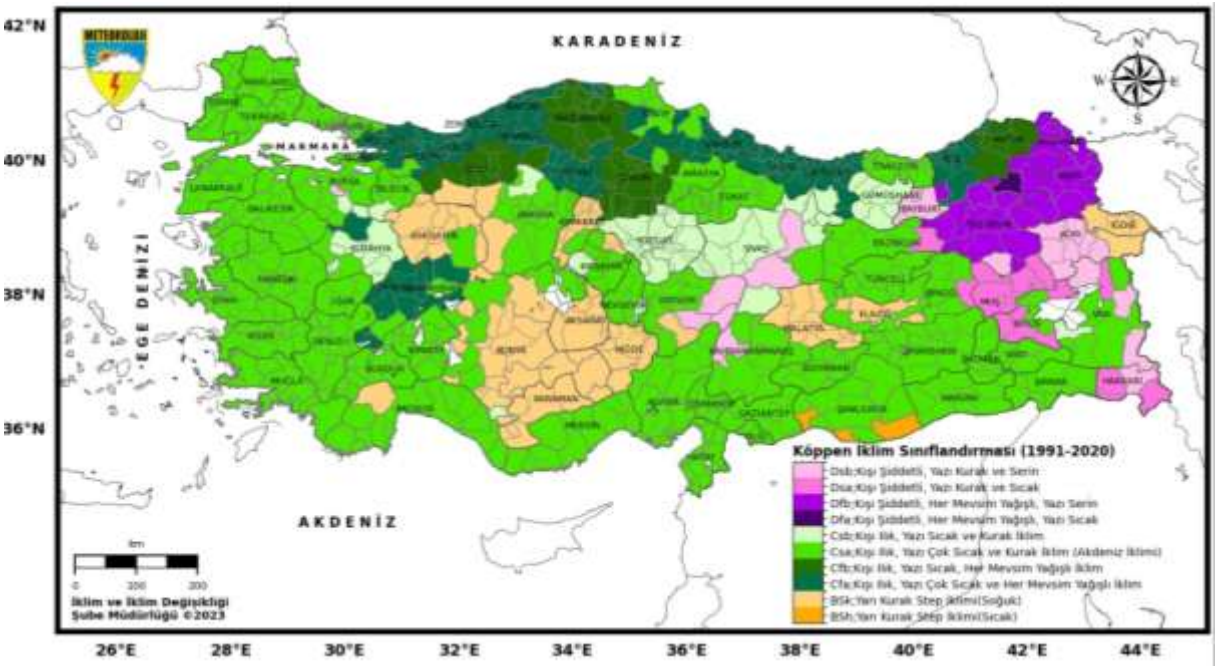
Aydeniz indeksi: Hesaplanan indeks değeri (~437), Bingöl'ü kış yağışlarının yüksek olması nedeniyle "çok nemli" sınıfa yerleştirmektedir (Şekil 5); ancak mevsimsel kuraklık da

gözlenmektedir. Mevsimsel kruaklığın son yıllarda belirgin şekilde artması geelcek açıdan endişe vericidir.



Şekil 5. Bingöl ilinin Aydeniz İndeksine göre görünüşü (MGM, 2024)

Köppen ve Köppen-Trewartha indeksi: Köppen'e göre Bingöl Csa (Akdeniz iklimi), Trewartha'ya göre ise Dca (ılıman karasal) olarak sınıflandırılmakta ve bu geçiş iklimi iklerini yansıtmaktadır (Şekil 6).



Şekil 6. Bingöl ilinin Köppen ve Köppen-Trewartha İndeksine göre görünüşü (MGM, 2024)

3.3 ETCCDI Tabanlı Aşırı İklim Göstergeleri

CSDI (Soğuk Dönem Süresi): Kış aylarında sık soğuk hava dalgaları.

FD0 (Don Günleri): Yılda ortalama 100 gün, minimum sıcaklık 0°C altındadır.

GSL (Vejetasyon Dönemi Uzunluğu): Ortalama 180 gündür.

ID0 (Buz Günleri): Maksimum sıcaklığın 0°C'nin altında olduğu günler.

SU25 (Yaz Günleri): Yaz aylarında 25°C'nin üzerinde 60–80 gün.

TN10p / TN90p: Sıcak gecelerde artış gözlenmektedir.

TR20: Tropikal gece nadirdir.

TX10p / TX90p: Sıcak günlerde belirgin artış.

TXn / TXx: Yıllık uç sıcaklıklar -15°C ile 41°C arasında değişmektedir.

CDD (Art Arda Kurak Günler): Son yıllarda yaz kuraklığı artış göstermiştir.

CWD (Art Arda Yağışlı Günler): İlkbahar aylarında yağış kümelenmeleri belirgindir.

DTR (Günlük Sıcaklık Farkı): Yüksek; 10–16°C arası.

PRCPTOT: Ortalama yıllık yağış 830 mm'dir.

R10mm / R20mm: İlkbaharda 10 mm ve 20 mm üzeri yağışlı günler artış göstermiştir.

R95p / R99p: Aşırı yağış olayları daha sık hale gelmiştir.

RX1day / RX5day: Maksimum tek gün ve 5 günlük yağışlar 45 mm'ye kadar ulaşabilmektedir.

4. Sonuç

Hesaplanan indis değerleri Çizelge 1'de gösterilmektedir. Çizelge incelendiğinde Bu kapsamlı değerlendirme, Bingöl ilinin yarı kurak ile yarı nemli iklim rejimleri arasında geçiş özellikleri taşıdığını ortaya koymaktadır. Klasik iklim indeksleri uzun vadeli desenleri öne çıkarırken, ETCCDI göstergeleri kısa vadeli aşırı olayların şiddetlendiğini göstermektedir. Yaz kuraklıkları, sıcak günlerin artışı ve ilkbahar yağışlarının yoğunlaşması; bölgesel düzeyde entegre iklim uyum planlaması ve risk yönetimi gerektiren başlıca bulgulardır.

İndis	Başlangıç Yılı	Bitiş Yılı	Eğim Tahmini	Olasılık Değeri
CSDI	2000	2022	-0,116	0,042
FD0	2000	2022	-0,22	0,069
GSL	2000	2022	0,298	0,061
ID0	2000	2022	-0,06	0,71
SU25	2000	2022	0,224	0,003

R10mm	2000	2022	-0,011	0,602
R20mm	2000	2022	-0,006	0,657
R25mm	2000	2022	Hesaplanamadı	
R95p	2000	2022	-0,298	0,709

5. Öneriler

Yerel yönetimler, bölgesel planlama ve erken uyarı sistemlerinde klasik indekslerle birlikte ETCCDI göstergelerini de entegre etmelidir. Yaz kuraklıklarının etkisini azaltmak için modern sulama altyapıları önceliklendirilmelidir. İklim izleme ağları, ETCCDI analizlerini gerçek zamanlı yapabilecek şekilde genişletilmelidir. Bingöl'e özgü iklim kırılganlıklarını gösteren risk haritaları geliştirilmelidir.

ABSTRACT

Precipitation is one of the key determinants of agricultural productivity, playing a critical role not only in the sustainable management of water resources but also in maintaining ecosystem balance. The agricultural sector is highly sensitive to variations in the amount, timing, and distribution of rainfall. In recent years, fluctuations in precipitation patterns due to global climate change have led to significant uncertainties in crop yields, soil moisture imbalances, and increased agricultural vulnerability. This study evaluates the impact of changes in precipitation regimes on agricultural production in Turkey, with a particular focus on the Eastern Anatolia Region. Additionally, the effects of climate change on food security are discussed, along with recommendations for adaptive agricultural strategies.

Keywords: Precipitation Regime, Agricultural Yield, Climate Change, Food Security, Rural Resilience

YAĞIŞ – ÜRÜN İLİŞKİSİ ÜZERİNE DEĞERLENDİRMELER

ÖZET

Yağış, tarımsal üretimin temel belirleyicilerinden biri olarak hem su kaynaklarının sürdürülebilir yönetimi hem de ekosistem sağlığı açısından kritik bir rol üstlenmektedir. Tarım sektörü, yağış miktarındaki, dağılımındaki ve zamanlamasındaki değişimlere son derece duyarlıdır. Küresel iklim değişikliğiyle birlikte, son yıllarda yağış rejimlerinde görülen belirsizlikler; ürün veriminde dalgalanmalara, toprak nemi dengesizliklerine ve artan tarımsal risklere yol açmaktadır. Bu çalışmada, Türkiye genelinde ve özellikle Doğu Anadolu Bölgesi özelinde yağış rejimindeki değişimlerin tarımsal üretime olan etkileri değerlendirilmiştir. Ayrıca, iklim değişikliğinin gıda güvenliği üzerindeki yansımaları ile alternatif üretim stratejileri üzerine öneriler sunulmuştur. Yağış rejiminin değişmesi ürün çeşitliliğini de doğrudan etkilemektedir.

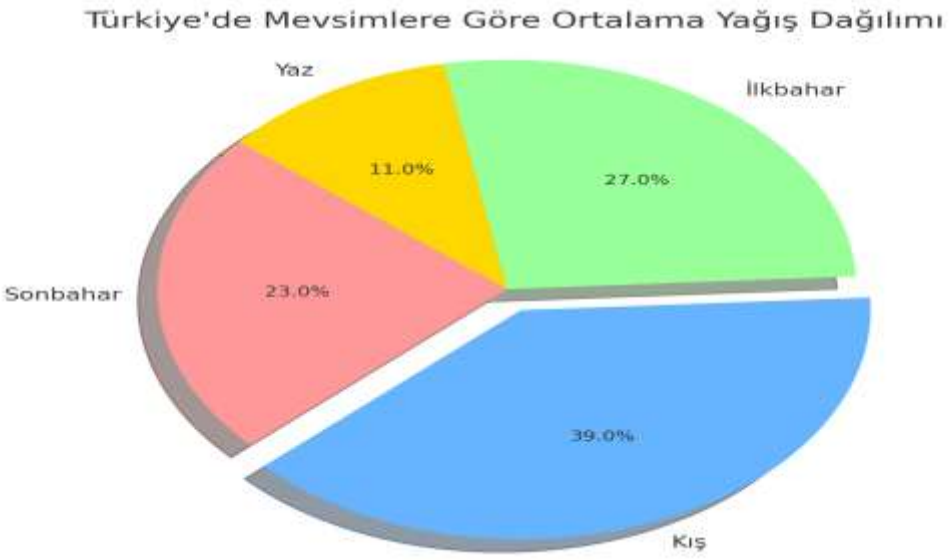
Anahtar Kelimeler: Yağış Rejimi, Tarımsal Üretim, İklim Değişikliği, Gıda Güvenliği, Kırsal Dirençlilik

1. Giriş

Tarımsal üretim sistemlerinin sürdürülebilirliği, büyük oranda doğal kaynaklara, özellikle suya bağımlıdır. Su döngüsünün temel bileşenlerinden biri olan yağış, ekosistemlerin düzenli işleyişini sağladığı gibi tarımsal faaliyetlerin zamanlamasını ve verimliliğini de doğrudan etkilemektedir. Ancak son yıllarda gözlemlenen düzensiz yağış rejimleri, tarım alanlarında kuraklık, aşırı nemlilik, toprak erozyonu gibi olumsuz etkiler yaratmakta; bu durum üretim planlaması açısından öngörülemezliğe neden olmaktadır. Yağış sürekli olarak değişmekte ve bu değişime karşılık üretim planları da değişmeye zorlanmaktadır. Son yıllarda küresel anlamda değişen iklim özellikle Akdeniz'e kıyısı olan ülkelerde çok daha derinden hissedilmeye başlamıştır. Türkiye iklim değişikliğini en derinden hisseden Akdeniz ülkelerinin başına gelmektedir. İklim değişmektedir. Bu kaçınılmaz bir gerçek olarak karşımızda durmaktadır. Ancak bu gerçeği görmezden gelemeyeceğimiz gibi oturum ağıt yamanında bir faydası olmayacaktır. Aksine yeni alternatifler üretmek, doğayı korumak ve ekolojik dengeyi sürdürülebilir sekle sokmak gerekmektedir.

2. Türkiye'de Yağış Rejimini Belirleyen Faktörler

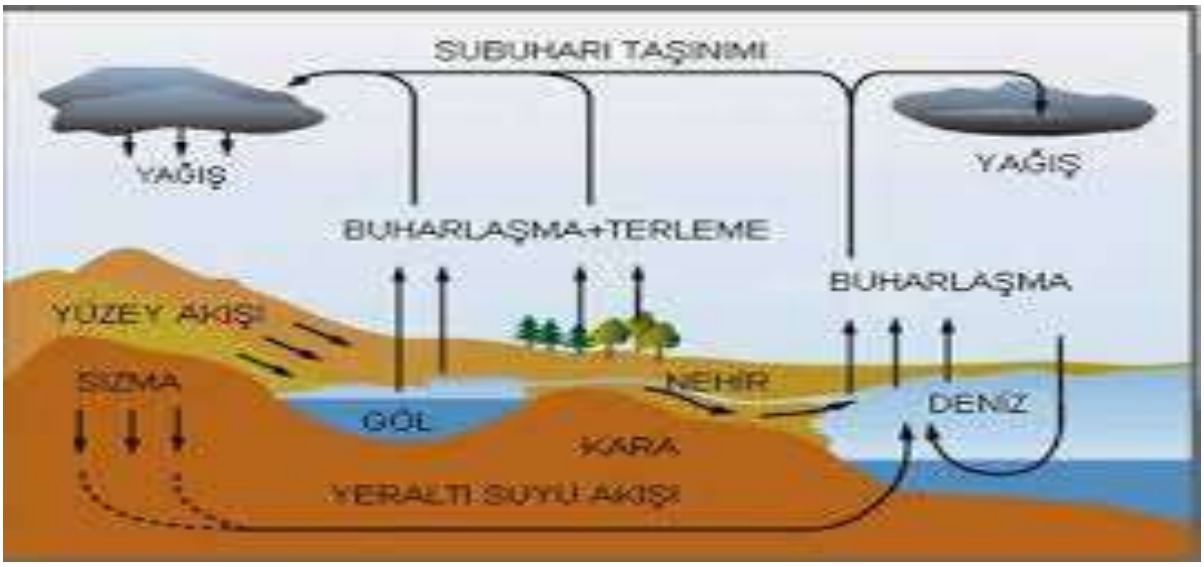
Türkiye'nin yağış rejimi; çeşitli atmosferik ve topografik faktörlerin bileşimiyle şekillenmektedir. Başlıca belirleyiciler arasında Hava Kütleleri ve Cephe Hareketleri: Karadeniz ve Akdeniz'den gelen nemli hava kütlelerinin Anadolu'nun iç kesimlerinde etkisini kaybetmesi, iç bölgelerdeki kuraklığı artırmaktadır. Topografya: Yükselti, eğim ve bakı gibi faktörler yağış miktarını ve türünü doğrudan etkiler. Karasallık: İç bölgelerde deniz etkisinin azalması, mevsimsel sıcaklık ve nem farklarını artırmakta ve yağışların düzensizleşmesine neden olmaktadır. Fizyografik Unsurlar: Ormanlık alanlar, göller ve tarım alanlarının dağılımı da mikroklimatik yağış farklılıklarına yol açmaktadır. Yağış rejiminin dağılımı şekil 1'de gösterilmektedir.



Şekil 1. Türkiye'de Mevsimlere Göre Ortalama Yağış Dağılımı

Şekil incelendiğinde en yüksek yağışın kış aylarında olduğu görülmektedir. Bunu ilk bahar ve sonbahar ayları izlemektedir. Ancak yağan yağışların miktarlarında düşme ile rejimsel olarak ciddi sorunlar yaşanmaktadır. Örneğin yaz ayları boyunca 150 mm yağış alan bölgelerde bu miktar bir gün içinde yağabilmektedir. Taşkın, sel ve toprak kayması gibi olumsuzluklar yaşanabilmektedir. Yapış rejimini belirleyen faktörlerde son yıllarda değişimler olmaya

başlamıştır. Bu değişimler ile iklimin tarımsal üretime olumsuz etkisi artmaya başlamıştır. Şekil 2'de yapış rejiminin belirleyicileri gösterilmektedir.



Şekil 2. Yapış rejiminin belirleyicileri

Bazen çok yağan ve bazen de hiç yağmama durumları strese sebep olmaktadır. Bunun sonucunda ise bitkiler strese girmekte verim ve kalite kayıpları baş göstermektedir. Yağış rejimini şekillendiren orman miktarının belirgin şekilde azalması, göllerin kurumaya başlaması ve kentleşme ile yol yapımları ciddi olarak rejimin değişmesini etkilemektedirler.

3. Yağış Rejimi ve Tarımsal Üretim

Yapış rejimindeki düzensizlik öncelikle bitkisel ve hayvansal üretimi etkilemektedir. Ürün deseninde gözlenen değişimler ile birlikte hayvanların besin maddesi temini bakımından yeterli yem üretiminin sağlanamaması sonucu ile karşılaşılmaktadır. Yağışın hem mevsimsel hem de yıllık dağılımındaki düzensizlikler;

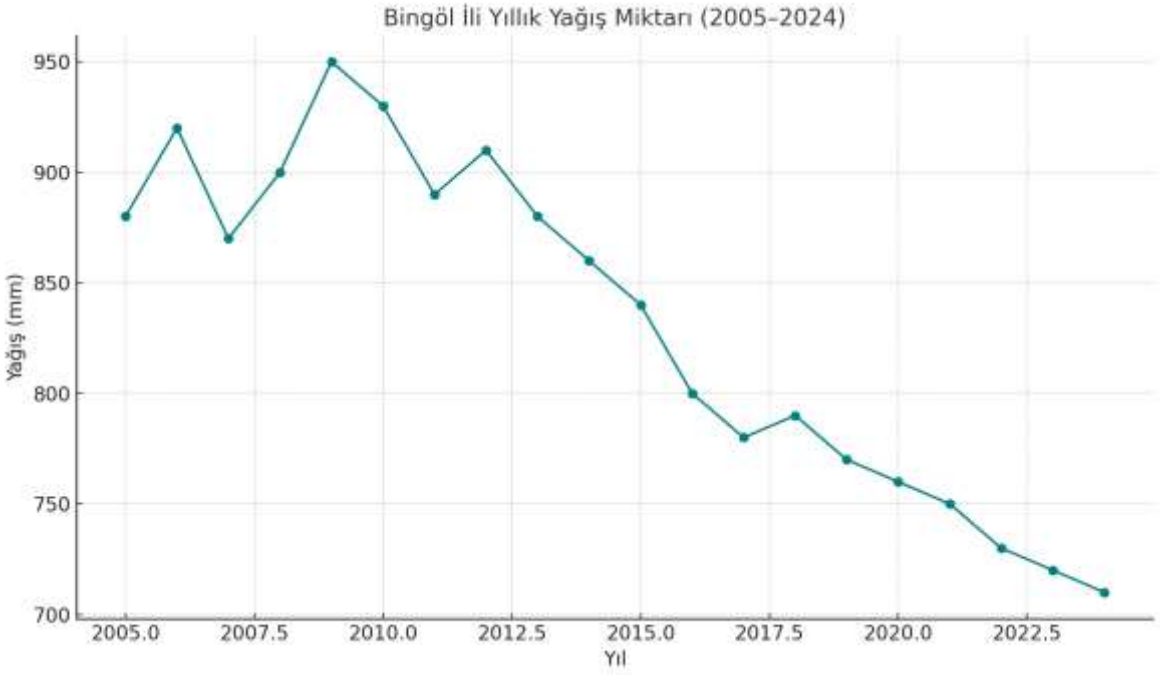
- Ekili alanların gelişim evrelerinde kritik su yetersizliklerine,
- Hasat dönemlerinde aşırı yağışa bağlı kalite kayıplarına,
- Verin ve kalite kayıplarına,
- Yemlerdeki kalite düşüklüğü ile birlikte hayvansal ürünlerdeki kalite düşüklüğüne,
- Tohum çimlenmesi ve fide gelişiminde gecikmelere yol açmaktadır.

Özellikle kuraklık stresine duyarlı ürünlerde (ör. buğday, mercimek gibi) verim kayıpları daha belirgin olmaktadır. Ayrıca yaz aylarında artan sıcaklıklarla birlikte yağış azlığı, sulama ihtiyacını artırmakta ve yer altı su kaynakları üzerinde baskı oluşturmaktadır.

4. Doğu Anadolu Bölgesi Örneği

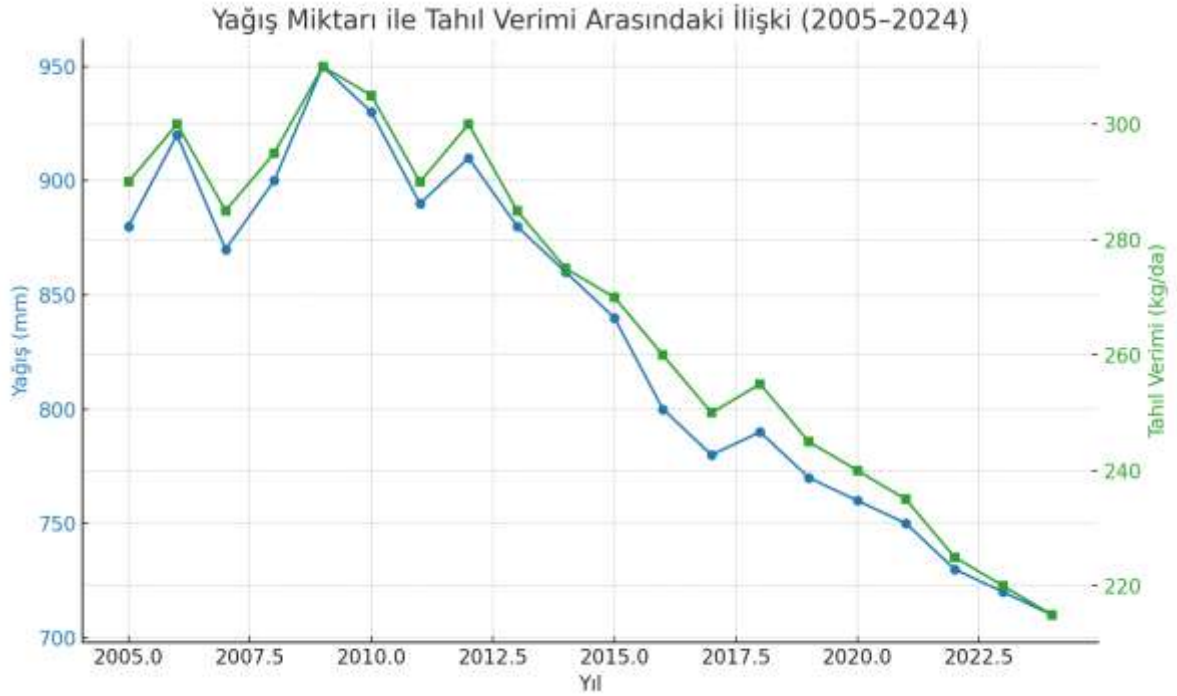
Doğu Anadolu Bölgesi, yüksek rakımı ve karasal iklim özellikleriyle Türkiye'nin diğer bölgelerinden ayrılmaktadır. Yıllık yağış miktarı bazı alanlarda yeterli gibi görünse de, bu yağışların düzensiz zamanlaması (örneğin çiçeklenme ya da hasat dönemlerinde yoğunlaşması), ürün verimini olumsuz etkilemektedir. Ayrıca son yıllarda kış yağışlarında az Doğu Anadolu'da son 20 yılda yağışlar azalma eğilimi göstermektedir. Yapışların son 20 yıldaki durumunun gösteren grafik Şekil 3'de gösterilmektedir. Şekil incelendiğinde yağış

miktarının gelecek açısından belirgin şekilde azaldığı görülmektedir. Eğer gerekli tedbirler alınmazsa geleceğin iyi olmayacağı söylenebilir.



Şekil 3. Bingöl İli Yıllık Yağış Trendi (2005–2024)

Bitkisel üretim denilince her zaman için akla ilk gelen tahıllar olmaktadır. Tahıllar bizler için temel besin kaynağımız olan un ve ekmeğin ana kaynağı olduğundan önemli olmaktadır. Yağış miktarı azaldıkça verim ve kalitede düşmeye başlamıştır. Şekil 4'de yağış miktarı ile tahıl verimi arasındaki ilişki gösterilmektedir. Şekil incelendiğinde 2015 yılından itibaren düşüsün ciddileştiği ve geriye dönme hareketi yapmadığı görülmektedir. Bu aslında bizlere bir uyardır. Eğer gerekli tedbirler alınmazsa ciddi sorunlar ile karşılaşmak kaçınılmaz olacaktır. Verim azalması aynı zamanda birim alandan alınacak olan ürün miktarının da azalması anlamına gelmektedir. Birim alandaki azalma ise rekolteye olumsuz etki yapacaktır. Ülke olarak yıllık 20 milyon ton buğdaya ihtiyacımız bulunmaktadır. Ancak son yıllarda üretim miktarı azaldığından 16 milyon tona kadar düşmüştür. Bu nedenle de dışarıdan buğday ithali başlamıştır. Kuraklığın ve iklim değişiminin dünyanın her yerini etkilediği düşünüldüğünde ileride paramız olsa bile alım yapmayacağımız akıldan çıkarılmamalıdır. Bunun için fazla gecikilmeden üretim planlamaları ve uygun ürün desenlemesi çalışmalarının yapılması gerekmektedir.



Şekil 4. Yapış Miktarı le Tahıl Verimi Arasındaki İlişki

5. İklim Değişikliği ve Gıda Güvenliği

İklim değişikliğinin etkileri sadece tarımsal üretimle sınırlı kalmamakta; aynı zamanda gıda tedarik zinciri, fiyat dalgalanmaları ve besin erişimi gibi temel gıda güvenliği bileşenlerini de tehdit etmektedir. Gıda güvenliği şu dört temel unsurla değerlendirilmelidir:

1. Gıdanın Tedariki (availability): Gıdanın tedariki her yıl bir önceki yıla göre zorlaşmaktadır. Bu nedenle daha ciddi davranılmalı ve gıda tedariki konusunda erkenden tedbirler alınmalıdır. Hatırlanacağı gibi pandemi döneminde parayla dahi ürün alınamamıştır.

2. Gıdaya Erişim (accessibility): Gıdaya erişimde tedarike bağlı olarak değişmektedir. Tedarik yapılamayınca erişimde zorlaşmaktadır.

3. Gıdanın Kullanılabilirliği (utilization): Bazı durumlarda ise gıdaya ulaşılsa da gıda maddesinin kullanılabilir olmadığı görülebilmektedir. Kalitesiz gıda aynı zamanda sağlığı da tehdit edebilecektir.

4. Gıda Sistemlerinin İstikrarı (stability): İstikrar her yerde öncelikli olmalıdır. İstikrarlı olan yerler her aman için güven veren yerlerdir. Gıda sistemlerinin istikrarı da bizlere gelecek açısından güven vermelidir.

Yağış rejimindeki öngörülemezlik, bu dört temel alanı da zayıflatarak kırılgan grupların (çiftçiler, düşük gelirli tüketiciler) üzerindeki baskıyı artırmaktadır.

6. Sonuç ve Öneriler

Tarımsal üretimin iklim değişikliğine karşı dayanıklılığını artırmak için;

- Kuraklığa ve strese dayanıklı türlerin yaygınlaştırılması,

- Yerel hava ve toprak verilerine dayalı erken uyarı sistemlerinin kurulması,
- Çiftçilerin iklim riskleri konusunda bilinçlendirilmesi,
- Sulama teknolojilerinin modernize edilmesi gibi önlemler öncelikli olmalıdır.
- Ayrıca, iklim-tarım senaryolarına dayalı üretim planlamalarının desteklenmesi ve bölgesel politikaların oluşturulması büyük önem taşımaktadır.

ABSTRACT

Türkiye is recognized as a significant center of genetic diversity for grapevine (*Vitis vinifera* L.) owing to its strategic geographical location and varied climate. The extensive viticultural activities practiced across the country for millennia have facilitated the development of numerous indigenous varieties and types. While traditional variety identification has been based on ampelographic characteristics, the application of molecular techniques in determining grape varieties has become increasingly prevalent due to the susceptibility of ampelographic traits to environmental conditions and vine age. Türkiye's rich grapevine genetic resources face the threat of extinction due to environmental factors, the prevalence of diseases and pests, a decline in demand for local varieties, and socio-economic transformations. Projects aimed at the conservation of grapevine genetic resources are of paramount national importance for safeguarding both production and heritage against potential future adversities. Furthermore, the promotion of locally cultivated grape varieties, an increase in the number of scientific publications focusing on these varieties, the support of adaptation studies in diverse viticultural regions, and the fostering of their perception as a millennia-old natural heritage are crucial for establishing sustainability in viticulture and ensuring the effective conservation of existing genetic resources. These strategies will significantly contribute to the economic valorization of local varieties, enhance the motivation of farmers to preserve and cultivate these varieties, and consequently mitigate genetic erosion. This study synthesizes significant research conducted on grapevine genetic resources and evaluates the current status of these resources within Türkiye, with a specific focus on the Karaerik grape variety, which holds socio-economic and cultural significance for the Erzincan region.

Keywords: Grapevine, genetic resource, Karaerik

Introduction

Grapes, among the myriad fruits generously provided by nature, distinguish themselves through their unique attributes. This assertion might initially appear ambitious; however, those who delve into the origins, evolutionary trajectory, rich diversity, and distinguished position of this ancient fruit among other global fruits can readily discern that these words are not an exaggeration but rather an expression of profound admiration for the grape (Anlı, 2006). Numerous exceptional qualities set grapes apart from other fruits. Acting as a vibrant living palette or an artist leaving its mark wherever it touches, the grape stands as one of the Earth's most prolific fruits. Throughout history, it has transcended its role as a fundamental food source and a sweet delicacy; both the fruit itself and its derived products have become an indispensable component of diverse cultures (Anlı, 2006). Indeed, the history of this ancient fruit is as old as human history itself, and it has consistently held a significant position in Anatolia (Doğan, 1996). Archaeological evidence suggests that the domestication process of *Vitis vinifera* commenced approximately 6000 to 7000 years ago in Southeastern Anatolia (the Asian part of Türkiye) or Transcaucasia, from where it disseminated via various routes to neighboring regions in Europe and North Africa (McGovern, 2003; Zohary et al., 2012), (Figure 1).

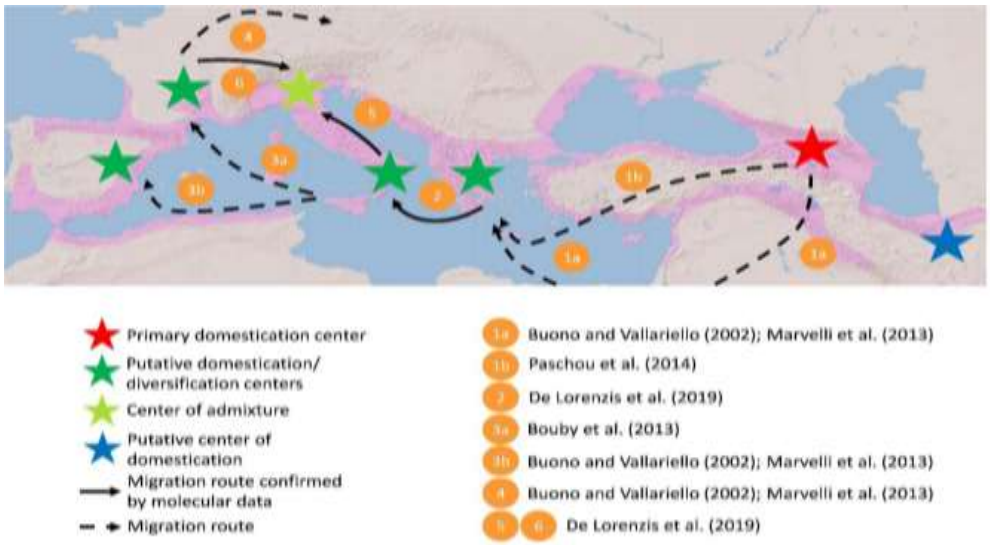

Figure 1. Possible migration and domestication route of grapevine (Grassi & De Lorensiz, 2021).

While the distribution areas of grapevine are generally limited to regions between 20°-52° north and 20°-40° south latitudes, grape cultivation can also be feasible in high-altitude areas near the equator in both the southern and northern hemispheres (Sağlam & Sağlam, 2018). Notably, the 35°-45° north latitude belts in the northern hemisphere stand out as zones where vineyard areas are concentrated. Türkiye's geographical location between the 36°-42° north latitude lines indicates that the country's geography is highly suitable for viticulture (Odabaş, 1980; Özden & Vardin, 2009). Furthermore, Türkiye is situated at the intersection of the Anatolian and Near Eastern gene centers, serving not only as a significant gene source for the world's important fruit species and varieties (İlim Serhat et al., 2017) but also lying within the world's most favorable climatic zone for viticulture (Taşkesenlioğlu et al., 2022). Research findings

corroborate that Türkiye is among the key gene centers for cultivated grapevine (*Vitis vinifera* L. *sativa*) and wild grapevine (*Vitis vinifera* spp. *sylvestris*) (Arroyo Garcia et al., 2006).

The discovery of grape-related shapes and reliefs in historical artifacts unearthed during archaeological excavations in various regions of Türkiye serves as a significant indication of the deep-rooted history of viticultural culture in these areas. Indeed, notable findings pertaining to viticulture from prehistoric periods have been encountered in excavations conducted across the country. For instance, archaeological work in Yozgat Alişar revealed a wine and beverage vessel in the form of a grape cluster, dating back to 1800-1600 BCE. Similarly, gold wine goblets and wine jugs dating to 2300 BCE were found in the royal tombs of Çorum Alacahöyük. Furthermore, grape motifs, wine vessels, and amphorae are frequently observed on ancient coins minted in settlements where viticulture flourished in the Aegean and Marmara regions (Çelik, 2011).Thanks to its cultural accumulation and favorable climate for viticulture, Türkiye ranked 7th in global grape production in 2023, with 3,400,000.00 tons of grapes produced on 377,848 hectares of land (FAO, 2024).

The cultivated grapevine (*Vitis vinifera* L. subsp. *sativa*) is widely grown globally and has evolved from the wild grapevine (*Vitis vinifera* L. subsp. *sylvestris* Gmel.) through millennia of natural or artificial hybridization and selection processes (Oraman, 1972; This et al., 2006). Southern Caucasus, the western Caspian Sea region, and Anatolia stand out as regions with the highest natural genetic diversity of grapevine. Türkiye is recognized as a significant gene center for both cultivated (*Vitis vinifera* L. *sativa*) and wild (*Vitis vinifera* spp. *sylvestris*) grapevine (ArroyoGarcia et al., 2006). Globally, approximately 10,000 grape varieties are reported to exist (Alleweldt, 1997). The high genetic diversity among *Vitis* species has been shaped by factors such as the sexual reproduction mechanism and spontaneous mutations (Vouillamoz & Grando, 2006; Myles et al., 2011; Margaryan et al., 2021). According to the Vitis International Variety Catalogue over 12,000 grapevine varieties have been recorded. (Maul & Töpfer, 2015). However, the number of economically cultivated varieties is limited, with producers predominantly favoring commercial varieties (Bouby et al., 2013). The rapid spread of the phylloxera epidemic has led to a significant reduction in grapevine genetic diversity. Additionally, the removal of old and local varieties with less desirable traits from vineyards over time has been another crucial factor contributing to the depletion of genetic resources (Tello et al., 2019; Kaya et al., 2023). The diversity observed in contemporary grapevine populations is a result of a protracted evolutionary process intertwined with human influence. Vavilov (1951) posited that the geographical regions where plants are cultivated should be the primary consideration in determining their origin. According to this approach, the region exhibiting the highest level of diversity for a plant species indicates its gene center, or place of origin (Fidan, 1985; Karataş & Karataş, 2018). For a long time, humankind primarily regarded soil, water, and air as fundamental natural resources; however, genetic resources have recently been included in this list. One of the elements that makes our planet unique within the solar system is its wealth of genetic resources. Genetic resources encompass the genetic material (genes) that directs the development of living organisms. The conservation of genetic resources is not a novel concept. For instance, the practices of collecting and storing seeds for the subsequent production cycle have a history as old as written records (Yalçın Dittgen, 2023).

The intersection of three of the world's seven major biogeographical regions (Mediterranean, Euro-Siberian, and Irano-Turanian) (Figure 2) renders Türkiye a remarkably rich country in terms of plant biological diversity (Muminjanov & Karagöz, 2019). Efforts towards the collection of plant genetic resources in Türkiye and the evaluation of their potential gained momentum in the early 20th century. Turkish scientist Mirza Gökgöl, during a period when the

global significance of genetic resources was not yet fully comprehended, contemporaneously with leading scientists of the era such as Vavilov, Harlan, and Zhukovsky, meticulously examined plant samples he collected from various regions of Türkiye in 1929, 1930, 1935, and 1939 (İşçi & Altındişli, 2023).

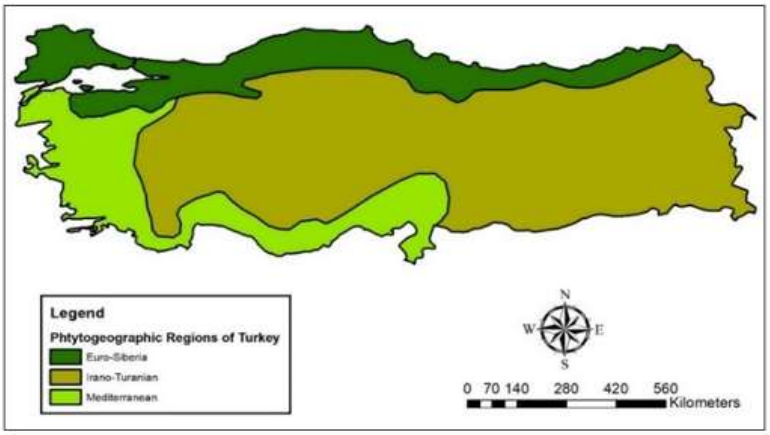

Figure 2. Three biogeographic regions in Türkiye (Aktürk & Güney, 2021)

The sustainability and advancement of viticulture, which holds a significant position within Turkish agriculture, are contingent upon the effective identification and conservation of the country's rich grapevine (*Vitis vinifera* L.) genetic resources. Türkiye possesses a remarkable genetic diversity in terms of the number of grapevine varieties and types. Traditionally, the diagnosis of these varieties has primarily relied on ampelographic characteristics (leaf, cluster, berry morphology, etc.) (Tekdal & Sarlar, 2016).

In Türkiye, the initial ampelographic studies aimed at the scientific identification of grapevine (*Vitis vinifera* L.) varieties were initiated in 1926 by Ahmet Hamdi. Ahmet Hamdi examined the viticulture of Ankara Province and the ampelographic characteristics of the grape varieties cultivated in this region, adhering to Moog's (1930) methodology (Çelik & Karanis, 1998). The fundamental criteria accepted for determining the ampelographic characteristics of grapevine include: the shoot tip type, the morphology of young and mature leaves, the characteristics of shoots and one-year-old branches, the color and pubescence status of organs, as well as the characteristics of the inflorescence, berry, and seed (Moog, 1930; Fidan et al., 1996).

Numerous valuable studies have been conducted in Türkiye in the field of ampelography. In another of the early ampelographic works, Oraman (1937) meticulously examined the viticulture of Ankara province and shared his findings in his publication titled "Viticulture of Ankara Province and the Ampelography of the Main Grape Varieties Grown in Ankara." This study holds the distinction of being the first scientific publication on ampelography in Türkiye. Kısakürek (1950) addressed the viticulture of the Southeastern Anatolia Region, describing the ampelographic characteristics of 27 distinct grape varieties and identifying their potential synonyms. Pamir (1956) investigated the viticulture of the Marmara Region, providing the ampelographic characterization of 21 commonly cultivated grape varieties in the area. İştar (1959), on the other hand, focused on the viticulture of the Mediterranean Region, specifically researching the vineyards of İçel (Mersin) and identifying 19 standard grape varieties in this region. In subsequent years, ampelographic studies intensified in various regions. Fidan I. and Fidan Y. (1976) investigated the viticulture of the Gülnar district, identifying 48 distinct grape

varieties and providing detailed ampelographic descriptions for 21 of them. Yalınkılıç (1996) examined the viticulture of Kahramanmaraş province, determining the ampelographic characteristics of 23 white and 10 colored grape varieties cultivated in the region. Ecevit and Kelen (1999), in their study on the viticulture of Isparta Province, ascertained that all varieties in the region belonged to the *Vitis vinifera* L. species. Kader and Ilgın (2002) investigated the phenological development of 5 seedless and 4 seeded grape varieties, introduced from the United States and France, in the collection vineyard of the Manisa Viticulture Research Institute. Odabaş et al. (2002) and Köse et al. (2004) determined the ampelographic characteristics of the Dişi Mercan, Erkek Mercan, Abalıkoca, Horoz Yüreği, Merzifon Karası, Amasyalık, Kırmızı Üzüm, and Kazova grape varieties grown in Amasya province, confirming that all these varieties belong to the *Vitis vinifera* L. species (Tekdal & Sarlar, 2016).

The most comprehensive initiative for the systematic collection and conservation of Türkiye's grapevine genetic resources is the project titled "Identification, Conservation, and Characterization of Turkish Grapevine Genetic Resources," launched in 1965 by the Tekirdağ Viticulture Research Institute, affiliated with the Ministry of Agriculture and Forestry of the Republic of Türkiye (İşçi & Altındişli, 2023). This project marked a significant milestone with the aim of securing the country's viticultural potential and genetic richness. Through this project, the National Collection Vineyard (field gene bank) currently located in Tekirdağ (Figure 3) conserves the largest number of grapevine genetic resources in the country, encompassing a total of 1539 accessions, including 1439 local types and 104 accessions of foreign origin, across a 90-decare area. In addition to the Tekirdağ Viticulture Research Institute, various levels of responsibility for the conservation of grapevine genetic resources are undertaken by field gene banks of some other institutes affiliated with the Ministry of Agriculture and Forestry (Table 1). For example, the Manisa Viticulture Research Institute conserves 1231 grapevine genetic resources, while the Pistachio Research Institute in Gaziantep maintains 112 accessions (Aykas et al., 2018).

Figure 3. National Collection Vineyard (Tekirdağ)

Table 1. Institutes Responsible for Grapevine Genetic Resources

Institute	Responsibility
Pistachio Research Institute, Gaziantep	Responsible for conservation at the regional level.
East Mediterranean Transitional Zone Agricultural Research of Institute, Kahramanmaraş	Responsible for conservation at the regional level.
Horticultural Research Institute, Erzincan	Responsible for conservation at the regional level.
Apricot Research Institute, Malatya	Responsible for conservation at the regional level
Viticulture Research Institute, Manisa	Responsible from conservation at second degree.
Viticulture Research Institute, Tekirdağ	Responsible from conservation at first degree.

In addition to the Viticulture Research Institutes, five other Research Institutes engaged in viticultural activities are also establishing their collections by conducting surveys within their respective areas of responsibility. As a result of the work carried out by these research institutes, the "Catalogue of Turkish Grapevine Genetic Resources," comprising photographs, inventory, and ampelographic information of 883 genotypes, was published in 2012 (Anonymous, 2021). Characterization information is available for 62% of the fruit and grapevine genetic material conserved in *ex situ* gene banks in Türkiye. When Turkish field gene banks are examined according to fruit groups, grapes rank first with a proportion of 28% (Aykas et al., 2018).

***Vitis vinifera* L. cv. Karaerik**

The Erzincan Plain is a prominent region in Türkiye in terms of plant biological diversity, and within this richness, the Karaerik grape variety has consistently held a central position in local grape production due to its superior fruit characteristics (Küpe et al., 2021). The indigenous Karaerik (Cimin) variety, which constitutes approximately 99% of the vineyards in Erzincan, has been cultivated using unchanged traditional methods since 800 BCE. Having developed a high degree of adaptation to the unique soil and climatic conditions of Erzincan, this variety requires fewer inputs (pesticides, fertilizers, etc.) compared to other grapes, thus presenting a sustainable production alternative (Taşkesenlioğlu et al., 2022).

Karaerik, a variety of *Vitis vinifera* L., holds the distinction of being the first variety registered as a "Registered Geographical Indication" under the name "Cimin üzümü" in the Turkish Patent Institute's list, with registration number 37 and dated June 13, 2001. It is particularly cultivated intensively in the Üzümlü (Cimin) district of Erzincan. Characterized by black, oblate-oval berries, Karaerik has an average berry weight of 3-4 grams, a seed count ranging from 1 to 4, medium skin thickness, firm berry density within the cluster, and an average cluster weight of 300-500 grams (Ekinci, 2008), (Figure 4). A distinctive bloom is present on the surface of its berries. The flavor profile exhibits a delicate balance between tart and sweet, accompanied by a unique aroma not found in other grape varieties (Karadeniz & Altınbilek, 2016).

The training system employed for the Karaerik grape variety is the baran system, a cultivation method unique to the region (Figure 4). The baran system is a distinctive growing technique where the grapevine trunk is buried underground, with its branches left above the soil surface, and the soil is mounded in a fishbone pattern. Due to its characteristic appearance and aroma, Karaerik grapes are in high demand in Erzincan city center and surrounding provinces. The harvest period extends from the beginning of September to the end of October (Köse & Güleryüz, 2009; Küpe, 2012, Özoğul & Küpe 2025). The number of individuals who do not

engage in viticulture or do not have grapes in their gardens is quite low in the district center and some villages. A significant portion of the produced grapes is consumed fresh, while a certain amount is used to make products such as molasses and fruit pulp. Furthermore, it is known that a substantial quantity of a local product called "saruç" is produced, although not officially recorded. Saruç is made by halving Karaerik grapes, placing walnuts in between, and then stringing them on a thread like prayer beads (Özoğul, 2024).

In 2024, 5488 tons of Karaerik grapes were produced in Erzincan across an area of 9279 decares (TÜİK, 2024).

Figure 4. Karaerik grape (left) and baran training system (right)

Conclusion

The identification and conservation of grapevine genetic resources are of critical importance for the advancement of viticulture, a significant component of Turkish agriculture. Local varieties, facing the risk of extinction due to ecological changes, improper cultivation practices, the proliferation of harmful organisms, and the insufficient maintenance of vineyard areas resulting from labor shortages caused by rural-to-urban migration, must be protected by their inclusion in genetic resource collections. Grapevine genetic resources, which encompass living materials harboring genes with current and future potential value for humanity, include propagation materials such as seeds, pollen, DNA, and vegetative material used in the conservation and multiplication of plant genetic diversity. Therefore, genetic resources hold strategic importance for sustainable viticulture. Ensuring the food and nutritional security of the present and future, safeguarding this genetic richness, a heritage of millennia, and transmitting it to future generations is a vital necessity. Particularly, ensuring the sustainability and conservation as genetic resources of unique varieties grown in limited geographical areas and adapted to local conditions can establish a crucial safeguard mechanism for the continuity of agricultural production against the unpredictable adverse effects of global climate change.

ABSTRACT

The escalating global population and the concurrent reduction in arable land are generating considerable challenges concerning food accessibility. Simultaneously, the increasing prevalence of health-related issues underscores the critical need for nutritious diets. Within this context, *Aronia melanocarpa* emerges as a promising fruit for both agricultural producers and consumers alike. Its adaptability to a wide range of climatic and soil conditions, coupled with its precocious fruit-bearing habit, ease of cultivation, and abundant content of polyphenols, minerals, and vitamins, positions it as an advantageous crop. Furthermore, its potential applications extend beyond fresh consumption into the cosmetic, pharmaceutical, and food processing sectors, suggesting a trajectory of increasing *Aronia melanocarpa* production in the years to come. A thorough investigation into the role of *Aronia melanocarpa* products and by-products in human nutrition and their contributions to overall well-being is therefore of paramount importance. Current scientific literature supports the premise that *Aronia melanocarpa*, characterized by its multifaceted functions and health-promoting attributes, holds substantial potential as a valuable component of a nutritious and health-conscious dietary regimen. This study endeavors to elucidate the positive attributes of *Aronia melanocarpa* from both horticultural and health perspectives, thereby aiming to enhance its recognition and public awareness.

Keywords: Aronia, berries, chokoberry, miracle fruit

Introduction

Due to its geographical location and diverse climatic characteristics, Turkey possesses a rich potential for various fruit species. Among these fruits, berry fruits have been experiencing increasing consumer interest both globally and within Turkey in recent years. While berry fruits are generally consumed fresh, their processing potential contributes to their growing significance in the industrial sector (Engin & Boz, 2018). The increasing production of berry fruits is significantly influenced by their positive effects on human health. Owing to their high levels of anthocyanins and phenolic compounds, berry fruits exhibit potent antioxidant properties. This enhances their importance in a balanced diet and their potential to protect the body against various oxidative stress factors, thereby contributing to their growing popularity (Tosun & Yüksel, 2003). Furthermore, the presence of minerals, which are essential for the healthy functioning and development of human physiology, is a well-established fact. The rich mineral content of berry fruits is also noteworthy in this context. Adequate consumption of berry fruits aids in the relaxation of the human body and the replenishment of lost minerals (Ağaoğlu, 2003). Among these berry fruits, aronia has recently become the most prominent, with rapidly increasing production and consumption volumes. Aronia (*Aronia melanocarpa*) is a species native to the eastern regions of North America and Canada, and it was introduced to Europe and Russia via return migrations in the late 19th century, subsequently being domesticated (Hardin, 1973; Strigl et al., 1995). Belonging to the Rosaceae family, aronia flowers in May, and its fruits are harvested between August and September. This long-lived berry fruit species, with an average lifespan of 15 to 20 years, develops in a shrub form and can reach heights of 2 to 3 meters Initially regarded solely as an ornamental plant, the cultivation of *Aronia melanocarpa* has gradually become widespread with the discovery of its resistance to low-temperature conditions (-30°C) and the superior health benefits of its fruits(Ara, 2002). This study closely examines *Aronia melanocarpa*, which has gained significant global demand in recent years due to its positive effects on human health and whose cultivation area is steadily increasing, with the aim of contributing to its recognition.

Systematics and Varieties of Aronia

Order: Rosales,

Family: Rosaceae,

Genus: Aronia

The three most well-known *Aronia* species are red-fruited (*Aronia arbutifolia* (L.) Elliot), purple-fruited (*Aronia prunifolia* (Marsh)), and black-fruited (*Aronia melanocarpa* (Michx) Elliot) But the most common and well-known of these three varieties is *Aronia melanocarpa*. (Hardin, 1973; Lehmann, 1982; Jeppsson, 2000). *Aronia melanocarpa*, introduced to the European continent in the early twentieth century, has been domesticated over time, leading to the development of standardized cultivars such as 'Albigowa', 'Ahonnen', 'Aron', 'Autumn Magic', 'Dabrowice', 'Egerta', 'Fertödi', 'Galicjanka', 'Hakkija', 'Hugin', 'Kurkumachki', 'Kutno', 'McKenzie', 'Morton', 'N', 'Nero', 'Nova', 'Rubin', 'Serina', 'Viking', and 'Wies' (Sidor & Gramza-Michałowska, 2019). Its suitability for mechanical harvesting, resistance to transportation processes, and storage potential contribute to this plant species being increasingly preferred by farmers.

Botanical Characteristics of Aronia

Aronia melanocarpa is a perennial shrub species native to North America. Typically reaching a height of 80 to 140 cm, its berries are approximately 6 mm in diameter and turn purplish-

black upon ripening. The plant's leaves, ranging from 3 to 7 cm in length, have a glossy and glabrous (hairless) surface. Its white-pink flowers bloom in May (Hardin, 1973; Scott & Skirvin, 2007). The flowers of *Aronia* are hermaphroditic, with 20 to 25 flowers arranged in a corymb (Figure 1). An average of 8 to 14 fruits develop from these flowers. The floral structure exhibits typical characteristics of the Rosaceae family, including 5 sepals, 5 petals, and a variable number of stamens (male reproductive organs) ranging from 10 to 30. The flowering period lasts approximately 20 to 25 days. *Aronia melanocarpa* is a self-fertile species and does not require a pollinator plant for fertilization (Poyraz & Engin, 2018).

Figure 1. Fruit and flowering period of Aronia

Climatic Requirements

While *Aronia melanocarpa* does not have specific climate requirements, temperate climate zones offer optimal growing conditions. Its high tolerance to frost enables its cultivation across a wide geographical range globally. This plant species exhibits significant resistance to low temperatures, and since its flowering occurs around May, after the risk of late spring frosts, the flowers and young fruits are protected from frost damage. Cultivation in areas with good sun exposure is particularly critical for productivity and fruit quality. Direct sunlight exposure on the fruits increases their sweetness, while shaded fruits tend to have a more pronounced tannic structure. Shoots under snow cover can withstand low temperatures down to -30 to -35°C. However, flower damage can occur if the temperature drops to -2.3°C during the flowering period (Anonymous, 2021; Kadıoğlu & Yılmaz, 2023).

Soil Requirements

Aronia melanocarpa is a perennial, shrub-forming berry fruit species with a high degree of adaptability, enabling its cultivation in various soil types and across a broad pH range. For optimal growth, well-drained, medium-textured soils rich in organic matter and with a pH value between 6.0 and 6.5 are recommended. The presence of organic matter not only supplies essential nutrients and moisture to the soil but also improves aeration and drainage, thereby creating favorable conditions for plant development (Trinklein, 2007; Hannan, 2013; Fidancı, 2015).

Water Requirements

The water requirement of *Aronia melanocarpa* is similar to that of many other fruit species. An annual rainfall of 500 to 600 mm is generally sufficient for plant development; however, the

distribution of rainfall, particularly during the vegetation period, is crucial. Water stress, which can negatively impact yield, typically occurs during dry periods in July and August, coinciding with the rapid fruit growth stage. Irrigation practices can be implemented using either drip irrigation or sprinkler systems, taking into account available resources and land conditions (Trinklein, 2007; Hannan, 2013; Fidancı, 2015).

Harvest and Yield

The fruits of *Aronia melanocarpa* develop in clusters, with each cluster typically containing 5 to 15 berries. The fruit ripening period varies between 90 and 110 days, depending on cultivar characteristics, the type of branch left after pruning techniques, and regional climatic conditions. Harvesting takes place when the fruits ripen, usually in late August or early September. During the ripening process, the berries exhibit softening, increased color intensity, sweetening, and an increase in berry size. However, fruits harvested before reaching full maturity have lower quality compared to those that ripen naturally on the shoots. *Aronia melanocarpa* berries can be harvested manually or using mechanical harvesting equipment (Figure 2). In the United States and Europe, aronia harvesting is commonly done with specialized machines similar in design to blueberry harvesters. At full yield capacity, an average of 10 kg of fruit per plant and 2 tons per hectare can be obtained from *Aronia* (Table 1), (Anonymous, 2021).

Table 1. Yield of *Aronia melanocarpa* by year

Year	kg/tree	kg/da
4	5	1000
5	6	1200
6-10	8	1600
11-15	10	2000
16-19	10	2000
20	10	2000

Figure 2. Hand (left) and machine harvesting (right) of aronia

Aronia in the World

Aronia, utilized for centuries by Native Americans for disease resistance (Moerman, 1998), naturally occurs in the Great Lakes region of northeastern North America and in the higher-elevation foothills and wetlands of the Appalachian Mountains to the south (Rossell & Kesgen, 2003). In 1910, in Russia, Ivan Mitschurin initiated breeding programs to obtain sweet-fruited varieties of North American *Aronia* species by hybridizing them with *Sorbus* and *Mespilus* species. These efforts resulted in the development of two distinct cultivars: 'Likernaja' and 'Desertnaja Michurina'. Following World War II, starting in 1946, *Aronia* cultivation began to spread across Europe and Russia (Walther & Müller, 2012). In the 1980s, *Aronia* cultivation commenced in Scandinavian countries such as Denmark and Finland, as well as in former Soviet Bloc countries including Bulgaria, Czechoslovakia, East Germany, Poland, and Slovenia (Walther & Müller, 2012). Poland accounts for approximately 90% of global aronia production. The United States (2500 tons) and Germany (1434 tons) follow Poland in production volume (Table 2). Commonly cultivated aronia varieties in different countries include 'Aron' in Denmark, 'Nero' in the Czech Republic, 'Viking' in Finland, 'Hugin' in Sweden, 'Fertödi' in Hungary, and 'Nero' and 'Viking' in Turkey (Strigl et al., 1995; Šnebergrová et al., 2014; Fidancı, 2015).

Table 2. Aronia production of some countries (Şahin & Erdoğan, 2022)

Country	Production Area (ha)	Production Quantity (tons)
Poland	6000	50000
USA	800	2500
Germany	583	1434
Türkiye	78	130
Finland	60	4

Aronia in Türkiye

Despite being a relatively new fruit species in Türkiye, aronia cultivation has been rapidly increasing in recent years. The initial studies on aronia in Türkiye were conducted in Yalova in 2012, followed by the establishment of the first orchards in 2014. Kırklareli currently ranks first in Turkey in terms of aronia production area, followed by Bursa and Manisa (Table 3).

Table 3. Aronia Production Area of Türkiye

Provinces	Trees(pieces)	Production Area (da)
Kırklareli	40.000	240
Bursa	23.500	141
Manisa	15.500	90
Kırşehir	8.000	48
Yalova	8.000	48
Çanakkale	7.000	42
Samsun	6.000	36
İzmir	5.000	30
Antalya	3.000	18
İstanbul	3.000	18
Ordu	3.000	18
Ankara	2.000	12

Aronia for Health

Aronia contains various bioactive components such as carbohydrates, organic acids, amino acids, minerals, vitamins, aroma compounds, and polyphenols (Kulling & Rawel, 2008). The chemical composition of *Aronia* fruit is influenced by various factors, including climatic conditions, soil structure, fruit maturity level, harvesting techniques, and storage conditions. Notably, its high polyphenol content distinguishes it significantly from other fruits (Tolić et al., 2017). Polyphenols are fundamental compounds that impart characteristic taste, aroma, color, nutritional value, and antioxidant properties to fruits (Robards et al., 1999). In recent years, polyphenols have garnered significant attention as promising candidates in the prevention of cardiovascular diseases. *Aronia melanocarpa* has garnered significant interest due to its exceptionally high polyphenol content, including anthocyanins and caffeic acid derivatives, and exhibits a wide range of health-promoting effects (Górska-Drabik et al., 2023; Bloch, 2025). Antioxidants play a critical role in safeguarding human health through their capacity to neutralize free radicals and prevent cellular damage. Consequently, antioxidant effects hold significant potential in alleviating conditions triggered by oxidative stress, such as cancer, infections, cardiovascular diseases, and diabetes. Within this framework, the phenolic compounds and other natural products found in high concentrations in aronia fruits, which exhibit potent antioxidant activity, contribute to the improvement of human health (Ren et al., 2022; Negreanu-Pirjol et al., 2023).

Due to its diverse bioactive components, vitamins, minerals, and particularly its high content of polyphenolic compounds, *Aronia melanocarpa* (chokeberry) and its leaves offer a broad spectrum of health benefits (Jurikova et al., 2017; Szopa et al., 2017). The primary polyphenolic constituents of *Aronia melanocarpa* possess potent antioxidant capacities, as well as anti-inflammatory, anticancer, antimicrobial, antiviral, antidiabetic, antiatherosclerotic, hypotensive, antiplatelet, and anti-inflammatory properties (Borowska & Brzóska, 2016; Kulling & Rawel, 2008; Jurikova et al., 2017; Szopa et al., 2017). Furthermore, polyphenols

are known to play a preventive role in the development of cancer and heart diseases (Oszmiański & Wojdyło, 2005; Jelska et al., 2024). Given the concentrated and consistent composition of bioactive compounds in standardized *Aronia* extract, which may not be present in sufficient amounts in *Aronia* juice and other preserves, its consideration for cardiovascular health is highly significant. The Oxygen Radical Absorbance Capacity (ORAC) value of aronia berries indicates that they possess the highest antioxidant capacity among the fruits and berries investigated to date (Figure 3), (Wang & Cao 1996; Kalt et al., 1999; Ehlenfeldt et al., 2001; Wang & Strecth., 2001; Moyer et al., 2002; Wu XL et al., 2004; Jakobek L et al., 2004).

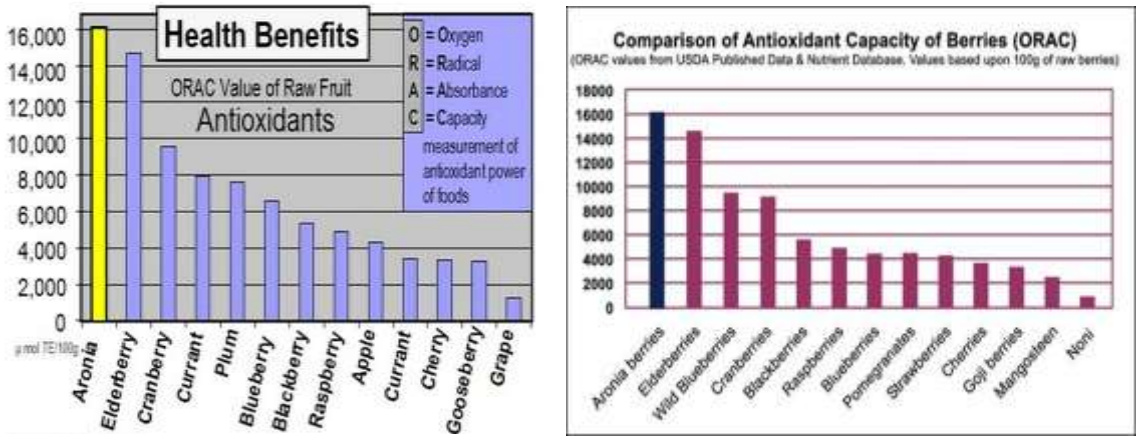

Figure 3. Antioxidant capacity, measured as ORAC, of various fresh berries and fruits including chokeberries

Usage Areas

Aronia berries have a wide range of applications, including fresh consumption, the fruit juice industry (consumed alone or as a cocktail with other fruit juices), the pharmaceutical industry (using dried fruit, flowers, roots, and leaves), dairy technology (aronia-flavored ice cream and milk), dried fruit technology (in fruit bread, buns, cakes, puddings, and pastries), the spice industry, fruit salads, jam, marmalade, and the canning industry, tea production (using dried leaves and dried fruit), and dietary menus. In breakfasts, aronia sauce or salsa can be used to add a distinctive taste and flavor to garnishes. Tea can be prepared from both the berries and the fresh leaves. Furthermore, aronia is a valuable fruit in the cosmetic industry, utilized in creams, soaps, skincare products, and as a raw material for fragrances. As a significant component of the Mediterranean diet, aronia is exceptionally rich in vitamins, minerals, and fiber (Figure 4), (Anonymous, 2021).

Figure 4. Some products of Aronia

Conclusion

The high adaptability of *Aronia* to diverse climatic and soil conditions, its early fruit-bearing characteristic (starting the year after planting), minimal cultural requirements, and favorable market value facilitate the expansion of its cultivation both globally and in Turkey. Its late flowering period, extending to the end of May, and long harvest season ensure fruit production even in regions prone to frost. The combination of its suitability for processing, rich bioactive content, and economic returns is driving increasing global interest in *Aronia*. Recognized for its positive effects on cancer, cardiovascular diseases, obesity, diabetes, and neurological disorders due to its high antioxidant content, aronia is gaining popularity as a "miracle fruit" in line with alternative medicine and natural nutrition trends. Consequently, it has become a sought-after fruit in the market for individuals seeking healthy foods, leading to a significant increase in its consumption. As the importance and health benefits of aronia are increasingly understood in Turkey, where its production and consumption are expanding daily, a rise in its use as fresh produce, dried fruit, and an additive in the food industry is anticipated.

ABSTRACT

Lavender (*Lavandula* spp.) is a semi-shrub and perennial plant with an economic life span of approximately 15 years. Especially its flowers and the essential oil obtained from them are commercially valuable. It is an important plant with analgesic, sedative, diuretic and anti-rheumatic properties, widely used in perfumery, cosmetics, pharmaceuticals, beekeeping and aromatherapy sectors, whose oil is at the forefront of the world essential oil trade. In its cultivation; it is a very important plant because it adapts to barren lands and requires low input costs (water, fertilizer), is important in terms of rural tourism with its visual richness during the flowering period and contributes to both local and national economy by offering new job opportunities. It is a plant that can be easily grown in most regions of our country in terms of its flowering between May and August, its resistance to drought, heat and cold. In addition to the above-mentioned advantages of lavender cultivation, it has the quality of being used as bee pasture due to its adaptability to climate and soil conditions, preference by bees, flowering period, life span, etc. In some regions, it is seen that lavender honey is among the preferred products among visitors due to the fact that beekeeping is also practiced in lavender gardens used for tourism purposes. Since lavender is a medicinal and aromatic plant, bees fed from lavender gardens are likely to gain resistance against diseases and pests. Producers who practice beekeeping close to lavender gardens offer alternatives to utilize lavender products to increase bee health and welfare in the hive.

As a result, the ease of lavender cultivation and the wide range of uses of its products, the economization of barren areas, the possibility of creating an additional source of income as bee pasture, and the possibility of being beneficial in bee welfare and health in the hive clearly show that lavender has an important potential as a bee pasture.

Key words: *Lavandula* spp., beekeeping, nutrition, essential oil, cultivation

LAVANTANIN ARI MERASI OLARAK KULLANILMA POTANSİYELİNİN DEĞERLENDİRİLMESİ

ÖZET

Lavanta (*Lavandula* spp.), yaklaşık olarak 15 yıllık ekonomik ömre sahip, yarı çalımsı ve çok yıllık bir bitkidir. Özellikle çiçekleri ve bunlardan elde edilen uçucu yağı ticari açıdan değerlidir. Dünya ucu yağ ticaretinde, yağı ön sıralarda yer alan, parfümeri, kozmetik, ilaç, arıcılık ve aromaterapi sektörlerinde yaygın kullanılan, analjezik, sedatif, diüretik ve anti-romatizmal özellikleri bulunan önemli bir bitkidir. Yetiştiriciliğinde; kıraç arazilere uyum sağlaması ve düşük girdi maliyetleri (su, gübre) gerektirmesi, çiçeklenme dönemindeki görsel zenginlik ile kırsal turizm açısından önemli, yeni iş olanakları sunması ile hem yerel hem de ulusal ekonomiye katkı sağlamasında dolayı oldukça önemli bir bitkidir. Mayıs -Ağustos ayları arasındaki çiçeklenmesi, kuraklığa, sıcak ve soğuğa dayanıklılığı bakımından ülkemizin çoğu bölgesinde kolaylıkla yetiştirilebilen bir bitkidir. Lavanta yetiştiriciliğinin yukarıda belirtilen avantajlarının yanında özelikle iklim ve toprak koşullarını uyumu, arılar tarafından tercih edilmesi, çiçeklenme periyodu, ömür uzunluğu vb. sebeplerden dolayı arı merası olarak kullanılma niteliği taşımaktadır. Bazı bölgelerde turizm amaçlı kullanılan lavanta bahçelerinde aynı zamanda arıcılık yapılması ile ziyaretçiler arasında lavanta balının en fazla tercih edilen ürünler arasında olduğu görülmektedir. Lavantanın tıbbı ve aromatik bir bitki olması nedeni ile lavanta bahçelerinden beslenen arıların hastalık ve zararlılara karşı direnç kazanma olasılıkları yüksektir. Lavanta bahçelerine yakın arıcılık yapan üreticilerin kovan içi arı sağlığı ve refahını artırmada lavanta ürünlerinden yararlanma alternatifleri sunmaktadır.

Sonuç olarak lavanta yetiştiriciliğinin kolaylığı ve ürünlerinin geniş kullanım alanına sahip olması, kıraç alanların ekonomiye kazandırılması, arı merası olarak ek gelir kaynağı oluşturması, kovan içi arı refahı ve sağlığında faydalı olma olasılığı lavantanın arı merası olarak önemli bir potansiyele sahip olduğunu açıkça göstermektedir.

Anahtar kelimeler: *Lavandula* spp., arıcılık, beslenme, uçucu yağ, yetiştiricilik

Giriş

Günümüzde hızla artan insan nüfusu, teknolojik gelişmeler ve değişen yaşam koşulları doğal kaynaklar üzerindeki baskıyı her geçen gün artırmaktadır. Doğal döngülerin insan müdahalesiyle bozulması, su, toprak ve bitki örtüsü gibi yaşamsal kaynakların giderek azalmasına ve ekosistemlerin dengesinin sarsılmasına yol açmaktadır. Bu durum yalnızca çevresel sorunları değil aynı zamanda gıda güvenliği ve sürdürülebilir tarımsal üretimi açısından da ciddi tehditler oluşturmaktadır (Sancak et al., 2013). Özellikle son yıllarda yaşanan küresel salgınlar ve iklim değişikliği tarımsal üretimin ve doğal kaynakların korunmasının ne denli hayati olduğunu bir kez daha gözler önüne sermiştir.

Bitkisel ve hayvansal üretim insan sağlığının ve yaşam kalitesinin temelini oluştururken bu iki alan arasındaki etkileşim sürdürülebilir tarımın başarısı için kritik öneme sahiptir. Tarımsal üretimde yalnızca ana ürün verimine odaklanmak yerine bitkilerin yan faydalarının ve atıklarının da değerlendirilmesi, entegre tarım uygulamalarının yaygınlaştırılması gerekmektedir. Özellikle arıcılık, hem ekosistem hizmetleri hem de ekonomik getirisiyle bu döngüde merkezi bir rol üstlenmektedir. Arılar bitkilerin tozlaşmasında üstlendikleri vazgeçilmez görevleri sayesinde hem doğal ekosistemlerin hem de tarımsal alanların biyolojik çeşitliliğinin korunmasına katkı sağlamaktadırlar (Balfour et al., 2013). Dünya genelinde tarımsal üretimin yaklaşık üçte biri arıların gerçekleştirdiği tozlaşmaya bağlı olup bu durumun arı popülasyonlarının sağlığının gıda güvenliği açısından ne kadar kritik olduğunu göstermektedir (Chu & Kemper, 2001). Türkiye sahip olduğu zengin bitki çeşitliliği, farklı iklim ve topografik özellikleriyle arıcılık açısından büyük bir potansiyele sahiptir (Avcı, 1993; Kumova & Korkmaz, 2000). Ülkemizde hem doğal vejetasyonda hem de kültürel tarımda kullanılan çok sayıda bitki türü, arıların beslenmesi ve arı ürünlerinin kalitesi açısından önemli fırsatlar sunmaktadır. Ancak mevcut potansiyelin tam anlamıyla değerlendirilebilmesi için arı merası olarak kullanılabilecek bitki türlerinin çeşitlendirilmesi ve sürdürülebilir tarım uygulamalarının yaygınlaştırılması gerekmektedir (Genç, 1990; Doğaroğlu & Genç, 1995). Arıların sağlıklı ve verimli bir şekilde faaliyet gösterebilmesi için kaliteli ve çeşitli arı meralarına ihtiyaç duyulmaktadır. Ancak geleneksel arı meralarının azalması, tarımsal monokültürlerin yaygınlaşması ve doğal vejetasyonun tahrip edilmesi arıların besin kaynaklarında ciddi daralmalara yol açmıştır. Bu nedenle alternatif ve sürdürülebilir arı merası bitkilerinin önemi giderek artmaktadır (Sorkun, 2008). Özellikle tıbbi ve aromatik bitkiler hem arıcılık hem de kırsal kalkınma açısından yeni fırsatlar sunmaktadır. Lavanta (*Lavandula* spp.) bu bitkiler arasında öne çıkmakta; uzun çiçeklenme dönemi, yüksek nektar ve polen verimi, kuraklığa dayanıklılığı ve farklı ekolojik koşullara uyum yeteneğiyle arıcılık için cazip bir seçenek oluşturmaktadır (Balfour et al., 2013). Lavanta tarlaları arılar için uzun süreli ve zengin bir besin kaynağı sunarken lavanta balı da kendine özgü aroması, yüksek antioksidan içeriği ve ekonomik değeriyle hem yerel hem de uluslararası pazarlarda ilgi görmektedir. Bunun yanı sıra lavanta yetiştiriciliği kırsal alanlarda ekonomik çeşitliliği artırmakta, istihdam olanakları yaratmakta ve sürdürülebilir kalkınma hedefleriyle uyumlu bir model sunmaktadır. Lavantanın endüstriyel ve tıbbi kullanımları da bu bitkinin stratejik önemini daha da pekiştirmektedir (Sancak et al., 2013; Balfour et al., 2013).

Bu çalışmada; lavantanın botanik özellikleri, ekolojik gereksinimleri, ekonomik ve endüstriyel önemi, arı merası olarak kullanımı, arıcılık ve bal kalitesi üzerine etkileri, lavanta balının özellikleri, lavanta ve arı sağlığı ilişkisi ile sürdürülebilir kalkınma ve kırsal turizm açısından önemi ele alınmıştır.

Lavantanın Botanik Özellikleri ve Yetiştiriciliği

Lavanta (*Lavandula* spp.) Ballıbabagiller (*Lamiaceae*) familyasına ait çok yıllık ve aromatik bir bitki olup, dünya genelinde 30'dan fazla türü bulunmaktadır. Ekonomik açıdan en önemli türleri *Lavandula angustifolia* (İngiliz lavantası), *Lavandula x intermedia* (lavandin), *Lavandula latifolia* (spike lavanta) ve *Lavandula stoechas* (İspanyol lavantası) olarak gösterilmektedir (Vairinhos & Miguel, 2020; Aprotosoaie et al., 2023). Yarı çalımsı özelikte olan lavanta; yaşlandıkça bitkinin alt kısımlarından başlayarak yukarıya doğru odunsu hale gelen çok sayıda dal gelişir. Bu dallar üzerinde karşılıklı sıralanmış 2 ile 6 cm uzunluğunda, oldukça kısa saplı ve gri-yeşil tonlarında yapraklar bulunur. Lavantanın yapraklarının her iki yüzeyi uçucu yağ içeren pamuksu tüylerle kaplıdır. Bitkinin çiçekleri 20-30 cm uzunluğundaki çıplak sapların uç kısmında bulunur. Çiçek başakları yaklaşık 15-20 cm uzunluğundadır. Her bir başakta ortalama 5 ila 6 çiçek kümesi yer alır ve bu kümelerin her birinde 5 ile 15 arasında çiçek bulunur. Lavantanın çiçekleri çok kısa saplı ve gri-mavi renklidir. Her bir çiçeğin iç yüzeyi parlak ve düz, dış yüzeyi ise tüylü olan yaklaşık 5 mm uzunluğunda çanak yapraklarla çevrilidir. Bu çanak yaprakların dış kenarlarında uçucu yağları depolayan, sapları tek hücreden oluşan çok sayıda küçük tüy bulunur. Lavanta küçük tohumlu bir bitki türüdür. Tohumları yaklaşık 2 mm uzunluğunda ve 1 mm enindedir. Uzunumsu oval şekilde olup rengi koyu ve parlak kahverengidir. Bulunduğu bölgenin iklimine bağlı olarak 80 ile 100 cm derinliğe kadar inebilen sağlam bir kazık kök sistemine sahiptir (Duarte & Souza, 2014; Giray, 2018; Pokajewicz et al., 2021; Pokajewicz et al., 2022).

Kökeni itibari ile Akdeniz iklim bitkisi olan lavanta, yetiştiriciliği başta Akdeniz ve Eğe bölgeleri olmak üzere son yıllarda ülkenin farklı yerlerinde talep gören bir bitki olmuştur. İlk tarımsal üretimi Isparta, Burdur ve Denizli illerinden yaygınlaştığı kabul edilmek ile birlikte özellikle Isparta ili ülke üretiminin %93'ünü karşılamaktadır (Güler & Korkmaz, 2018). Lavanta üretim maliyetlerinin düşük olması ve ihracatının uzun yıllar sorunsuz devam etmesi bu bitkinin ekonomik önemini artırmaktadır. Ancak son yıllarda bölge ülkelerinin pazara girmesiyle rekabet artmıştır.

Lavanta, sıcak iklimleri seven ve yüksek ısı ihtiyacı olan bir bitkidir. Ortalama 230-245 günlük gelişme sürecinde yaklaşık 3600 °C'lik bir sıcaklık toplamına gereksinim duyar. Soğuklara karşı da dirençlidir; çok yıllık gövdeleri -26 °C'ye kadar dayanabilir. Gelişim dönemi başından çiçek açımına kadar olan süreçte yağış bitkinin büyümesini desteklerken çiçeklenme döneminde ise sıcak, kuru ve güneşli hava koşulları uçucu yağ verimini artırır. Lavanta ışık seven bir bitki olup güney ve güneydoğuya bakan, bol güneş alan yamaçlarda daha iyi gelişim gösterir. Hafif yapılı, iyi havalanan, besin yönünden zengin ve genellikle kumlu, taşlı, alkali ya da nötr topraklarda sağlıklı gelişim gösterir. Asitli, ağır killi ve su tutan zeminlerde yetiştirilmeye uygun değildir. Topraktaki mevcut besin içeriğine göre gübreleme yapılır. Dallanmayı teşvik etmek için azot ilkbaharda verilir; fosfor ve potasyum ise sonbahar toprak işlemesi sırasında uygulanır. Lavanta hem tohumla hem de vejetatif yollarla (çelik, kök sürgünü vb.) çoğaltılabilir. Ancak tohumla çoğaltıldığında lavanta yabancı döllenmeye açık olduğu için ana bitkinin verim ve kalite özelliklerini kaybetme riski vardır. Çelikle çoğaltma daha uygun olup, çelikler sağlıklı ve bakımı yapılmış anaç bitkilerden genellikle Aralık-Şubat ayları arasında alınır. Fideler 1 yaşında iken sonbaharda genellikle Kasım-Aralık aylarında ve kırağı tehlikesi geçtikten sonra dikilmelidir. İlkbaharda dikim yapılacaksa, kuraklık başlamadan önce, Şubat-Mart aylarında gerçekleştirilmelidir. Lavanta, kuraklığa karşı dayanıklı bir bitkidir. Bu özelliği, derinlere inebilen güçlü kök sistemi ve yapraklarını kaplayan buharlaşmayı azaltıcı tüyler sayesinde kazanır. Sadece dikimin yapıldığı yıl yaz aylarında sulamaya ihtiyaç duyabilir. İlk yıl kök sistemi tam olarak gelişirse, sonraki yıllarda sulamaya gerek kalmaz. Ayrıca,

kuraklığa dayanıklı bir tür olması nedeniyle su kaynaklarının sınırlı olduğu bölgelerde de başarıyla yetiştirilebilir (Aprotosoaie et al., 2023). Lavanta dikildiği yıl çiçek verebilmekte bu nedenle Haziran, Temmuz ve Ağustos aylarında birkaç kez çiçek sürgünleri kesilerek bitkinin olumsuz etkilenmesi önerilir. 8. yılından sonra bitkide verim kayıplarını önlemek için gençleştirme budaması yapılır. Sıra aralarında ve bitki çevresinde hem mekanik hem de kimyasal yabancı ot mücadelesi yapılabilir. Hasat, elle ya da makineyle yapılabilir. En yüksek uçucu yağ verimi, bazı çeşitlerde çiçeklerin yarısı açtığında, bazılarında ise tam çiçeklenme sırasında elde edilir. Genellikle çiçeklenmenin %80'ine ulaşıldığında hasat gerçekleştirilir. Lavanta kuraklığa dayanıklı, kireçli ve iyi drene edilmiş topraklarda yetişebilme yeteneği, düşük su ihtiyacı ve hastalık-zararlılara karşı doğal direnci ile sürdürülebilir tarım uygulamaları için önemli bir alternatif tarımsal üründür (Aslancan & Sarıbaş, 2011; Katar et al., 2020). Bitkinin ömrü uygun bakım koşullarında 15-20 yıla kadar uzayabilmekte, fide ile çoğaltma yöntemiyle ekimden sonraki ikinci yıldan itibaren ekonomik verim alınabilmektedir. Ayrıca lavanta tarlalarının arıcılıkla entegre edilmesi hem bitki verimini hem de arı ürünlerinin kalitesini artırmaktadır (Tarhan et al., 2019).

2. Lavantanın Ekonomik ve Endüstriyel Önemi

Lavantanın ekonomik değeri; başta uçucu yağ olmak üzere kozmetik, ilaç, gıda ve turizm sektörlerinde yaygın kullanımından kaynaklanmaktadır. Lavanta ve lavandin uçucu yağları parfüm, farmasötik, kozmetik ve kişisel bakım ürünleri başta olmak üzere çok çeşitli endüstriyel alanlarda geniş bir kullanım yelpazesine sahiptir (Cavanagh & Wilkinson, 2002; Lesage-Meessen et al., 2015). Lavanta yağı içeriği ve kalitesi; tür, genotip, çevresel koşullar, agronomik uygulamalar ve işleme-depolama süreçlerine bağlı olarak değişkenlik göstermektedir (Mantovani et al., 2013; Golubkina et al., 2020). Lavanta yağı, antiinflamatuar (Hajhashemi et al., 2003; Cardia et al., 2018), antioksidan (Biesiada et al., 2008; Carrasco et al., 2016), antibakteriyel ve antimikrobiyal (Tardugno et al., 2018) gibi çeşitli biyoaktif özelliklere sahip olup aynı zamanda doğal ve güvenli bir herbisit olarak da değerlendirilmektedir (Ibanez, 2019). Tarihsel olarak lavanta uçucu yağı bedensel ve ruhsal arınma, uykusuzluk, kaygı, yorgunluk, sindirim sorunları, saç dökülmesi, baş ve diş ağrısı gibi pek çok rahatsızlığın giderilmesinde kullanıla gelmiştir (Sienkiewicz et al., 2011; Soltani et al., 2013; Gül et al., 2016; Stanev et al., 2016; Karakaya & Ceylan, 2023). Ayrıca lavanta yağı, antimikrobiyal özellikleri nedeniyle gıda koruyucu olarak da değerlendirilmektedir (Lis-Balchin, 2023). Lavandula angustifolia (İngiliz lavantası) yüksek kaliteli uçucu yağ üretimiyle öne çıkarken, Lavandula x intermedia (lavandin) ise daha yüksek yağ verimiyle ve dünya genelinde en fazla üretilen lavanta yağı olmasıyla dikkat çekmektedir. Lavander yağı, lavandin yağına kıyasla daha yüksek kaliteye sahip olup, pazarda yaklaşık 2–5 kat daha yüksek fiyatlarla satılmaktadır. Lavanta uçucu yağı, başta linalool ve linalil asetat olmak üzere, 1,8-sineol, ocimene, terpen ve kafur gibi monoterpenlerden oluşmaktadır. Linalool ve linalil asetat oranları özellikle L. angustifolia, L. x intermedia ve L. latifolia türlerinde yüksek olup, bu bileşikler lavanta yağının ticari değerini belirleyen ana unsurlardır (Aprotosoaie et al., 2017; Karık et al., 2017; Vairinhos & Miguel, 2020; Aprotosoaie et al., 2023). Uluslararası Standartlar Organizasyonu (ISO) ve çeşitli farmakopeler, lavanta uçucu yağında linalool ve linalil asetatın dengeli oranlarda bulunmasını ve kafur ile 1,8-sineol gibi bileşiklerin düşük seviyelerde olmasını kalite kriteri olarak belirlemiştir. Lavandin yağında ise kafur ve 1,8-sineol oranları daha yüksektir (ISO 8902:2009). Küresel ölçekte lavanta ve lavandin yağları, özellikle Avrupa pazarında büyük talep görmekte olup, ABD ve Asya pazarlarında da son yıllarda artan bir ilgi söz konusudur. 2018 yılında kozmetik sektörünün küresel hacmi 420 milyar dolara ulaşırken,

uçucu yağ ticaretinin değeri 5,44 milyar dolar olarak kaydedilmiştir. Dünya lavanta yağı üretiminde Bulgaristan ve Fransa başı çekmekte, bu iki ülke toplam üretimin üçte ikisini karşılamaktadır (Giray, 2018; Stanev et al., 2016; Koba et al., 2018). Lavandin yağı üretiminin ise %90'ı Fransa'da gerçekleştirilmektedir (Lesage-Meessen et al., 2015). Türkiye'de özellikle Isparta-Keçiborlu-Kuyucak bölgesi, lavanta üretimi ve lavanta turizmi açısından öne çıkmaktadır (Tarhan et al., 2019). Lavanta balı ise, yüksek piyasa değeri ve özgün aroması ile arıcılık sektöründe önemli bir yer tutmaktadır. Ayrıca lavanta, kırsal kalkınma ve kadın istihdamı açısından da önemli fırsatlar sunmaktadır (Tarhan et al., 2019). Lavanta yağı, dünya genelinde en çok ticareti yapılan uçucu yağlardan biridir. Kozmetik ve parfümeri sektöründe yaygın olarak kullanılmakta ayrıca sabun, şampuan, krem ve losyon gibi ürünlerin üretiminde de tercih edilmektedir. Lavanta yağı, antimikrobiyal, antifungal ve antioksidan özellikleriyle de dikkat çekmektedir (Chu & Kemper, 2001). Türkiye'de lavanta üretimi, özellikle son on yılda artış göstermiş ve lavanta tarlaları, kırsal turizmin gelişmesine de katkı sağlamıştır (Tarhan et al., 2019).

Lavanta ve Arıcılık İlişkisi

Arı merası, arıların nektar ve polen toplamak için kullandığı bitki topluluklarını ifade eder. Arı meralarının zenginliği ve sürekliliği, arı kolonilerinin sağlığı ve bal verimi açısından kritik öneme sahiptir. Lavanta tarlaları arı kolonilerinin gelişimi ve bal üretimi açısından önemli avantajlar sunar. Lavanta; iklim ve toprak koşullarına dayanıklılığı, bakım işlerinin kolaylığı, uzun çiçeklenme süresi, yüksek nektar verimi, arı sağlığı ve refahına katkısı, biyoçeşitliliğe katkısı, ek gelir sağlaması vb. faydalarından dolayı arı merası olarak yüksek potansiyele sahip bir bitki türüdür. Lavanta çiçeklerinin yüksek nektar içeriği, arıların enerji ihtiyacını karşılamada önemli bir kaynaktır. Ayrıca lavanta uçucu yağlarının arı sağlığı üzerinde olumlu etkileri olduğu, bazı parazit ve hastalıklara karşı koruyucu rol oynayabileceği bildirilmektedir (Chu & Kemper, 2001). Özellikle lavanta çiçeklerinin yoğun olduğu bölgelerde arıların koloni gelişimi ve bal verimi artmaktadır (Balfour et al., 2013). Lavanta, arıların beslenme sürekliliğini sağlayan uzun çiçeklenme dönemiyle, arı kolonilerinin yıl boyunca yeterli nektar ve polen bulmasına olanak tanır. Bu durum, özellikle ilkbahar ve yaz aylarında arıların koloni gelişimi ve bal üretimi açısından büyük avantaj sağlar (Aslancan & Sarıbaş. 2011). Lavantanın çiçeklenme süresi, arı sayısı ve arının çiçekte kalma süresi bakımından önemli bir arı merası bitkisi potansiyelindedir (Uçar, 2022). Lavanta balı; açık sarıdan kehribar rengine kadar değişen rengi, kendine özgü aroması ve yüksek antioksidan içeriği ile diğer ballardan ayrılmaktadır. Piyasa değeri diğer monofloral ballara göre daha yüksektir. Lavanta balı antimikrobiyal ve antiinflamatuar özellikler taşımakta, yüksek oranda flavonoid ve fenolik bileşikler içermektedir (Chu & Kemper, 2001). Çiçeklenme döneminde yoğun nektar salgılaması nedeniyle arılar için önemli bir besin kaynağıdır. Lavanta arıcılık faaliyetleri için ideal ortamlar sunmakta, lavanta balı kendine has aroması ve antioksidan içeriğiyle dikkat çekmektedir (Seraj et al., 2023). Lavanta balı özellikle Fransa ve İspanya gibi ülkelerde yüksek ticari değere sahip olup ülkemizde son yıllarda önem kazanmaya başlamıştır. Lavanta uçucu yağlarının, arıların bağışıklık sistemini güçlendirdiği ve bazı zararlılara karşı koruyucu etkiler göstermektedir. Özellikle *Varroa destructor* gibi parazitlere karşı lavanta yağının potansiyel biyolojik mücadele ajanı olarak kullanılma potansiyeline sahiptir (Balfour et al., 2013). Lavanta uçucu yağlarının arıların bağışıklık sistemini güçlendirdiği, bazı zararlılara karşı koruyucu etkiler gösterdiği ve kovan hijyenini artırdığı bildirilmiştir (Chu & Kemper, 2001).

Lavantanın Sürdürülebilir Kalkınma ve Kırsal Turizm Etkileri

Lavanta tarımı; kırsal kalkınma ve sürdürülebilir tarım uygulamaları açısından önemli fırsatlar sunmaktadır. Lavanta tarımı ve arıcılığın entegrasyonu; kadın istihdamı ve kırsal turizmde

artışa yol açmış, arıcılık ve bal üretiminin yanı sıra, lavanta turizmi ile bölgesel ekonomiye katkı sağlamıştır (Tarhan et al., 2019). Lavanta tarlaları, fotoğrafçılık, doğa yürüyüşleri ve bal tadım etkinlikleriyle turizme entegre edilmiştir. Kırsal alanlarda lavanta bitkisinden elde edilebilecek ekonomik ürünler arasında: lavanta balı, lavanta çayı, lavantalı Türk kahvesi, lavanta dondurması, lavantalı gözleme, lavanta kesesi, lavanta demeti, lavantalı bebek, lavanta yastığı, lavanta yağı, lavanta sabunu, lavanta kolonyası, lavanta kremi, lavanta reçeli, lavantalı kurabiye, lavantalı muhallebi olduğu belirlenmiştir (Ongun et al., 2017). Lavanta alanlarında yürüyüş aktiviteleri, atlı yürüyüş, bisiklet, su sporları, tırmanma, kanyon geçişi, golf, balıkçılık, foto safari vb. tuzim aktivitelerinin yapılabildiği bildirilmiştir (Bilgiç et al., 2016: Ongun et al., 2018).

Sonuç ve Öneriler

Lavantanın arı merası olarak kullanılması hem arıcılık sektörü için hem de kırsal kalkınma içi önemli katkılar sunma potansiyeline sahiptir. Lavanta tarımının yaygınlaştırılması, arı sağlığının korunması ve bal kalitesinin artırılması açısından büyük önem arz etmektedir. Lavanta tarlalarının arı merası olarak kullanımı; arı popülasyonunun ve bal veriminin artırılmasına katkı sağlamakta, arı sağlığını olumlu yönde etkilemekte, üreticiye ek gelir sağlamakta, lavanta tarımına dayalı ticari ürünlerin çeşitlenmesi vb. katkı sağlama potansiyeline sahiptir. Lavanta balı; yüksek piyasa değeri ve özgün aroması ile diğer monofloral ballardan ayrılmaktadır. Lavanta yetiştiriciliğine bağlı arı meralarının yaygınlaştırılması kırsal kalkınma ve sürdürülebilir tarım uygulamaları açısından da büyük önem taşımaktadır. Lavanta çok yönlü kullanım alanları, ekonomik değeri ve ekolojik adaptasyon yeteneği ile dikkat çeken bir bitkidir. Tıbbi, kozmetik, gıda ve tarım sektörlerinde geniş bir yelpazede değerlendirilen bir bitki olup aynı zamanda arıcılık faaliyetleri için de önemli bir kaynaktır. Bu özellikleriyle lavanta, sürdürülebilir tarım ve kırsal kalkınma açısından önemli bir potansiyele sahip olup konu ile ilgi daha kapsamlı bilimsel araştırmalara ihtiyaç bulunmaktadır.

ABSTRACT

This study, conducted under Bingöl ecological conditions, aimed to determine the effects of two different base fertilizer applications on silage quality of some silage corn varieties. Eight different silage corn varieties (30B74, 94MAY66, DKC6442, DKC6777, EVEREST, HIDO, P32W86 and TK6063) and two different fertilizer types (DAP and organomineral) were used in the experiment. The study was carried out according to the split-plot experimental design in randomized blocks with three replications. Dry matter (DM), pH, crude protein (CP), crude cellulose (CS), neutral detergent fiber (NDF), acid detergent fiber (ADF), crude ash (CA) and acid detergent lignin (ADL) were examined as quality parameters of silage. According to the research findings, the highest DM rate and the lowest CS, NDF and ADF rates were obtained from DAP fertilizer, while the lowest pH value was obtained from organomineral fertilizer. There was no statistical difference between fertilizer types in terms of CP, CA and ADL ratios. Among the silage corn varieties, the lowest CS, NDF, ADF, CA and ADL ratios were obtained from all varieties except 30B74, DKC6777 and TK6063. While no difference was observed between the varieties in terms of CP ratios, the lowest pH value was obtained from P32W86 variety and the highest DM ratios were obtained from 94MAY66 and EVEREST varieties. As

a result, it was determined that DAP fertilizer gave better results in terms of DM, CS, NDF, ADF ratios, which are important parameters of silage quality, and the other varieties except 30B74, DKC6777 and TK6063 varieties were also prominent in terms of the examined characteristics.

Keywords: Silage corn, dry matter, pH, crude protein, crude cellulose

TABAN GÜBRESİ UYGULAMALARININ BAZI SİLAJLIK MISIR ÇEŞİTLERİNİN SİLAJ KALİTESİ ÜZERİNE ETKİLERİ

ÖZET

Bingöl ekolojik koşullarında yürütülen bu çalışma, iki farklı taban gübresi uygulamasının bazı silajlık mısır çeşitlerinin silaj kalitesi üzerindeki etkilerini belirlemeyi amaçlamaktadır. Denemede sekiz farklı silajlık mısır çeşidi (30B74, 94MAY66, DKC6442, DKC6777, EVEREST, HİDO, P32W86 ve TK6063) ile iki farklı gübre türü (DAP ve organomineral) kullanılmıştır. Araştırma, tesadüf bloklarında bölünmüş parseller deneme desenine göre, üç tekrarlamalı olarak yürütülmüştür. Denemede silajın kalite parametreleri olarak kuru madde (KM), pH, ham protein (HP), ham selüloz (HS), nötr deterjanda çözünmeyen lif (NDF), asit deterjanda çözünmeyen lif (ADF), ham kül (HK) ve asit deterjanda çözünmeyen lignin (ADL) oranları incelenmiştir. Araştırma bulgularına göre en yüksek KM oranı ile en düşük HS, NDF ve ADF oranları DAP gübresinden alınırken, en düşük pH değeri organomineral gübreden alınmıştır. HP, HK ve ADL oranları açısından gübre türleri arasında istatistiksel bir farklılık görülmemiştir. Silajlık mısır çeşitleri arasında en düşük HS, NDF, ADF, HK ve ADL oranlarının 30B74, DKC6777 ve TK6063 çeşitleri dışında kalan diğer tüm çeşitlerden alındığı belirlenmiştir. HP oranları açısından çeşitler arasında bir farklılık gözlenmezken, en düşük pH değerinin P32W86 çeşidinden, en yüksek KM oranlarının da 94MAY66 ve EVEREST çeşitlerinden alındığı belirlenmiştir. Sonuç olarak silaj kalitesinin önemli parametreleri olan KM, HS, NDF, ADF oranları açısından DAP gübresinin daha iyi sonuçlar verdiği ve 30B74, DKC6777 ve TK6063 çeşitleri dışında kalan diğer çeşitlerin de incelenen özellikler açısından öne çıktığı belirlenmiştir.

Keywords: Silajlık mısır, kuru madde, pH, ham protein, ham selüloz

Giriş

Hayvancılığın sürdürülebilirliğinin sağlanmasında, kaba yem kaynaklarının güvenilir ve kaliteli bir şekilde temin edilmesi temel bir gereklilik olarak öne çıkmaktadır. Bu çerçevede, silaj, özellikle süt ve et üretimini artırmayı hedefleyen ruminant hayvan beslenmesinde hayati bir yem kaynağı haline gelmiştir. Silajlık mısır (*Zea mays* L.), yüksek düzeyde kuru madde verimi, sindirilebilirlik kapasitesi ve enerji içeriği gibi avantajlarıyla en yaygın tercih edilen silaj bitkileri arasında yer almaktadır (Yıldız ve ark., 2017; Karagöz, 2018).

Günümüz şartlarında hayvan beslenmesi açısından büyük bir öneme sahip olan silaj, dünya genelinde en çok mısır bitkisinden üretilmekte ve bu amaç doğrultusunda geniş ölçekte mısır tarımı yapılmaktadır. Mısır bitkisi, yüksek verimliliği, hayvanlar tarafından kolay sindirilebilir oluşu, lezzetli yapısı, yüksek kuru madde üretimi, yüksek enerji değeri, tamamen makinelerle üretilebilirliği ve işlenme kabiliyetinin son derece iyi olması gibi özellikleriyle dikkat çekmektedir. Bu unsurlardan dolayı, dünyada olduğu gibi ülkemizde de sıcak iklim tahılları arasında silaj üretimi için en çok tercih edilen bitkilerden biridir (Özata ve ark., 2012)

Türkiye İstatistik Kurumu'nun 2022 verilerine göre, 2021 yılında ülkemizde toplamda 5,2 milyon dekar alanda silajlık mısır ekimi gerçekleştirilmiş, bu ekimden 27,3 milyon ton üretim elde edilmiş ve dekar başına düşen verim 5208 kilogram olarak kaydedilmiştir (TÜİK, 2022).

Silajın kalitesi, hayvanların performansı ve yemden yararlanma düzeyi açısından önemli bir rol oynar. Kalite değerlendirmesi yalnızca kuru madde oranına bağlı kalmaz; aynı zamanda ham protein (HP), ham selüloz (HS), nötr ve asit deterjanda çözünmeyen lif içerikleri (NDF, ADF), ham kül (HK), asit deterjanda çözünmeyen lignin (ADL) ve pH gibi birçok kimyasal ve fiziksel parametre ile doğrudan ilişkilidir (Çaçan ve İşikten, 2019). Bu parametreler, silajın besin içeriğini ve fermentasyon kalitesini belirlemede etkili olur.

Bitkilerin ihtiyaç duyduğu anda ve uygun miktarda yapılan gübreleme, hem verimi hem de kaliteyi olumlu bir şekilde etkiler. Gübrenin tüm gelişim dönemlerinde bitkiyi desteklediği, bu etkinin ise kullanılan gübrenin türüne, dozuna ve uygulanma şekline bağlı olduğu belirtilmektedir (Çelebi ve ark., 2010).

Silaj kalitesini belirleyen en önemli tarımsal unsurlardan biri gübreleme stratejisidir. Özellikle tercih edilen taban gübresinin türü ile içeriği, bitkinin fizyolojik gelişimini ve bünyesinde barındırdığı besin maddelerinin dengesini önemli ölçüde etkileyebilmektedir. Son yıllarda geleneksel kimyasal gübrelerin yerine yaygınlaşan organomineral gübreler, toprak verimliliğini koruma yetenekleriyle birlikte silaj kalitesini artırma potansiyeline de sahip olduğu bilinmektedir.

İzmir'in ekolojik koşullarında gerçekleştirilen bir araştırmada, çeşitli mısır türlerinin silaj performansı, kalite ve verim değerleri bir yıl boyunca incelenmiştir. Araştırma sonuçlarına göre, kuru madde oranı %20,6-%29,0 arasında, ham protein oranı %6,16-%8,61 arasında, ham selüloz oranı %25,7-%33,4 arasında ve kuru ot verimi 2479-3608 kg/da arasında bulunmuştur. (Yıldız ve ark., 2017).

Kayseri ekolojik koşullarında NK Antria silajlık mısır çeşidi üzerinde yapılan bir çalışmada, farklı azotlu gübre dozlarının verim ve kalite özellikleri üzerindeki etkileri incelenmiştir. Araştırma kapsamında, farklı azot uygulamaları sonucunda mısırdan elde edilen ham protein oranının %6,88 ile %8,61, ham protein veriminin 65,25 ile 124,71 kg/da, ham kül oranının %5,78 ile %6,62, ADF oranının %18,69 ile %23,73 ve NDF oranının %43,98 ile %50,08 arasında değiştiği tespit edilmiştir. Ayrıca azot dozlarının artışıyla birlikte yeşil ot ve kuru ot veriminde de bir artış gözlendiği belirtilmiştir (Karagöz, 2018).

Akdeniz ekolojik koşullarında gerçekleştirilen ve iki yıl boyunca 14 farklı silajlık mısır çeşidinin verim ile kalite parametrelerinin değerlendirildiği araştırmada, ham protein oranı %8,80, ADF oranı %34,91, NDF oranı %59,7, ham kül oranı %7,2 ve KM oranı %61,7 olarak belirlenmiştir (Korkmaz ve ark., 2019).

Bingöl ekolojik koşullarda ana ürün olarak yetiştirilen silajlık mısır çeşitlerinin verim ve kalite parametrelerinin değerlendirildiği bir çalışmada, ham protein oranının %10,67 ile %12,50 arasında değiştiği, ham protein veriminin ise 230,5 ila 362,5 kg/da olduğu tespit edilmiştir. Ayrıca ADF oranı %18,53 ile %22 arasında, NDF oranı %26,21 ile %30,89 arasında, kalsiyum (Ca) oranı %0,28 ile %0,53 arasında, magnezyum (Mg) oranı %0,13 ile %0,16 arasında, fosfor (P) oranı %0,33 ile %0,36 arasında ve potasyum (K) oranı %2,40 ile %2,75 arasında olduğu tespit edilmiştir (Çaçan ve İşikten, 2019).

Orta Karadeniz'in ekolojik koşullarında bir yıl boyunca yetiştirilen silajlık mısır çeşitlerinin verim ve kalite özelliklerinin araştırıldığı çalışmada, ham protein oranları %5,01 ile %9,48 arasında değişirken, NDF oranları %42,40 ile %56 ve ADF oranları ise %29 ile %39,17 arasında farklılık göstermiştir (Yılmaz ve ark., 2020).

Bu araştırmada, farklı silajlık mısır çeşitlerinin silaj kalite parametreleri üzerindeki DAP ve organomineral gübre uygulamalarının etkileri incelenmiştir. Çalışmanın temel amacı, çeşit ve gübre etkileşimlerinin silaj kalitesine olan etkilerini ortaya koyarak yem üretiminde kalite optimizasyonuna katkı sağlamak olarak belirlenmiştir. Bu doğrultuda, bölge koşullarında silajlık mısır çeşitlerinin hem üretim miktarını hem de kalitesini artırmaya yönelik en uygun taban gübre türünün tespit edilmesi ve bu gübre türünün kalite üzerindeki etkisinin değerlendirilmesi hedeflenmiştir.

MATERYAL VE TÖNTEM

Materyal

Araştırma materyali olarak DKC6442, DKC6777, 94MAY66, Hido, Everest, 30B74, PR32W86 ve TK6063 olmak üzere toplam sekiz adet farklı silajlık mısır çeşidi seçilmiştir. Araştırma, 2020 yetiştirme sezonunda Bingöl Üniversitesi Ziraat Fakültesi Uygulama ve Araştırma sahasında gerçekleştirilmiştir. Uygulama sahası, Bingöl ili ile Genç ilçesi arasında yer almakta olup, coğrafi olarak 38° 48' 41.07" kuzey enlemleri ile 40° 32' 20.65" doğu boylamları arasında bulunmaktadır. Araştırma bölgesinin ortalama rakımı ise 1080 m'dir.

Çizelge 1. Araştırmanın yürütüldüğü döneme ait Bingöl ilinin 2020 yılı ile uzun yılların iklim verileri.

Bingöl Meteoroloji Genel Müdürlüğünden temin edilen veriler kapsamında, Bingöl iline ait aylık sıcaklık, toplam yağış ve nispi nem değerleri Çizelge 1'de sunulmuştur. İncelenen verilere göre, çalışmanın gerçekleştirildiği 2020 yılına ait aylık ortalama sıcaklık 13,8°C, toplam yağış 839 mm ve ortalama nispi nem oranı %51,9 olarak tespit edilmiştir. Ayrıca, 2020 yılı, uzun yıllar ortalaması (1990-2020) ile karşılaştırıldığında daha sıcak bir yıl olmuş; buna karşın yağış miktarı ve nispi nem oranı daha düşük kaydedilmiştir. Deneme alanının toprak özellikleri Çizelge 2'de sunulmuştur.

Çizelge 2. Araştırmanın yürütüldüğü deneme alanının toprak özellikleri.

Parametre	**Metot**	**Sonuç**	**Açıklama**
Organik madde (%)	Walkley-Black	1,09	Düşük
Kireç (%)	Kalsimetrik	0,41	Düşük
Saturasyon (%)	Su ile doygunluk	73	Killi-Tınlı
pH	Potansiyometrik	6,26	Hafif Asidik
Tuzluluk	(EC metre)	0.014	Tuzsuz
P (kg/da)	Olsen-Spektro	7,60	Orta
K (kg/da)	A.Asetat-Flame	18,27	Düşük

Metot

Tarla denemesi, ilkbahar döneminde gerçekleştirilen toprak hazırlığının ardından, 23 Haziran 2020 tarihinde kurulmuştur. Deneme, tesadüf bloklarında bölünmüş parseller deneme desenine göre üç tekrarlı olacak şekilde planlanmıştır. Bloklar arasındaki mesafe 1 metre, sıra arası mesafeler 70 cm, sıra üzeri mesafeler ise 12 cm olarak belirlenmiştir. Her bir parsel, 5 metre uzunluğunda ve 4 sıradan oluşacak şekilde düzenlenmiştir.

Mısır tarımında gübreleme uygulamaları genellikle saf madde bazında dekar başına 15-20 kg azot ve 8-12 kg fosfor oranlarında gerçekleştirilmektedir. Uygulanan toplam gübre miktarının ekim sırasında verilen kısmı, genellikle dekar başına ortalama 30 kg DAP gübresi ile eşdeğerdir. Bu çalışmada da ekim esnasında denemeye, dekar başına 30 kg DAP gübresi ile 30 kg organomineral gübresi uygulanmıştır.

Bingöl SÜTAŞ tarafından sağlanan organomineral gübre, Tarım ve Orman Bakanlığı tarafından onaylanmış bir üründür ve daima bu yetkili kurumdan temin edilebilmektedir. Organomineral gübrenin içeriği, %6 azot, %10 fosfor ve %6 potasyum olacak şekilde formüle edilmiştir. Ticari olarak "SÜTAŞ 6-10-6+10SO3+ME" adı ile bilinmektedir. Kimyasal DAP gübresinin (%18 N, %46 P_2O_5) içeriği ile organomineral gübrenin (%6 N, %10 P_2O_5, %6 K_2O) bileşimi arasında farklılıklar görülmektedir. Ancak, üretim açısından dekara uygulanacak 30 kg kimyasal DAP gübresinin mi yoksa ekim sırasında dekara verilecek 30 kg organomineral gübrenin mi daha faydalı olabileceği araştırılmıştır. Bitki boyu 70-80 cm olduğu zaman boğaz doldurma ve yabancı ot kontrolü işlemi yapılmıştır. Bu işlemler ile birlikte bu aşamada dekara 15 kg/da N gelecek şekilde Üre gübresi, üst gübre olarak tüm parsellere verilmiştir. Deneme alanı düzenli bir şekilde salma sulama sistemi ile sulanmıştır. Hasat, 06-20.10.2020 tarihlerinde silajlık mısır çeşitlerinin süt olum devrelerine ulaşma dönemleri esas alınarak yapılmıştır.

Silaj kalitesini belirleyen temel parametreler; kuru madde (KM), pH, ham protein (HP), ham selüloz (HS), nötr deterjanda çözünmeyen lif (NDF), asit deterjanda çözünmeyen lif (ADF), asit deterjanda çözünmeyen lignin (ADL) ve ham kül (HK) oranlarıdır. Hasat edilen bitkiler öğütüldükten sonra vakum torbalarına konularak 60 gün silajlanmış ve silaj süzüntülerinin pH'ı ölçülmüştür. Ardından, yeşil ot ve silaj örneklerinin kuru madde oranları belirlenmiş, elde edilen kuru örnekler öğütülerek Kjeldahl yöntemiyle azot ve ham protein oranları hesaplanmıştır (AOAC, 1990). NDF, ADF ve ADL analizleri Van Soest ve ark. (1991) metoduna göre, ham kül oranı ise 550 °C'de yakma yöntemiyle tespit edilmiştir. Deneme, "tesadüf bloklarında bölünmüş parseller deneme desenine" göre üç tekerrürlü, iki gübre çeşidi ana parsellere, silajlık mısır çeşitleri ise alt parsellere gelecek şekilde kurulmuş ve yürütülmüştür. Gübre çeşitleri ile silajlık mısır çeşitleri arasındaki benzerlik ve farklılıklar, $P \leq 0,05$ önem seviyesinde LSD testi kullanılarak değerlendirilirken, gübre x çeşit etkileşimi $P \leq 0,05$ önem seviyesinde Tukey testi aracılığıyla karşılaştırılmıştır.

Bulgular ve Tartışma

Çalışmada iki farklı taban gübresi uygulamasının silajlık mısır çeşitlerinin silaj kalitesine etkileri değerlendirilmiştir. İncelenen özelliklere ait varyans analiz sonuçları Çizelge 3'te verilmiştir. Gübre uygulamaları açısından ham protein, ham kül ve ADL değerlerinin, çeşit açısından ham protein değerinin, çeşit x gübre interaksiyonu açısından ise ADL değerinin istatistiksel olarak önemli olmadığı tespit edilmiştir. Geriye kalan diğer özellikler arasındaki farklılıkların istatistiksel olarak önemli olduğu görülmüştür.

Çizelge 3. İncelenen özelliklerin varyans analizi sonucu elde edilen F değerleri ve önemlilik kontrolü.

	SD	KM	pH	HP	HS	NDF	ADF	HK	ADL

*: P≤0.05, **: P≤0.01 düzeyinde önemlidir.

Silajlık mısır çeşitlerine ait silajın kalite özellikleri Çizelge 4'te verilmiştir. Çeşitler arasında en yüksek KM oranı EVEREST ve 94MAY66 çeşitlerinden, en düşük KM oranı ise DKC6777 ve TK6063 çeşitlerinden elde edilmiştir. İnteraksiyon açısından en yüksek KM oranı %36,1 ile DKC6442 çeşidinde DAP gübresinden elde edilirken, en düşük değer %26,6 ile DKC6442 çeşidinde ve organomineral gübreden elde edilmiştir. Gübre türleri bazında ortalama KM değerlerine bakıldığında ise DAP gübresinde %32,0, organomineral gübrede ise %29,2 olarak tespit edilmiştir. Mısır çeşitlerinin silajlarındaki ortalama KM değerleri, Yıldız ve ark (2017)'nın bulgularından (%20.6-29.0) yüksek iken, Başaran ve ark (2017)'nın belirlemiş olduğu değerler (%28.36-34.58) ile uyumlu olduğu tespit edilmiştir. Bu sonuçlar, özellikle DAP gübresinin KM oranını optimum seviyede tutmada etkili olduğunu ortaya koymaktadır.

Araştırma sonuçlarına göre, pH değerleri 3.62 ile 3.81 arasında değişim göstermiştir. Çeşitler arasında en yüksek pH değeri EVEREST çeşidinden, en düşük pH değeri ise P32W86 çeşidinden alınmıştır. Ortalama pH değeri DAP gübresinde 3.73, organomineral gübrede ise 3.70 olarak belirlenmiştir. İnteraksiyon açısından en düşük pH değeri organomineral gübre uygulamasında ve DKC6777 çeşidinde, en yüksek pH değeri de DAP gübresinde ve EVEREST çeşidinden alınmıştır. Çalışma kapsamında elde edilen tüm ölçümler ideal silaj pH aralığında (3.7-4.0) yer almış ve başarılı bir fermentasyon sürecinin gerçekleştiği tespit edilmiştir.

HP oranı, %5.06 ile %6.99 arasında değişiklik göstermiştir. Çeşitler ve gübre türleri arasında istatistiksel bir fark gözlenmezken, interaksiyon açısından en yüksek HP oranı organomineral gübre kullanılarak 30B74 çeşidinde (%6.99) elde edilirken, en düşük oran ise yine organomineral gübreyle TK6063 çeşidinde (%5.06) tespit edilmiştir. Özata ve ark. (2012) yaptıkları çalışmada HP oranını %5.2-9.06 aralığında tespit ederken, Başaran ve ark. (2017) %6.02-9.39 aralığında tespit etmişlerdir. Elde edilen bulgular, diğer araştırmacıların bulgularından nispeten düşük olmuştur.

OM: Organomineral, DAP: Diamonyum fosfat.

En yüksek HS oranı 30B74, DKC6777 ve TK6063 çeşitlerinden elde edilirken, geriye kalan diğer çeşitler HS oranı açısından en düşük değeri veren grubu oluşturmuştur. İnteraksiyon açısından da en yüksek HS oranlarının her iki gübre uygulamasında da DKC6777, 30B74 ve TK6063 çeşitlerinden alındığı görülmektedir. Ortalamalara bakıldığında DAP gübresinden daha düşük HS oranının elde edildiği belirlenmiştir. Bu değerler Çakmak ve ark. (2013)'ının tespit ettiği HS oranlarından (%18.76-21.76) yüksektir.

En yüksek NDF oranı 30B74, DKC6777 ve TK6063 çeşitlerinden alınırken, en düşük NDF oranı EVEREST çeşidinden alınmıştır. İnteraksiyon açısından bakıldığında NDF oranının %42.7-59.3 arasında değişim gösterdiği ve en düşük NDF oranının DAP gübresi uygulaması

ile EVEREST çeşidinden alındığı görülmektedir. Gübre türleri açısından DAP gübre uygulaması ile daha düşük NDF oranı elde edildiği görülmüştür. Elde edilen bulgular, Başaran ve ark. (2017)'ını tespit ettiği %50.53-60.40 ile Özata ve ark. (2012)'ının tespit ettiği %47.5-58.9 NDF değerleri ile örtüşmektedir.

En yüksek ADF oranı 30B74, DKC6777 ve TK6063 çeşitlerinden alınırken, en düşük ADF oranı geriye kalan diğer çeşitlerden alınmıştır. İnteraksiyon açısından bakıldığında ADF oranının %24.5-34.0 arasında değişim gösterdiği ve en düşük ADF oranının DAP gübresi uygulaması ile EVEREST çeşidinden alındığı görülmektedir. Gübre türleri açısından DAP gübre uygulaması ile daha düşük ADF oranı elde edildiği görülmüştür. Özata ve ark. (2012), yaptıkları çalışmada ADF oranını %24.1-40.9 değerleri arasında tespit ederken, Başaran ve ark. (2017) ADF oranını %31.30-37.47 değerleri arasında bulduklarını bildirmişlerdir. Yıldız ve Erdoğan (2018) yaptıkları çalışmada ADF oranını %30.47 olarak tespit etmiştir. Bu bağlamda elde edilen bulgular, literatürdeki diğer sonuçlar ile örtüşmektedir.

En düşük HK oranı DKC6442 ve EVEREST çeşitlerinden alınırken, geriye kalan diğer çeşitler en yüksek değeri veren grubu oluşturmuştur. Gübre türleri arasında bir fark görülmezken, interaksiyon açısından HK oranları %3.70-5.03 arasında değişiklik göstermiştir. En yüksek HK oranı DAP uygulaması ile 30B74 çeşidinden alınırken, en düşük HK oranı yine DAP gübre uygulaması için EVEREST çeşidinden ve organomineral gübre uygulaması ile DKC6442 çeşidinden alınmıştır. Alaca ve Parlak (2017) HK oranı için %6.77 değerini, Taş ve ark. (2017) %7.60 değerini bulduklarını bildirmişlerdir. Linn ve ark. (2006) silajlık mısırda yem kalitesi için ideal HK değerinin %6'dan düşük olması gerektiğini bildirmiştir. Bu bağlamda tüm çeşitlerin HK içeriklerinin %6'dan düşük olduğu görülmektedir.

Çeşitlerin ADL değerleri %3.13 ile %4.13 arasında değişiklik göstermiştir. En düşük ADL oranı HİDO çeşidinden, en yüksek ADL oranı ise DKC6777 çeşidinden alınmıştır. Gübre türleri ile interaksiyon önemsiz bulunmuştur. Elde edilen ADL değerleri, Taş ve ark. (2017)'ının bulduğu %3.81 değerinden düşük, Alaca ve Parlak (2017)'ın bildirdiği %2.62 değerinden yüksek olduğu tespit edilmiştir.

Sonuç ve Öneriler

Yapılan araştırmada, DAP gübresinin özellikle kuru madde oranı, lif içeriği (NDF, ADF) ve ham selüloz gibi kalite ölçütlerinde daha olumlu etkiler sağladığı ortaya konmuştur. Bu, DAP gübresinin hem silaj verimini artırmada hem de sindirilebilirliği iyileştirmede önemli bir avantaj sunduğunu göstermektedir. Öte yandan, organomineral gübrelerin de belirli kalite parametrelerinde kayda değer yararlar sağladığı tespit edilmiştir. Bu sonuçlar, organik madde açısından zengin olan bu tür gübrelerin toprak sağlığını koruma, kimyasal gübre kullanımını azaltma ve sürdürülebilir tarım uygulamalarına destek sağlama açısından önemli bir potansiyele sahip olduğunu vurgulamaktadır.

Kalite parametrelerinde en yüksek verimi elde etmek adına DAP gübresi, kısa vadede etkili bir seçenek olarak görülebilir. Ancak, uzun vadede toprak sağlığını korumak ve sürdürülebilirliği teşvik etmek için organomineral gübrelerin kullanımı öne çıkarılmalı, bu gübrelerin faydalarını artırmaya yönelik entegre gübreleme stratejileri geliştirilmelidir. Aynı zamanda, bitki çeşit seçiminin ve gübre stratejisinin bir arada ele alınması büyük önem taşımaktadır. Bu kapsamda, farklı iklim ve toprak şartlarında uzun süreli uygulamaların etkilerini değerlendiren kapsamlı araştırmalara ihtiyaç duyulmaktadır.

ABSTRACT

The study ascertained mortality risk management practices among poultry farmers in Enugu State, Nigeria. A multistage sampling procedure was used to select 60 poultry farmers. Data were collected using structured interview schedule and analyzed using mean score and presented using frequency count and percentage. Results revealed that mortality risk sources faced by farmers include; heat stress (95.0%) excessive cold/harmattan (91.7%) etc. Result also showed that farmers have a positive attitude towards mortality risks management practices in the area. Results revealed that majority (97.5%) of the farmers have high knowledge on mortality risk management practices. The results further revealed that the mortality risk management practices among poultry farmers include; clean water and proper ventilation to prevent health issues ($\bar{x}$=4.87) and monitor and control the feed quality of birds to reduce the risk of health issues ($\bar{x}$= 4.82). Lastly, major constraint faced by the farmers on mortality risk management practices include; costly insurance coverages ($\bar{x}$=1.95), fluctuations in feed prices ($\bar{x}$=1.88), inadequate facilities and technologies ($\bar{x}$=1.78) etc. Therefore, the study recommends that Therefore, the study recommends that Enugu State government and non-governmental organizations should support poultry farmers in making available affordable insurance policies that can help them to mitigate against mortality risk in their farms.

Keywords: Poultry, Farmers, Mortality, Risk, Management, Practices

Introduction

Agriculture remains the largest sector in Nigeria contributing an average of 24% to the nation's GDP over the past seven years (2013 – 2019). In addition, the sector employs more than 36% of the country's labour force, a feat which ranks the sector as the largest employer of labour in the country (Oyaniran, 2020). It is broadly divided into four sectors: crop production, fishing, forestry and livestock (poultry). Poultry production in Nigeria contributes to the solution of unemployment problems. It can open new jobs indirectly through the development of industries connected with poultry products such as feed industries, slaughtering industries, food freezing, packaging industries, and industries producing machines and technical tools necessary for poultry production. It can also be considered as one of the most important sources of cheap protein. (Wahyono & Utami, 2019). Poultry production is the art of raising birds domestically or commercially, primarily for meat and eggs. (Food and Agriculture Organization, (FAO)2021). Poultry production is a significant part of the global agricultural industry, providing a valuable source of protein and employment for millions of people worldwide. The growth of the poultry industry has been driven by increasing demand for poultry products, particularly in developing countries, as well as improvements in genetics, nutrition, and management practices.

However, poultry farming is subjected to various risks including production risks, market risks, financial risks, and biological risks such as infectious diseases. These risks can result in significant economic losses, reduced productivity, and negative impacts on animal welfare (World Organization for Animal Health (WOAH), 2021). Risk is an inherent feature of modern poultry production. When birds die prematurely, farmers lose the investment they made in acquiring and raising them, including the cost of feed, labor, and medication. Additionally, high mortality rates may result in a reduction in the supply of poultry products, leading to a decrease in revenue for farmers and potentially impacting the overall supply of animal protein. Nigeria has faced several challenges in poultry farming due to risks associated with the industry. These challenges include disease outbreaks, inadequate biosecurity measures, high cost of production, and limited access to finance. Limited access to credit facilities makes it difficult for poultry farmers to invest in necessary infrastructure and technology, impeding industry growth and modernization. (Igbokwe & Adebayo, 2020). In particular, the failure to rise up to this challenge to save the industry could lead to a serious reduction in poultry production and protein intake of the people. Risk management strategies play a crucial role in poultry farming to mitigate potential risks and ensure the overall success and sustainability of the industry. Implementing risk management strategies in poultry farming is essential for disease control and maintaining biosecurity. Another strategy is diversifying production systems, such as integrating poultry farming with other livestock or crop enterprises, which can reduce the dependency on a single production, thereby minimizing the risks associated with market fluctuations and disease outbreaks. (Kariuki & Kaguongo, 2019).

Also, risk management strategies are crucial to mitigate the impact of market volatility and price fluctuations on poultry farming. Effective risk management practices are crucial for poultry farmers to mitigate the effects of various risks associated with the enterprise. According to Adeyonu et al (2021) who conducted a study in south-west, Nigeria, production risk, financial risk, and human risk were perceived by farmers as the most common risks in the poultry business. Farmers have adopted disease prevention and financial management strategies to mitigate these risks. The study also found that years of experience in poultry business, value of poultry, and production risk are important determinants of disease prevention and financial management strategies adopted by the respondents.

In a report by the Enugu State Ministry of Agriculture, it was stated that the poultry industry in the state provides employment opportunities for a large number of people and generates substantial income for farmers and the government (Enugu State Ministry of Agriculture, 2019). Despite this contribution of poultry farming, these risks against it cannot be overemphasized. Poultry farming has significant potential in Enugu State. The state is located in the southeastern part of Nigeria and has a population of over 3.2 million people. The state's climate is suitable for poultry farming, and there is a high demand for poultry products in the state and its neighboring states. Risk in poultry production poses significant dangers to investments in the industry and the degree of mortality risk in poultry farms in Enugu State varies depending on several factors such as the type of poultry operation, management practices, disease prevalence, and environmental conditions. However, mortality rates in poultry production in Enugu State can be high, with some reports indicating mortality rates of up to 30% in some farms. (Enugu State Ministry of Agriculture, 2019). Few studies on poultry management practices have recently been conducted. For instance, Eze et al. (2017) ascertained biosecurity measures used by poultry farmers in Enugu State, Nigeria and Onoerigho et al. (2014) examined socio-economic traits of small-scale poultry farmers and level of adoption of poultry management practices before and after training in Enugu State, Nigeria Amongst these studies, none seemed to have researched on management practices among poultry farmers as it relates to mortality risk in Enugu State, Nigeria. There seems to be a research gap in Enugu State on mortality risk management practices among poultry farmers.

Objective of the study

The overall objective of the study was to ascertain the mortality risk management practices among poultry farmers in Enugu State, Nigeria. Specifically, the study sought to:

i. ascertain the mortality risk sources in poultry farms;
ii. ascertain attitude of the farmers toward mortality risk;
iii. ascertain farmer's knowledge level on mortality risk management practices;
iv. ascertain information needs of poultry farmers on mortality risk management practices;
v. identify mortality risk management practices among poultry farmers; and
vi. identify constraints to mortality risk management practices.

Materials and methods

Study area

The study was carried out in Enugu State, Nigeria. Enugu State is in the southeastern region of Nigeria. It is located on a Latitude of 6° 27' 9.60" N and Longitude 7° 30' 37.20., The state has a total land area of approximately 7,161 square kilometers and is bordered by Benue State to the north, Kogi State to the northwest, Anambra State to the west, Abia State to the south and Ebonyi State to the east (Britannica, 2022).). There are various types of poultry farms in Enugu State, ranging from small-scale backyard farms to large-scale commercial farms. The poultry farms in the state produce a variety of poultry products such as eggs, meat, and feathers. In terms of tourism, Enugu State has several attractions, including the Ngwo Pine Forest and Waterfall, the Nike Lake Resort, the Awhum Waterfall, and the Ezeagu Tourist Complex. These natural attractions and cultural sites draw tourists from within and outside the country and contribute to the state's economy. There are many hotels and eateries in Enugu State that have given poultry businesses good patronage by sourcing their poultry products from

local poultry farms in the state.

Population and sampling procedure

The population for this study comprised all poultry farmers in Enugu state, Nigeria. A multistage sampling procedure was used in selecting respondents. In the first stage, two local government areas (Enugu-South and Nsukka) were purposively selected for the study because of their prominence in poultry production. In the second stage, three town communities were selected using purposive sampling technique in each local government area because of the availability of poultry farms in those areas. In the third stage, ten poultry farmers were selected using snowball sampling technique giving a total number of 60 farmers for the study. Data for the study were collected using structured interviews schedule. Mortality risk sources in poultry farms. Respondents were asked to tick from a list of eleven possible mortality risk sources and respondents were asked to tick either Yes (1) or No (0). Attitude of farmers toward mortality risk management practices in poultry farming. To achieve this a list of fifteen positive and negative attitude questions was given on a five-point Likert-type scale of strongly agreed (5), agreed (4), undecided (3), strongly disagreed (2), and disagreed (1). The values were added up to obtain a mean score of 3.0. Any variable with a mean score of equal and greater than 3.0 was regarded as positive attitude towards mortality risk management practices while any variable with a mean score less than 3.0 was termed as negative attitude towards mortality risk management practices. Knowledge on mortality risk management practices. To achieve this, a list of 21 positive and negative knowledge questions was given to the respondents. The respondents were asked to tick yes or no against each response option. Every correct response attracted a score of 1 while incorrect responses attracted a score of 0. against the questions. The correct answers from the twenty-one knowledge questions provided used to categorize the knowledge level thus: 0 (no knowledge), 1-7 (low knowledge) 8-14 (moderate knowledge) and 15 -21(high knowledge). Information needs among poultry farmers on mortality risk management practices. To achieve this, a list of perceived information needs was presented to the farmers to indicate either yes or no. Mortality risk management practices employed by the respondents. To achieve this, a list of twelve mortality risk management practices and respondents were asked to indicate using a five-point Likert-type scale of strongly agreed (5), agreed (4), undecided (3), strongly disagreed (2), and disagreed (1). The values were added up to obtain a mean score of 3.0. Any variable with a mean score of equal and greater than 3.0 was regarded as a major mortality risk management practice while any variable with a mean score less than 3.0 was termed as not a mortality risk management practice. Constraints to mortality risk management practices faced by the respondents. This was measured by asking the respondents to indicate from a list of possible constraints encountered in mortality risk management practices on a three-point Likert-type scale of no constraint, low extent, and no extent with nominal values of 0, 1, and 2 respectively. The values were added to obtain a mean score of 1.0. Any variable with a mean score of equal and greater than 3.0 was regarded as a major constraint to mortality risk management practice while variables with a mean score less than 3.0 was termed as minor constraints to mortality risk management practices.

Data analysis

Variables in objectives 1,3, and 4 were presented using frequency count percentage and mean score. Variables in objectives 2,5 and 6 were analyzed using mean scores. IBM-SPSS Statistics version 21.0 was used for data analysis.

Findings and Discussion

Mortality risk sources in poultry farms

Results in Table 1 show that mortality risk sources include: heat stress (95.0%), excessive cold/harmattan (91.7%), physical injuries while handling the bird (70.0%), contaminated feeds (30.0%), and floods (10.0%). This shows that heat stress is a major environmental condition that negatively impacts the well-being of various avian species. In chickens, heat exposure is associated with disruption of metabolic and immune system function and an increased risk of mortality. Techniques to mitigate exposure to high temperatures have been discussed in depth, and most research suggested that the root cause of heat stress-induced physiological aberrations is alterations in the stress response and reduced food intake. (Bohler et al 2021).

Furthermore, excessive cold or harmattan can also pose a significant risk to birds. Cold weather can cause birds to use more energy to maintain their body temperature, which can lead to weight loss and decreased immune function. Additionally, cold weather can cause frostbite and other physical injuries. Birds use more energy to maintain their body temperature in cold weather, which can lead to weight loss and decreased immune function. It's important for bird owners to take measures to protect their birds from these environmental stressors. This can include providing adequate shelter, ensuring access to clean water and nutritious food, and implementing proper vaccination programmes.

Table 1: Mortality risk sources in poultry farm

Mortality risk sources	Frequency(f)	Percentage(%)
Zoonotic diseases	21	35.0
Allergies	21	35.0
Excessive cold/harmattan	55	91.7
Physical injuries while handling birds	42	70.0
Heat stress	57	95.0
Floods	6	10.0
Predators	30	50.0
Parasitic infestations	40	66.7
Poor water and feed management	22	36.7
Contaminated feeds	18	30.0
Improper vaccination programs	40	66.7

Attitude of farmers towards mortality risk management practices in poultry farming

Data in Table 2 reveal the attitude of farmers towards mortality risk management practices which include: Proactive approach to risk management is more effective than a reactive approach ($\bar{x}$ =4.80), risks of poultry farmers are managed with proper risk management strategies ($\bar{x}$ = 4.77), risks in poultry farming can be reduced with proper training and knowledge ($\bar{x}$ =4.77), risk management is an essential part of a successful poultry farming ($\bar{x}$ =

4.75), open to learning about new risk management strategies to improve ability to manage risks in poultry farm ($\bar{x}$ = 4.73), potential benefits of poultry farming outweigh the risk ($\bar{x}$ =4.57), confident to identify and manage risk in poultry farm ($\bar{x}$ =4.65), considering the potential risks in poultry farming when making decisions ($\bar{x}$=4.52), taking on higher levels of risk in poultry farming can lead to higher rewards ($\bar{x}$=4.52) etc. The findings reveal that the respondents have a positive attitude towards mortality risk management practices in their poultry farming. This indicates a generally positive outlook on risk management in poultry production. Respondents' inclination to perceive risks as manageable and rewards as outweighing risks reflects an optimistic mindset. The willingness to invest time, and resources, and collaborate for risk mitigation suggests a proactive approach. Belief in training, knowledge, and proactive strategies underscores confidence in risk reduction.

Farmer's believe that proactive risk management is more effective than a reactive approach. this is because a proactive approach involves identifying and addressing potential risks before they escalate into significant problems. This helps prevent or minimize negative consequences, such as disease outbreaks or production disruptions, which is more effective and less costly than reactive measures taken after the damage has occurred. Poultry farmers, like any other `farmers, prefer a proactive approach over a reactive approach because it involves planning for the future and taking into consideration potential problems that may arise. This can help prevent issues before they occur and save time, costs, and effort in the long run. On the other hand, a reactive approach involves managing issues as they arise, without appropriate planning or arrangements. **(**Sikdar, 2019). The risks of poultry farmers are managed with proper risk management strategies and Risks in poultry farming can be reduced with proper training and knowledge. According to Adeyonu et al. (2021), poultry farmers in South-West, Nigeria perceive production risk, financial risk, and human risk as the most important risks in their business. Farmers have adopted disease prevention and financial management strategies to mitigate the effects of various risks.

Table 2: Respondent's attitude towards mortality risk in poultry farming

Attitude statements	Mean	Std deviation
Risks in poultry farming are unavoidable	4.60	1.04
The potential benefits of poultry farming outweigh the risk	4.57	0.62
Risks of poultry farmers are managed with proper risk management strategies	4.77	0.43
Comfortable taking risks in poultry farming	4.37	0.74
The risks of poultry farming are too high to manage	3.73	1.45
Always willing to invest time and resources into risk management strategies to mitigate risks on my farm	4.68	0.68
Risks in poultry farming can be reduced with proper training and knowledge	4.77	0.56
Confident in identifying and managing risk on my farm	4.65	0.61
The risks of poultry farming are unpredictable and can be difficult to manage	4.13	1.14
Open to learning about new risk management strategies to improve the ability to manage risks	4.73	0.45
Risk management is an essential part of successful poultry farming	4.75	0.44
Always consider the potential risks in poultry farming when making decisions	4.52	0.60
A proactive approach to risk management is more effective than a reactive approach	4.80	0.63
Willing to collaborate with other farmers to manage risks in my farm	4.37	1.09
Taking on higher levels of risk in poultry farming can lead to higher rewards	4.52	1.03

Knowledge level on mortality risk management practices

Figure 1 shows that the majority (97.5%) of the respondents have high knowledge about mortality risk management practices while 2.5% have moderate knowledge about mortality risk management practices, this result showed that the majority of the poultry farmers in the study area are highly knowledgeable about mortality risk management practices. The majority of respondents exhibited a remarkably high level of knowledge in various critical aspects of poultry farming, including risk management, biosecurity, nutrition, technology, disease prevention, and business considerations. However, little proportion of respondents showed moderate knowledge levels, particularly in terms of local regulations and reproductive efficiency. Poultry farmers may have a high level of knowledge of mortality risk management practices because it is essential for the success of their business. Mortality risk management practices help to reduce the incidence of disease, morbidity, and mortality in poultry, which can have a significant impact on the profitability of the farm. By understanding and implementing effective mortality risk management practices, poultry farmers can improve the health and

productivity of their birds, leading to increased revenue and reduced losses. (Otunaiya et al. 2020)

In addition, there may be various resources available to poultry farmers to help them learn about mortality risk management practices. For example, government agencies, industry organizations, and educational institutions may offer training programs or expert consultations to help poultry farmers improve their knowledge and skills in this area. By taking advantage of these resources, poultry farmers can increase their knowledge and understanding of effective mortality risk management practices.

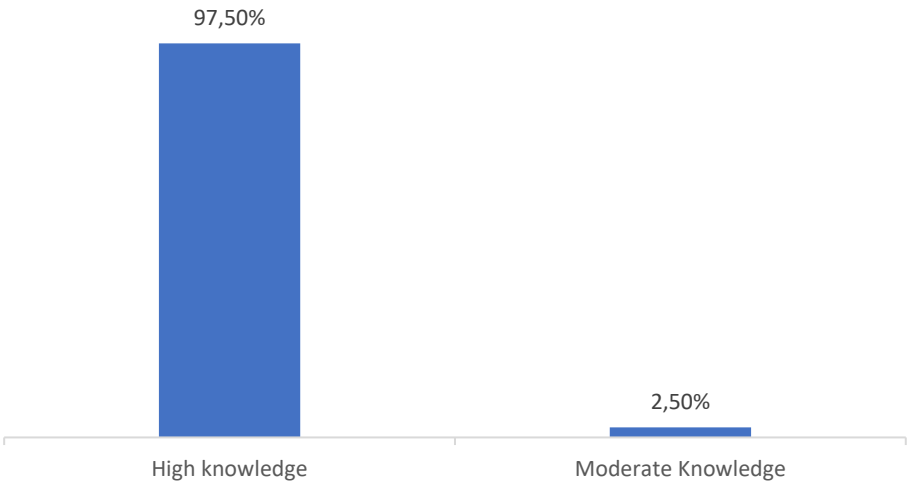

Fig 1: knowledge level of the farmers on mortality risk management practices

Information needs on mortality risk management practices

Data in Table 7 indicates that the major information needs of the respondents includes: effective risk management strategies (100.0%), mitigating the risks associated with disease outbreaks (100.0%), biosecurity measures to minimize disease transmission (100.0%), management and control parasite infestations (100.0%), ensuring the quality and safety of the feed provided to your birds (100.0%), preventing and management errors that can lead to higher mortality rates(100.0%), strategies to minimize the impact of extreme weather conditions on your poultry (98.3%), feed quality and formulations necessary (98.3%), identifying and assessing risks specific to your farm (96.7%), predator control measures to protect your birds (96.7%), disease surveillance systems important (81.7%), predator and wildlife management relevant (78.3%) and genetic management strategies to reduce vulnerability to diseases (75.0%) etc.

The majority (100%) of the farmers are interested in information on strategies to manage risks effectively in their poultry operations. This includes a wide range of risk factors, from disease control to biosecurity and more. All (100%) of the respondents are highly concerned on information regarding mitigating the risks associated with disease outbreaks in their poultry flocks. This is a critical aspect of poultry farming and the same 100% of respondents are interested in information on implementing biosecurity measures to minimize disease transmission within their poultry operations. Biosecurity is fundamental to prevent diseases from entering and spreading in the farm. The Food and Agriculture Organization (FAO) 2020),

supports and advises countries to improve their animal health surveillance and risk assessment capabilities by reviewing and publishing up-to-date disease information, including global disease situation updates, qualitative risk assessments for high-impact animal diseases, technical publications, and forecasting tools. These efforts help to improve the ability of countries to detect and respond to emerging diseases in poultry.

Overall, the data suggests that there is a high level of interest among the respondents in learning about various aspects of poultry management, including risk management, disease prevention, feed quality and safety, and predator control measures. There is also a significant interest in understanding how to prevent and manage management errors and in learning about genetic management strategies, although this interest is somewhat lower than for other topics. Knowledge of disease surveillance systems is also considered important by a majority of respondents. This information could be useful for developing educational programs or resources for poultry farmers to help them improve their operations and reduce risks.

Table 3: Information needs of the respondents.

Information needs	Frequency(f)	Percentage%
Effective risk management strategies for your poultry operation	60	100.0
Identifying and assessing risks specific to your farm	58	96.7
Mitigating the risks associated with disease outbreaks	60	100.0
Biosecurity measures to minimize disease transmission	60	100.0
Management and control parasite infestations	60	100.0
Predator control measures in protecting birds	58	96.7
Strategies to minimize the impact of extreme weather conditions in poultry farms	59	98.3
Ensuring the quality of feeds	60	100.0
Preventing and management of errors that can lead to higher mortality rates	60	100.0
Genetic management strategies to reduce vulnerability to diseases	45	75.0
Predator and wildlife management in poultry farms	47	78.3

Sources: Field survey 2023

Mortality risk management practices employed by the respondents

Data in Table 4 indicate mortality risk management practices of the respondents include; access to clean water and proper ventilation to prevent health issues ($\bar{x}$=4.87), monitor and control the feed quality of birds to reduce the risk of health issues ($\bar{x}$ = 4.82) biosecurity measures to prevent the spread of diseases ($\bar{x}$ = 4.80), ensure the safety of myself or workers and reduce the risk of accidents ($\bar{x}$ = 4.73), establishment of a network of suppliers and buyers to reduce supply chain risk ($\bar{x}$= 4.73), understanding of the regulatory environment governing poultry farming in my location" ($\bar{x}$=4.667), use of pest control measures to prevent the spread of pests and parasites in my poultry farm ($\bar{x}$ =4.65), cordial relationship with a veterinarian to

ensure the health and welfare of my birds ($\bar{x}$ =4.612) etc. The implication of the findings show that the mortality rate is low and they rarely will there be outbreak of disease in the farm. Mortality rate is an important indicator of the overall health and welfare of poultry flocks. High mortality rates can be a sign of poor management practices, inadequate nutrition, disease outbreaks, or other issues that negatively impact the health and well-being of the birds. Effective management practices can help to reduce mortality rates and improve the overall success of a poultry farming operation.

According to Jerson, (2020), Clean water and proper ventilation are essential for maintaining the health and welfare of poultry flocks. Access to clean water is important for preventing the spread of diseases and ensuring that birds are properly hydrated. Proper ventilation, on the other hand, helps to maintain good air quality by removing excess heat, moisture, and harmful gases such as ammonia and carbon dioxide from the poultry house. Ventilation is a key factor in poultry production facilities. Maintaining adequate temperature and aeration of the houses is essential to ensure animal welfare and economic performance of the farm. Ventilation helps to eliminate excess heat and humidity from the sheds where the birds are housed, generating comfort and welfare. Having a ventilation system and a controlled poultry environment provide some benefits such as correct balance of the gases that participate in the metabolism of the birds: good availability of oxygen breathed, and elimination of gases such as Carbon Dioxide CO2 and ammonia NH3. (Jerson, 2020). Overall, providing clean water and proper ventilation are important management practices in poultry farming that can help to prevent health issues, reduce mortality rates, and improve the overall success of a poultry farming operation. (Jerson, 2020)

Table 4: Mortality risk management practices

Risk management practices	Mean	Standard deviation
Biosecurity measures to prevent the spread of diseases	4.80	0.55
Monitor and control the feed quality of birds to reduce the risk of health issues	4.82	0.39
Contingency plan to deal with emergencies such as natural disaster	4.47	0.62
Use of pest control measures to prevent the spread of pests and parasites in my poultry farms	4.65	0.68
Records of poultry farming operations to track financial performance and identify areas for improvement	4.53	0.54
Cordial relationship with a veterinarian to ensure the health and welfare of birds	4.62	0.61
Diversification of my poultry farming operation by producing and processing birds for live sales and meat	4.33	0.86
Ensure the safety of myself or workers and reduce the risk of accidents	4.73	0.48
Management of the waste generated by poultry farming operation in an environmentally friendly way	4.57	0.53
Establishment of a network of suppliers and buyers to reduce supply chain risks	4.73	0.55
Ensure the safety of myself or workers and reduce the risk of accidents	4.73	0.48
Management of the waste generated by poultry farming operation in an environmentally friendly way	4.57	0.53
Establishment of a network of suppliers and buyers to reduce supply chain risks	4.73	0.55

Constraints to mortality risk management practices

Data in Table 5 below show constraints poultry farmers are faced with in mortality risk management practices; costly insurance coverages ($\bar{x}$=1.95), fluctuations in feed prices ($\bar{x}$=1.88), inadequate facilities and technologies ($\bar{x}$=1.78), limited market access ($\bar{x}$=1.583), costly and time-consuming regulatory measures ($\bar{x}$=1.53), cost of implementing biosecurity measures ($\bar{x}$=1.52), difficulty in securing loans ($\bar{x}$=1.50), high cost of transporting poultry birds and eggs to the market ($\bar{x}$=1.38), irregular visits of extension agents ($\bar{x}$=1.37), emergence of new diseases or invasive species of pests ($\bar{x}$=1.27), inadequate information on poultry management practices ($\bar{x}$=1.25) and inadequate land for expansion ($\bar{x}$=1.07). Costly insurance coverages ($\bar{x}$= 1.95). This finding implies that poultry farmers find insurance coverage to be costly, which can significantly impact their overall operational expenses. This is likely due to the various risks associated with poultry farming, such as disease outbreaks, natural disasters, and theft, which can make insurance premiums high. Additionally, the operational costs of running a poultry farm, including feed and veterinary care, can further strain a farmer's budget. Therefore, while insurance is crucial for mitigating risks and protecting their investment, the cost can be a significant burden for poultry farmers. Given these risks, it's understandable that poultry farmers find insurance coverage to be costly. While insurance is essential for risk management, the high cost can significantly impact their overall operational expenses. Fluctuations in feed prices ($\bar{x}$=1.88), high variability in feed prices is a significant concern for poultry farmers, as it affects their production costs and profitability and inadequate facilities and technologies ($\bar{x}$=1.78). The lack of modern facilities and technologies can hinder the efficiency and productivity of poultry farms, leading to financial challenges.

These challenges have made it difficult for the farmers to expand their farms. The implication of this is that, it increases in costly insurance coverages and fluctuations in feed prices were inhibiting the growth of poultry production in the study area. Furthermore, Table 5 also shows the standard deviation which shows that the standard deviation values reflect the degree of consensus or variation among poultry farmers' perceptions of specific challenges. Lower standard deviations (e.g., for feed prices, insurance costs, and market access) indicate that most farmers generally agree on the severity of these challenges. In contrast, higher standard deviations (e.g., for irregular visits of extension agents and inadequate land for expansion) suggest more diversity in opinions and experiences among farmers regarding these challenges. Factors such as regional differences, individual circumstances, and the nature of the challenges themselves influence the level of variation in responses.

Table 5: Constraints to mortality risk management practices

Constraints to risk management practices	Mean	Std. Deviation
Difficulty in securing loans	1.50*	0.79
Irregular visits of extension agents	1.37*	0.88
Inadequate veterinary services	0.98	0.83
Fluctuations in feed prices	1.88*	0.37
Costly and time-consuming regulatory measures	1.53*	0.75
Cost of implementing biosecurity measures	1.52*	0.75
Inadequate information on poultry management practices	1.25	0.86
Inadequate land for expansion	1.07	0.84
Labor shortages	0.85	0.88
Inadequate facilities and technologies	1.78*	0.72
Costly insurance coverages	1.95*	0.50
Limited market access	1.58*	0.56
Emergence of new diseases or invasive species of pest	1.27	0.70
High cost of transporting poultry birds and eggs to the market	1.38	0.67
Unavailability of drugs for the treatment of some diseases	0.85	0.73
Predator	0.73	0.86
Theft	0.43	0.65

Source: Field survey, 2023

Conclusion and recommendation

This study examined mortality risk management practices among poultry farmers in Enugu State, Nigeria, highlighting the various strategies employed to mitigate losses due to poultry mortality. The findings reveal that while many farmers are aware of the risks associated with poultry farming, their management practices vary significantly in effectiveness due to factors such as access to veterinary services, level of education, and financial capacity. Preventive measures such as proper hygiene, vaccination, and biosecurity were commonly adopted, though often inconsistently. Financial constraints and limited access to technical support were among the key challenges limiting the adoption of more effective risk management strategies. To enhance poultry productivity and reduce mortality, it is essential to improve access to veterinary services, provide targeted training programs for farmers, and facilitate access to affordable insurance and credit facilities. Effective mortality risk management is critical to sustaining poultry production. Stakeholders including government agencies, agricultural extension services, and non-governmental organizations must work collaboratively to support farmers to reduce losses and ensure long-term viability in the poultry sector in Enugu State. Therefore, the study recommends that Enugu State government and non-governmental organizations should support poultry farmers in making available affordable insurance policies that can help them to mitigate against mortality risk in their farms.

ABSTRACT

The building sector conduce remarkably to global warming, liable for 35% of global energy use and 38% of related CO_2 emissions. In this regard, assessment of environmental impacts of buildings during the construction, use and destruction phase is important issue for ecological sustainability. This paper estimates the life cycle embodied energy consumption (LCEEC) and related embodied CO_2 emissions of a historic college building (B-1) dates back to 1875, a contemporary building (B-2) erected with the most recent construction materials with compatible floor plans of the historic college building and the historic college building after that the structural strengthening and restoration (B-3) by utilizing tangible documents acquired from the building site. The findings of the study demonstrated that LCEEC values of B-1, B-2 and B-3 are found to be 4039.01, 2969 and 5709 GJ, respectively. Embodied CO_2 emissions pertinent to construction of the B-1, B-2 and B-3 are calculated to be 215.85, 281.12 and 347.94 tCO_2, respectively. Via implementing current practices, the structural strengthening and restoration of the historic college building enhances about 41.36% of LCEEC as well 61.2% of embodied CO_2 emissions. Structural strengthening and restoration of historic structures should be carried out via implementing convenient practices respecting the heritage conservation policies, ecology and energy.

Keywords: Global warming**,** Ecological sustainability, Life cycle assessment, Embodied energy, CO_2 emissions

1. Introduction

In previous decades, buildings and construction sector have become a key element tending to diminish global greenhouse emissions. The construction sector is liable for remarkable energy use globally that cause greenhouse emissions in conjunction with the diminution of energy supplies. The use of fossil resources as the primary source for energy throughout the world further aggravate this issue. All fossil resources release CO_2 to the atmosphere as burned. The CO_2 facilitates trap heat within the atmosphere, a primary contributant factor to the potential global warming (Goudie, 2013). The former decade was declared to be one of the hottest period and CO_2 concentrations have currently attained over 401 ppm (parts per million) (Tans, 2014) , that is regarded to be remarkably higher than allowable limit of 350 ppm for atmospheric CO_2 (Rauf and Crawford, 2015) . In the last age, the population of world has raised expeditiously accompanied by increment in per capita energy demand and life expectancy (Smil, 2011). It is foreseen that this trend will proceed. Therefore it is crucial that energy demand within the buildings and construction sector is addressed in order to prevent further deterioration of the ecology.

Heritage Buildings (HBs) stand for a pecicular building sample, and these structures are dependent upon legal conservation provisions because of their tremendous importance. The favourable effects of reusing HBs against to construction of new buildings are often considered in respect of design, cultural and economic aspects. If such considerations are broadened to involve ecological impact, one must furthermore tackle the issue of Embodied Energy (EE) . The EE is the summation of whole the energy needed to extract, process, transfer and set up the materials required to form a building (Jackson, 2005).

A number of studies have been presented in order for surveying the ecological impacts of buildings and its constitutive materials. But, most of the investigators paid attention to recently constructed structures. There is a gap of knowledge in existent literature about the structural strengthening and restoration practices on the LCEEC and related embodied CO_2 emissions of HBs. The target of this research is to examine the LCEEC and related emissions of a historic building, match the findings with re-construction project scenario of the historic structure, and show the effects of structural strengthening and restoration of throughout a lifespan period of 50 year.

2. Materials and Methods

2.1. Life Cycle Analysis (LCA) Methodology

LCA methodology is used to determine the environmental impacts of a process or product throughout its lifespan. LCA practice quantify entire the supply as inputs, comprehending energy, materials as well water, and ecological burdens involving emissions and wastes of a structure throughout differing stages of the life cycle. This methodology can be formulized by the subsequent arithmetic equation:

$$I = I_{Extraction} + I_{Manufacture} + I_{Onsite} + I_{Operation} + I_{Demolition} + I_{Recycling} + I_{Disposal} \quad (1)$$

in which I symbolizes to life cycle ecological effect, and I_j symbolizes to ecological effects of jth building phase.

Three basic category of studies are present dealing with the ecological effects of structures. The initial category of studies is LCA that centers on the whole ecological effects of structures within their entire lifespan. The second category of studies is Life Cycle Energy Assessment (LCEA), which is a valuation of the energy consumption over distinct phases of a buildings' lifespan, expressed as primary energy derived from nature furthermore secondary energy as tangibly depleted energy (Fay et al., 2000; Chau et al., 2015; Atmaca et al., 2021) The latter category is the Life Cycle Carbon Emissions Assessments ($LCCO_2A$), the main target of which is to valuate the CO_2 outputs throughout the entire lifespan of a structure (Chau et al., 2015).

2.2. LCEA and $LCCO_2A$ Methodology

LCEA approach can be stated as a simplified form of LCA that solely targets the assessment of energy intakes for distinct stages of the life cycle. The energy needed for production (embodied energy), use (operating energy), and destruction phases constitutes the boundary of the system. Production phase comprises procurement and conveyance of building materials as well maintenance activity of the buildings. Use phase involves the energy required for space heating as well cooling, ventilation, hot water, lighting and operating electrical devices in the building. Lastly, destruction phase comprises demolition of the structure and conveyance of deconstructed debris to recycling factory or landfill areas. LCEA approach can be implemented using primary or else secondary energy. Primary source of energy is derived from nature (e.g.natural gas), whereas actually consumed source of energy is secondary energy (e.g.electricity) (Chau et al., 2015).

In a mathematical form, the terms 'I's in Eqn. (1) are interchanged by 'E's to obtain Eqn. (2) as indicated in the subsequent equation:

$$E= \quad E = E_{Extraction} + E_{Manufacture} + E_{Onsite} + E_{Operation} + E_{Demolition} + E_{Recycling} + E_{Dis} \qquad (2)$$

in which E symbolizes to the total energy depleted within the whole life cycle of a structure, and E_j symbolizes to the energy depleted over jth building phase.

The cumulative carbon equivalent (CE) emissions generated at discrete steps of the life cycle of a structure form the domain of $LCCO_2A$. The value of life cycle carbon outputs can be estimated by interchanging the terms I' s in Eqn. (1) with 'CO_2' and it can be obtained numerically from the Eqn. (3):

$$CO_2 = CO_{2Extraction} + CO_{2Manufacture} + CO_{2Onsite} + CO_{2Operation} + CO_{2Demolition} + CO_{2Recycling} + CO_{2Disposal} \qquad (3)$$

in which CO_2 symbolizes to the CO_2 outputs of a structure over the whole life cycle, CO_{2j} symbolizes to the CO_2 outputs over the jth building phase.

Three practices are utilized in life cycle approach: process analysis, input-output (I - O) analysis, as well hybrid analysis. Preference of the basic analysis methodology, controls the precision of life cycle approach. Process Analysis is a bottom-up practice which just comprise processes over the limits of the product system being evaluated. But, ecological effects,

affiliated with inputs and outputs, which are placed away from the system limits are out of the framework of this methodology. This procedure is generally typified by the 'truncation error', which is involved with the elimination of stages omitted in the upstream levels of the framework (Lenzen, 2000).

Embodied energy incorporate two principal components (Chau et al., 2015):

- Initial embodied energy: the overall energy that encompasses material extraction and manufacturing, thereafter energy required to carriage of the material to field of construction.
- Recurrent embodied energy: the overall energy that is needed for replacement or refurbishment of building.

In this study, in order for estimating LCEEC and related CO_2 emissions, ICE (Inventory of Carbon and Energy) Version 3.0 is utilized (Jones and Hammond, 2019). For a vast number of materials, the ICE database contains estimates of EE, carbon as well GHG (quantified in grams of CO_2 equivalent, g CO_2eq.). The LCEEC of the structures have been estimated by counting recurrent embodied energy. In order to generate architectural plans of the building models Autodesk Revit BIM software is used. Material quantities of the building models were collected from the BIM software tool.

2.3. Suppositions and Uncertainities

LCEEC and related CO_2 emissions analysis of structures encompass several simplifications and suppositions associated with the kinds of building materials applicated. Important uncertainties prevail pertinent to energy depletion and related CO_2 emissions by reason of the place and the location of the buildings, the constituent materials of structures and processes for material production. Slight discrepancies and variations in any of such factors can alter the outcomes of this survey. The following suppositions were considered within the calculations

- It was assumed that manufacturing of entire final products carried out within Gaziantep city, supposing that the products are conveyed inside of a 40 km radius.

- Energy intensities, construction materials and standard construction procedures were supposed to be same throughout the next 50 years.

- So as to compare the findings, the lifecycle period of the studied buildings was supposed to be 50 years.

- The service lives were supposed to be identical for both studied buildings and building materials.

3. Case Study

3.1. The Historic Building (B-1)

The historic building is located in the city of Gaziantep that takes place in the southeast part of Turkey. The city had a multi-religious and multiethnic fabric. In the 19th age, missionary strategies provided to its multi-layered fabric. As well as Latin Catholics, American Congregationalists, and some Anglicans inhabited in the city; their religious, instructional, and healthcare facility structures enabled diversity in built environment of the city. The surveyed historic college building building is one of the remained buildings which was built by the American Board in 1875 (Babanınoğlu, 2020). The Central Turkey College was in the form of

campus that involve several structures. But, as a consequence of damaging fire happened in 1890 nearly 70% of the structures inside the campus was devastated (Güllü, 2009). The historic building includes three floors (basement, ground, as well first floor) and eight rooms. The cumulative floor area of B-1 is 1008.16 m^2. B-1 was constructed with load bearing masonry wall that is made up of limestone blocks and timber floor. Figure 1 demonstrates the 1/100 scaled floor plans of the B-1. Exact details of the B-1 are given in Table 1. Figure 2 shows dated photo of B-1.

Ground floor plan

Figure 1. Floor plans of B-1

1 st floor plan

Figure 1. (continued)

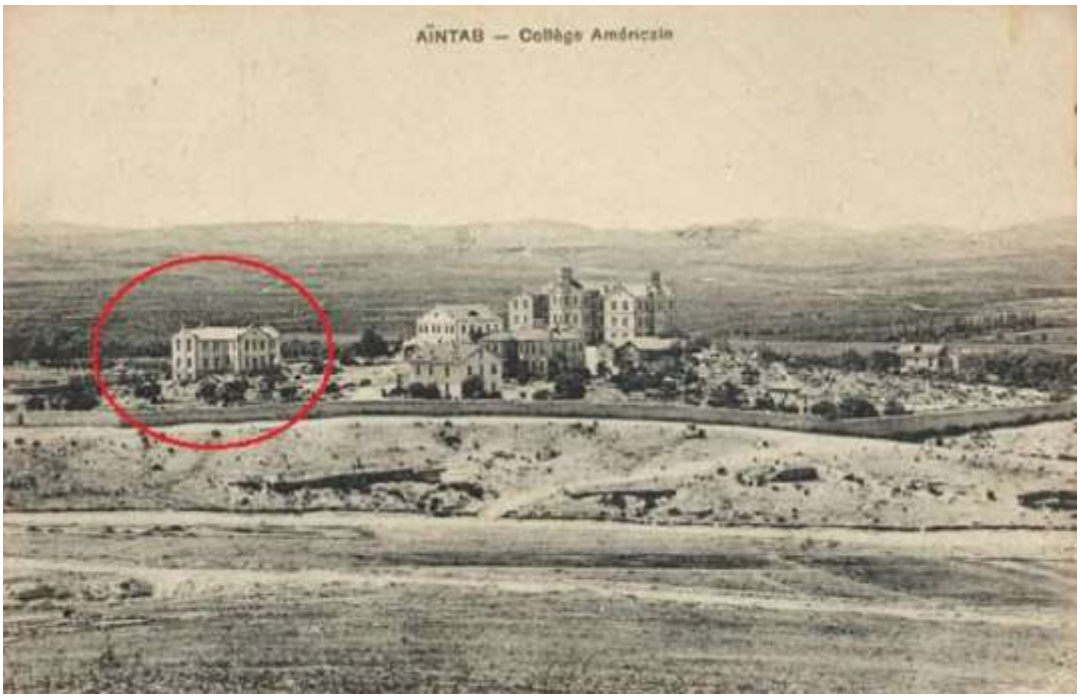

Figure 2. Photo of B-1 (Source: https://www.levantineheritage.com/antep.htm)

3.2. Reconstruction Scenario (B-2)

In B-2, the reconstruction scenario has been analysed by the usage of novel structural elements as well as materials. The B-2 is assessed to be redesigned by Reinforced Concrete (RC) framed structure which has modelled with high strength concrete of 35 Mpa and steel rebar grade of S420. Exterior and partition wall constructions of B-2 have been formed with aerated concrete blocks in lieu of masonry wall. The façade of the building has been designed by conforming to the obligatory standard of TS825 (Thermal Insulation Requirements for Buildings). In order for preventing moisture and infusion of water, bitumen is used at the foundation section of the building. For B-2 case, the precise quantities of concrete and structural steel have been computed by a structural analysis program (ideCAD Structural Analysis v 10.17) conforming the requirements of Turkish Building Earthquake Code of 2018. Exact details of the B-2 are given in Table 1. Figure 3 shows floor plans of the B-2.

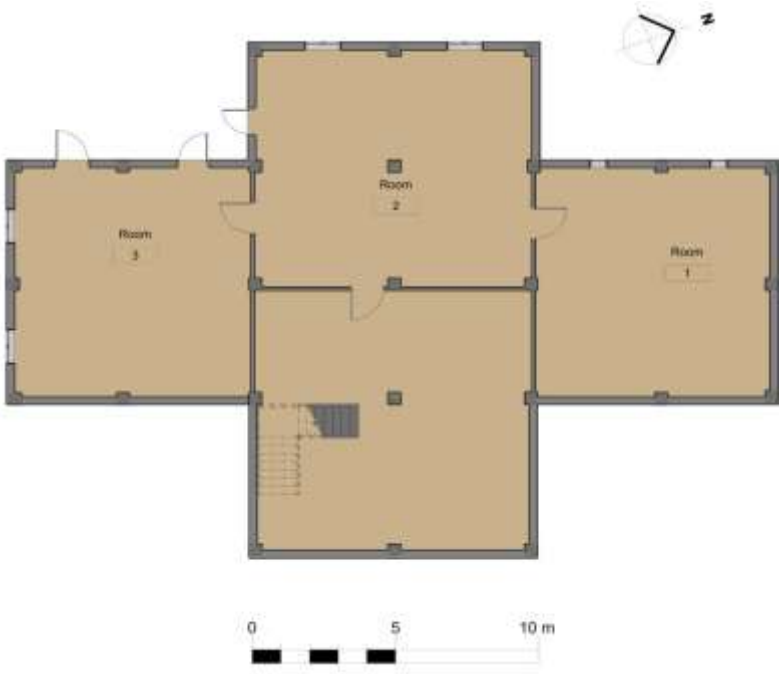

Figure 3. Basement floor plan

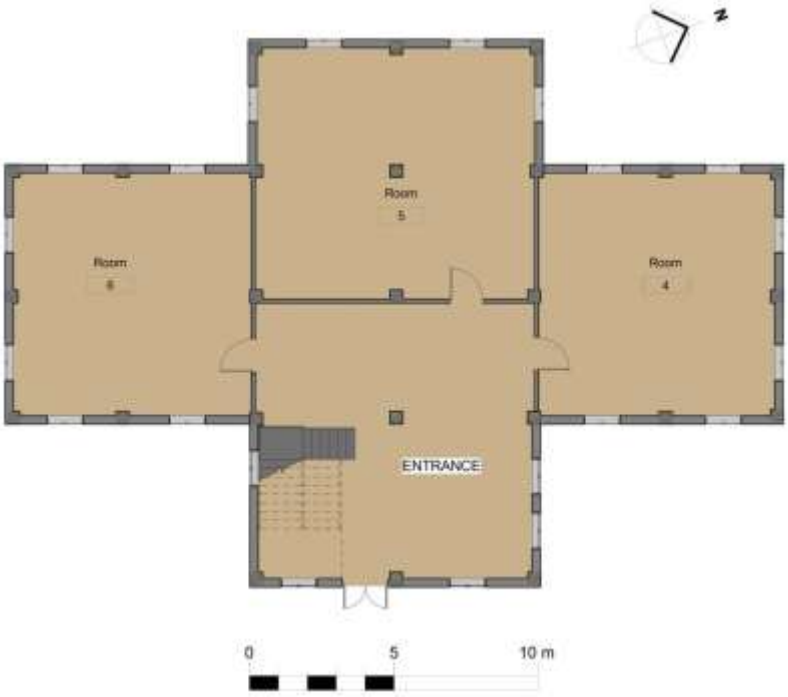
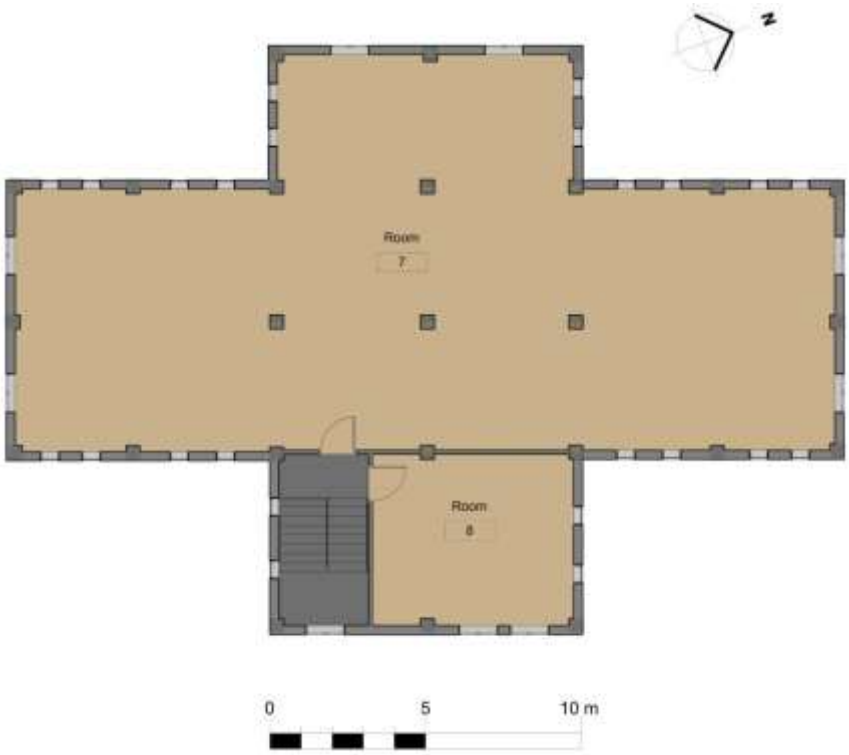


Ground floor plan



1 st floor plan

Figure 3. (continued)

3.3. Structural Strengthening and Restoration Case (B-3)

In recent years, B-1 has been seismically upgraded with steel frame to sustain its structural safety. Also, windows were renovated by double glazed (6 mm thickness) wooden windows. Roof of the B-1 was reconstructed with timber roof truss that has a standard layer of bitumen and glass wool insulation (8 cm thickness). In order to survey effect of thermal insulation on energy use, it has been presumed that external walls of the structure had been insulated with 3 cm thick rock wool together with overlaying by plaster layer (1.5 cm thickness). The quantities of building materials pertinent to structural strengthening and restoration case was collected from Şahinbey Municipality. Exact details of the B-3 are given in Table 1. Figure 4 demonstrates photos of the B-3.

Table 1. Specifications of B-1, B-2, and B-3

Specifications	**B-1**	**B-2**	**B-3**
Number of floor	3	3	3
Base area (m^2)	340.33	340.33	340.33
Gross floor area (m^2)	1008.16	1008.16	1008.16
Total building height	10.33 m	10.33 m	10.33 m
Floor elevation	2.93 m for basement floor 3.70 m for ground floor 3.70 m for 1 st floor	2.93 m for basement floor 3.70 m for ground floor 3.70 m for 1 st floor	2.93 m for basement floor 3.70 m for ground floor 3.70 m for 1 st floor
Foundation	20 cm compacted crushed stone	50 cm raft foundation Bitumen 10 cm lean concrete	20 cm crushed stone
Internal wall	Limestone block wall (thickness of 45- 60 cm)	10 cm aerated concrete block	Limestone block wall (thickness of 45- 60 cm)
External wall	Limestone block wall (thickness of 60- 90 cm)	20 cm aerated concrete block	Limestone block wall (thickness of 60- 90 cm) 3 cm rockwool insulation 1.5 cm of plaster inside

The findings of our study showed that the B-1 has a total EE of 4039.01 GJ. The total embodied carbon associated with construction of the B-1 is 215.85 tCO_2. Masonry wall (72% of EE) and wood (24% of EE) are the main building materials referring to EE usage for the B-1. It is determined that masonry wall (81%) and wood (14%) produce the foremost contribution with respect to CO_2 outputs.

The B-2 has a total EE of 2969 GJ. The total embodied carbon associated with construction of the B-2 is 281.12 tCO_2. Concrete (29% of EE) and steel reinforcement (26% of EE) are the main building materials referring to EE usage for the B-2. Concrete and steel reinforcement produce the foremost contribution with respect to CO_2 outputs with a reciprocal proportion of 48%, and 25%, respectively.

The B-3 has a total EE of 5709 GJ. The total embodied carbon associated with construction of the B-3 is 347.94 tCO_2. It is understood that masonry wall and steel are the main building materials referring to EE usage with a corresponding contribution of 47% and 28%,

respectively. It is essential to declare that the structural strengthening and restoration of B-1 has raised about 41.36% of LCEEC as well as 61.2% of related CO_2 emissions of the building.

Figures 5, 6, and 7 demonstrates the EE shares of the construction materials for B-1, B-2 and B-3 respectively.

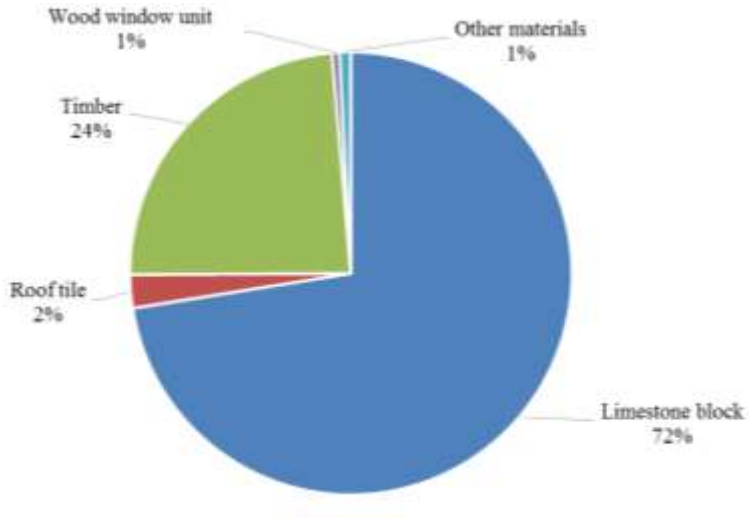

Figure 5. EE shares of building materials for B-1

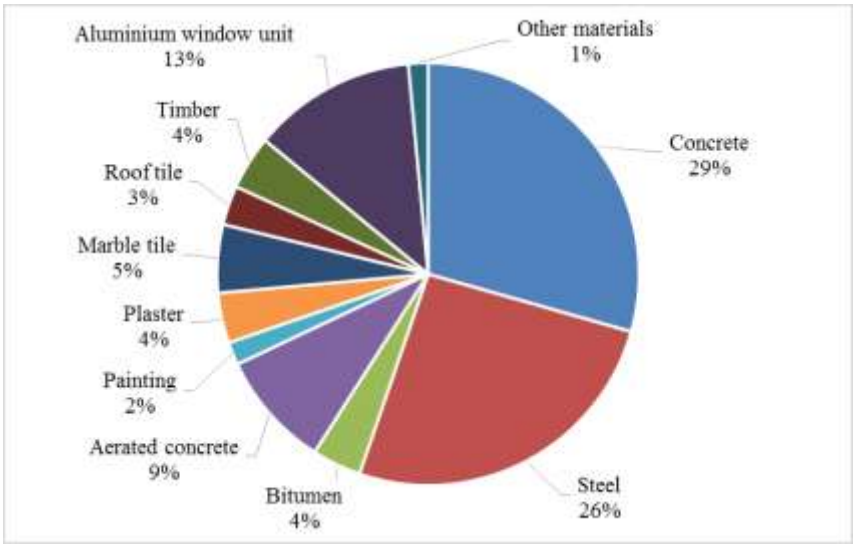

Figure 6. EE shares of building materials for B-2

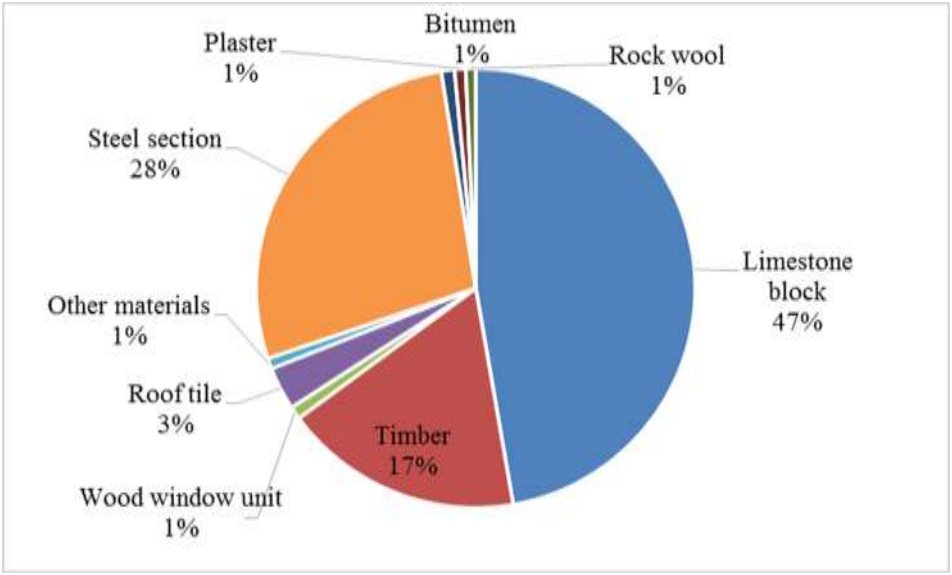

Figure 7 EE shares of building materials for B-3

5. Conclusion and Recommendations

In this survey, LCEEC and related CO_2 emissions of a historic college building (B-1), rebuilt scenario of a contemporary building (B-2) and structural strengthening and restoration of heritage building (B-3) in Gaziantep, Turkey are examined thoroughly. It is concluded that historic college building has 36.04% greater LCEEC with respect to the contemporary building. However, the contemporary building has 30.24% higher embodied CO_2 emissions than the historic college building. Via implementing current practices, the structural strengthening and restoration of the historic college building enhances about 41.36% of LCEEC as well 61.2% of embodied CO_2 emissions.

Even though operating energy of buildings is expressed as the basis of sustainability in building energy performance regulations, EE and related CO_2 emissions will become more crucial as operating energy depletion is reduced.

During the construction of buildings, substantial amount of construction materials that have higher embodied CO_2 are practiced (for instance steel rebar, concrete, dye and insulation materials). The choice of materials for construction has a direct impact on EE and related CO_2 emissions. The EE of a wood window with double pane is 0.49 GJ/kg, whilst this value is 5.47 GJ/kg for a aluminium window with double pane.

Sustainable practices for structural strengthening and restoration of HBs are crucial to alleviate the LCEEC and related CO_2 outputs. The determinations related with LCEEC and related embodied CO_2 emissions acquired from this investigation are a breakthrough for heritage building stock in Turkey. Future investigations should pay attention to analysis of proper multi-objective retrofit practices and techniques for historic structures.

ABSTRACT

This study aims to evaluate the potential industrial and pharmacological applications of *Mentha longifolia* subsp. *longifolia* L. through a detailed analysis of its essential oil composition and comparative review of the literature. The taxon *Mentha longifolia* subsp. *longifolia* is a member of the Lamiaceae family, known for its aromatic and medicinal properties. In Turkey, the *Mentha* genus is represented by 11 distinct species, among which this subspecies is particularly notable for its essential oil content.

The GC-MS analysis of the sample conducted in this study identified 87 compounds, with *Eucalyptol* (28.89%), *Menthone* (17.59%), and *Thymol* (10.60%) being the major constituents. These components have been highlighted in literature for their significant antimicrobial and antioxidant activities.

Essential oils from *Mentha longifolia* have been noted for their dual use in food—both as flavoring agents and natural preservatives, owing to their antimicrobial properties. The menthol content has shown documented soothing effects on the digestive system. Furthermore, thanks to its high content of terpenes and natural aroma compounds, this essential oil is utilized in chewing gum, confectionery, and beverages.

Due to the presence of antioxidant compounds, the oil is also favored in anti-aging cosmetic products, where it neutralizes free radicals effectively. The GC-MS findings, along with existing literature, underscore the strong pharmacological potential of *Mentha longifolia* subsp. *longifolia*. These insights provide a scientific foundation for further exploration of its use in pharmaceutical and cosmetic industries.

Keywords*: Essential oil, Ethnobotany, Mentha*

1.Introduction

Medicinal and aromatic plants have been known for centuries as natural resources with a wide range of applications in both traditional medicine and modern pharmaceutical research (Yıldız et al., 2019). These plants' essential oils, thanks to their rich chemical compositions, are utilized in numerous fields such as the food, cosmetic, and pharmaceutical industries (Çelik et al., 2020). Monoterpenes, sesquiterpenes, and other phytochemical compounds found in these essential oils draw significant attention due to their antimicrobial, antifungal, antioxidant, and anti-inflammatory properties (Kaya et al., 2021). The taxon *Mentha longifolia* subsp. *longifolia* is a member of the Lamiaceae family, known for its aromatic and medicinal properties (Davis, 1982). In Turkey, the *Mentha* genus is represented by 11 distinct species, among which this subspecies is particularly notable for its essential oil content. It usually grows naturally along stream banks, wetlands and thickets. This taxon, which is widespread in the flora of Turkey, can exist in different climatic and soil conditions with its strong adaptability (Baser et. al., 1999).

Mentha longifolia subsp. longifolia L. is defined as one of the richest species of the Lamiaceae family in terms of essential oil and has been used in traditional medicine for a long time. This subspecies is widely grown especially in the Middle East and Mediterranean geography and attracts attention in terms of pharmacological and industrial applications thanks to the phytochemical compounds it contains (Yousefian & Esmaeili, 2023; Patonay et. al., 2021).

In addition, like other species belonging to the Lamiaceae family, Mentha longifolia has developed adaptation against environmental stresses through essential oils and this adaptation contributes to the chemotype richness of the plant (Patonay et al., 2021). This species, which has a natural distribution especially in the flora of Turkey, is also used by local people in traditional herbal treatments for stomach ailments, respiratory diseases and antiseptic purposes (Singh & Pandey, 2018).

The aim of this study is to analyse the essential oil composition of *Mentha longifolia* subsp. *longifolia* in detail and to establish a scientific basis for the industrial and therapeutic potential of its bioactive compounds.

2. Materials and Methods

2.1. Collection of the Plant Material

The plant material utilized in this study was gathered from Bingöl province. It was collected from its natural habitat during May–June, which corresponds to the peak flowering period, and subsequently dried in the shade. Plant specimens were preserved at Firat University.

2.2. Isolation of the Essential Oil

Essential oils were obtained from the aboveground parts (100 g) of the collected plants using the Clevenger apparatus. Essential oils were obtained after 3-4 hours of distillation by hydrodistillation and no oil was obtained from some samples.

2.3. Gas Chromatography–Mass Spectrometry (GC-MS) and FID Analysis

The EO was analyzed using HP 6890 GC equipped with an FID detector. An HP-5 MS capillary column (30 m × 0.25 mm i.d., film thickness 0.25 μm) was used. The column and the analysis

conditions were the same as in Gas Chromatography-Mass Spectrometry (GC/MS). The percentage composition of the EO was computed from Gas Chromatography-Flame Ionization Detection (GC/FID) peak areas without correction factors. Chromatographic processes were performed at Fırat University Plant Products and Biotechnology Res. Lab. (BUBAL), using Hewlett Packard system, HP-Agilent 5973 N GC-FID and GC-MS (Gas ChromatographyMass Spectrometer) 6890 GC system. Helium was used as DB-5 MS column and carrier gas; Injector temperature 250°C, split flow rate 1 ml/min. The GC oven temperature was kept at 60°C for 2 min and programmed to 150°C at a rate of 10°C/min and then kept constant at 150°C for 15 min to 240°C at a rate of 5°C/min. The characterization of the components in essential oils was done using electronic libraries (WILEY, NIST and Essential oil library) (Wiley, 1989; NIST, 2002).

3.Result of the Discussion

In this study, the essential oil composition of *Mentha longifolia* subsp. *longifolia* was analysed by Gas Chromatography-Mass Spectrometry (GC-MS). As a result of the analysis, a total of 87 different components were identified; among these components, eucalyptol (28.89%), menthone (17.59%) and thymol (10.60%) were particularly prominent. These compounds are natural substances of pharmacological importance, which are frequently emphasised in the scientific literature with their antimicrobial and antioxidant effects (Baser & Buchbauer, 2010; Soković et al., 2010).

Eucalyptol (1,8-cineole) is known for its antimicrobial and anti-inflammatory properties, which make it valuable in various medical applications ((Baser & Buchbauer, 2010; El Omari et al., 2024). Menthone exhibits antimicrobial and antioxidant activities, making it useful in both food preservation and medical contexts (Ćavar Zeljković et al., 2021; Hudz et al., 2023). Thymol is especially recognized for its potent antimicrobial, antifungal, and antioxidant effects (Brasesco et al., 2017; Martinez-Pabon et al., 2020). The anti-inflammatory properties of eucalyptol, in particular, have been extensively documented in various studies (Baser & Buchbauer, 2010). The antimicrobial properties of menthone indicate its potential use in both food preservation and cosmetic products (Hudz et al., 2023; Cavar Zeljković et al., 2021). Thymol has been highlighted as a significant microbial control agent, especially in food safety and oral health. Additionally, studies have shown that thymol and eucalyptol can exhibit synergistic effects when used together (Brasesco et al., 2017).

The findings obtained support the potential applications of this species both in the food sector (as natural preservative and flavouring) and in cosmetics and pharmaceuticals. In particular, menthol is used in chewing gum, confectionery and beverage industry due to its stomach relaxing effects and terpene-rich structure. Due to its antioxidant content, it is effective in neutralising free radicals and is also preferred in anti-aging cosmetic products (Viuda-Martos et al., 2008). This study aims to provide a scientific basis for the potential industrial and pharmacological use of *Mentha longifolia* subsp. *longifolia* by revealing its chemical profile in detail.

ABSTRACT

Pneumatic systems are widely used among automation components in the industry. They contribute to the increase in efficiency and quality in mass production. Being safe, clean and straightforward in structure increases the possibility of preference. In addition, features such as friction effect and compressibility of air (nonlinear) are dynamics that require attention at the control point. Control of designs carried out in this direction is of particular importance. Uncertain evaluations such as less, more, cold, and hot are challenging situations encountered in daily life. Uncertainties encountered in industry are also weak points of control systems. Today, effective control can be achieved against uncertainties with Fuzzy Logic modelling. The system can be realized with fuzzy logic applications to exhibit high stability and low energy and time consumption. In this study, the control of a proportional valve in a pneumatic system is provided with fuzzy logic and a sensitive actuator efficiency is obtained. The reference voltage applied to control the proportional valve is calculated without any loss of time thanks to the input and output membership functions and the rule base. In the study, the current position of the cylinder and the position information that should be for the next job were processed, and the output value was converted to the reference voltage so that the proportional valve could make the necessary direction. In the design, it was planned that the system would be more economical than alternative control methods with this setup using the Arduino code editor and card. The design created from the study will be the preferred setup with the sensitive control results obtained in the system, including nonlinear (friction, fluid compression, etc.) dynamics. A pioneering record was created for more efficient and economical results to be obtained in the future with developing technology.

BULANIK MANTIK İLE PNÖMATİK ORANSAL VALF KONTROLÜ

ÖZET

Pnömatik sistemler, endüstride otomasyon bileşenleri arasında yaygın olarak kullanılmaktadır. Seri üretimde verim ve kalite arttışına katkı sağlamaktadır. Güvenli, temiz ve basit yapılı olmaları tercih olasılığını arttırmaktadır. Bunun yanında sürtünme etkisi, havanın sıkıştırılabilirliği (nonlineer) gibi özellikler ise kontrol noktasında dikkat gerektiren dinamiklerdir. Bu doğrultuda gerçekleştirilen tasarımların kontrolü ayrı önem teşkil etmektedir. Kesin olmayan az, çok, soğuk, sıcak olarak yapılan değerlendirmeler günlük hayatta da karşılaşılan zorlayıcı durumlardır. Endüstride karşılaşılan belirsizlikler de kontrol sistemlerin zayıf noktalarıdır. Günümüzde belirsizliklere karşı Bulanık Mantık modellemeleri ile etkili kontrol sağlanabilmektedir. Sistemin düşük enerji ve zaman tüketiminin yanında yüksek kararlılık sergilemesi bulanık mantık uygulamaları ile gerçekleştirilebilmektedir. Bu çalışmada bir pnömatik sistemde oransal valfin kontrolü bulanık mantık ile sağlanıp hassas bir aktüatör verimi elde edilmiştir. Oransal valfin kontrolü için uygulanan referans gerilimi girdi ve çıktı üyelik fonksiyonları ile kural tabanı sayesinde zaman kaybı olmadan hesaplanmıştır. Çalışmada, silindirin mevcut konumu ve sıradaki iş için olması gereken konum bilgileri işlenmiş, çıktı değeri oransal valfin gerekli yönlendirmeyi yapabileceği referans gerilimine dönüştürülmüştür. Tasarımda Arduino kod editörü ve kartı kullanılarak sistemin bu kurgu ile alternatif kontrol yöntemlerine göre daha ekonomik olması planlanmıştır. Çalışma sonucunda oluşturulan tasarım, doğrusal olmayan(sürtünme, akışkan sıkıştırılması gibi) dinamikler barındıran sistemde elde edilen hassas kontrol sonuçları ile tercih edilen kurgu olacaktır. Gelişen teknoloji ile ilerleyen zamanda alınacak daha verimli ve ekonomik sonuçlar için öncü kayıt oluşturulmuştur.

Anahtar Kelimeler: Bulanık Mantık, Pnömatik Oransal Valf, Hassas Kontrol.

Introduction

The fact that pneumatic systems are clean, safe and frequently preferred in the industry has triggered studies on sensitive control. The nonlinear dynamics contained in pneumatic systems necessitate these studies. In this study, a control system based on Fuzzy Logic was created. In different studies, methods such as artificial neural networks, PID (Proportional Integral Derivative) control methods and hybrid controls can be preferred. Proportional-integral-derivative (PID) control is a control method with an important place and importance in solving control problems related to industrial processes. PID control is expressed depending on the proportional value of the error signal (P), its integral concerning time (I) and its derivative for time (D). The controlled signal is taken and compared with the reference signal. The PID controller evaluates the difference between the input and output signal and the proportional signal, and the most suitable output signal is produced for the system to eliminate the error and be applied to the system. For the system to operate as desired, PID parameters must be adjusted. In addition to various methods, such as manual adjustment and calculation of parameters, there are also automatic adjustment methods (Birok, 2013). Pandian et al. investigated the usability of the pneumatic motor instead of the electric motor in their study. The mathematical model of the pneumatic motor was derived to make a performance comparison (Pandian, et al. 1999). Among the intelligent control methods, systems can be identified with artificial neural networks. In the study conducted by Özçalık and Küçüktüfekçi, forward and reverse identification of a direct current motor was carried out with a multi-layer artificial neural network (Özçalık and Küçüktüfekçi, 2003). In the study conducted by Shi and Sepehri, the control of the movement of a pneumatic piston was carried out with an adaptive artificial neural network-based fuzzy controller (Shi and Sepehri, 2004). In 2004, Akyıldız, in his master's thesis, sent a white noise signal to the system for system diagnosis purposes, recorded the system's position and pressure responses, then processed this data numerically and created a parametric model of the system. To eliminate the steady-state error observed in the previous PID control study of the system, a Model Predictive Control - Dynamic Matrix Control strategy was applied. To run this in real-time, a program was written in the Matlab-Simulink environment, and the code he obtained using Matlab Real-Time Workshop was used to monitor the system's real-time position (Akyıldız, 2004). Cajetinac et al. tried to develop a cheaper pneumatic servo system by using open/close electromagnetic valves (2/2 or 3/2) instead of proportional and servo valves. The pneumatic actuator was controlled by open/close type electromagnetic valves and pulse width modulation technique (Cajetinac, et al. 2012). Gyeviki et al. implemented a sliding regime control application using a 5/3 proportional pneumatic valve and PLC (Programmable Logic Controller) and achieved position control within ±0.02 mm. They showed in their experimental studies that the implemented sliding regime controller gave a fast response time and good transient performance (Gyeviki et al. 2011). Yilmaz determined that his study aimed to investigate the performance of a servo pneumatic system containing a linear cylinder and proportional valve with a PID controller to improve its low-speed characteristics (Yilmaz, 2008). Altun et al., who provided speed control of the stepper motor, which is frequently used in industrial applications with fuzzy logic, achieved successful results. Due to its cost and ease of use, Arduino was preferred over PLC, a control unit widely used in the industry (Altun, et al. 2016). In his master's thesis, Anlak preferred a fuzzy logic-based approach to solve uncertainties such as unwanted vibrations at the system output and improve system performance in the operation of hydraulic test machines, where PID control is widely used in practical applications. As a result of his studies, he found a 10% improvement in system performance (Anlak, 2021). In this study, the purpose of choosing fuzzy logic control is to give the optimum response in economic conditions against the possibilities that may be encountered

in the system. In the study, the sensitivity and importance of creating a fuzzy logic rule base come to the fore. In line with these rules, the system automatically produced the most appropriate solution for the situation and responded positively to the expectations of precision and speed. The created system aimed to provide an economic advantage over alternatives such as PLC, which is used in the industry by using Arduino among microcontrollers (Altun et al. 2016).

Materials and Methods

Pneumatic proportional directional control valves (5/3) are directional control valves supplied with 24V DC operating voltage and controlled with reference voltages in the range of 0-5-10V DC. In the study, the proportional valve used with the 5V reference was positioned in the middle position, and the fluid movement was stopped (Figure 1). Flow control was performed in the left and right positions of the proportional valve with the reference value between 0-5V and 5-10V. In intermediate values (such as 3.7 - 6.2), there are also differences in our flow rate, resulting in control differences (FESTO, 2024).

Figure 1. Pneumatic proportional directional control valve

In the face of such variable situations and possibilities, the control system's effectiveness can be increased with fuzzy logic applications. The actuator needed for the job can be integrated into the systems. The study realised a standard cylinder drive with the controlled directional control valve (Figure 2).

Figure 2. Standard cylinder

To examine the effectiveness of the control system and the results in detail, cylinder position sensors were used to create different position points on the cylinder (Figure 3). The opportunity

to control the effectiveness of the design was created with scenarios on movements in different directions and distances.

Figure 3. Cylinder sensor

The current position of the cylinder and the position information that needs to be found for the next task were transmitted as fuzzy values to the rule base from our membership functions as input information of our fuzzy logic model. The rule base clarified this value, and the output signal was created (Figure 4 and Figure 5).

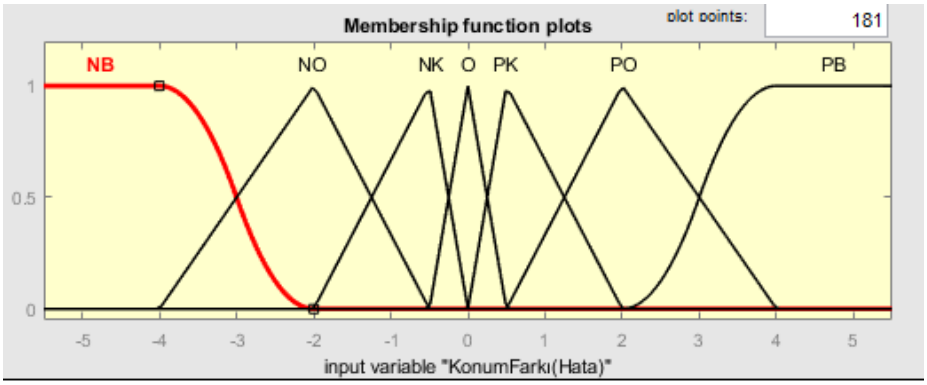

Figure 4. Membership function

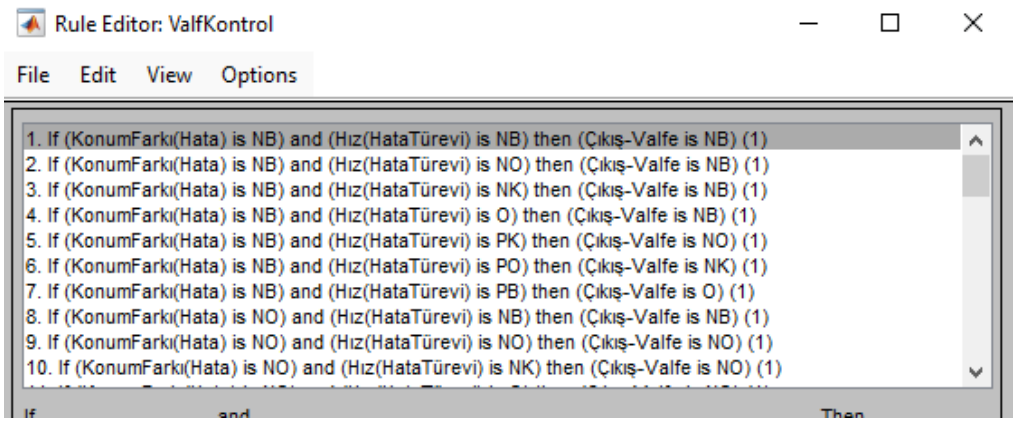

Figure 5. Examples of rules

The integrity of the design was achieved with the Arduino card and editor, which are microcontroller-based circuit boards (Figure 6).

Figure 6. Microcontroller-based circuit board

Findings and Discussion

The reference voltage was transmitted to the proportional directional control valve in the study with the clarified output signals given. The valve provided efficiency and the desired action from the cylinder by directing the fluid according to the reference voltage in line with the operating principle (Figure 7). The function for the output value determined the range of 0-10. The aim is to facilitate the adaptation of the proportional directional control valve to the operating structure at 0-5V and 5-10V reference voltages.

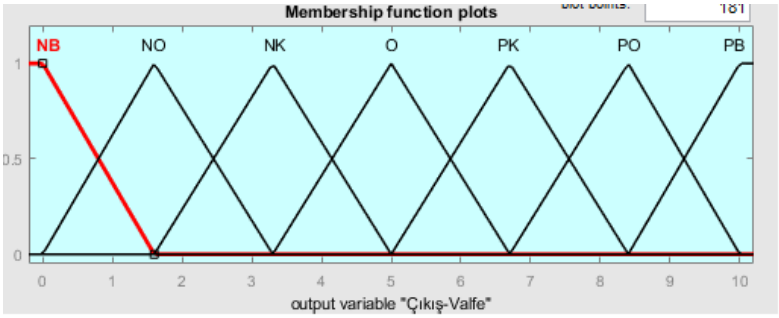

Figure 7. Output function

In input memberships, (-) values indicate that the cylinder moves in the opposite direction of the specified. If the proportional direction control valve is positioned to the right with a reference voltage of 5-10V and moves the cylinder in the right direction, then with a reference voltage between 0-5V and a (-) position difference input, it is positioned to the left and ensures that the cylinder moves in the left direction. In Figure 8, the surface map and the values are seen together.

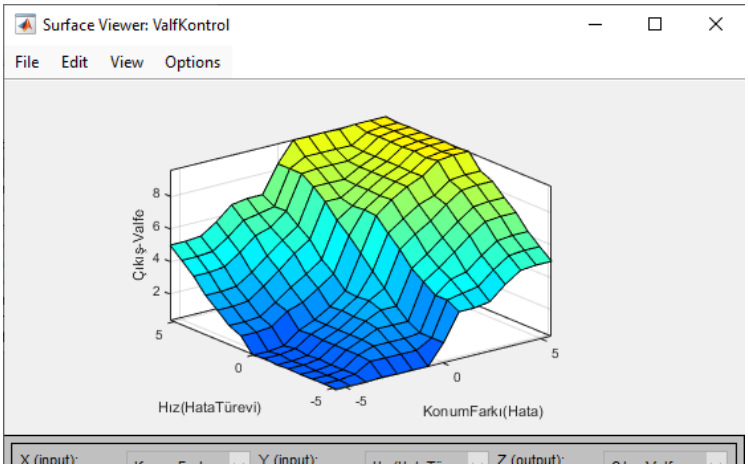

Figure 8. Surface map

The values of the output signals as a result of different input values are seen in the rule diagrams in Figure 9, Figure 10 and Figure 11. The output signal is compatible with the reference voltage required for the proportional directional control valve to direct the fluid as desired.

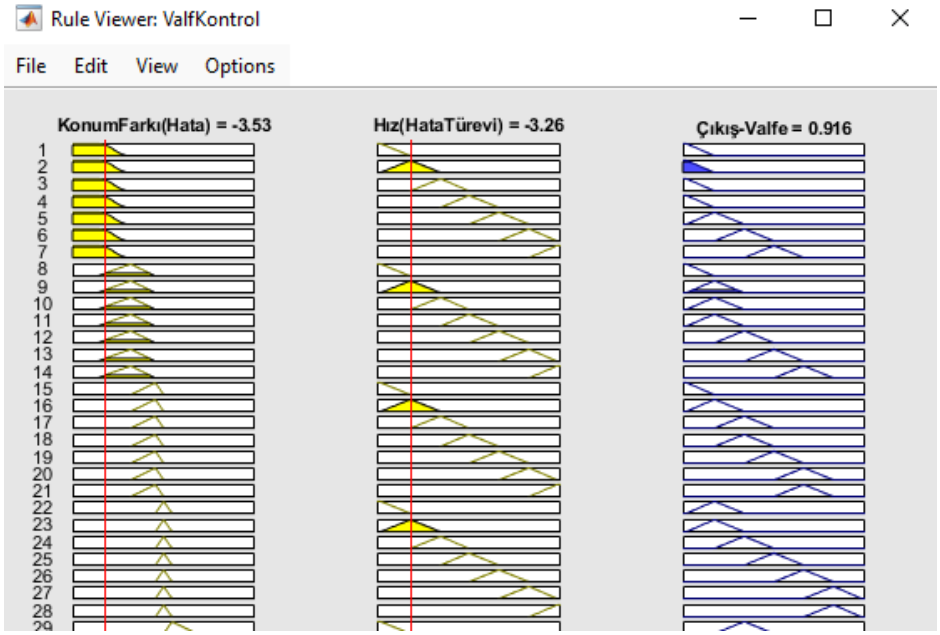

Figure 9. Rule diagram-1

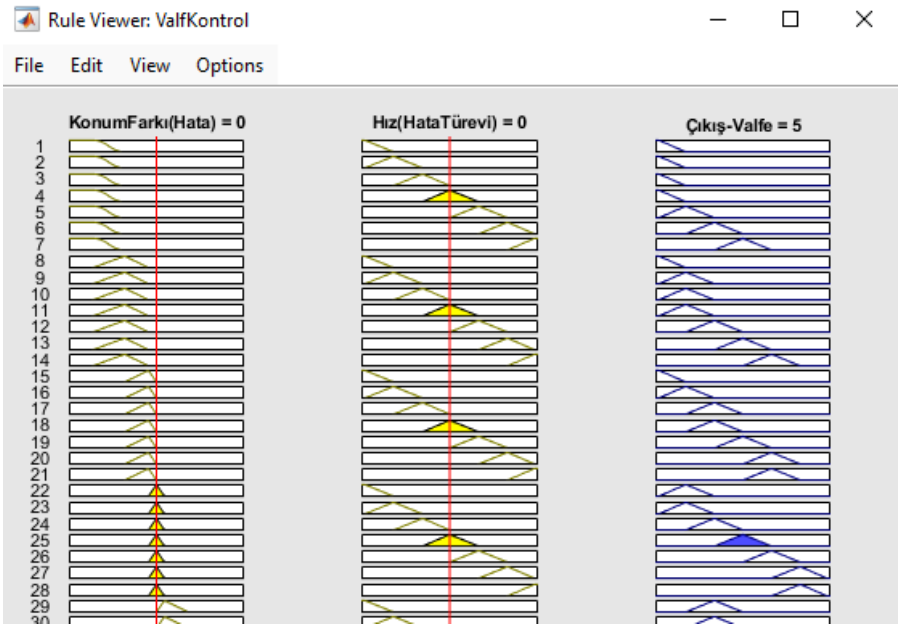

Figure 10. Rule diagram-2

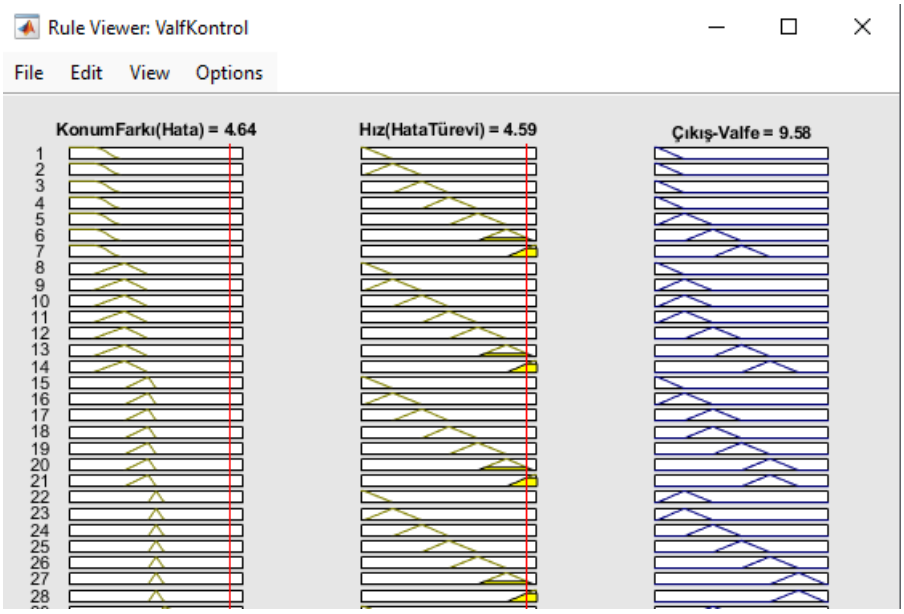

Figure 11. Rule diagram-3

Conclusion and Recommendations

The competition in the industry is getting fiercer with the development of technology day by day. As a result of changing needs and production, energy consumption and costs are increasing. In this direction, energy-saving, clean, low-cost, automatic controlled systems provide advantages. For these reasons, pneumatic systems are preferred components in automation. For this reason, there are many studies on the increase in control and efficiency. The difficulty of controlling the fluid in the system, the lack of automation, and efficiency loss are the parameters that must be prevented. In this study, a pneumatic proportional directional control valve, one of the latest technology products, was controlled with a fuzzy logic-based controller. This study developed a system that responds to scenarios other than the difficulty of controlling the fluid, system uncertainties and open-close clarity. In addition, this study

increased the automation efficiency. The variable control activity of the valve with intermediate reference values contributed to speed and energy saving. The cushioning feature inherent in the first and last positions of the cylinder was also provided in intermediate positions with the changing reference voltage of the valve. Therefore, the valuable life loss and maintenance costs were reduced with the vibration and impact effect of the cylinder. Thus, an alternative method was created for sensitive control studies in pneumatic systems.

ABSTRACT

The increasing integration of digital technologies across various sectors has led to a corresponding surge in cybersecurity threats, making the accurate and efficient analysis of vulnerabilities a critical requirement. The Common Vulnerabilities and Exposures (CVE) system serves as a standardized global framework for cataloguing security vulnerabilities by assigning unique identifiers to each issue. Complementing this, the Common Vulnerability Scoring System (CVSS) offers a consistent methodology for quantifying the severity of vulnerabilities through a set of well-defined base metrics. This study presents a deep learning-based approach for the automatic classification of CVE records using CVSS vector components, leveraging the capabilities of the Bidirectional Encoder Representations from Transformers (BERT) model. The dataset comprises up-to-date CVE entries sourced from the cvelistV5 repository maintained by the CVE Program on GitHub. The pre-trained bert-base-uncased model available on the Hugging Face platform was selected as the foundation and subsequently fine-tuned using 10,000 training samples and 2,000 testing samples. Classification was performed across eight CVSS base metric categories: Attack Vector (AV), Attack Complexity (AC), Privileges Required (PR), User Interaction (UI), Scope (S), Confidentiality (C), Integrity (I), and Availability (A). These metrics span between two to four discrete class labels each. The model achieved classification accuracies of 89.89% (AV), 90.70% (AC), 75.42% (PR), 90.82% (UI), 89.08% (S), 80.95% (C), 81.90% (I), and 81.11% (A), respectively. The results indicate that transformer-based language models can significantly enhance the automation and accuracy of vulnerability classification tasks, contributing to improved threat management in cybersecurity domains.

Keywords: Deep Learning, Cybersecurity, CVE Classification, CVSS Metrics, Vulnerability Assessment.

Introduction

With the rapid advancement of technology, digitalization has emerged as a central focus for organizations and institutions. Many companies have transitioned from manual operations to digital environments, streamlining their processes and increasing efficiency. Consequently, cybersecurity has become a critical concern. One essential aspect of cybersecurity is the determination of vulnerability scores, which play a pivotal role in assessing the protection level of an organization's digital assets and in implementing proactive measures against potential threats. Vulnerability scores quantify the severity of system vulnerabilities and the associated risk levels. This quantification facilitates the prioritization of security measures, allowing limited resources to be allocated efficiently toward addressing the most critical vulnerabilities. By doing so, organizations can mitigate the potential impact of cyberattacks and reduce associated losses. Furthermore, vulnerability scores serve as important reference points in various domains, including regulatory compliance, insurance evaluations, and third-party security audits. These scores help assess an organization's cyber resilience and inform strategic decision-making. Given their multifaceted utility, vulnerability scoring is widely recognized as a fundamental component of an effective cybersecurity strategy.

The concepts of Common Vulnerabilities and Exposures (CVE) and Common Vulnerability Scoring System (CVSS) are frequently used to calculate vulnerability scores in the field of cyber security. CVE is a standardized system for identifying and cataloging cybersecurity vulnerabilities, providing a unique identifier for each vulnerability to facilitate information sharing and coordination. CVSS is a framework that quantifies the severity of vulnerabilities using a numerical score from 0 to 10, based on metrics such as exploitability (e.g., attack vector, complexity) and impact (e.g., confidentiality, integrity, availability). The CVSS score is critical as it enables organizations to prioritize remediation efforts by assessing the potential risk a vulnerability poses. The score is calculated using a formula that combines base metrics (inherent vulnerability characteristics), temporal metrics (evolving factors like exploit availability), and environmental metrics (organization-specific contexts). Customized CVSS score estimation, tailored to an organization's specific environment, enhances risk assessment by accounting for unique system configurations and operational priorities. Estimating CVSS scores from vulnerability descriptions is beneficial, particularly in early-stage analysis, as it allows rapid prioritization before detailed assessments, though it may lack precision without full context. This integrated approach supports effective vulnerability management in academic and practical cybersecurity research.

In the CVSS framework, each base metric category is associated with a specific multiplier used in the calculation of the overall vulnerability score. Accordingly, the accurate classification of a given vulnerability within these predefined metric categories is critical to determining an accurate CVSS score. Various methods are employed to perform this classification, including expert analysis, adherence to standardized guidelines, and the use of automated tools (Khazaei et al., 2015; Sun et al., 2023). While expert-driven evaluations and standard guideline-based classifications often yield reliable results, these approaches become increasingly challenging as the volume of vulnerabilities grows. The scalability of manual methods is limited, and the likelihood of human error rises proportionally with the number of vulnerabilities. Consequently, there has been a growing demand for automated systems that can classify vulnerabilities efficiently and accurately. These systems offer a scalable solution to support consistent and timely CVSS scoring, particularly in environments where large volumes of vulnerability data must be processed.

A review of the literature reveals that various studies have been conducted on CVE classification based on CVSS metrics. In the study conducted by (Khazaei et al., 2015), a classification approach was developed for calculating CVSS scores using data obtained from the open-source vulnerability database. Feature extraction was performed using text mining techniques, and the performance of fuzzy systems, support vector machines, and random forest methods was compared. The results indicated that fuzzy systems outperformed the other two methods. In a study led by (Kühn et al., 2023), a deep learning-based model was proposed to predict the CVSS vector. By analyzing reference websites in the National Vulnerability Database, the study achieved better results compared to previous research. (Kekül et al., 2024) employed word embedding and multi-class classification methods to predict CVSS 2.0 and CVSS 3.1 metrics. Their analysis, based on data from the National Vulnerability Database, achieved an accuracy ranging from 87.34% to 96.25% for CVSS 2.0 and from 84% to 90% for CVSS 3.1. (Kekül et al., 2021) used natural language processing techniques in combination with naïve Bayes, decision tree, k-nearest neighbour, multi-Layer perceptron, and random forest classifiers to develop a standard-compliant prediction model on a general dataset. (Kai et al., 2023) applied data augmentation techniques and an optimal subset integration method in their study, utilizing the DistilBERT model for classification to calculate CVSS metric scores. The analysis results demonstrated that the proposed model operated more efficiently than manual evaluation and achieved higher accuracy compared to similar studies. In a study where a pre-trained XLNet-based model was fine-tuned on a specific dataset, the model achieved better performance in predicting CVSS metric scores compared to existing studies in the literature (Shi et al., 2022). (Nowak et al., 2021) proposed machine learning algorithms to facilitate the transition from CVSS 2.0 to CVSS 3.x by enabling the conversion of scores between the two versions.

Effectively managing security vulnerabilities is crucial for organizations, a fact consistently highlighted in research. As digitalization advances, the significance of robust vulnerability management is only expected to increase. A key aspect of this process involves prioritizing vulnerabilities by assigning them scores. This study introduces an innovative approach to this challenge by proposing and fine-tuning a language model designed to classify security vulnerabilities based on CVSS metrics. This offers a novel alternative within the field of security vulnerability management.

Materials and Methods

In our study, a dataset was created using the repository available on the official CVE website (*CVE: Common Vulnerabilities and Exposures*, 2025). The CVE List documents publicly known security vulnerabilities and defines them using standardized naming conventions. Each CVE entry includes a unique CVE ID, a brief description of the vulnerability, and links to additional information.

For CVSS classification, the eight primary metrics defined in CVSS version 3.1 were utilized (*CVSS v3.1 Base Score Calculator*, 2025). These metrics are as follows:

- Attack Vector (AV): Describes how the vulnerability can be exploited. It includes four categories: Network (remotely exploitable), Adjacent (limited by logical topology), Local (requires read/write/execute capabilities), and Physical (requires physical interaction).

- Attack Complexity (AC): Indicates the conditions required for a successful attack. It has two categories: Low (no special conditions) and High (specific conditions required).
- Privileges Required (PR): Specifies the level of privileges an attacker must possess. The categories are: None, Low (basic user privileges), and High (administrator privileges).
- User Interaction (UI): Indicates whether user interaction is necessary for the exploitation of the vulnerability. The categories are: None and Required.
- Scope (S): Describes whether the vulnerability impacts components beyond the security scope of the vulnerable component. It has two values: Unchanged and Changed.
- Confidentiality (C): Assesses the impact on data confidentiality. The categories are: High (complete loss), Low (partial loss), and None.
- Integrity (I): Assesses the impact on data integrity. The categories are: High (complete loss), Low (some changes), and None.
- Availability (A): Assesses the impact on the availability of the affected component. The categories are: High (complete loss), Low (performance degradation), and None.

For our classification task, we utilized BERT-base-uncased, a pre-trained language model readily available on the Hugging Face platform. BERT, or Bidirectional Encoder Representations from Transformers, is a powerful language representation model first introduced by (Devlin et al., 2019). It's built upon a bidirectional Transformer architecture, enabling it to process language context from both directions simultaneously. The "base" version of this model features 12 Transformer layers. Each layer incorporates 768-dimensional hidden vectors and employs 12 multi-attention heads, allowing for robust feature extraction. The "uncased" variant, which we used, preprocesses text data by converting it to lowercase and removing punctuation marks, simplifying the input. This specific model, comprising approximately 110 million parameters, was pre-trained on a massive corpus: the BooksCorpus dataset (800 million words) and the English Wikipedia dataset (2.5 billion words) (Wolf et al., 2020).

Findings and Discussion

In our study, a training dataset consisting of 10,000 samples was created from data obtained from the CVE website, and a test dataset was constructed using 2,000 samples. Following the dataset preparation, the BERT model was implemented using the torch and transformers libraries. Model training began with the pre-trained model described in the Materials and Methods section. During training, the batch size was set to 16, the number of epochs to 5, the learning rate to 2e-5, and the maximum sequence length to 256. The model was trained on the training dataset using these configured hyper-parameters, and its performance was evaluated on the test dataset. The resulting accuracy, precision, F1 score, and AUC score are summarized in Table 1.

Table 1. Performance scores of BERT model computing on test dataset

CVSS Metric Name	Number of Class	Accuracy (%)	Precision (%)	F1 Score (%)	AUC (%)
AV	4	89.89	88.70	88.81	93.88
AC	2	90.70	88.75	88.19	94.17
PR	3	75.42	75.43	74.81	88.59
UI	2	90.82	90.81	90.74	96.10
S	2	89.08	88.98	88.98	95.15
C	3	80.95	80.96	80.93	93.13
I	3	81.90	81.99	81.92	93.91
A	3	81.11	81.92	80.80	92.33

Table 1 presents the classification performance of the BERT model across various CVSS metrics. The results generally indicate a high level of performance for the model. Notably, the model achieved its strongest performance on the UI CVSS metric, demonstrating 90.82% accuracy and a 96.10% AUC score. Similarly impressive results were observed for the AV and AC metrics, with accuracy values exceeding 89% and AUC scores around 94%. However, for the PR, C, I, and A CVSS metrics, which each have three classes, accuracy values ranged between 75% and 82%. The relatively lower accuracy rate of 75.42% for the PR metric is particularly noteworthy. While these results suggest the model faces greater challenges distinguishing between certain metrics, the overall performance confirms that the BERT model offers effective and consistent performance in the automatic classification of CVSS metrics.

Conclusion and Recommendations

In this study, we developed and implemented a BERT-based deep learning model for the automatic classification of CVE records based on their CVSS base metrics. The model was trained and tested using current CVE data from the cvelistV5 dataset. Our classification results for the eight different CVSS base metrics demonstrate successful performance. We observed particularly high accuracy rates in the UI (90.82%), AV (89.89%), and AC (90.70%) metrics. However, the PR metric showed a lower accuracy rate of 75.42%, indicating that classification for this specific metric presents more challenges and offers an area for future improvement. This study makes significant contributions to both academic research and industrial applications. Automating CVSS scoring can lead to faster and more accurate analysis of cybersecurity threats, which in turn accelerates decision-making processes for security teams and optimizes resource allocation. Given the difficulties associated with manually classifying large-scale security vulnerabilities, our proposed method offers an effective and feasible alternative for automating this process.

The lower scores observed in some CVSS metrics suggest several avenues for future improvements. We anticipate that incorporating techniques like data augmentation and weighted loss functions could help mitigate class imbalances, leading to better performance.

Additionally, future studies could benefit from conducting analyses with other powerful language models such as XLNet, RoBERTa, and DeBERTa, and comparing their performance with our BERT-based model. This comparative analysis would enhance the originality of subsequent research. Finally, a promising direction for future work involves developing software or an API that integrates our model to analyze real-time CVE data. Measuring the impact of the trained model on real-time systems would offer a unique and valuable perspective for future studies in this domain.

ABSTRACT

Stunting is a condition in which the height of an infant or toddler is shorter than that of other children of the same age. This condition is usually identified by the failure of growth in infants (0–11 months) and toddlers (12–59 months), which results from chronic malnutrition during the First 1,000 Days of Life. Stunting in children is a serious issue because it is associated with an increased risk of illness and death, impaired brain development, delays in motor skill development, and hindered mental growth. In North Sumatra, the stunting rate in 2021 was 25.8%, while in Pematangsiantar City, it was 15% which is below the national average of 24.4%. This study aims to describe the characteristics of pregnant mothers about stunting in the Batu Anam Health Center area, Simalungun Regency. The design of this research was descriptive with a cross-sectional design. The analysis uses univariate analysis to describe the characteristics of pregnant mothers. The population is pregnant mothers in the working area of Batu Anam Health Center from May 2024 to September 2024. The sample for this study was the whole population of 30 pregnant mothers. The results of the study showed that the majority of pregnant mothers who were aged 20-35 years (80%), the majority of pregnant mothers who had higher education (80%), the majority of pregnant mothers who were primigravida (50%), the majority of postpartum mothers who experienced tearing worked as housewives (60%), %), and the majority of pregnant mothers who have good knowledge about stunting (73.3%). The conclusion of the research above showed that most of the respondents of pregnant mothers who have good knowledge about stunting (73.3%).

Keywords : *pregnant mothers, stunting*

Introduction

Stunting is a nutritional problem caused by inadequate nutrition, leading to further nutritional issues. Ideally, adequate nutrition should begin from the time a child is in the womb until they reach the age of two years (the first 1,000 days of life). According to the Ministry of Health (Kemenkes), stunting is defined as a condition in which a toddler's z-score is less than -2.00 standard deviations (stunted) and less than -3.00 SD (severely stunted) (Kemenkes RI, 2022a). Stunting can be caused by both direct and indirect factors. The factors that can influence the occurrence of stunting include nutritional intake, exclusive breastfeeding, genetic factors, maternal education, maternal knowledge, infectious diseases, socioeconomic status, environment, and food availability.(Kemenkes RI, 2022a)

Stunting remains one of the major nutritional problems among toddlers in Indonesia. According to data from the World Health Organization (WHO) in 2020, 5.7% of toddlers globally were overweight, 6.7% were undernourished or severely malnourished, and 22.2% or 149.2 million children suffered from stunting (chronic malnutrition)(Kemenkes RI, 2022b). The stunting prevalence rate in Indonesia, based on the 2022 Indonesian Nutrition Status Survey (SSGI), was 21.6%, showing a decrease from the previous year's rate of 24.4%. Although the trend is decreasing, it is still considered high based on WHO criteria (>20%). The stunting prevalence in Pematangsiantar City according to SSGI (2022) was 14.3%.

Stunting has both short and long - term effects on a child's health. Short-term effects include impaired growth and development, and metabolic disturbances. Common characteristics of stunted children include short stature, delayed growth, learning concentration difficulties, and increased susceptibility to illness. If not addressed early, stunting can have long-term impacts such as reduced cognitive ability, greater vulnerability to diseases, and increased risk of metabolic disorders and conditions such as heart disease. Stunting can be prevented, starting as early as pregnancy. Pregnant women need to pay close attention to their nutritional intake during pregnancy. A mother's knowledge plays a crucial role in shaping her behavior regarding nutrition during and after pregnancy.(Kemenkes RI, 2022a)

A study conducted by Munthe (2022) found a significant relationship between the level of maternal knowledge and the incidence of stunting in children, with a p-value of 0.022, indicating that a low level of parental knowledge is associated with a higher incidence of stunting. The study also found a correlation between maternal knowledge and stunting prevention efforts.(Munthe, Atika, & Candra, 2023) Based on this background, the author is interested in conducting research titled: "The Characteristics Of Pregnant Women Concerning Stunting At The Midwifery Clinic In The Bahkapul Health Center Working Area.

Materials and Methods

This research method is descriptive and uses a cross-sectional design. The analysis used univariate analysis to describe the characteristics of pregnant mothers in the Batu Anam Health Center area, Simalungun Regency. The population of this study was population is pregnant mothers in the working area of Batu Anam Health Center from May to September 2024. The sample for this study was the whole population of 30 pregnant mothers, with as many as 30 respondents. The analysis uses univaraite to describe age, level of education, parity, employment status and knowledge about stunting of pregnant mothers at the Batu Anam Health Center in Simalungun Regency.

Findings and Discussion

This research is about the characteristics of pregnant mothers about knowledge stunting in the Batu Anam Health Center area, Simalungun Regency in 2024**.** This research was conduct in from May to September 2024. During this period, 30 respondents were obtained as a research sample. The results of the study obtained the following data :

Table 1. Characteristic of Respondents were by Age, Level Education, Parity Employment Status and Knowledge about Stunting Of Postpartum Mothers At The Batu Anam Health Center In Simalungun Regency.

No	Characteristic of Respondents	n	%
1	**Age**		
	- Risk Age (< 20 Years & > 35 Years Old)	6	20%
	- Not Risk Age (20-35 Years Old)	24	80%
	Total	**30**	**100%**
2	**Level of Education**		
	- Higher Education (SMA/PT)	24	80%
	- Low Education (SMP/SD)	6	20%
	Total	**30**	**100%**
3	**Parity**		
	- Primipara (1)	15	50%
	- Multipara (>1)	15	50%
	Total	**30**	**100%**
4	**Employment Status**		
	- Housewives	18	60%
	- Working	12	40%
	Total	**30**	**100%**
5	**Knowledge about stunting**		
	- Less Knowledge (<70)	21	70%
	- Good Knowledge (≥70)	7	30%
	Total	**30**	**100%**

-

- Base on the table above showed that that most of the respondents were not at risk age (were 20 to 30 years old), as many as 24 respondents or (80%), and very few of the respondents were at risk age (less than 20 years & more than 35 years old), as many as 6 or (20%) respondents. The majority of respondents, 24 respondents or (80%) had higher school education and very few of the respondents, 6 respondents or 20 % had low education. Half of the

respondents, 15 respondents (50%) had primipara parity, and half of the respondents, 15 respondents or 50 % had Multipara parity. Most of the respondents of pregnant mothers worked as housewives as many as 18 respondents or (60%) and almost half of the respondents, 12 respondents or 40 % was working. Most of the respondents had good knowledge about stunting, namely as many as 21 respondents (70%) and and almost half of the respondents, 7 respondents or 30 % had less knowledge.

-

Conclusion and Recommendations

The results showed that most of the respondents were within the non-risk reproductive age group (20 to 30 years old), accounting for 24 respondents (80%). Meanwhile, a very small portion of the respondents, 6 individuals (20%), were considered to be in the at-risk age group (under 20 years or over 35 years old). A study conducted by Hasrun (2024) found a significant relationship between maternal age and the incidence of stunting in toddlers, with a p-value of 0.015.(Hasrun, 2024) These findings suggest that maternal age can influence the occurrence of stunting in children. Mothers who are either too young or too old are more likely to have children affected by stunting (Kemenkes RI, 2022a). The ideal reproductive age for women to conceive is between 20 and 35 years (Purborini & Rumaropen, 2023). A similar study was conducted by Sani (2020), who found a significant association between maternal age at the time of pregnancy and stunting among children aged 24 to 59 months in the service area of the Citeras Public Health Center. The study reported that 49 respondents categorized as being of high-risk maternal age (< 20 years and > 35 years) had children who were classified as having short or severely short stature (Sani, Solehati, & Hendarwati, 2020).

The majority of the respondents (24 respondents or 80%) had a high school level education, while only a few (6 respondents or 20%) had a lower educational background. This is consistent with the findings of Hasrun (2024), who reported a significant relationship between the mother's education level and stunting in toddlers, with a p-value of 0.000. (Hasrun, 2024)Low maternal education can affect the mother’s ability to absorb information, which in turn influences her behavior in preparing nutritious food for her child (Kemenkes RI, 2022a).

Half of the respondents (15 respondents or 50%) were primiparous (first-time mothers), while the remaining half (15 respondents or 50%) were multiparous. These findings indicate that maternal parity may influence the incidence of stunting. Closely spaced pregnancies and births can increase the risk of stunting in children (Kemenkes RI, 2022a).

Most of the pregnant respondents were housewives (18 respondents or 60%), while nearly half (12 respondents or 40%) were employed. According to a study by Savita (2020), there is a significant relationship between maternal employment and stunting among children aged 6–59 months in South Bangka Regency, with a p-value of 0.000 (Savita & Amelia, 2020). Similarly, Rahmawati (2023) found a significant relationship between maternal occupation and stunting in the working area of Landono Health Center, also with a p-value of 0.000 (Rahmawati, Zakiah, & Mutmaina, 2023). Working mothers are expected to have better access to information and resources through their experiences in the workplace (Savita & Amelia, 2020).

- Most of the respondents had good knowledge about stunting, namely as many as 21 respondents (70%) and and almost half of the respondents, 7 respondents or 30 % had less knowledge. The results of this study are also consistent with the research conducted by Juniantari (2024), which states that there is a relationship between maternal knowledge and the

incidence of stunting in toddlers in the working area of Puskesmas Abang I. The assumption of the researcher, Juniantari, states that if a mother has good knowledge, then her behavior regarding stunting will also be good (Juniantari, Triana, Sukmandari, & Purwaningsih, 2024). Mothers who have sufficient knowledge about stunting can also be influenced by other external factors that can contribute to the occurrence of stunting in children (Juniantari, 2024). This study is also in line with the research conducted by Asnawi (2024), which states that maternal knowledge is statistically significantly related to the incidence of stunting in children under five years old (p=0.209) (Asnawi et al., 2024). Similar research by Hamdin (2023) also states that there is a relationship between maternal knowledge and the incidence of stunting in toddlers in the working area of Puskesmas Moyo Hilir, Sumbawa Regency, with a p-value of 0.006 (Hamdin, Hamid, & Nurhayati, 2023).

Stunting in children can be caused by several direct and indirect factors. These factors include: toddler nutritional intake, infections, maternal factors, genetic factors, exclusive breastfeeding, food availability, socioeconomics, education level, knowledge, maternal nutrition knowledge, and environmental factors. Mothers with insufficient knowledge about nutrition may find it difficult to prepare nutritious food for their children. Conversely, when a mother has good knowledge, it is expected that her behavior and actions will align with the knowledge she possesses, allowing her to prepare good nutrition for her child and thus prevent stunting (Kemenkes RI, 2022a).

Stunting can result in disturbances in a child's growth and development, leading to long-term effects on their overall development. Stunting can even be prevented by paying attention to nutritional content starting from pregnancy. The role of the mother is crucial in preventing stunting, as the mother is primarily responsible for preparing the nutritional intake for the family. Therefore, mothers need to be equipped with knowledge about nutrition and stunting (Kemenkes RI, 2022a).

Thanks and Information Note

The researcher would like to express sincere gratitude to all parties who have provided support and assistance throughout the research process. Special thanks are extended to Bahkapul Health Center for the warm welcome and cooperation during the study. The researcher also extends appreciation to the pregnant mothers within the Bahkapul Health Center working area for their willingness to participate as respondents in this research.

USE OF INSECTS AS ALTERNATIVE PROTEIN SOURCES IN POULTRY FEEDS: A REVIEW

***Anyanwu, U. H. and Daniel, L. E.**
Department of Agricultural Technology, Federal Polytechnic Ekowe, Bayelsa State, Nigeria.
*Email: ugochukwuanyanwu50@gmail.com

ABSTRACT

Despite the exponential growth witnessed in the poultry industry in Nigeria over a few decades, there still exits deficiency in meeting the nutritional demands of the populace. To bridge this gap sustainably, the exploration of alternative protein sources away from the conventional, high-cost feedstuff such as fishmeal and soybean meal is imperative. Insect meal has emerged as a promising solution, offering high nutritional value and ecological benefits. This review examines the nutritional composition of insect meal such as the black soldier fly, house fly, grasshopper, cricket, meal worn, earthworm meals into poultry diets as well as their effects on the growth performance of poultry species. It was observed that insect meals possess nutritional compositions that are comparable to soybean and fishmeal respectively and can improve the growth performance of birds, hence, providing a affordable alternatives for poultry feeds. Furthermore, it describes challenges and future prospects associated with scaling up insect production. Despite facing limitations, insect meal presents a viable and eco-friendly option to enhance poultry nutrition. With ongoing research, insect-based feeds hold the potential to revolutionize the poultry industry, thereby ensuring food security.

Keywords: Insect Meal; Poultry; Alternative Protein Source; Nutrient composition; Food Security

INTRODUCTION

Poultry have strong affinity for worms and insect larvae. This is the reason their innate instinct of digging in and scratching of ground. Birds prefer insect-based diets, probably because of their taste and nutritive value. Birds reared on free range rely on insects to meet their protein needs. This indicates that insects and worms have excellent potentials for use as a replacement for highly competitive fishmeal and soybean meal in poultry production. According to Agazzi *et al*., (2016) insect meals are considered a possible protein source for use in animal nutrition based on the nutritive values. Veldkamp *et al.,* (2012) reported that insect meals have an amino acid profile and essential amino acid indices similar to those of soybean meal.

Insect meal as an alternative protein ingredient gives rise to diverse views for animal feeding, with a question of how to combine sustainability and quality (Reis & Dias, 2020). An efficient inclusion of insect meal can close the cycle in a sustainable circular economy (Veldkamp *et al.,* 2012). There is a high demand and consequent rise in the prices of fish and soybean meal necessitating the development of research on protein sources from insects (FAO, 2013). The inclusion of insect pupae and larvae in poultry feed does not affect meat quality and the performance of growing animals (Zegeye, 2020). The use of insects in animal feed results in low-cost feed since the production of these insects require simple technology with organic waste as input. However, according to Gasco (2019), the presence of chitin in some insect species could lead to a decrease in nutrient digestibility, interfering with animal performance.

Insect meal is environmental-friendly ingredient. It contributes to decreasing environmental pollution as organic wastes are used in insect production (Sayed *et al*., 2019; Sacci *et al*., 2018; Sacci *et al*., 2020). Insect meals are considered as potential substitution candidates for soybean meal (SBM) and fish meal (FM) since they have been used as partial or total substituents without adverse effects on production performances or product quality (Kah *et al*., 2018; Marorno *et al*., 2015; Bovera *at al*., 2015).

This paper is one of the numerous efforts geared towards providing ample information an about the nutritional value of some insect meals, as well as their effects on growth performance of poultry. The safety concerns regarding insects rearing or feeding insect-based diets are also discussed.

Nutritive value of Insect meal

The black soldier fly (BSF) is a common and widespread fly of the family *Stratiomyidae*. BSF meal is a naturally nutritious, protein-packed, and calcium-rich source. The concentration of crude protein (CP) in BSF larvae meal varies from 35 to 61%, and the content of crude fat (*CF*) ranges from 7 to 42%. High concentrations of lauric and palmitic acids are also reported (Moula *et al*, 2018). Methionine, lysine, threonine, and valine contents were found to be between 0.08 and 0.90% (Brede *et al*., 2018; Mwaniki *et al.,* 2018; De Marco *et al*, 2015), 0.34 and 3.30% (Neumann *et al*., 2018), 0.22 and 2.26% (Brede *et al*., 2018; Mwaniki *et al.,* 2018), and 0.33 and 3.38% (Brede et al., 2018; Mwaniki *et al.*, 2018) respectively. The concentration of calcium ranges from 1.21% (Mwaniki *et al*., 20) to 4.39% (Chu *et al*., 2020), and that of phosphorous varies from 0.74% (Liu *et al*., 2021) to 0.95% (Mwaniki *et al.*, 2018). The nutritive value of BSF meal depends on the rearing substrate, the age of harvesting, and the technology of processing. The pressing and defatting treatments could decrease fat content, from 37% (original) to 27.36% (steamed), 17.05% (methanol extracted), 17.95% (normal pressing), or 13.05% with heated pressing (Astuti *et al*., 2018).

The housefly (HF) can be found in all countries and can be reared on animal manure and food waste. HF larvae meal contains considerable amounts of CP and *CF* ranging from 40 to 64%,

and from 2.5 to 28%, respectively. In HF larvae, the content of CP decreases with age, whereas the content of *CF* increases (Aniebo *et al*., 2008, Aniebo and Owen, 2010). Lysine and methionine are the most limiting amino acids in poultry nutrition. Both of these amino acids are available in high amounts in HF meal (Hall *et al*., 2018). Interestingly, the amino acid profile of HF meal resembles that of FM. Similarly to BSF meal, the processing method of the insect impacts the nutritive value of the meal (Aniebo and Owen, 2010).

Mealworms (MW) can be found worldwide where warm, dark, and damp places are available. MW meal is considered a good source of protein and fat, with a CP amount ranging from 27 to 54%, and *CF* content from 4 to 34%. Values of ash, crude fibers, and energy in MW larvae range from 3.0 to 4.5% (Hall *et al.*, 2018; Jozenfiak and Engberg, 2018), 5.0 to 8.8% (Hall *et al*., 2018; Jozenfiak and Engberg, 2018), and 1,378 to 4029.63 Kcal/Kg DM (De Marco *et al*., 2015), respectively. As compared to SBM, MW larvae had higher CP, *CF*, and ADF (Bovera *et al*., 2018). Methionine + cysteine, lysine, leucine, isoleucine, histidine, threonine, valine, and arginine contents are higher in SBM, whereas MWs had greater tryptophan content (Bovera *et al*., 2018). Moreover, MW larvae contain low amounts of Ca (434.59 mg/Kg) and high levels of K and P [9479.73 and 7060.70 mg/Kg, respectively (Bavzanaadii *et al*., 2011)]. Consequently, the Ca/P ratio is not suitable for poultry production, especially for hens, and Ca supplementation is recommended (5). In addition to these minerals Zn, Fe, and Cu are found in MW in considerable amounts [104.28, 66.87, and 13.27 mg/kg, respectively (Bavzanaadii *et al*., 2011)].

Crickets and grasshoppers are also valuable protein sources for poultry. The amount of CP ranges from 48 to 65% and *CF* is between 3 and 21%. Of course, these contents varied between African grasshoppers (*Acanthacris ruficornis*), Chinese grasshoppers (*Acrida cinerea*), wild edible grasshoppers (*Ruspolia nitidual*), short-horned grasshoppers (*Oxya hyla hyla*), and desert locusts (*Schistocerca gregaria*) (Amobi *et al*., 2020). The crude fiber content varies between 1.06 and 9.21% (Ojewole *et al*., 2005; Hassan *et al*., 2009). In addition to crickets, earthworms (EW) are a good source of protein, energy, and amino acids (Jankovic *et al*., 2020; Istiqomah *et al*., 2009; De Marco *et al*., 2015). The CP content of EW meal ranges from 41 to 66%, and *CF* is between 3.5 and 18%. Important contents of lysine and methionine were recorded in EWs (Finke, 2002). However, it is important to mention that these values depend on the freshness and dryness of the EWs.

Fig 1. Some insects used in poultry feed. (Belhadj *et al*., 2023)

Effects of Insect Meal on Growth Performance

Housefly larvae and pupae have been extensively investigated in broilers (Awoniniyi *et al*., 2003; Adeniji 2003; Adesina *et al*., 2011; Okah and Onwu jiariri, 2012 Teguia *et al*., 2002). The various results pointed to the fact that this protein source, either fresh or dried, can be used as an alternative to fish meal, soybean meal, and other protein ingredients. The studies observed no adverse effect on survival rate, daily feed intake, body weight gain, and feed conversion ratio. However, a more balanced diet can be achieved by combining housefly meals and conventional meals in the same diet for better growth performance (Awoniniyi *et al*., 2003; Adeniji 2003; Adesina *et al*., 2011; Okah and Onwu jiariri, 2012 Teguia *et al*., 2002). Furthermore, housefly meal can partially or totally replace FM in broiler diets. Inaoka *et al*. (1999) and Awoniyi *et al*. (2003) reported that housefly maggots and pupae may be included in the diet up to 7%. If the inclusion rate exceeds 10%, a decrease in feed intake and growth performance was observed. This seems to be related to the dark color of the produced feed, which is not attractive to chickens (Atteh and Ologbenla, 1993), and to the imbalanced AAs profile (Makkar *et al*., 2014). In this latter case, methionine supplementation might improve broiler growth performance. Nevertheless, Hwangbo *et al*. (2009) concluded that growth performance was enhanced when supplementing broiler feed with 10–15% housefly larvae. Similarly, Okah and Onwujiariri (2012) described that the experimental group of chickens fed 20 and 30% of housefly maggot meal recorded the best body weight, as compared with the control group. It seems that this discordance regarding the inclusion rate is related to the processing method of the insect, which influences the availability of nutrients.

Mealworm meal is another alternative protein source that has investigated extensively in poultry feed. Hall *et al*. (2018) who reported that mealworm, once incorporated in the broiler diets up to 10%, has no negative effects on body weight gain, feed intake, and feed conversion ratio. It was also observed that a consequent decrease in the inclusion rate of SBM from 31 to 20% after incorporating dried yellow mealworm up to 10%, had no significant differences in the performance results. According to Schiavone *et al*. (2014), the best body weight gain was obtained using 25% mealworm. Bovera *et al*, (2015), reported no significant effects on growth performance, carcass traits, and meat quality on broiler chickens when soybean meal was completely substituted with mealworm. In addition, the feed conversion ratio was significantly enhanced ($p < 0.05$) in the mealworm group. As compared to the control group (SBM group), broilers fed MW as a unique protein source had a more developed digestive system, a greater percentage of the spleen, longer intestines, ileum, and ceca ($p < 0.05$). Indeed, a better feed conversion ratio was calculated in the experimental group (Bovera *et al*., 2015).

BSF is another potent candidate to be included in poultry feed as SBM and FM substitute. The nutritional profile of these worms is comparable to that of FM and, in some aspects, better than that of SBM. Maggot meal could replace FM, without altering body weight gain, feed intake, and feed conversion ratio. As a substitute for SBM, dried BSF larvae allowed for decreasing feed intake and enhancing feed conversion ratio, without adverse effects on body weight gain (Makkar *et al*., 2014). In growing broiler quails, no significant statistical differences were reported regarding body weight gain, feed intake, and feed conversion ratio, and mortality rate between control, 10% defatted BSF larvae meal, and 15% defatted BSF larvae meal groups (Cullere *et al*., 2016). Regarding palatability, no special preference for broilers was shown toward control or defatted BSF larvae meals. It is interesting to mention that in this latter study, 10% defatted BSF larvae substituted for 28.4% of soybean oil and 16.1% of SBM, and 15% of defatted BSF larvae meal allowed the replacement of 100% of soybean oil and 24.8% of SBM.

It can be concluded that BSF meal is a good alternative to FM and SBM in broiler diets, without any negative impacts on the growth performances of the birds.

Grasshoppers were also assessed in broilers' feed. Grasshopper meal was used to replace 50 and 100% of FM (the inclusion rate was 5 and 10%, respectively) in Arbor Acres broiler chickens, which exhibited improved growth (Brah *et al*., 2017). These findings were corroborated by the findings of Sanusi *et al*. (2013) and Sun *et al*. (2013) who reported that grasshopper meal could totally replace FM without any adverse effects in Anak 2000 broiler chickens. However, diets containing more than 25% wild edible grasshopper (*Ruspolia nitidual*) meal were found to lower FI in indigenous chickens (Nginya *et al*., 2019).

Earthworms were also recommended as a potential protein source that could replace FM and SBM in poultry feeding. Loh *et al*. (2009) reported that incorporating EWM in Ross male broiler chickens diets at 5, 10, 15 and 20% allowed enhancing feed intake ($p < 0.05$), increasing BW ($p < 0.05$), improving FCR ($p < 0.05$) and reducing fecal lactic acid bacteria count. Other related studies confirmed that Ross 308 broiler chickens fed on diets containing 2, 3%, or 4% EWM increased their BW and feed intake (Loh *et al*., 2009; Zang *et al*., 2018). An inclusion rate of 5% EWM (*Eudrilus eugeniae*) enhanced feed conversion ratio (Park and Hahm, 2005). Lower inclusion rates (1% EWM and 1% *vermi-humus*) resulted in a negative impact on body weight gain, despite the observed improvements in the immune functions in broilers (Zang *et al*., 2018). This was probably due to the unbalanced amino acid profile of the diet.

Challenges

Insect species, feed substrate, and processing methods play crucial roles in determining the nutritional quality of insect meal. Therefore, optimizing rearing conditions and processing techniques is essential to ensure that insect-derived feed products meet the nutritional requirements of poultry.**Limitations**

There are fewer number of cultured insect species and the dry matter content of insects constitutes a significant set-back. Also the production technology seem to vary from region to region and may resulting to inconsistent outputs. Another challenge lies in the presence of specific anti-nutritional compounds such as protease inhibitors, oxalates, tannins, lectins, and alkaloids in insect meal, which can affect nutrient absorption and animal health. Additionally, to gauge the economic feasibility of integrating insects into poultry feeding, regular cost-benefit analyses are necessary.

Prospects of insect meal

The future outlook for insect meal as an alternative protein source for poultry diets is promising. With continued research and development efforts, there is a greater possibility of fulfilling the growing demand for economical and sustainable protein sources in the poultry industry. By leveraging technological advancements, regulatory support, and ongoing research initiatives, insect-based feeds have the potential to play a significant role in addressing the protein needs of the poultry sector while contributing to sustainable agricultural practices.

Conclusion

In conclusion, the mass production of insects presents a promising opportunity to generate a sustainable novel feed ingredient for the poultry-feed sector while simultaneously addressing

the environmental impact of food waste. Applied research has demonstrated encouraging results, highlighting insect-derived products as one of the most intriguing and sustainable sources of nutrients for animal feed. However, it is important to acknowledge that the insect protein industry is still in its early stages of development. Further research is needed to fully explore the potential of insect-based feed ingredients, optimize production processes, and ensure product safety and quality. With continued innovation, collaboration, and regulatory support, the insect protein industry has the potential to make significant contributions to sustainable agriculture and food security.

ABSTRACT

This study investigates the Total Factor Productivity (TFP) and supply response of wheat production in Nigeria over the period 1982 to 2022, utilizing secondary data obtained from the Food and Agriculture Organization (FAO), World Bank, and other climatic data repositories. The Törnqvist-Theil index was applied to estimate productivity, revealing a pattern of fluctuations across the decades. Average TFP values increased modestly from 0.96 in the 1980s to 1.04 in the 2012–2022 period. Notable peaks occurred in 1993 (TFP = 1.72) and 2007 (TFP = 1.49), while troughs were recorded in 1988 (TFP = 0.64) and 2020 (TFP = 0.65), indicating periods of inefficiency likely driven by infrastructural constraints and adverse climatic conditions. Additionally, the Auto Regressive Distributed Lag (ARDL) model was employed to assess short- and long-run supply responses. In the short run, wheat production was significantly influenced by lagged output (DPRQ(-2), $p = 0.0465$), wheat price ($p = 0.0054$), maize price ($p = 0.0141$), and humidity ($p = 0.0031$). However, none of the explanatory variables had statistically significant effects in the long run. The error correction term (-0.433, $p < 0.01$) confirms the presence of a stable long-run equilibrium, with approximately 43.3% of deviations corrected annually. These findings highlight the sensitivity of wheat production to both market conditions and environmental factors in the short-run, while emphasizing the need for sustained policy and technological interventions to improve long-run productivity.

Keywords: Total Factor Productivity (TFP), Wheat Production, Törnqvist-Theil Index, ARDL Model, Supply Response, Agricultural Productivity, Price Elasticity, Time Series Analysis.

1. INTRODUCTION

Agricultural production dropped, triggering food insecurity challenges in Nigeria (Ifeoma and Agwu, 2014). As noted by the Vision 20: 2020, National Technical Working Group (NTWG) on agriculture and food security, agriculture has always played a key role in the nation's economy, currently contributing about 42% of Gross Domestic Product (GDP) as against 13% for Oil & Gas; and employing two-thirds of the entire labor force, but, over the past 20 years, value-added per capita in agriculture has risen by less than one (1) percent annually (NTWG, 2009). The agricultural sector comprises crop production, fishery, livestock, and forestry, crop production is the dominant activity accounting for 87.6%, relative to livestock (8.1%), fishery (3.2%), and forestry (1.1%) In Nigeria (NBS, 2020). Nigeria's agricultural sector contributes to a significant part of the country's GDP. Between July and September 2021, agriculture contributed to almost 30 percent of the total GDP, an increase of about six percentage points compared to the previous quota in 2022 (Statista, 2023).

Wheat is grown in many different varieties throughout the world, each with unique uses and traits, the most common wheat type in Nigeria is bread wheat (Triticum aestivum), which is renowned for its high gluten content, making it ideal for baking, due to its tougher kernel and higher protein content than bread wheat, durum wheat (Triticum durum) is mostly used to make pasta, couscous, and some varieties of bread, Ancient wheat types like emmer wheat (Triticum dicoccum) have more nutritional content than contemporary wheat cultivars.

Wheat (Triticum Aestivum) is consumed in one way or another in almost all homes, restaurants, and lodging facilities across the nation. Furthermore, the crop serves as the primary raw material used in Nigerian flour mills. Its flour is used to make biscuits, bread, candy, and other treats. The offal (residue) is used in the feed mills in compounding livestock feeds (Ahmed, 2014). Due to the population's shifting tastes, there is an increasing local need for wheat products, which constantly generates a gap between local supply and demand, leading to a significant import of wheat into the nation. Wheat farming has been the most complicated area of Nigerian agriculture for the last decades, due to the high temperatures that is not favorable for the crop, low production, and many more (Haruna *et al.,* 2017).

Nigeria depends on imported wheat to meet the demands of its large growth. However, since the oil shock of the last quarter of 2014 up to 2016, wheat farming has attracted policymakers who see Nigeria's capacity in wheat production to be self-sufficient (KMPG, 2016). Throughout history, the Nigerian government's efforts to increase wheat production led to the ban on wheat importation in 1987, and the Accelerated Wheat Production Programme (AWPP) was implemented to encourage local production Nigeria's wheat production rose from 50,000MT to 450,000MT within three years of the program (Haruna *et al.,* 2017).

Nigerian wheat productivitys are no more than 2 tons per hectare, according to the Food and Agricultural Organization (FAO, 2020). This is significantly lower than irrigated wheat production in other countries, including Mexico at 5.1 tons per hectare, India at 3.4 tons, and Sudan at 2.5 tons. Low productivitys also lead to much higher prices in the local market than imports, making it difficult for millers to buy local wheat while keeping flour prices sustainable for Nigerian consumers. Unstable weather conditions and climate change create additional challenges, sometimes affecting wheat production planning and forecasting (Bamiro *et al.,* 2020). Other challenges include uncompetitive pricing, insufficient funding systems for research, lack of a cohesive national strategy on wheat development, unclear role of various stakeholders, and high cost of production (Danbazau *et al.*, 2021).

Solving Nigeria's cereal production problems is an indirect and powerful approach to alleviating poverty and improving the standard of living for Nigerian farmers. It is also a direct way of improving the GDP of the country. Mining policies and investment strategies must be designed and implemented at national levels to preserve soil nutrients, focusing on well-defined target areas. Furthermore, these measures must successfully promote the judicious use of inputs in conjunction with sound soil conservation practices (Ismaila *et al.,* 2010).

Abah and Ochoche (2021) state that during the past 20 years, wheat consumption has steadily increased throughout all African countries due to population growth, shifting dietary preferences, and a strong urbanization trend. This has resulted in a growing "food gap" in all regions, which is primarily filled by imports. Nigeria is becoming more and more enmeshed in the "wheat trap," where the majority of its food is produced using wheat (Ayo, 2010). The current domestic demand for wheat exceeds the amount produced locally. According to records, 90–95% of the wheat consumed comes from imports into the United States (Falaki & Mohammed, 2011). In conclusion, according to AgFlow report, (2023), Nigeria bought 0.14 million tons of wheat from Canada in July 2023, with Poland importing 64,365 tons, Russia importing 51,080 tons, and the United States importing 27,000 tons, hence Jan–to July 2023 saw 1.9 million tons of imports overall, Nigeria was buying 55,000 tons of wheat a year from Brazil, Latvia, Lithuania, and Poland.

Ochoche, (2021), study assessed the trend of wheat production in Nigeria and its implication on agricultural output (1981-2018), The production of wheat increased until 1987 throughout the specified period, after remaining constant from 1981 to 1984. However, a notable downturn started in 1987 and lasted until 1993. Production then climbed until 2000, fluctuating until 2006, when it increased dramatically and peaked in 2010. Up till 2018, output has continuously decreased after then. This described the complex nature of wheat production fluctuation in Nigeria, but how does the area harvested for wheat fluctuate? How does the productivity change over time? All these questions will be addressed in this study. Also, Determinants of Wheat Price Fluctuation in Nigeria (1981-2013) was accessed by,(Adefemi Oladejo *et al.,* 2019) the results show that wheat prices fluctuate over time, with an estimated intrinsic rate of price rise of 0.0238. Wheat prices were shown to be highly influenced by per capita income.

Thiam *et al.,* (2001) reveal that technical efficiency (TE) studies in agriculture show varying results across India, Pakistan, Ghana, and other African countries. In India, TE estimates range from 68% to 89% across crops like whole farm, wheat, and rice, with rice showing the highest efficiency. Pakistan's TE in rice production varies significantly from 24% to 73%, indicating a broader range of efficiency levels. Ghana exhibits moderate to high TE in rice production at 73%, similar to some of Pakistan's higher estimates.

Other African countries, such as Tanzania, are also considered to increase the geographical representation. These findings highlight diverse agricultural efficiencies and inefficiencies, providing valuable insights for comparing and improving yield efficiency in wheat cultivation in Nigeria by adopting best practices and avoiding common pitfalls observed in these regions.

A substantial research gap still exists in our understanding of the precise causes of productivity decline and the thorough examination of total factor productivity and supply response will help reveal some issues related to the input use, resources allocation and production responses toward various factors.

2. OBJECTIVES OF THE RESEARCH

1. To study the total factor productivity of wheat in Nigeria.
2. To examine the factors affecting the supply of wheat in Nigeria

3. MATERIAL AND METHODS

Data source:

Table 3.1. Variables used in the Analysis

Variables	Objectives	Sources
Wheat Production	1,2	FAO
Wheat Area	1	FAO
Labor Index	1	World Bank

Maize Price	2	FAO
Inflation	2	FAO

Augmented Dickey-fuller Tests

The ADF test is classified as a 'Unit Root Test', which is the right way to determine the stationarity of a time series, developed by Said and Dickey (1984). Unit root is a characteristic of a time series that makes it non-stationary.

Tonqvist-Theil Index of Productivity

The Total Factor Productivity (TFP) measures the efficiency with which inputs are converted into output, accounting for factors beyond just labor and capital. The Tonqvist-Theil index is an excellent index that is exact for the linear homogeneous translog production function. A further advantage of the Tornqvist-Theil index is that it accounts for changes in the quality of inputs. Because current factor prices are used in constructing the weights, quality improvements in inputs are incorporated, to the extent that these are reflected in higher wage and rental rates (Rosegrant & Evenson, 1995).This method used by researchers across the globe such as (Gocic & Trajkovic, 2013; Polisetty & Paidipati, 2020; Yue *et al.*, 2019) among others.

$$In\left(\frac{TFPt}{TFPt-1}\right) = \left(\sum_{i=1}^{n}\frac{1}{2}(s_{it}+s_{i\,(t-1)})\,In\left(\frac{Y_{it}}{Y_{i(t-1)}}\right)\right) - \left(\sum_{j=1}^{m}\frac{1}{2}(Wj_t+W_{j(t-1)})\,In\left(\frac{X_{jt}}{X_{j(t-1)}}\right)\right)$$

Where; TFP_t and TFP_{t-1} are the total factor productivity at time t and t-1. Y_{it} and Y_{it-1} is the quantities of i output at t and t-1. X_{jt} and X_{jit-1} is the quantities of j output at t and t-1. S_{it} and S_{it-1} is the share of output i at t and t-1. W_{jt} and W_{jt-1} is the share of input j at t and t-1. n and m are number of inputs and the number of outputs.

Auto Regressive Distributed Lags (ARDL)

This study presents the econometric specification using the ARDL model proposed by Pesaran et al. (2001). The benefit of this model is that it helps to simultaneously study the short-run and long-run effects of the independent variable on the dependent variable. Moreover, it can also be used when variables are integrated of either order zero or one. The short-run and long-run relationship between the variables is given by this equation:

$$\triangle PROQ\text{t} = \alpha + \sum_{i=1}^{p-1} \beta_{\text{i}} \triangle PROQ_{\text{t-I}} + \sum_{j=0}^{q1} \gamma j \triangle WPR_{\text{t-j}} + \sum_{k=0}^{q2} \delta_{\text{k}} \triangle CLI_{\text{t-k}} + \sum_{l=1}^{q3} \eta_{\text{l}} \triangle MPR_{\text{t-l}} + \sum_{m=0}^{q4} \theta_{\text{m}} \triangle CPI_{\text{t-m}} + \varepsilon_{\text{t}}$$

The first set of terms in the equation includes $\triangle PORQt$ as the change in the production quantity of wheat at a time t, representing the dependent variable, α is the constant term. $\sum_{i=1}^{p-1} \beta_i \triangle PROQ_{t\text{-}I}$ is the lagged change in production quantity as the autoregressive component of the model. $\sum_{j=0}^{q1} \gamma j \triangle WPR_{t\text{-}j}$ is the lagged change in the wheat price. $\sum_{k=0}^{q2} \delta_k \triangle CLI_{t\text{-}k}$ is the lagged change in climate variables . $\sum_{l=1}^{q3} \eta_l \triangle MPR_{t\text{-}l}$ is the lagged change in the maize price as substitute . $\sum_{m=0}^{q4} \theta_m \triangle CPI_{t\text{-}m}$ is the lagged change in the consumer price index reflecting the socioeconomic status of the farmer. ε_t is the error term, capturing the random shocks not accounted for by other variables in the model. All the variables were transformed into their natural logarithm before fitting the ARDL model.

Average	0.96	-	1.01	-	1.02	-	1.04

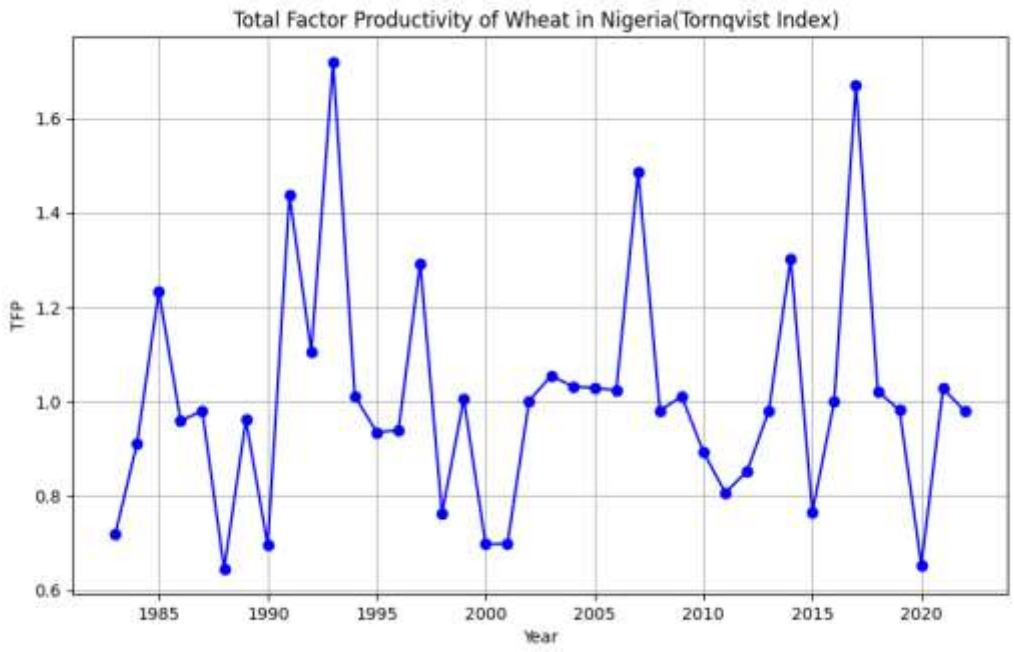

Figure 4.1 Total Factor Productivity of Wheat Crop in Nigeria (1982-2022)

From Table 4.8, between 1983 and 2022, Nigeria's wheat Total Factor Productivity (TFP) exhibited a trend of fluctuation, with an average TFP ranging from 0.96 to 1.04 throughout all of the decades. This points to gradual increases in production over time, with notable decreases in 1988 (0.64) and 2020 (0.65) and peaks in 1993 (1.72) and 2007 (1.49). The relative stability of the early 1990s and mid-2000s may be attributed to improvements in agricultural inputs and

supportive policies, whereas the volatility of the 1980s and recent years may be attributed to infrastructure challenges inconsistent policies, and other influences such as climate change.

The lack of mechanization and the slow adoption of modern farming techniques were identified as major obstacles to agricultural output in early research, such as (Kimmage, 1991). This issue is still present in more recent work by (Olomola & Nwafor, 2018).

This contributes to the understanding of why productivity fluctuated during the 1980s and early 1990s, even if it improved in the mid-2000s due to government reforms and subsidies. Inadequate investment and climate variability are two more recent studies which point to significant obstacles to increasing TFP.

Usman, (2007) highlights how unpredictable rainfall patterns, which are linked to the diminishing TFP trend starting in 2015, are one effect of climate change on wheat output. Although mechanization and input availability were enhanced by reforms in the late 1990s and early 2000s, as noted by (Asiva Noor Rachmayani, 2015; Castelein et al., 2022; O. J., 2015) the industry has not reached its full potential.

According to Adeola et al., (2024); Eswaran & Kotwal, (2006), governance problems and a lack of funding prevent technology solutions from being fully deployed, which keeps TFP below expectations. This review of the literature demonstrates that, despite certain advancements, Nigeria's wheat industry still faces significant challenges such as inconsistent policy, poor infrastructure, and the consequences of climate change, which hinder the nation's capability to increase its total food production significantly over the long run.

Supply Response Analysis

Table 4.3 Unit-Root Test Result

Variables	Estimated ADF	ADF-1%	ADF-5%	P-value
CPI	-3.63	-3.61	-2.93	0.0095
PRQ	-3.58	-3.61	-2.93	0.0106
HUM	-2.95	-3.61	-2.93	0.049
TEM	-3.74	-3.61	-2.93	0.0071
PRC	-5.05	-3.61	-2.93	0.0002
MPR	2.61	-3.67	-2.96	1
IPR	-1.81	-3.61	-2.93	0.3682
D(MPR)	-4.2	-3.67	-2.96	0.0026
D(IPR)	-7.73	-3.61	-2.93	0

Table 4.3 presents the Augmented Dickey-Fuller (ADF) test results which indicate that multiple variables are stationary at the 5% significance level, since their estimated ADF statistics are less than the crucial values at both 1% and 5%. The Consumer Price Index (CPI), Production Quantity (PRQ), Human Humidity (HUM), Temperature (TEM), and Precipitation (PRC) are all stationary, with p-values < 0.05. However, the Maize Price (MPR) and Wheat Price (WPR) show non-stationary levels, as evidenced by p-values of 1 and 0.3682, respectively. When D (MPR) and D (WPR) are differentiated, they become stationary, as seen by significantly

reduced ADF values and p-values of 0.0026 and 0, respectively. It also implies that these variables are integrated of order 1 (I (1)), which means they become stationary after the first differencing.

The ARDL model results for wheat cultivation in Nigeria in Table 4.4 indicate distinct both short- and long-run dynamics. In the short run, lagged wheat production (DPRQ (-2)) has a significant positive effect, with a two-period lag (p = 0.0465), suggesting that historical production levels influence current output. Wheat prices (WPR -1) also have a positive effect (p = 0.0054), showing that higher prices encourage more output. Humidity (HUM -1) reduces productivity (p = 0.0031), most likely due to poor growing conditions produced by high wetness. The positive influence of maize prices (MPR-1) (p = 0.0141) supports crop substitution effects, with higher maize prices potentially leading to increased wheat output. Temperature (TEM) and inflation (CPI) have no significant short-term effects.

The F-statistic (4.36) is above the upper bound at the 5% level (3.61) from Table 4.5, indicating a long-run relationship (co-integration) between wheat production and the explanatory variables. Wheat production is not considerably affected over the long run by any of the explanatory variables (wheat price, humidity, temperature, price of maize, or inflation) from Table 4.5. Stability over time is ensured by the error correction term (-0.433, p = 0.000), which shows that deviations from long-run equilibrium are corrected at a rate of 43.3% every period.

The short-run results are supported by recent studies, particularly when it comes to price responsiveness. According to Balint, (2024), producers quickly consider price rises and other market incentives when deciding how much to produce to maximize their profits. Additionally, A. Ali et al., (2023); and Shah et al., (2024)stress that environmental factors such as humidity may significantly hamper agricultural productivity in the near term, particularly in regions like Nigeria that rely heavily on rainfall. The crop substitution theory, according to which farmers modify their crop selections based on relative profitability, is compatible with the effects of maize prices (Nkhata et al., 2021).

Some studies indicate that climatic factors like temperature and humidity might have cumulative effects on agricultural output over time, as opposed to the long-run findings, Hassan, (2010)for example, argues that long-run production trends are typically shaped by climate variables, especially when persistent climate change is present. Similarly, Anderson, (2022) finds that, while prices may lose predictive power in the long run due to market

adjustments, natural stressors like extensive droughts or floods continue to affect yields over extended periods.

Ultimately, the diagnostic findings from Table 4.6, verify that there is no serial correlation, heteroscedasticity, time-varying volatility, or non-normality in the residuals of the ARDL model. These diagnostics corroborate the credibility of the estimated short-run and long-run interactions for wheat agriculture in Nigeria.

5. CONCLUSION AND RECOMMENDATION

The empirical findings of this study provide valuable insights into the dynamics of wheat production in Nigeria. Total Factor Productivity exhibited marginal growth over the study period, punctuated by periods of both efficiency gains and declines. These trends mirror the interplay between policy shifts, climatic variability, and infrastructural development.

The supply response analysis revealed that wheat production is significantly influenced by price signals and environmental factors in the short run, notably wheat and maize prices, as well as humidity levels. However, the lack of significant long-run effects implies the presence of structural limitations within the sector, including weak policy coherence, insufficient investment in agricultural technology, and inadequate adaptation to climate risks. The stable and significant error correction mechanism suggests the possibility of long-term improvements if systematic interventions are sustained.

Therefore, to enhance wheat productivity in Nigeria, there is an urgent need for an integrated and consistent agricultural policy framework that fosters private and public sector collaboration, improves access to agricultural inputs, and promotes mechanization. Investments in research and development should prioritize the breeding and dissemination of climate-resilient wheat varieties, alongside the expansion of irrigation infrastructure to mitigate the impact of erratic weather patterns. Furthermore, targeted subsidies and credit schemes could incentivize farmers to adopt modern technologies and improve input efficiency.

Future research should explore the interaction effects between specific inputs such as the synergy between fertilizer application and irrigation on productivity outcomes. Comparative studies across agro-ecological zones within and beyond Nigeria could also provide broader insights into best practices and contextual adaptability. Additionally, integrating climate change projection models into productivity analysis would be instrumental in formulating long-term adaptive strategies for the wheat sector in Nigeria.

Conflict of Interest Statement
the authors declare that there is no conflict of interest regarding the publication of this paper.

Data Availability Statement
the data that support the findings of this study are available from the Food and Agricultural Organization (FAO) database [https://www.fao.org/faostat], which is publicly accessible. Other data were sourced from World Bank.

Ethics Statement
This study used secondary data and did not involve any human participants or animals; therefore, ethical approval was not required.

Funding Statement
This research received no external funding.

ABSTRACT

Organic farming has emerged as a vital approach to sustainable agriculture, promoting environmental health, biodiversity, and long-term soil fertility while reducing dependence on synthetic chemicals. This paper explores the principles and practices of organic farming and evaluates its contributions to sustainability goals, including improved soil quality, water conservation, and reduction of greenhouse gas emissions. The review highlights the benefits of organic methods in enhancing ecosystem services and resilience against climate change. Additionally, challenges such as lower yields, certification costs, and market access are discussed. The paper concludes by emphasizing the need for supportive policies, farmer education, and research innovations to scale up organic farming as a sustainable alternative that balances productivity with ecological stewardship.

Keywords: Organic farming, sustainable agriculture, soil health, biodiversity, environmental conservation, climate resilience, eco-friendly practices, food security.

INTRODUCTION

Organic farming is an agricultural system that emphasizes the use of natural inputs and processes to enhance soil fertility, conserve biodiversity, and maintain ecological balance while producing food (Reganold & Wachter, 2016). Unlike conventional farming, which relies heavily on synthetic fertilizers, pesticides, and genetically modified organisms, organic farming practices avoid chemical inputs and focus on crop rotation, composting, biological pest control, and the use of organic fertilizers (Gomiero, Pimentel, & Paoletti, 2011). This approach aims to promote sustainable agriculture by fostering long-term soil health, reducing environmental pollution, and supporting resilient agro-ecosystems.

Sustainable agriculture addresses the growing global challenges of environmental degradation, climate change, and food security by integrating economic viability with ecological preservation and social equity (Pretty, 2008). Organic farming contributes significantly to these goals by improving soil organic matter, enhancing biodiversity, and minimizing greenhouse gas emissions associated with intensive chemical use (Tuomisto, Hodge, Riordan, & Macdonald, 2012). Additionally, organic farming systems have been linked to improved water retention and reduced contamination of water bodies, which are critical for sustaining agriculture in the face of climate variability (Seufert, Ramankutty, & Foley, 2012). Despite its benefits, organic farming faces challenges such as generally lower yields, certification complexities, and market accessibility issues (Ponisio et al., 2015). However, growing consumer demand for organic products and increasing policy support worldwide suggest a positive trajectory for organic farming as a core component of sustainable agriculture.

PRINCIPLES OF ORGANIC FARMING

Organic farming is guided by core principles that focus on ecological balance, sustainability, and the avoidance of synthetic inputs. These principles ensure that farming practices support soil health, biodiversity, and environmental conservation while producing nutritious food (IFOAM, 2014).

Health: Organic farming prioritizes the health of soil, plants, animals, humans, and the planet as interconnected systems. Maintaining soil fertility through natural processes ensures the production of healthy crops without harmful chemical residues (Reganold & Wachter, 2016).

Ecology: Farming practices are designed to work with natural ecosystems rather than against them. Organic systems promote biodiversity, nutrient cycling, and ecological balance by using crop rotations, intercropping, cover crops, and biological pest control to reduce pest outbreaks and soil erosion (Gomiero et al., 2011).

Fairness: Organic farming emphasizes fairness in the relationships between farmers, consumers, and society. It supports equitable labor conditions, community well-being, and transparency in production and marketing (IFOAM, 2014).

Care: Stewardship of the land requires careful management to protect natural resources for future generations. This principle encourages precaution and responsibility in farming decisions, avoiding practices that may harm the environment or human health (Pretty, 2008).

Key organic practices stemming from these principles include the use of organic fertilizers such as compost and manure, biological nitrogen fixation through legumes, minimal soil disturbance, and prohibition of synthetic pesticides, herbicides, and genetically modified organisms (GMOs)

(Seufert et al., 2012). By adhering to these principles, organic farming fosters resilient agricultural systems that can adapt to climate variability and reduce environmental degradation.

BENEFITS OF ORGANIC FARMING FOR SUSTAINABLE AGRICULTURE

Organic farming offers numerous benefits that align closely with the goals of sustainable agriculture by promoting environmental health, economic viability, and social well-being.

Soil Health Improvement

Organic farming enhances soil structure and fertility through practices such as compost application, green manuring, and crop rotation. These methods increase soil organic matter, microbial diversity, and nutrient cycling, which lead to improved soil productivity and resilience (Lori, Symnaczik, Mäder, De Deyn, & Gattinger, 2017). Healthier soils also improve water retention, reducing erosion and mitigating drought effects (Reganold & Wachter, 2016).

Biodiversity Conservation

By avoiding synthetic chemicals and fostering diversified cropping systems, organic farming supports higher levels of biodiversity both above and below ground. Increased biodiversity contributes to ecosystem stability, pest control, and pollination services essential for crop production (Bengtsson, Ahnström, & Weibull, 2005). Studies have shown that organic farms host more species of plants, insects, and soil organisms compared to conventional farms (Hole et al., 2005).

Reduced Environmental Pollution

Organic farming eliminates the use of synthetic pesticides and fertilizers, significantly reducing chemical runoff and groundwater contamination. This minimizes harm to aquatic ecosystems and protects human health from pesticide exposure (Tuomisto, Hodge, Riordan, & Macdonald, 2012). Moreover, organic practices reduce fossil fuel use by avoiding synthetic input manufacturing, lowering agriculture's carbon footprint (Gomiero, Pimentel, & Paoletti, 2011).

Climate Change Mitigation

Organic systems tend to sequester more carbon in soil due to higher organic matter inputs and reduced soil disturbance. This sequestration contributes to mitigating greenhouse gas emissions (Powlson et al., 2014). Additionally, organic farming's emphasis on local inputs and energy efficiency supports climate resilience.

Economic and Social Benefits

Though yields may be lower in some cases, organic farming can improve farmers' income through premium product prices and reduced input costs (Ponisio et al., 2015). It also encourages rural development by promoting local knowledge, community engagement, and sustainable livelihoods.

IMPACT ON SOIL HEALTH AND BIODIVERSITY

Organic farming has a profound positive impact on both soil health and biodiversity, which are crucial components of sustainable agricultural ecosystems.

Soil Health

Organic farming enhances soil quality by increasing organic matter content, improving soil structure, and fostering a diverse and active microbial community. The use of compost, green

manures, and crop rotations replenishes essential nutrients and stimulates beneficial soil microorganisms, which in turn promote nutrient cycling and disease suppression (Lori, Symnaczik, Mäder, De Deyn, & Gattinger, 2017). Reduced reliance on synthetic chemicals prevents the degradation of soil biota and maintains soil fertility over the long term (Gomiero, Pimentel, & Paoletti, 2011). Moreover, organic soils typically exhibit better water infiltration and retention, helping mitigate drought stress and erosion (Reganold & Wachter, 2016).

Biodiversity

Organic farming supports greater biodiversity at multiple levels—soil organisms, plants, insects, birds, and other wildlife. The avoidance of synthetic pesticides and herbicides allows beneficial insects and pollinators to thrive, enhancing ecosystem services such as natural pest control and pollination (Bengtsson, Ahnström, & Weibull, 2005). Diverse cropping patterns and habitat conservation on organic farms further contribute to the richness and abundance of species (Hole et al., 2005). Soil biodiversity, including earthworms and mycorrhizal fungi, plays a vital role in nutrient cycling and soil structure improvement, reinforcing the overall resilience of organic systems (Lori et al., 2017).

WATER CONSERVATION AND ENVIRONMENTAL PROTECTION

Organic farming plays a significant role in conserving water resources and protecting the environment, which are essential for sustainable agriculture.

Water Conservation

Organic practices improve soil structure and increase organic matter content, which enhances the soil's water-holding capacity and infiltration rates. This means organic soils can retain more moisture and reduce surface runoff, making water use more efficient and reducing the need for irrigation (Reganold & Wachter, 2016). The use of cover crops and mulching further reduces evaporation losses and maintains soil moisture levels (Lal, 2020). By promoting healthy soils and reducing compaction, organic farming helps mitigate drought impacts and supports crop resilience during dry periods (Drinkwater, Wagoner, & Sarrantonio, 1998).

Environmental Protection

Organic farming reduces the contamination of water bodies by eliminating synthetic pesticides and fertilizers, which are common sources of nutrient runoff and water pollution in conventional agriculture (Tuomisto, Hodge, Riordan, & Macdonald, 2012). This decrease in chemical inputs protects aquatic ecosystems, reduces eutrophication, and safeguards biodiversity in surrounding habitats (Gomiero, Pimentel, & Paoletti, 2011). Furthermore, organic farming practices contribute to lower greenhouse gas emissions and reduced fossil fuel use, promoting overall environmental sustainability (Seufert, Ramankutty, & Foley, 2012).

CHALLENGES AND LIMITATIONS OF ORGANIC FARMING

While organic farming offers numerous environmental and health benefits, it also faces several challenges and limitations that can affect its widespread adoption and productivity.

Lower Yields and Productivity

One of the primary concerns with organic farming is generally lower crop yields compared to conventional agriculture. Studies indicate that organic yields can be 20-25% lower on average, primarily due to constraints in nutrient availability and pest management (Seufert, Ramankutty, & Foley, 2012). This yield gap may affect food security, especially in regions with high population pressure.

Pest and Disease Management

Organic farmers rely on natural pest control methods, which may be less effective or slower to act compared to synthetic pesticides. This can result in higher vulnerability to pest outbreaks or diseases, leading to crop losses (Hillocks, 2012). The absence of chemical inputs demands more labor-intensive practices, increasing production costs.

Labor Intensity and Costs

Organic farming often requires more manual labor for weed control, soil preparation, and monitoring, which can increase operational costs (Lampkin & Measures, 2015). The higher labor requirement and the need for specialized knowledge can limit adoption, particularly for small-scale or resource-poor farmers.

Certification and Market Barriers

Obtaining organic certification involves strict compliance with standards, record-keeping, and inspection, which can be time-consuming and costly for farmers (Willer & Lernoud, 2019). Additionally, the premium prices of organic products may not always be accessible to all consumers, limiting market demand in certain regions.

PROSPECTS AND INNOVATIONS IN ORGANIC FARMING

Organic farming is increasingly recognized as a key strategy for sustainable agriculture, addressing environmental degradation, food safety, and climate resilience. The future prospects of organic farming are promising, bolstered by technological innovations and supportive policies.

Integration of Smart Technologies

Emerging technologies such as Internet of Things (IoT), drones, and remote sensing are being integrated into organic farming to enhance precision in monitoring soil health, moisture levels, and pest management without relying on chemicals (Sharma et al., 2020). Smart irrigation systems help optimize water use, vital for resource-efficient organic practices.

Advances in Biofertilizers and Biopesticides

Innovations in biofertilizers and biopesticides are improving the efficacy and scalability of organic inputs. Microbial formulations that enhance nutrient uptake and pest resistance are being developed, reducing dependence on synthetic fertilizers and pesticides (Singh et al., 2019).

Use of Artificial Intelligence (AI) and Machine Learning

AI-driven tools are being used to predict pest outbreaks, optimize crop rotation, and improve yield forecasting in organic farming systems. Machine learning models can analyze large datasets to tailor organic management practices to specific local conditions (Liakos et al., 2018).

Vertical and Urban Organic Farming

With rising urbanization, vertical farming combined with organic principles offers a sustainable solution to produce fresh, chemical-free food in limited spaces. Hydroponics and aeroponics are being adapted for organic inputs, reducing land use and transport emissions (Despommier, 2013).

Genetic Improvement of Organic Crop Varieties

Breeding crop varieties specifically suited to organic conditions such as improved nutrient use efficiency and pest resistance—can help close the yield gap with conventional farming (Mäder et al., 2007). Participatory plant breeding involving farmers accelerates adoption.

Policy and Market Evolution

Increasing consumer demand for organic products is driving market expansion and encouraging investment in organic supply chains. Policies that support certification, subsidies for organic inputs, and research funding are expected to grow (Willer & Lernoud, 2023).

CONCLUSION

Organic farming holds significant promise for advancing sustainable agriculture by promoting environmental health, biodiversity, and food safety. With the integration of smart technologies, advances in biofertilizers, and AI-driven tools, organic farming is becoming more efficient and scalable. Innovations such as urban vertical farming and development of organic-specific crop varieties further enhance its potential to meet growing food demands sustainably. Coupled with supportive policies and rising consumer demand, these trends indicate a positive future for organic agriculture as a cornerstone of resilient and eco-friendly food systems.

ABSTRACT

Water scarcity poses a significant challenge to agricultural productivity, especially in drought-prone regions where erratic rainfall and depleting groundwater resources threaten food security and rural livelihoods. This research explores innovative and sustainable water management techniques tailored to such vulnerable areas. It examines the effectiveness of methods including drip and sprinkler irrigation, rainwater harvesting, mulching, soil moisture conservation, and the use of drought-resistant crop varieties. The study also highlights the role of digital tools like remote sensing and IoT-enabled smart irrigation systems in optimizing water use. Through case studies and field data analysis, the research aims to identify best practices and scalable models that enhance water-use efficiency while maintaining agricultural output. The findings are intended to support policymakers, farmers, and agricultural planners in adopting context-specific solutions to build climate-resilient farming systems.

Keywords: Water management, drought-prone agriculture, drip irrigation, rainwater harvesting, soil moisture conservation

Introduction

Agriculture is a major consumer of freshwater resources worldwide, accounting for approximately 70% of global freshwater withdrawals (FAO, 2021). In drought-prone agricultural areas, water scarcity severely limits crop production and threatens food security, particularly in regions dependent on rain-fed agriculture. The increasing frequency and intensity of droughts due to climate change have exacerbated the challenges faced by farmers in these vulnerable areas (IPCC, 2022). Efficient water management is therefore critical to sustaining agricultural productivity and ensuring the livelihoods of rural populations. Traditional water management practices such as rainwater harvesting and mulching have been practiced for centuries to conserve soil moisture and optimize water availability (Kumar & Singh, 2019). However, these methods alone may not suffice to address the growing water demands under changing climatic conditions. Recent advancements in irrigation technologies, including drip and sprinkler systems, offer promising solutions by enhancing water-use efficiency and reducing wastage (Jat et al., 2020). Furthermore, the integration of digital technologies like Internet of Things (IoT) sensors and remote sensing tools has enabled precision irrigation, where water application is tailored to crop needs in real-time, maximizing efficiency (Patel et al., 2021). This research aims to analyze and evaluate various water management techniques suitable for drought-prone agricultural regions, focusing on both traditional and modern approaches. Through a review of literature and case studies, the study seeks to identify best practices and propose integrated strategies to improve water sustainability and resilience in agriculture.

Overview of Drought-Prone Agricultural Areas

Drought-prone agricultural areas are regions characterized by low and irregular rainfall, high evapotranspiration rates, and limited water availability, which collectively create harsh conditions for crop cultivation (Vicente-Serrano et al., 2020). These areas are predominantly found in arid and semi-arid zones, covering significant parts of continents such as Africa, Asia, Australia, and parts of the Americas (Wilhite et al., 2014). The vulnerability of these regions to drought is heightened by soil degradation, over-extraction of groundwater, and increasing population pressures that intensify competition for scarce water resources (Zhang et al., 2021).

The socio-economic impact of drought in these agricultural landscapes is profound. Crop failures due to insufficient water supply lead to food insecurity, income loss, and increased poverty among rural communities who largely depend on farming for their livelihood (FAO, 2022). Moreover, droughts exacerbate land degradation processes such as desertification, reducing the long-term productive capacity of the land (UNCCD, 2017). Understanding the spatial and temporal dynamics of drought in these regions is therefore critical to designing effective water management and drought mitigation strategies. The complex interaction of climatic, hydrological, and human factors shapes the challenges faced by drought-prone agricultural areas. Variability in rainfall patterns, often resulting in prolonged dry spells and unpredictable monsoons, creates uncertainty for farmers planning sowing and harvesting cycles (Dai, 2013). Additionally, traditional reliance on rain-fed agriculture without adequate irrigation infrastructure compounds the risks of drought-induced crop failure (Rockström et al., 2010). Therefore, targeted interventions to improve water use efficiency and enhance drought resilience are essential to sustain agricultural productivity in these vulnerable zones.

Traditional Water Management Practices

Traditional water management practices have been the cornerstone of agricultural sustainability in drought-prone regions for centuries. These methods focus on conserving and efficiently

utilizing available water resources by adapting to local environmental conditions and indigenous knowledge systems. One of the most widely used traditional techniques is rainwater harvesting, which involves collecting and storing rainwater from rooftops, catchment areas, or small reservoirs to be used during dry periods. This practice reduces dependency on erratic rainfall and supplements irrigation needs (Alaerts & Vairavamoorthy, 2013). Mulching is another essential technique used to conserve soil moisture by covering the soil surface with organic or inorganic materials. Mulching helps reduce evaporation, suppress weed growth, and improve soil fertility, thereby enhancing water retention capacity in agricultural fields (Kumar & Singh, 2019). Similarly, contour bunding and terracing are soil and water conservation methods that reduce runoff, increase water infiltration, and prevent soil erosion on sloped lands (Sreedevi et al., 2018).

Traditional check dams and small-scale water harvesting structures have also played a significant role in capturing surface runoff, recharging groundwater, and providing supplemental irrigation water in arid zones (Palanisami et al., 2020). These community-managed water systems often involve collective action, fostering social cohesion and shared responsibility for sustainable resource management (Fernandez, 2014). While these traditional practices are cost-effective and environmentally friendly, their efficiency can be limited by changing climatic patterns and increased water demand. Nonetheless, integrating traditional methods with modern technologies offers a promising pathway toward sustainable water management in drought-prone agricultural areas.

Modern Water Management Techniques

Modern water management techniques have transformed agricultural practices by enhancing water-use efficiency and mitigating the impacts of drought, particularly in water-scarce and drought-prone regions. Among these, drip irrigation stands out as a highly efficient method, delivering water directly to the plant root zone through a network of tubes and emitters. This precision watering reduces water wastage due to evaporation and runoff, leading to water savings of up to 50% compared to traditional flood irrigation (Jat et al., 2020). Similarly, sprinkler irrigation systems distribute water through pressurized pipes and nozzles, mimicking natural rainfall and providing uniform water coverage, which is beneficial for a variety of crops and terrains (Patel et al., 2019). The development and adoption of drought-resistant crop varieties represent another key strategy in modern water management. These crops are genetically bred or biotechnologically enhanced to tolerate water stress, thus maintaining yield levels during periods of limited water availability (Ashraf & Foolad, 2013). This biological approach complements physical water-saving techniques by reducing crop water demand.

Furthermore, the integration of digital technologies such as Internet of Things (IoT)-based smart irrigation systems and remote sensing has revolutionized water management. IoT sensors monitor soil moisture, weather conditions, and crop water requirements in real-time, enabling automated and optimized irrigation scheduling (Patel et al., 2021). Remote sensing technologies provide large-scale data on soil moisture and vegetation health, assisting farmers and policymakers in decision-making for water allocation and drought preparedness (Zhang et al., 2020). These modern techniques, when combined with traditional practices, offer a comprehensive approach to water management in drought-prone agricultural areas, promoting sustainability and climate resilience.

Role of Technology in Water Management

Technology plays a pivotal role in modernizing water management practices, especially in drought-prone agricultural regions where efficient use of scarce water resources is critical.

Advances in digital technologies, sensor networks, and data analytics have enabled more precise, timely, and sustainable water management solutions. One of the most significant technological advancements is the use of Internet of Things (IoT) devices for real-time monitoring of soil moisture, weather conditions, and crop water requirements. These IoT-based smart irrigation systems automate water delivery based on actual needs, thereby minimizing wastage and optimizing water use efficiency (Patel et al., 2021). Coupled with remote sensing technologies such as satellite imagery and drones, farmers can monitor large agricultural landscapes to assess drought stress, soil moisture variability, and crop health remotely, facilitating informed decision-making (Zhang et al., 2020).

Geographic Information Systems (GIS) have also been instrumental in water resource management, enabling spatial analysis of water availability, watershed management, and identification of vulnerable zones. GIS combined with hydrological modeling supports planners and policymakers in developing sustainable water allocation strategies under changing climatic scenarios (García et al., 2017). Furthermore, artificial intelligence (AI) and machine learning algorithms are increasingly being applied to predict drought events, optimize irrigation scheduling, and manage water distribution networks efficiently (Liakos et al., 2018). These predictive models enhance early warning systems and help mitigate the adverse impacts of water scarcity on agriculture. Overall, the integration of these technological tools fosters precision agriculture, enhances drought resilience, and promotes sustainable water management practices essential for food security in drought-prone areas.

Case Studies and Field Applications

Practical implementations of water management techniques in drought-prone agricultural areas provide valuable insights into their effectiveness and adaptability. Several case studies worldwide demonstrate the integration of traditional knowledge with modern technology to optimize water use and improve crop productivity. In India’s semi-arid region of Rajasthan, the Watershed Development Program combined traditional water harvesting structures such as check dams and johads with modern soil and water conservation techniques. This integrated approach significantly improved groundwater recharge and enhanced agricultural productivity in drought-affected villages (Bhatt et al., 2019). The community-based management of these water resources also fostered local participation and long-term sustainability.

In Kenya, the adoption of drip irrigation systems in smallholder farms within drought-prone areas has shown remarkable improvements in water use efficiency and crop yields. Farmers using these systems reported up to 40% water savings and increased income from higher-quality produce (Mwangi & Ouma, 2021). The success was attributed to capacity-building programs that educated farmers on system installation and maintenance. Another notable example is from the state of California, USA, where IoT-enabled smart irrigation systems have been deployed in vineyards and orchards. These systems use soil moisture sensors and weather forecasts to automate irrigation, reducing water consumption by approximately 30% without compromising crop quality (Jones et al., 2020). The integration of remote sensing data allowed large-scale monitoring and precise water allocation, enhancing drought resilience.

In Australia, the Drought Resilience Adoption and Innovation Hub promotes the use of drought-tolerant crop varieties alongside water-saving irrigation technologies in drought-prone farming zones. Pilot projects have demonstrated improved farm profitability and resource sustainability, providing models for scaling up in similar agro-climatic regions globally (Smith et al., 2022). These case studies underline the importance of tailoring water management practices to local conditions and engaging stakeholders in participatory approaches to ensure successful outcomes in drought-prone agricultural landscapes.

Challenges and Limitations

Despite significant advances in water management techniques, several challenges and limitations hinder their widespread adoption and effectiveness in drought-prone agricultural areas. One major challenge is the high initial cost and maintenance requirements associated with modern technologies like drip irrigation systems and IoT-based smart irrigation. Smallholder farmers, who constitute the majority in many drought-affected regions, often face financial constraints that limit access to such innovations (Gebregziabher et al., 2020).

Another limitation is the lack of technical knowledge and training required to operate and maintain sophisticated water management systems. Without proper capacity building, farmers may struggle to utilize these technologies efficiently, leading to underperformance and resource wastage (Patel et al., 2021). Furthermore, technological solutions may not always be tailored to local socio-economic and environmental contexts, which can reduce their relevance and adoption rates (Fernandez, 2014).

Water governance and institutional issues also pose significant barriers. Fragmented water management policies, lack of coordination among stakeholders, and inadequate support from governmental agencies can impede the implementation of integrated water management strategies (García et al., 2017). In many regions, competing demands for water from agriculture, industry, and households exacerbate scarcity and complicate sustainable management.Additionally, climate variability and unpredictability present inherent uncertainties that challenge water management planning. Extreme drought events and irregular rainfall patterns can overwhelm existing infrastructure and adaptive capacities, reducing the resilience of farming systems (Ashraf & Foolad, 2013). Addressing these challenges requires a holistic approach that combines technological innovation, capacity building, community participation, and supportive policies to ensure sustainable water management in drought-prone agricultural landscapes.

Policy Recommendations and Future Directions

To enhance water management in drought-prone agricultural areas, comprehensive policy interventions and future-focused strategies are essential. Policymakers should prioritize investment in affordable and scalable water-saving technologies, ensuring that smallholder farmers have access to drip irrigation, sprinkler systems, and IoT-enabled smart irrigation solutions through subsidies, microfinancing, and public-private partnerships (Gebregziabher et al., 2020). Capacity building and farmer education programs must be strengthened to improve technical know-how and system maintenance skills, facilitating better adoption and sustained use of modern water management practices (Patel et al., 2021). Extension services and community-led training initiatives can foster local innovation and adaptation to specific agro-climatic conditions.

Integrating traditional water harvesting methods with modern technologies offers a promising pathway to sustainability. Governments should support the restoration and maintenance of indigenous water conservation structures such as check dams and percolation tanks while encouraging technological upgrades (Bhatt et al., 2019). Policy frameworks should also emphasize inclusive and participatory water governance, promoting coordination among farmers, local authorities, and water management institutions. Such collaboration can enhance water allocation efficiency, conflict resolution, and drought preparedness (García et al., 2017).

Looking forward, advancements in artificial intelligence, remote sensing, and big data analytics hold significant potential to revolutionize drought forecasting, irrigation scheduling, and resource management. Future research should focus on developing affordable, user-friendly

technologies that are adaptable to diverse socio-economic contexts (Liakos et al., 2018). Moreover, climate change adaptation must be integrated into all water management policies, encouraging the adoption of drought-resistant crop varieties, diversification of cropping systems, and resilient farming practices to safeguard food security under changing climatic conditions (Ashraf & Foolad, 2013).Through these policy measures and innovation-driven approaches, sustainable water management in drought-prone agricultural areas can be achieved, ensuring long-term agricultural productivity and rural livelihoods.

Conclusion

Effective water management in drought-prone agricultural areas is crucial to ensuring sustainable agricultural productivity and rural livelihoods. This research highlights the importance of combining traditional water conservation practices with modern technologies such as drip irrigation, IoT-based monitoring, and data-driven decision-making tools. While these innovations offer significant potential to improve water use efficiency, challenges such as financial constraints, technical knowledge gaps, and governance issues must be addressed through inclusive policies and community engagement. Future efforts should focus on affordable technology dissemination, capacity building, and integrated water governance to build resilience against increasing drought risks exacerbated by climate change. With coordinated actions and continued innovation, water scarcity in vulnerable agricultural zones can be mitigated, contributing to food security and sustainable development.

preye.ofunama@federalpolyekowe.edu.ng

ABSTRACT

The growing demand for food and the pressures of climate change, resource limitations, and sustainability concerns have made the adoption of effective farm management tools essential. This paper presents a comprehensive review of various digital and traditional farm management tools and evaluates their impact on agricultural productivity. Furthermore, it compares these tools with Lean tools, originally developed for manufacturing to highlight complementarities and differences in driving efficiency, waste reduction, and continuous improvement in farming operations. The study underscores the need for integrated approaches in modern farm management for optimal productivity.

Keywords: Farm management, productivity, Lean tools, agricultural efficiency, digital agriculture, precision farming

Introduction

Agricultural productivity remains central to food security, rural development, and global sustainability. It is shaped by a complex interplay of factors, including the effective management of natural and human resources, informed decision-making, and the degree to which farms adopt innovations and technologies (FAO, 2021). As the global population continues to rise and climate change introduces new agricultural uncertainties, farmers are increasingly expected to produce more with fewer inputs. This demand has placed farm management at the core of agricultural transformation strategies (World Bank, 2023). Specifically, the use of farm management tools, ranging from traditional record-keeping methods to sophisticated digital decision-support systems; has gained momentum as a way to enhance productivity, resource optimization, and sustainability in farming systems (Klerkx & Rose, 2020; Jiménez et al., 2021).

In this evolving landscape, digital agriculture has emerged as a powerful paradigm. Technologies such as precision agriculture, remote sensing, farm management information systems (FMIS), and artificial intelligence (AI)-driven analytics are now widely recognized for their role in transforming farm operations. These tools allow farmers to monitor crop health, predict yields, track financial performance, and make real-time decisions based on accurate and timely data (Wolfert et al., 2020; Zhang et al., 2023). For example, FMIS platforms integrate agronomic, financial, and logistical data into a unified system, enabling comprehensive farm oversight and strategic planning (Goense et al., 2021). Similarly, mobile applications have enhanced access to market information, weather forecasts, and best farming practices, particularly benefiting smallholder farmers in developing regions (Misaki et al., 2022).

However, the integration of these tools into everyday farm practice is not without challenges. Factors such as digital literacy, infrastructure deficits, cost of technology adoption, and cultural resistance to change can hinder the effective utilization of advanced farm management systems (Rose et al., 2021). Consequently, achieving maximum benefit from these tools requires not only technological advancement but also the development of complementary frameworks that address human and institutional dimensions of agriculture.

Parallel to the growth of digital agriculture, the principles of Lean thinking, originally developed in the manufacturing sector, are gaining attention in agricultural discourse. Lean philosophy emphasizes the elimination of waste, continuous improvement (kaizen), and value creation from the customer's perspective (Womack & Jones, 2003). When applied to agriculture, Lean tools can streamline workflows, reduce inefficiencies in production and distribution processes, and enhance quality and consistency in farm outputs (Ruiz-de-Arbulo-Lopez et al., 2021). Tools such as value stream mapping, 5S (Sort, Set in order, Shine, Standardize, Sustain), visual management, and just-in-time (JIT) have been adapted to farming contexts with varying degrees of success (Hurst et al., 2020).

Recent studies have demonstrated the potential of Lean tools in addressing long-standing inefficiencies within agricultural value chains. For instance, a study by Alarcon and Pawlik (2022) highlighted the application of Lean principles in horticultural farms to optimize labor use, improve harvest scheduling, and reduce postharvest losses. Similarly, in livestock production, Lean tools have been employed to reduce feed waste, streamline animal movement, and improve hygiene practices, contributing to both productivity and animal welfare (Martin et al., 2021). The intersection of Lean philosophy with sustainable agriculture is particularly promising, as Lean focuses on reducing non-value-adding activities that often correlate with environmental degradation and resource inefficiency.

Nevertheless, Lean implementation in agriculture is still in its early stages and is often limited to larger commercial farms with the capacity to invest in management training and operational restructuring. There remains a gap in the literature and in practice regarding the adaptation of Lean tools for smallholder farms, which make up a significant portion of global agricultural production, especially in Africa and Asia (IFAD, 2023). Moreover, there is limited research on the synergies that may arise from combining Lean principles with digital farm management tools, which could create integrated systems for continuous improvement, data-driven decision-making, and strategic resource use. In recent years, farm management tools; both traditional and digital, have emerged as critical enablers of modern agriculture. Lean tools, derived from Lean manufacturing philosophy, also offer potential benefits when adapted to farming by eliminating waste and improving operational efficiency. This paper reviews selected farm management tools and compares them with Lean tools to identify best practices and strategic integration possibilities. Given the rapid evolution of both digital agriculture and Lean farming methodologies, there is a compelling need to compare and contrast their tools, identify best practices, and explore potential areas for strategic integration. Such comparative analysis can yield valuable insights into how different types of farm operations—ranging from small-scale subsistence farms to large commercial enterprises—can adopt appropriate management tools to enhance their productivity, sustainability, and resilience.

This paper aims to provide a comprehensive review of selected farm management tools, both traditional and digital, and assess their utility in diverse farming contexts. It also examines key Lean tools adapted from industrial practices and evaluates their relevance and impact when applied to agricultural systems. Through a comparative framework, the paper identified areas of convergence between the two approaches and highlights opportunities for hybrid models that combine the systematic rigor of Lean with the adaptability and intelligence of digital agriculture.

Furthermore, the study emphasizes the importance of contextual factors such as farm size, crop type, labor availability, market access, and regulatory environment that influence the adoption and effectiveness of management tools. In doing so, it seeks to contribute to the broader discourse on agricultural innovation and offer practical guidance to farmers, agribusinesses, extension agents, and policymakers interested in optimizing farm performance through smart and efficient management systems.

In conclusion, as the global agricultural sector confronts unprecedented challenges including climate change, supply chain disruptions, and population pressure, there is a growing recognition that productivity gains must be achieved not only through better inputs but also through smarter management. By reviewing and comparing farm management tools and Lean tools, this paper contributes to the strategic rethinking of farm operations and supports the transition toward more resilient, efficient, and sustainable agricultural systems.

Overview of Farm Management Tools

Farm management tools support farmers in planning, monitoring, analyzing, and optimizing agricultural activities. These tools can be categorized into software-based solutions, decision-support systems, and organizational frameworks. Below are five commonly used tools:

(i) **AgriWebb:** A digital farm management platform offering tools for livestock and pasture management, record keeping, and real-time analytics.

(ii) **John Deere Operations Center:** An integrated digital platform that uses machinery data to optimize field operations, input application, and yield analysis.

(iii) **Trimble Ag Software:** Provides precision agriculture solutions including crop planning, variable rate technology, and equipment guidance.

(iv) **CropX:** A soil sensing and data analytics tool that helps optimize irrigation and fertilization through real-time soil data.

(v) **FarmLogs:** A farm management software offering crop tracking, field mapping, weather insights, and input cost analysis.

Overview of Lean Tools in Agriculture

Lean tools focus on minimizing waste and improving efficiency. When applied to agriculture, they enable resource optimization and continuous improvement. Key Lean tools include:

- **5S (Sort, Set in Order, Shine, Standardize, Sustain)**
- **Kaizen (Continuous Improvement)**
- **Value Stream Mapping (VSM)**
- **Just-In-Time (JIT)**
- **Total Productive Maintenance (TPM)**

Comparative Analysis of Farm Management Tools and Lean Tools

Table 1. Key Differences between Farm Management Tools and Lean Tools

Criteria	Farm Management Tools	Lean Tools
Focus Area	Decision-making in farm operations	Process improvement and waste elimination
Industry Fit	Agriculture	Manufacturing, now extended to agriculture
Data Requirements	Agronomic, financial, environmental	Operational, procedural, performance-based
Training Needs	Agribusiness knowledge	Lean methodology and change management

Integration Pathway Flowchart

Figure 1 presents the integration pathway flowchart from traditional tools to lean-enhanced digital farm management

Figure 1 Integration pathway flowchart from traditional tools to lean-enhanced digital farm management.

Table 2. Integration Opportunities and Challenges

S/N	Opportunities	Challenges
1	Lean tools provide strategic frameworks; digital tools offer execution platforms.	Need for training and mindset shift among farmers.
2	Combined use enhances decision-making and waste reduction.	Integration may be costly and technologically demanding.
3	Automation and Lean reduce labor costs and variability in output	Data security and infrastructure remain concerns in rural areas.

Conclusion

This study has established the relationship between Lean philosophy with digital tools and sustainable agricultural productivity. Through a comparative analysis of conventional farm management tools and Lean strategies, it charts a clear course for innovation and efficiency in modern agriculture. Farm management tools and lean tools offer complementary benefits. While farm management focuses on strategic and operational decisions in agriculture, lean tools offer structured methodologies to improve efficiency. A strategic integration of both can lead to sustainable, competitive, and productive agricultural enterprises. More so, there is growing synergy in integrating lean tools into farm management systems, especially in agribusinesses and value-added processing. For instance, lean's 5S can improve farm storage and safety, and

value Stream Mapping helps streamline harvest-to-market logistics, while combining farm budgeting with Kaizen enhances financial discipline and operational efficiency.

Farm management tools have significantly transformed modern agriculture by providing actionable insights and optimizing resources. However, their full potential can be unlocked when strategically combined with Lean tools, fostering a culture of continuous improvement and systematic efficiency. Future strategies should focus on hybrid models integrating Lean philosophy with digital tools to ensure sustainable agricultural productivity.

NETWORKING WITH PURPOSE: HOW TO BUILD RELATIONSHIPS THAT CONNECT AND PROPEL

Maria Duarte Bello
PhD Communication Sciences Master Communication Sciences; Bachelor+2 Law
Associate Professor, LIACOM - School of Social Communication and Media Studies
Polytechnic University of Lisbon, mbelo@escs.ipl.pt

ABSTRACT

Networking, often associated with exchanging professional contacts, goes beyond the mere exchange of information. This paper explores the importance of an authentic, intentional, and consistent approach to building meaningful and lasting professional relationships. The research highlights how networking, when practiced with purpose, can foster personal and professional growth, driven by a strong personal brand and mutual value creation. It also discusses the importance of reciprocity in interactions, emphasizing the quality over the quantity of connections. Through the analysis of effective strategies for cultivating these relationships, this study concludes that networking should be viewed not only as a tool for immediate success but as a means to strengthen collaboration and foster long-term opportunities.

1. Introduction

In today's world, professional connections play a crucial role in career development and personal growth. The concept of networking, often confused with simple contact exchanges or self-promotion, has evolved into a deeper process of building genuine and collaborative relationships. This paper discusses how networking can be practiced authentically and intentionally to create meaningful relationships that drive the development of both parties involved.

Networking with purpose involves the exchange of value, where connections are not just means to achieve individual goals, but opportunities to contribute to the growth of others. Through the analysis of various aspects, such as personal branding and reciprocity in interactions, we will discuss how to build a solid network focused on quality, trust, and collaboration.

2. Literature Review

The literature on professional networking is extensive and varied, ranging from traditional contact strategies to the latest digital trends. According to Cross, Thomas, and McArthur (2016), networking is seen as a strategic practice that not only increases professional visibility but also facilitates access to valuable information and resources. However, many authors argue that traditional networking approaches are insufficient to build lasting relationships.

In their research, Ibarra (2003) suggests that effective networking should be based on a relational approach, where trust-building and mutual value are key. For Grant (2017), intentional networking, which prioritizes reciprocity and collaboration, has the potential to transform a network of contacts into a supportive professional community. Additionally, studies on authenticity, such as those by Goffee and Jones (2000), emphasize the importance of building a strong personal brand that reflects genuine values, making it easier to form more meaningful connections.

3. Methodology

The research was conducted through a qualitative and exploratory analysis, reviewing academic studies on the impact of authentic approaches to networking, as well as conducting interviews with professionals from various fields. Data collection included semi-structured interviews with industry leaders, focusing on the strategies and experiences they find most effective in building lasting and collaborative relationships. Moreover, case studies of companies and professionals who have succeeded in purposeful networking practices were also analyzed.

4. Results

The research findings indicate that professionals who adopt an authentic and intentional approach to networking build more lasting and valuable relationships. The development of a strong personal brand was identified as an essential factor for the success of these interactions. Additionally, the most effective relationships are those in which both parties share value, with a clear balance between giving and receiving.

The research also revealed that, contrary to popular belief, the volume of connections is not an indicator of success in networking. Professionals who focused on the depth and quality of interactions demonstrated higher satisfaction and better long-term results. Consistency in

interactions, such as following up with thank-you messages or sharing relevant resources, was highlighted as a key strategy to keep these relationships active.

5. Discussion

Building an effective network is not a matter of numbers, but of genuine value. Through an approach grounded in authenticity, professionals can create a network that goes beyond superficial connections. The strongest relationships are those where there is a true interest in contributing to the success of the other, establishing a foundation of trust and mutual respect.

Furthermore, the importance of personal branding in the networking process cannot be underestimated. In an increasingly digital world, first impressions are often made online. Having clarity about who we are and what we represent allows us to become more memorable and, thus, strengthen relationships over time.

Reciprocity, in turn, is key to maintaining these relationships and ensuring that networking is a two-way street. When interactions are balanced, connections turn into genuine collaborations and opportunities that benefit all involved.

6. Conclusion

True success in networking lies not only in the opportunities it brings but in the quality of the relationships built over time. When practiced with authenticity, purpose, and consistency, networking becomes a powerful tool for professional and personal growth. By focusing on creating value, building trust, and cultivating a strong personal brand, we can transform networking from a superficial practice into a path of collaboration and mutual growth. The connections built in this way not only propel our careers but also have the potential to make a meaningful impact on the lives of all involved.

ABSTRACT

Concrete is becoming more and more in demand every day to meet the demands of infrastructure development. It is commonly known that producing OPC releases a sizable amount of carbon dioxide into the environment in addition to consuming a large amount of energy and natural resources. Finding alternatives is therefore crucial to making concrete environmentally friendly. Fly ash is used to create the inorganic alumino-silicate substance known as geopolymer. Although fly ash, one of the raw materials for geopolymer binders, is widely available in India, its use is still somewhat restricted. Therefore, in order to make concrete more environmentally friendly, efforts must be made to use this by-product in the production process. In order to improve its overall performance, this study details the experimental work done by casting 20 geopolymer concrete mixes to assess the impact of different factors impacting its compressive strength. Numerous factors have been examined, including the proportion of fly ash to alkaline liquid, the concentration of sodium hydroxide, the proportion of sodium silicate to sodium hydroxide, the curing temperature and duration, the dose of superplasticizer, the rest period, and the extra water content in the mixture. According to the test results, compressive strength rises as curing time, temperature, rest period, and sodium hydroxide solution concentration increase, whereas it falls as the mass ratio of water to geopolymer particles and admixture dose increase. The workability of geopolymer concrete is enhanced by the use of a superplasticizer based on naphthalene. It was also noted that attaining the required compressive strength in geopolymer concrete is significantly influenced by the water content of the mixture.

Keywords: Geopolymer, Concrete, Fly ash, Compressive strength, Parametric study.

1.Introduction:

One of the materials that is utilized extensively worldwide is concrete. The main binder used to make the concrete is ordinary Portland cement (OPC). Due to the necessity of developing infrastructural facilities, the demand for concrete is growing daily .However, it is widely known that producing OPC emits a sizable amount of carbon dioxide into the environment in addition to using a large amount of energy and natural resources . The global cement industry contributes around 2.8 billion tons of the greenhouse gas emissions annually, or about 7% of the total manmade greenhouse gas emissions to the earth's atmosphere. It is essential to find alternatives to make environment friendly concrete. One of the alternatives to produce more environmentally friendly concrete is to replace the amount of Portland cement in concrete with by-product materials such as fly ash. An important investigation in this regard is the development of high volume fly ash concrete that utilizes up to 60 percent of fly ash, and yet possesses excellent mechanical properties with enhanced durability performance. Another alternative to make environmentally friendly concrete is the development of inorganic alumina-silicate polymer, called Geopolymer, synthesized from materials of geological origin or by-product materials such as fly ash that is rich in silicon and aluminum [4]. Fly ash, one of the source materials for geopolymer binders, is available abundantly worldwide, but to date its utilization is limited. Currently, 90million tones of fly ash is being generated annually in India. By exploring use of the fly ash based geopolymer concrete two environment related issues are tackled simultaneously i.e. the high amount of CO_2 released to the atmosphere during production of OPC and Utilization of this fly ash.

The production of geopolymer concrete is carried out using the conventional concrete technology methods. The fly ash based geopolymer concrete consists 75% to 80% by mass of aggregate, which is bound by age polymer paste formed by the reaction of the silicon and aluminum within the fly ash and the alkaline liquid made up of sodium hydroxide and sodium silicate solution with addition of superplasticiser. In this paper,various factors which influencing the strength of concrete are studied and results are discussed by various graphs corresponding to the strength of the test cubes.

It can be observed from the above discussion that the geopolymer concrete has not been studied much in detail in India. India also is facing the problem of depletion on natural resources such as lime stone which is the most important ingredient to produce cement and in turn the concrete in India. In this situation, detailed study of geopolymer concrete which is the concrete with zero cement in concrete naturally becomes very important. Therefore, an attempt has been made in the present investigation by casting 20 geopolymer concrete mixes with 100% replacement of OPC with processed fly ash in each concrete mix [5]. Indian standards have always emphasized on the importance of compressive strength amongst various mechanical properties of concrete. Hence, the effect of various parameters affecting the compressive strength i.e.ratio. alkaline liquid to fly ash, concentration of sodium hydroxide, ratio of sodium silicate to sodium hydroxide, curing time, curing temperature, dosage of superplasticiser, rest period and additional water content in the Geopolymer concrete mixes has been investigated in order to enhance its overall performance.

1.Experimental Programme

Materials

Fly ash used in this study was low calcium class F processed fly ash from Dirk India private limited under the name of the product POZZOCRETE60. Chemical compositions of the fly ash used along with the specifications are given in Table 1.

Table 1. Composition of class F fly ash (POZZOCRETE)

SiO2	Al2O3	Fe2O3	MgO	SO3	Na2O	CaO	LOI
57.30%	27.13%	8.06%	2.13%	1.06%	0.73%	0.03%	1.60%

The alkaline liquid used was a combination of sodium hydroxide and sodium silicate solution. Sodium hydroxide (NaOH) in flakes form with 98% purity purchased from local chemical supplier was used and Sodium silicate solution (Na_2O = 16.84%, SiO_2= 35.01% and water = 46.37% by mass) was used as alkaline liquid. Sodium hydroxide solution is prepared by dissolving the flakes in water. Tap water available in laboratory was used to prepare NaOH solution. The activator solution was prepared at least one day priortoits use. Locally available 10 mm and 20mm crushed aggregates have been used as coarse aggregates. Locally available rivers and isused as fine aggregate in the concrete mixes. To improve the workability of the fresh geopolymer concrete, naphthalene sulphonate based superplasticizer was used in all of the geopolymer mixes.

Casting of concrete mixes

The mixing procedure used for geopolymer concrete is similar to that of conventional OPC concrete. Mixing of all the materials have been done in the laboratory at room temperature. The fly ash and the aggregate were mixed together in concrete pan mixture. The mixing is allowed to continue for about 3 to 4 minutes. The alkaline solution which was prepared one day before is added with additional water in the mix. The liquid component and superplasticiser was added to the dry material and mixing is continued for another 3 to 4 minutes.

Thefreshconcreteiscastintothemouldsimmediatelyaftermixingintwolayersforprismaticspecimens.For compaction of the concrete specimens, each layer was given 25 to 35 manual strokes using 20 mm rod. Concrete specimens were vibrated using vibration table for another 10 to 15 seconds. After the casting, the concrete specimen was kept at room temperature as per the decided rest period.

The details of mix design for geopolymer concrete Mix-1 to Mix-6 is given in Table 2. The coarse and fine aggregate proportions used in different geopolymer concrete mixes are about 75-77 % percent by mass of the concrete.

Table2. Ingredients for geopolymer concrete Mix-1 to Mix-6

Ingredient	Unit	Mix-1	Mix-2	Mix-3	Mix-4A	Mix-4B	Mix-5A	Mix-5B	Mix-5C	Mix-6A	Mix-6B
Fly ash	kg/m^3	428	444	428	428	428	428	428	428	428	428
C.A	kg/m^3	1170	1170	1170	1170	1170	1170	1170	1170	1170	1170
F.A	kg/m^3	630	630	630	630	630	630	630	630	630	630
Na2SiO3	kg/m^3	122	111	114	122	122	122	122	122	122	122

Extra water	kg/m^3	43	43	43	43	43	43	43	43	43	43
Molarity		14	14	14	14	14	14	14	14	14	14
Superplasticiser	kg/m^3	8.5	9	8.5	8.5	8.5	8.5	13	17	8.5	8.5
Curing temp	^0C	75	75	75	75	75	75	75	75	75	
Curing period	Hours	24	24	24	24	48	48	48	48	48	48
Rest period	Days	1	1	1	0	0	0	0	0	0	1
No. of cube		3	3	3	3	3	3	3	3	3	3

Curing of concrete specimen

The concrete specimens were heat cured in oven at required temperature up to the completion of curing time. After the curing period,the test specimens left in the moulds for at least 4-6 hours in order to avoid a major change in the environmental conditions. After demoulding, the concrete specimens are allowed to become air-dry in the laboratory until the day of the testing

2.Results and discussion

Ratio of alkaline liquid to fly ash

Two concrete mixes Mix-1 and Mix-2 with the alkaline liquid to fly ash ratio 0.35 and 0.4 have been cast using the ingredients as given in Table 2. The effect of alkaline liquid to fly ash ratio by masson compressive strength of concrete at age 3 days has been evaluated by comparing results of both mixes. The results are presented in Fig. 1. It has been observed that the ratio of alkaline liquid to fly ash, by mass, is not much effective in varying the compressive strength of the geopolymer concrete.

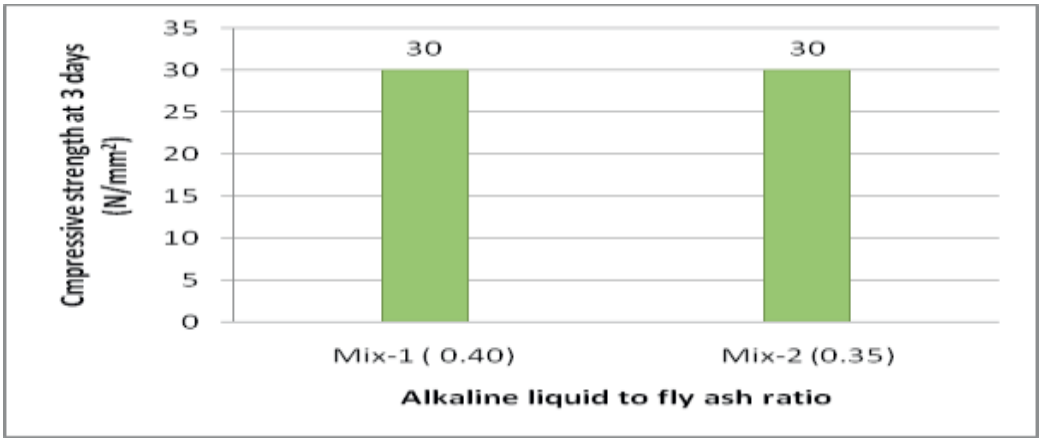

Fig.1 Effect of alkaline liquid to fly ash ratio on compressive strength

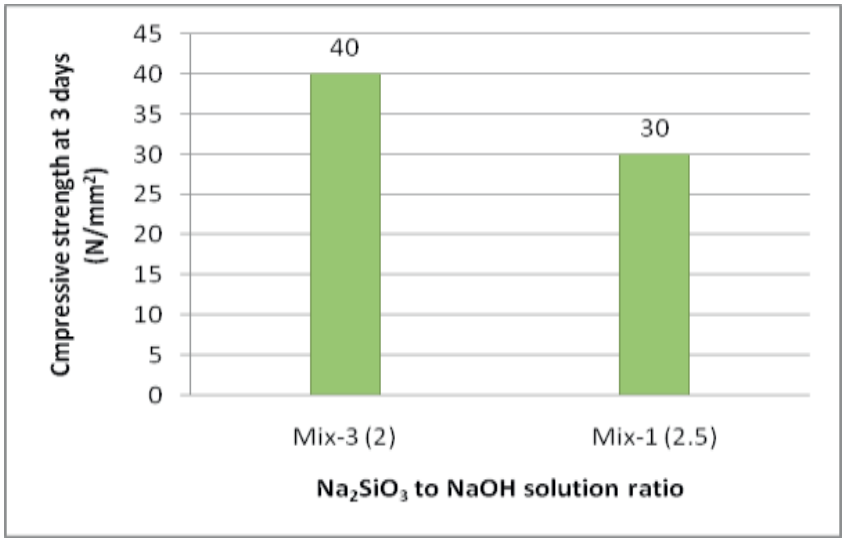
Ratio of sodium silicate solution to sodium hydroxide solution

The effect of sodium silicate solution to sodium hydroxide solution by masson compressive



strength of concrete has been observed by comparing results of Mix and Mix having ingredients as given in Table 2. The results are presented in Fig 2 Higher Compressive strength has been observed in concrete Mixs compared to that of concrete Mix.

Curing time

In order to investigate the effect of curing time, test specimens have been cured for curing periods of 24 hours and 48hours, respectively. Concrete Mix 4 with ingredients used as per Table 2 has been cast for investigating of the influence of curing time on the compressive strength.

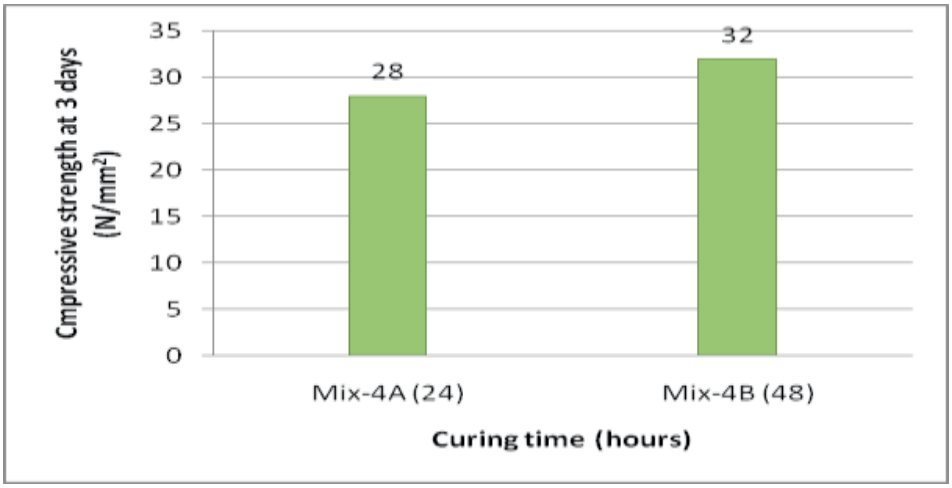


Fig.3.Effect of curing time on compressive strength

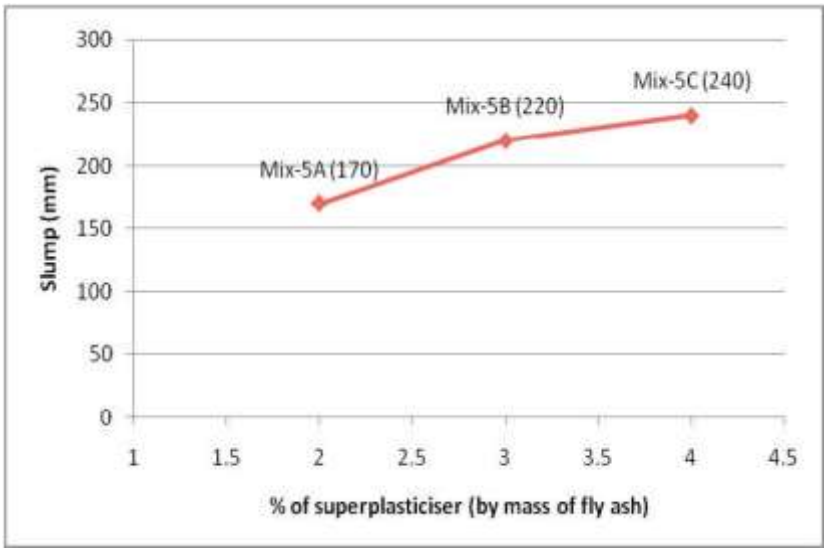
Fig shows that Longer curing time has improved the polymerisation process resulting in development of higher compressive strength. Rapid rate of increase in the strength has been observed up to the curing time of 24 hours.

Additional of superplasticiser

Geopolymer concrete has a stiff consistency in the fresh state. Although adequate compaction was achievable, an improvement in the workability was considered as desirable. Superplasticiser has been added in proportion to the fly ash in the concrete mix by mass as given in Table 2. Tests have been performed to study the effect of adding conventional commercially available Naphthalene Sulphonate based super plasticiser.

The test specimens have been cured for 48 hours at 75^0C in an oven. The effect of addition of superplasticiser on compressive strength of concrete has been observed by comparing results of Mix as presented in Table2 Concrete mixes have been cast using 2%, 3% and 4% dosage of admixture, respectively.



Concentration of sodium hydroxide solution

Mix has been cast using ingredients as shown in Table 3 to study the effect of concentration of sodium hydroxide solution on the compressive strength of geopolymer concrete. The measured compressive strength of test specimens after 7 days is given in Fig9

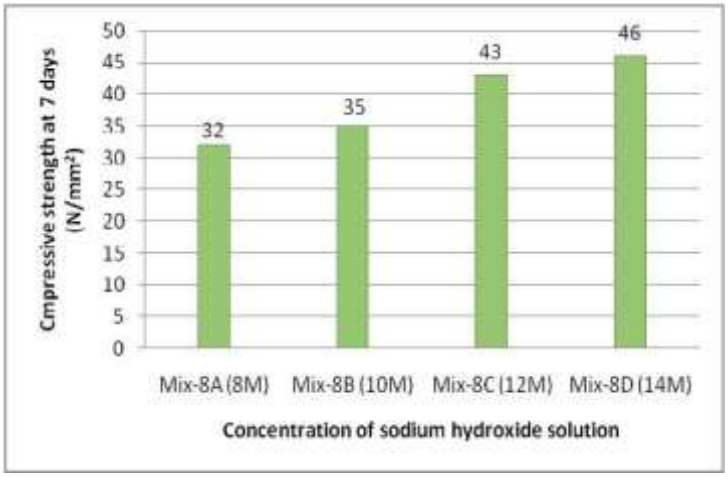


Fig.9. Effect of concentration of sodium hydroxide solution on compressive strength

The difference between a of Mix in terms of variation in compressive strength is the molar concentration of sodium hydroxide solution. Mix D with 4M concentration of sodium hydroxide solution has been able to gain much higher compressive strength as compared to other cases. It has been observed that, higher concentration of sodium hydroxide solution gives better results in terms of compressive strength of geopolymer concrete

4. Conclusions

Following concluding remarks have been made on basis of the work conducted:

- The ratio of alkaline liquid to fly ash, by mass does not affect the compressive strength of the geopolymer crea
- The sodium silicate to sodium hydroxide ratio by mass equal to 2 has resulted into the higher compressive strength a compared to the ratio of 2.5 for the geopolymer concrete.
- The compressive strength of the geopolymer concrete increases with increa of concentration in terms of molarities of sodium hydroxide.
- The compressive strength of the geopolymer concrete increases with increase in the curing time. However, the increase in strength beyond 24 hours is not much significant.
- Workability of the geopolymer concrete mix increase with the addition of superplasticiser up to 4% of fly ash by mass. Minor reduction of compressive strength of the geopolymer concrete is observed when the superplasticizer dosage used is greater than 2%.
- 1 day rest period in rathe compressive strength of the geopolymer concreteas compared to that for the concrete without the rest period.
- Compressive strength of the geopolymer concrete decreases with increase in the ratio of water to geopolymer solids by a

- The workability of the geopolymer concrete in fresh state increases with the increase of extra water added to the mix.
- Within crease in the curing temperature in the range of 60 ^{0}C to 90 ^{0}C the compressive strength of the geopolymer concrete also increases

It has been observed from the above discussion that wide variety of parameters affect the compressive strength of the geopolymer concrete. Therefore, parametric study of various factors affecting the compressive strength of the geopolymer concrete is strongly mended first before conducting any further investigations related to mechanical properties and durability of the geopolymer concrete in order to get the desirable benefits from the further investigations.

ABSTRACT

In this work, an innovative wearable antenna design which can be integrated into military berets has been developed to meet the communication and positioning needs of civil or military personnel in the field. The design has the attractive feature of operating in both the RFID (915 MHz) and GPS L1 (1.575 GHz) frequency bands. The resultant antenna provides operational flexibility by enabling secure identification in indoor environments and precise positioning in outdoor scenarios. By utilizing textile-based materials in the antenna structure, a significantly light and flexible form has been achieved compared to conventional microstrip patch antennas. This type of design approach enhances the portability of the antenna while minimizing the physical load such as weight. The main design includes a hexagonal slot RFID patch optimized for identification in indoor environments, and a slotted rectangular GPS patch intended for real-time positioning in outdoor operations. This configuration prioritizes mobility and ease of integration, aiming to provide an effective communication infrastructure in the field. EM (EM) simulation of the final design confirms that the system exhibits proper impedance match, low return loss, and desired radiation patterns for the frequency bands of operation. The RFID antenna demonstrates an omnidirectional radiation pattern characteristic, whereas the GPS antenna exhibits an upward directional pattern as desired. Especially, return-loss values below -10 dB and well-obtained radiation patterns indicate that the system delivers reliable performance in dual-band communication applications. Thanks to its ergonomic design, the antenna is suitable for long-term use without limiting the mobility of military personnel, providing a practical and efficient solution for field communication needs.

Keywords: Wearable microstrip antenna, Dual-band antenna design, RFID and GPS systems

Introduction

The advancement of wearable technologies has increased the demand for solutions that enable accurate and uninterrupted tracking of personnel location in both indoor and outdoor environments within modern military systems. In this context, wearable antenna systems have emerged as a significant area of research in the defense sector due to their characteristics such as lightness, flexibility, low profile, and ease of integration into clothing (Hall & Hao, 2006). Particularly in positioning-based applications, the integration of Global Positioning System (GPS) and Radio Frequency Identification (RFID) technologies offers comprehensive solutions for both indoor and outdoor scenarios (Kaivanto et al., 2011; Liu et al., 2015).However, conventional antenna designs can limit the mobility and comfort of military personnel. Therefore, there is a growing need for antenna structures that prioritize user ergonomics while delivering high electromagnetic performance. Antennas that can be integrated into equipment such as helmets, caps, or berets used during military operations significantly enhance operational efficiency by enabling data transmission independently of the user (Winterhalter et al., 2005). This study presents a novel dual-band microstrip antenna structure, entirely designed with textile materials and integrated into protective equipment such as helmets—differentiating it from existing approaches. The proposed antenna is optimized to operate efficiently in both the 915 MHz RFID frequency band and the 1.575 GHz GPS L1 band. In this regard, it aims to provide a holistic solution for short-range indoor communication and outdoor location tracking. Electromagnetic analyses demonstrate that the antenna achieves high gain, acceptable VSWR, and desired radiation patterns under various geometric configurations. Consequently, this original design is considered an effective and ergonomic alternative for location-based applications in military wearable technologies.

Materials and Methods

Antenna Structure

The antenna structure developed in this study is a dual-band, fully textile-based, wearable microstrip patch antenna designed to operate around 915 MHz and 1.575 GHz frequency bands. The antenna consists of two distinct patch geometries mounted on a 5 mm thick substrate made of felt, which features a low dielectric constant of ε_r=1.2 as depicted in Fig.1. The discontinuous rectangular patch, designated for GPS applications, provides a directional radiation pattern, while the slotted hexagonal patch, designed for RFID applications, exhibits omnidirectional energy distribution, making it suitable for near-field communication. Both patches are fabricated using Shieldex-type conductive fabric, which maintains mechanical flexibility while optimizing the antenna's EM performance. A highly conductive copper ground plane is positioned beneath the antenna to reduce EM radiation absorption by the human body and to support directional radiation characteristics. Geometric details such as slots, notches, and shorting points were optimized through parametric analyses conducted in the CST Studio Suite environment, achieving low return loss, proper impedance matching, and the desired radiation patterns. As a result, the antenna has been configured to provide high-performance operation for both indoor RFID and outdoor GPS applications.

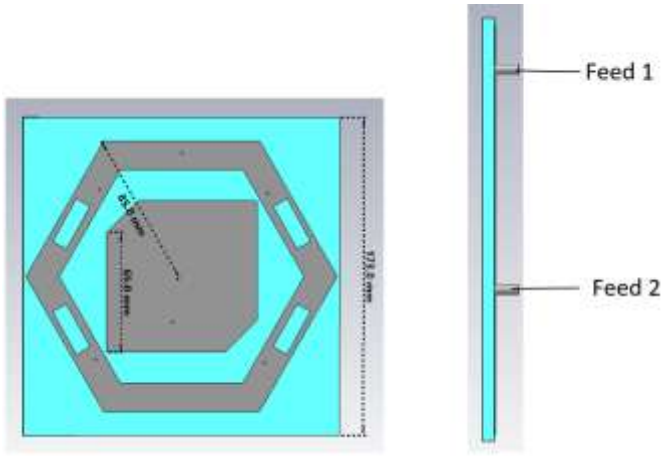

Figure 1: Basic Geometrical Structure of the Antenna

Simulation Results

The EM performance of the designed antenna was evaluated using the CST Studio Suite simulation environment. As a result of the simulations, key performance parameters such as return loss (see Fig. 2), radiation characteristics (see Fig. 3), and coupling between ports were obtained.In the simulation, the antenna was modeled with two separate feed ports: Port 1 was optimized for the 915 MHz center frequency used in RFID applications, while Port 2 was tuned for the 1.575 GHz GPS L1 band. For both ports, return loss values below the −10 dB threshold were obtained, indicating a high level of impedance matching between the antenna and its feeding lines. Radiation analysis for Port 1 (RFID) demonstrated an omnidirectional radiation pattern. The hexagonal patch structure radiates EM energy uniformly in the horizontal plane, making it well-suited for short-range near-field communication. The directivity in the RFID band was obtained as 1.25 dBi, which is sufficient for the tag reading applications.

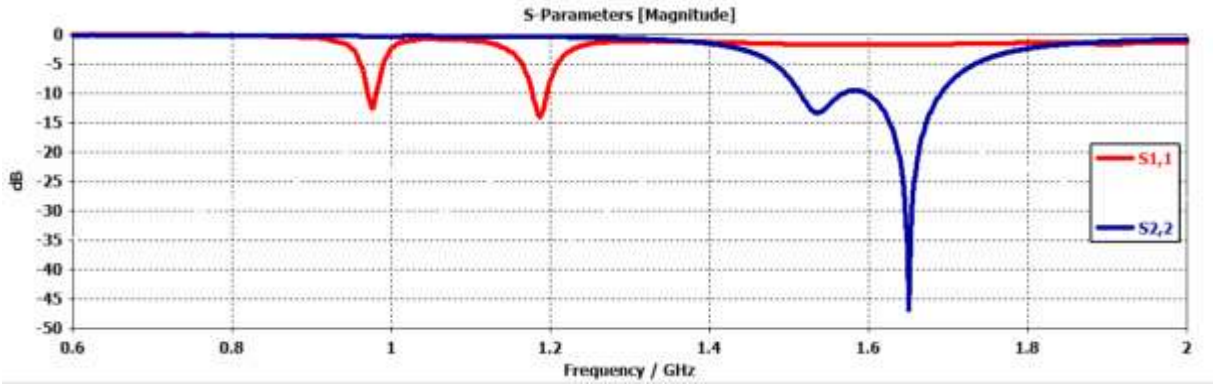

Figure 2: Simulated Frequency Response of S_{11} and S_{22} Parameters

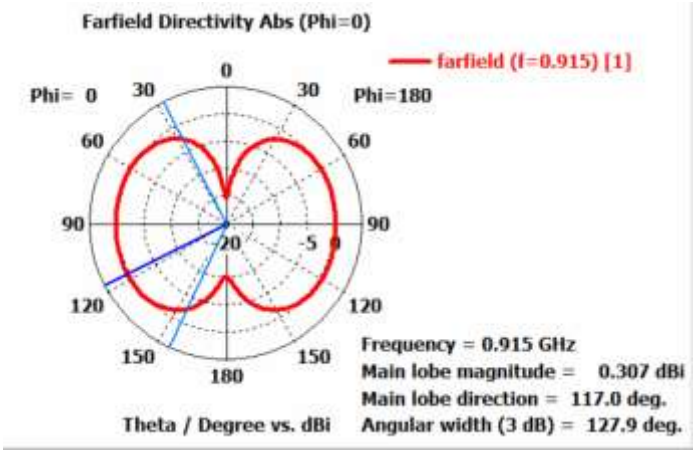
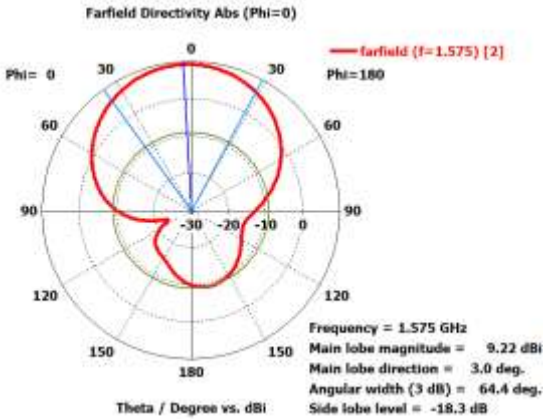


(a)



(b)

Figure 3: Radiation Pattern of the antenna for **(a)** RFID Applications, **(b)** GPS Applications

For GPS applications, Port 2 (1.575 GHz) utilizes a discontinuous rectangular patch that exhibits a directional radiation pattern. This structure was designed to enhance directionality and maximize signal strength for satellite signal reception. The simulated directivity was found to be 9.26 dBi, confirming the antenna's high directional radiation capability. The upward orientation of the main lobe enables efficient reception of GPS signals when mounted on the head. Moreover, side lobes were significantly suppressed, and the overall directivity was substantially improved.

Performance Analysis Under Bending Conditions

In wearable antenna applications, maintaining electromagnetic stability under physical deformation is of critical importance. Therefore, the antenna's performance on a curved surface was evaluated using a bent structure modeled with a defined radius. (see Fig. 4),

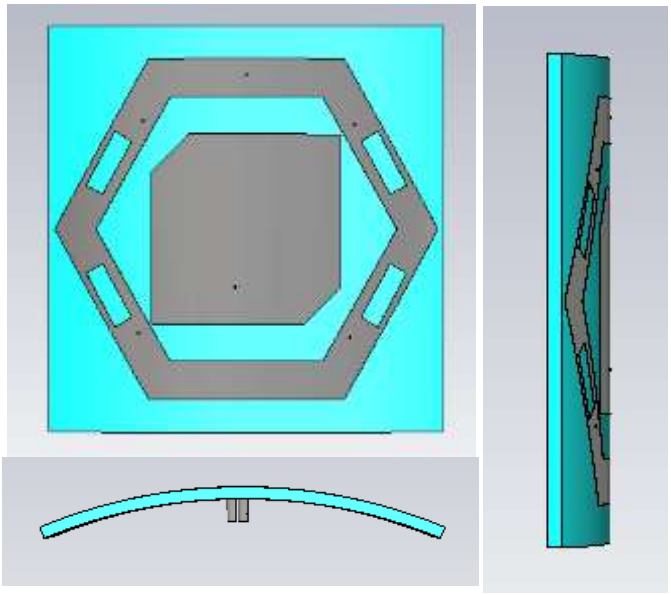


Figure 4: Basic Geometric Structure of a Bent Antenna

As it can be seen from Fig. 5, simulated results showed that return loss values for both ports remained below the −10 dB threshold, indicating that impedance matching was preserved even under bending conditions.

The radiation pattern in Fig. 6(a) for the RFID frequency band continued to exhibit omnidirectional characteristics despite bending, confirming the antenna's ability to maintain near-field communication performance. In Fig. 6(b) for the GPS band, the radiation pattern retained its directional characteristics, indicating that the antenna maintained its intended radiation properties for positioning purposes even under deformation.

These results demonstrate that the structural flexibility of the antenna does not impose limitations on its EM performance and that it remains functional under bending scenarios commonly encountered in wearable technology applications.

Figure 6: Radiation pattern of the bent antenna for **(a)** RFID, and **(b)** GPS applications

Findings and Discussion

In this study, the electromagnetic performance of a dual-band, wearable microstrip antenna was thoroughly analyzed. The findings demonstrate that the designed antenna meets the targeted performance criteria in both RFID and GPS frequency bands. Return loss analysis yielded results below the −10 dB threshold for both ports as shown in Fig. 5, indicating successful impedance matching across both operating bands. Additionally, it was observed that the directional and omnidirectional radiation characteristics of the antenna structures operated in alignment with their intended design goals.

The slotted hexagonal patch designed for RFID applications maintained its omnidirectional radiation pattern, making it well-suited for near-field communication. Compared to other patch antennas operating at similar frequencies in the literature, this antenna offers a more

homogeneous electromagnetic field distribution due to its symmetric slot structure (Kaufmann et al., 2013). The discontinuous rectangular patch designed for GPS applications, on the other hand, enables reception of long-range signals with a directional radiation pattern. In this regard, the antenna's performance in the GPS band aligns with and even exceeds that of other textile-based microstrip antennas developed for similar purposes, particularly in terms of optimized radiation directivity (Kaivanto et al., 2011).

The analyses conducted under bending conditions confirmed that the antenna's structural flexibility does not adversely affect its electromagnetic performance. Radiation patterns for both ports remained stable, and return loss values exhibited only limited variation. These results indicate that the antenna can be integrated onto curved surfaces and meets ergonomic requirements for wearable use. Similar evaluations in the literature have also shown that well-optimized textile antennas can operate stably up to a certain bending radius (Locher et al., 2006; Chen et al., 2016).

Overall, the results demonstrate that the antenna offers a technically effective and ergonomically unobtrusive solution, suitable for integration into wearable electronic systems. In this respect, the study is consistent with existing antenna designs in the literature, while also advancing the field by proposing a novel structure that can be integrated into real-world equipment such as helmets or headgear.

Conclusion and Recommendations

In this study, a dual-band microstrip patch antenna was presented, designed entirely from textile materials and suitable for integration into military headgear such as helmets. The resulting design offers an optimized structure in terms of both electromagnetic performance and mechanical flexibility. Simulations confirmed that the antenna operates effectively in the 915 MHz and 1.575 GHz frequency bands, with return loss values remaining below the −10 dB threshold for both ports. Additionally, the radiation patterns validated that the antenna exhibits the intended radiation characteristics for both RFID and GPS applications.

Under bending conditions, no significant degradation was observed in the radiation behavior of the antenna, and impedance matching was preserved. This indicates that the antenna is capable of maintaining stable performance under various deformation scenarios encountered in wearable systems. The findings suggest that the proposed antenna offers a versatile and ergonomic solution for both indoor RFID and outdoor GPS applications.

For future work, it is recommended that the antenna be validated through real-world measurements, and its performance compared across different textile materials. Furthermore, evaluating the Specific Absorption Rate (SAR) when worn on the human body would provide critical insight into user safety. Expanding the design for modular integration into various garments or headgear types may also offer valuable contributions to wearable systems.

These types of antennas hold potential not only for military applications but also for civilian use cases such as search and rescue, health monitoring, and security.

ABSTRACT

This study investigates the behaviour of the conformal* curvature tensor at Riemannian submersions endowed with quarter-symmetric non-metric connections. Initially, we introduce fundamental concepts related to Riemannian submersions, the conformal* curvature tensor, and quarter-symmetric non-metric connections, emphasizing their significance within the context of differential geometry and theoretical physics. The conformal* curvature tensor, an important generalization of the classical conformal curvature tensor, is examined comprehensively to explain its geometric characteristics and variations under these specialized connections.

The primary objective of this research is to derive explicit expressions for the conformal* curvature tensor in the context of Riemannian submersions endowed with quarter-symmetric non-metric connections. This investigation facilitates an enhanced understanding of geometric structures and provides a solid foundation for further theoretical developments and practical applications. Through systematic analysis, the study sheds light on how these specialized connections influence the geometric properties of submersions.

Moreover, specific attention is dedicated to examining the case where the total space of Riemannian submersions has umbilical fibers. For these particular cases, detailed results related to various curvature tensors, including the conformal* curvature tensor, are obtained and discussed thoroughly. These findings contribute significantly to the existing knowledge base, offering new insights into curvature interactions and geometric configurations. Consequently, this investigation opens avenues for potential applications in theoretical physics, manifold theory, and complex geometric modeling, enriching current geometric and physical understanding.

Keywords: Riemannian submersions, conformal* curvature tensor, quarter-symmetric non-metric connections, umbilical fibers.

1.Giriş

Diferensiyel geometri, matematiğin gelişmesiyle birlikte ortaya çıkmış ve geometrik yapıların çeşitli yöntemlerle incelenmesini mümkün kılan bir disiplindir. Günümüzde modern diferensiyel geometrinin temel yapı taşlarından biri haline gelen bu alan, manifoldlar üzerinde eğrisel ve yüzeysel yapıların ayrıntılı biçimde analizine olanak tanımaktadır. Bu çerçevede diferensiyellenebilir manifoldlar üzerinde konneksiyon kavramı, diferensiyel geometrinin temel bileşenlerinin (kovaryant türev, eğrilik tensörü gibi) incelenmesinde önemli bir rol oynamaktadır. Konneksiyonlar arasında quarter simetrik non-metrik konneksiyon dikkate değer bir örnek teşkil etmektedir. 1924 yılında Friedmann ve Schouten tarafından semi-simetrik lineer konneksiyon kavramı tanıtıldı (Friedmann A. & Schouten, J. A., 1924). Daha sonra, 1932 yılında Hayden tarafından genişletilmiş ve Riemann manifoldları üzerinde metrik konneksiyon kavramı geliştirilmiştir (Hayden, H. A., 1932). Riemann manifoldları üzerindeki semi-simetrik metrik konneksiyonların sistemli bir şekilde incelenmesi, ilk defa 1970 yılında Yano tarafından gerçekleştirilmiştir (Yano, K., 1970). Bu araştırma alanı birçok yazar tarafından genişletilmiş ve geliştirilmiştir (Ayar, G. & Demirhan, D., 2019; Altın, M., 2020; Chaubey, S. K. & Ojha, R. H., 2008; Zeren, S., Perktaş, S.Y. &Yıldız, A.; 2023).

Submersiyon kavramı, özellikle diferensiyellenebilir manifoldlar ve bunlar arasındaki dönüşümlerin incelenmesinde, diferensiyel geometrinin geliştirilmesinde uzun süredir temel bir rol oynamaktadır. Bu alandaki çok sayıda önemli çalışma literatürde mevcuttur (bkz. (Akyol, M. A. & Şahin, B.,2019; Gunduzalp, Y., 2015; Takano, K.& Kazan, S., 2024; Kazan, S., 2022)).

Submersiyonlar içerisinde Riemann manifoldlar arasında yatay vektörlerin uzunluklarını koruyan özel türden dönüşümler olan Riemann submersiyonlarının gösterimi ilk kez O'Neill ve Gray tarafından yapılan etkili çalışmalarla biçimsel bir yapıya kavuşturulmuştur (O'Neill, B., 1966; Gray, A., 1967). Bu öncü çalışmalar, daha genel diferensiyellenebilir yapılara sahip manifoldları kapsayan ileriki araştırmalara sağlam bir zemin hazırlamıştır. Zamanla, Riemann submersiyon teorisi, geometri ve matematiksel fiziğin çeşitli dallarında uygulamaları olan aktif bir araştırma alanı haline geldi. Pek çok araştırmacı özellikle farklı konneksiyon içeren submersiyonları inceleyerek bu konudaki çalışmalarını sürdürmüştür (Escobales, Jr & Richard, H., 1975; Ianus, S. ve ark., 2008; Eken Meriç, Ş. ve ark., 2017; Şahin, B., 2013; Karatas, E. ve ark., 2023; Ayar, G., 2021; Karataş, E. ve ark., 2024). Bu bağlamda Akyol ve Beyendi semi-simetrik non-metrik konneksiyonlarla tanımlanan Riemann submersiyonlara odaklanırken (Akyol, M. A. & Beyendi, S., 2018), Sarı benzer konneksiyon türlerini içeren semi-invaryant Riemannian submersiyonları incelemiştir (Sarı, R., 2021). Ayrıca Demir ve Sarı, Riemann submersiyonların semi-simetrik metrik konneksiyonlar altındaki davranışlarını incelemiştir (Demir, H. & Sarı, R., 2022).

1975 yılında Golab, diferansiyellenebilir manifoldlar üzerinde quarter-simetrik konneksiyon kavramını ortaya koymuştur (Golab, S., 1975). Bu teorik altyapıyı temel alan Demir ve Sarı Riemannian submersiyonların quarter-simetrik non-metrik konneksiyonlar altındaki davranışlarına odaklanarak çalışmalara yeni bir boyut kazandırmışlardır (Demir, H. & Sarı, R., 2021). Ayrıca yaptıkları çalışmalarında, bu konneksiyonlara ilişkin tensör alanlarının özelliklerini analiz etmiş ve çeşitli eğrilikleri ayrıntılı biçimde hesaplamışlardır.

Eğrilik tensörleri, matematik ve teorik fiziğin çeşitli alanlarında temel bir rol oynamaktadır. Özellikle, uzay geometrisinin tanımlanmasında ve yerçekimi etkilerinin anlaşılmasında önemli bir araçtır. Pokhariyal ve Mishra; Jawarneh ve Tashtoush; Mishra ve Kushwaha ile Ojha, eğrilik kuramı üzerine yaptıkları çalışmalarla literatüre önemli katkılarda bulunmuş ve alanda yeni araştırma başlıklarının gelişmesine zemin hazırlamışlardır (Pokhariyal, G. P. & Mishra, R. S.

,1971; Jawarneh, M. & Tashtoush, M., 2011; Mishra, R.S. & Kushwaha, R. D. S.,1971; Ojha, R. H.;1975).

Son yıllarda Ayar ve Akyol, Riemann submersiyonlar bağlamında yeni eğrilik tensörlerinin incelenmesine odaklanmıştır (Ayar, G. & Akyol, M. A., 2023). Bu çalışmalar, eğriliğin submersiyon dönüşümleri altında nasıl davrandığını anlamak ve farklı konneksiyonlarla bu dönüşümlerin geometrik etkilerini araştırmak açısından önemli katkılar sunmaktadır.

Bu çalışmada, quarter simetrik non-metrik konneksiyonlu Riemannian submersiyonlar genel bir çerçeve halinde sunularak bu geometrik yapı üzerine inşa edilen conformal* eğrilik tensörleri için ayrıntılı hesaplamalar yapılmaktadır. Ayrıca submersiyonun liflerinin tamamen umbilik olması durumu özel olarak ele alınarak, bu geometrik yapının detaylı analizi yapılmaktadır.

2.Temel Kavramlar

M, $\tilde{\nabla}$ lineer konneksiyonuna sahip diferensiyellenebilir bir manifold olsun. Bu konneksiyona karşılık gelen torsiyon tensörü olan $\tilde{T}$ aşağıdaki gibi tanımlanır:

$$\tilde{T}(X_1, X_2) = \tilde{\nabla}_{X_1} X_2 - \tilde{\nabla}_{X_2} X_1 - [X_1, X_2].$$

Her $X_1,\ X_2 \in \chi(M_1)$ için $\tilde{T}(X_1, X_2) = 0$, sağlanıyorsa, $\tilde{\nabla}$ konneksiyonu simetrik olarak adlandırılır. Aksi hâlde, non-simetrik kabul edilir (Yano, K., 1970).

n −boyutlu bir Riemann manifoldu olan (M_1, g_1) üzerinde tanımlı bir $\tilde{\nabla}$ lineer konneksiyonu, torsiyon tensörü $\tilde{T}$ nin aşağıdaki eşitliği sağlaması durumunda quarter-simetrik konneksiyon olarak adlandırılır:

$$\tilde{T}(X_1, X_2) = \eta(X_2)\varphi X_1 - \eta(X_1)\varphi X_2,$$

burada η diferensiyellenebilir bir 1-form ve $U_1 \in \Gamma(TM_1)$ olmak üzere $\eta(X_2) = g_1(U_1, X_2)$ eşitliği sağlanır, φ ise *(1,1)*- tipinde bir tensör alanıdır. Eğer $\tilde{\nabla}$ konneksiyonu tüm $X_1, X_2, X_3 \in \Gamma(TM_1)$ için

$$\left(\tilde{\nabla}_{X_1} g_1\right)(X_2, X_3) = 0$$

eşitliğini sağlıyorsa, bu konneksiyona quarter-simetrik metrik konneksiyon denir (Golab, S., 1975).

Aşağıdaki şekilde tanımlanan $\tilde{\nabla}$ lineer konneksiyonunu ele alalım:

$$\tilde{\nabla}_{X_1} X_2 = \nabla_{X_1} X_2 + \eta(X_2)\varphi X_1 \qquad (2.1)$$

burada ∇ Levi-Civita konneksiyonu olmak üzere, (2.1) eşitliği kullanıldığında, $\tilde{\nabla}$ konneksiyonuna karşılık gelen torsion tensörü $\tilde{T}$ aşağıdaki şekilde elde edilir:

$$\tilde{T}(X_1, X_2) = \eta(X_2)\varphi X_1 - \eta(X_1)\varphi X_2. \qquad (2.2)$$

Ayrıca, (2.1) ifadesinden yararlanılarak

$$\left(\tilde{\nabla}_{X_1} g_1\right)(X_2, X_3) = -\eta(X_2) g_1(\varphi X_1, X_3) - \eta(X_3) g_1(X_2, \varphi X_1) \qquad (2.3)$$

eşitliği elde edilir. Böylece, (2.1) ile tanımlanan $\tilde{\nabla}$ konneksiyonu hem (2.2) hem de (2.3) koşullarını sağladığından quarter-simmetric non-metrik konneksiyon olarak adlandırılır (Golab, S., 1975).

Tanım 2.1.1 (M_1, g_1) ve (M_2, g_2) sırasıyla m_1 ve m_2 boyutlu Riemann manifoldları olmak üzere f: $M_1 \rightarrow M_2$ diferensiyellenebilir dönüşümü maksimal ranka sahip ve f_{*p} dönüşümü her $p \in M_1$ noktasında yatay vektörlerin uzunluğunu koruyorsa bu dönüşüme Riemann submersiyonu denir. Diğer yandan, $q \in M_2$ için $f^{-1}(q)$ üzerindeki lif M_1'in $(m_1 - m_2)$ boyutlu altmanifoldudur. Bu altmanifoldlara submersiyonun lifleri adı verilir. M_1 üzerinde bir vektör alanı daima liflere teğet ise bu vektör alanı dikey vektör alanı, liflere dik ise yatay vektör alanı olarak tanımlanır. M_1 üzerindeki bir yatay vektör alanı X ile M_2 üzerindeki bir vektör alanı X' $f-$ bağlı ise bu durumda X temel vektör alanı olarak adlandırılır. Burada f – bağlılık, her $p \in M_1$ için $f_{*p}(X_{\mathrm{p}}) = \mathrm{X}'_{f(p)}$ eşitliği ile ifade edilir. (Sahin, B., 2017).

Bu çalışmada dikey ve yatay vektör alanları sırasıyla $\mathcal{V}$ ve $\mathcal{H}$ sembolleri ile gösterilecektir.

Öte yandan, (M_1, g_1) ve (M_2, g_2) sırasıyla ∇ ve ∇' Levi Civita konneksiyonlarına sahip Riemann manifoldları olmak üzere f: $M_1 \rightarrow M_2$ bir Riemann submersiyonu olduğunda aşağıdaki eşitlikler sağlanmaktadır:

i) $g_1(X_1, X_2) = g_1{}'(X_1', X_2') \circ f.$

ii) $h[X_1, X_2]$ temel vektör alanı $[X_1', X_2']$ vektör alanına f $-$bağlıdır.

iii) $h(\nabla_{X_1} X_2)$ temel vektör alanı ve $\nabla'_{X_1'} X_2'$ f $-$bağlıdır.

iv) Herhangi bir $U_1 \in \chi^v(M_1)$ için $[X_1, U_1]$ dikey vektör alanıdır.

Burada X_1 ve X_2, M_1üzerinde temel vektör alanlarıdır (O'Neill, B., 1966).

(M_1, g_1) ve (M_2, g_2) Riemann manifoldları ve f: $M_1 \rightarrow M_2$ Riemann submersiyonu olmak üzere, E_1, $E_2 \in \Gamma(TM_1)$ için M_1 üzerindeki temel (O'Neill) tensör alanları

$$\mathcal{T}_{E_1} E_2 = h\nabla_{vE_1} vE_2 + v\nabla_{vE_1} hE_2, \tag{2.4}$$

$$\mathcal{A}_{E_1} E_2 = v\nabla_{hE_1} hE_2 + h\nabla_{hE_1} vE_2, \tag{2.5}$$

olarak tanımlanır. Burada v ve h sırasıyla dikey ve yatay projeksiyonlardır. Ayrıca

$$\nabla_{U_1} U_2 = \mathcal{T}_{U_1} U_2 + v\nabla_{U_1} U_2, \tag{2.6}$$

$$\nabla_{U_1} X_1 = \mathcal{T}_{U_1} X_1 + h\nabla_{U_1} X_1, \tag{2.7}$$

$$\nabla_{X_1} U_1 = \mathcal{A}_{X_1} U_1 + v\nabla_{X_1} U_1, \tag{2.8}$$

$$\nabla_{X_1} X_2 = \mathcal{A}_{X_1} X_2 + h\nabla_{X_1} X_2, \tag{2.9}$$

dir. Burada $X_1, X_2 \in \chi^h(M_1)$; $U_1, U_2 \in \chi^v(M_1)$. Ayrıca $\mathcal{T}_{U_1} U_2 = \mathcal{T}_{U_2} U_1$ dir (O'Neill, B., 1966).

Tanım 2.1.2 (M_1, g_1) bir Riemann manifoldu olmak üzere her bir X_{i} yatay ve U_j dikey vektör alanları için, $\{X_{\mathrm{i}}, U_j\}_{1 \le \mathrm{i} \le \mathrm{n}, 1 \le \mathrm{j} \le \mathrm{r}}$ ifadesine M_1 üzerinde f-uyumlu yerel ortonormal çatı denir (Falcitelli, M. ve ark. 2004).

Tanım 2.1.3 $(M_1, g_1), \nabla$ Levi-Civita konneksiyonuna sahip bir Riemann manifoldu olsun. Bu durumda, Riemann eğrilik tensörü R

$$R(X,Y)Z = \nabla_X \nabla_Y Z - \nabla_Y \nabla_X Z - \nabla_{[X,Y]} Z,$$

şeklinde ifade edilir. Burada X, Y ve Z M_1 üzerinde tanımlı vektör alanlarıdır.

Kesit eğriliği K_p, $p \in M_1$ noktasında

$$K_p = \frac{g_1(R(X_1,X_2)X_2,X_1)}{\|X_1\|^2\|X_2\|^2 - g_1(X_1,X_2)^2}. \quad (2.10)$$

şeklinde tanımlanır.

Ayrıca, Ricci eğriliği,

$S: C_2^\infty(TM_1) \to C_0^\infty(TM_1)$ olmak üzere

$$S(X_1, X_2) = \sum_{i=1}^{m} g_1(R(X_1, e_i)e_i, X_2)$$

ile gösterilir.

Böylece, τ skaler eğriliği şu şekilde ifade edilir:

$$\tau = \sum_{j=1}^{m} R_i(e_j, e_j) = \sum_{j=1}^{m} \sum_{i=1}^{m} g_1(R(e_i, e_j)e_j, e_i), \quad (2.11)$$

Burada$\{e_1, e_2, \ldots, e_m\}$ tanjant demeti için keyfi yerel ortonormal bir çatıdır (Gundmundson, S., 2014).

Lemma 2.1.4 (M_1, g_1) ve (M_2, g_2) birer Riemann manifoldu olsun ve $f: M_1 \to M_2$ bir Riemann

submersiyonu tanımlasın. $X_1, X_2 \in \Gamma(\mathcal{H})$, $U_1, U_2 \in \Gamma(\mathcal{V})$ olmak üzere, $\{Xi\ ,\ Uj\ \}$, (M_1, g_1) üzerinde f-uyumlu bir çatı olsun. Bu durumda aşağıdaki eşitlikler sağlanır (Falcitelli, M. ve ark. 2004):

$$\sum_{i=1}^{n} g_1\left(\mathcal{T}_{U_1} X_i, \mathcal{T}_{U_2} X_i\right) = \sum_{j=1}^{r} g_1\left(\mathcal{T}_{U_1} U_j, \mathcal{T}_{U_2} U_j\right), \quad (2.12)$$

$$\sum_{i=1}^{n} g_1(\mathcal{A}_{X_1} X_i, \mathcal{A}_{X_2} X_i) = \sum_{j=1}^{r} g_1(\mathcal{A}_{X_1} U_j, \mathcal{A}_{X_2} U_j), \quad (2.13)$$

$$\sum_{i=1}^{n} g_1(\mathcal{A}_{X_1} X_i, \mathcal{T}_{U_1} X_i) = \sum_{j=1}^{r} g_1(\mathcal{A}_{X_1} U_j, \mathcal{T}_{U_1} U_j), \quad (2.14)$$

Tanım 2.1.5 (M_1, g_1) bir Riemann manifoldu ve $\mathcal{V}$ dikey distribüsyonun bir yerel ortonormal çatısı olsun. Bu durumda, (M_1, g_1) üzerinde yatay vektör alanı

$$\mathcal{N} = \sum_{j=1}^{r} \mathcal{T}_{U_j} U_j \quad (2.15)$$

şeklinde tanımlanır (Falcitelli, M. ve ark. 2004).

Bu çalışmada, quarter simetrik non-metrik konneksiyonlu Riemann submersiyonları kısaca Q-RS olarak belirtilecektir.

$f: M_1 \to M_2$ Q-RS olsun. Bu durumda (2.1)'den

$$\tilde{\mathcal{T}}(E,F) = \tilde{\mathcal{T}}_E F = \mathcal{T}_E F + \eta(vF)h\varphi(vE) + \eta(hF)v\varphi(vE), \quad (2.16)$$

$$\tilde{\mathcal{A}}(E,F) = \tilde{\mathcal{A}}_E F = \mathcal{A}_E F + \eta(hF)v\varphi(hE) + \eta(vF)h\varphi(hE), \quad (2.17)$$

eşitlikleri elde edilir. Burada $\mathcal{T}$ ve $\mathcal{A}$ M_1, üzerinde temel tensör alanları, $E, F \in \Gamma(TM_1)$ (Demir, H. & Sarı, R., 2021).

$f: M_1 \to M_2$ bir Q-RS olsun. Bu durumda,

$$\tilde{\mathcal{T}}_{U_1}U_2 = \tilde{\mathcal{T}}_{U_2}U_1 + \eta(vU_2)h\varphi(vU_1) - \eta(vU_1)h\varphi(vU_2), \quad (2.18)$$

$$\tilde{\mathcal{T}}_{U_1}X_1 = \mathcal{T}_{U_1}X_1 + \eta(hX_1)v\varphi(vU_1), \quad (2.19)$$

$$\tilde{\mathcal{A}}_{X_1}X_2 = -\tilde{\mathcal{A}}_{X_2}X_1 + \eta(hX_2)v\varphi(hX_1) + \eta(hX_1)v\varphi(hX_2), \quad (2.20)$$

$$\tilde{\mathcal{A}}_{X_1}U_1 = \mathcal{A}_{X_1}U_1 + \eta(vU_1)h\varphi(hX_1), \quad (2.21)$$

eşitlikleri elde edilir. Burada $U_1, U_2 \in \Gamma(\mathcal{V})$, $X_1, X_2 \in \Gamma(\mathcal{H})$ dir.

Diğer taraftan, (2.1) ifadesinden aşağıdaki eşitlikler elde edilir:

$$\tilde{\nabla}_{U_1}U_2 = \tilde{\mathcal{T}}_{U_1}U_2 + \hat{\nabla}_{U_1}U_2 - \eta(U_2)\varphi(U_1), \quad (2.22)$$

$$\tilde{\nabla}_{U_1}X_1 = \mathcal{T}_{U_1}X_1 + h\tilde{\nabla}_{U_1}X_1 + \eta(X_1)v\varphi(U_1), \quad (2.23)$$

$$\tilde{\nabla}_{X_1}U_1 = \mathcal{A}_{X_1}U_1 + v\tilde{\nabla}_{X_1}U_1 + \eta(U_1)h\varphi(X_1), \quad (2.24)$$

$$\tilde{\nabla}_{X_1}X_2 = \mathcal{A}_{X_1}X_2 + h\tilde{\nabla}_{X_1}X_2 + \eta(X_2)v\varphi(X_1), \quad (2.25)$$

burada $U_1, U_2 \in \Gamma(\mathcal{V})$, $X_1, X_2 \in \Gamma(\mathcal{H})$, ve $\hat{\nabla}_{U_1}U_2 = v\tilde{\nabla}_{U_1}U_2$ (Demir, H. & Sarı, R., 2021) ve (Karataş, E. ve ark., 2025).

Teorem 2.1.6 (M_1, g_1) ve (M_2, g_2) Riemannian manifoldları ve $f: (M_1, g_1) \to (M_2, g_2)$ bir Q-RS olsun. $\tilde{R}$, R' ve $\hat{R}$ sırasıyla M_1, M_2, ve $(f^{-1}(x), \hat{g}_{1x})$ lifinin Riemann eğrilik tensörleri olsun. Bu durumda, aşağıdaki eşitlikler elde edilir:

$$\begin{aligned} g_1(\tilde{R}(U_1,U_2)U_3,U_4) &= g_1(\hat{R}(U_1,U_2)U_3,U_4) - g_1(\eta(\hat{\nabla}_{U_2}U_3)\varphi(U_1),U_4) + g_1(\mathcal{T}_{U_1}\tilde{\mathcal{T}}_{U_2}U_3,U_4) \\ &+ g_1(\eta(\tilde{\mathcal{T}}_{U_2}U_3)v\varphi(U_1),U_4) - g_1(\tilde{\nabla}_{U_1}\eta(U_3)\varphi(U_2),U_4) + g_1(\eta(\hat{\nabla}_{U_1}U_3)\varphi(U_2),U_4) \\ &- g_1(\mathcal{T}_{U_2}\tilde{\mathcal{T}}_{U_1}U_3,U_4) - g_1(\eta(\tilde{\mathcal{T}}_{U_1}U_3)v\varphi(U_2),U_4) + g_1(\tilde{\nabla}_{U_2}\eta(U_3)\varphi(U_1),U_4) \\ &+ g_1(\eta(U_3)\varphi([U_1,U_2]),U_4), \end{aligned} \quad (2.26)$$

$$\begin{aligned} g_1(\tilde{R}(U_1,U_2)U_3,X_1) &= g_1(\tilde{\mathcal{T}}_{U_1}\hat{\nabla}_{U_2}U_3,X_1) - g_1(\eta(\hat{\nabla}_{U_2}U_3)\varphi(U_1),X_1) + g_1(h\tilde{\nabla}_{U_1}\tilde{\mathcal{T}}_{U_2}U_3,X_1) \\ &- g_1(\tilde{\nabla}_{U_1}\eta(U_3)\varphi(U_2),X_1) - g_1(\tilde{\mathcal{T}}_{U_2}\hat{\nabla}_{U_1}U_3,X_1) + g_1(\eta(\hat{\nabla}_{U_1}U_3)\varphi(U_2),X_1) \\ &- g_1(h\tilde{\nabla}_{U_2}\tilde{\mathcal{T}}_{U_1}U_3,X_1) + g_1(\tilde{\nabla}_{U_2}\eta(U_3)\varphi(U_1),X_1) \end{aligned}$$

$$-g_1\left(\tilde{\mathcal{T}}_{[U_1,U_2]}U_3,X_1\right)+g_1(\eta(U_3)\varphi([U_1,U_2]),X_1), \tag{2.27}$$

$$g_1\left(\tilde{R}(X_1,X_2)X_3,X_4\right)=g_1(R'(X_1,X_2)X_3,X_4)+g_1\left(\mathcal{A}_{X_2}X_4,\mathcal{A}_{X_1}X_3\right)-g_1(\mathcal{A}_{X_1}X_4,\mathcal{A}_{X_2}X_3)$$
$$+g_1(\eta\left(\mathcal{A}_{X_2}X_3\right)h\varphi(X_1),X_4)-\ g_1(\eta\left(\mathcal{A}_{X_1}X_3\right)h\varphi(X_2),X_4)+g_1\left(\tilde{\nabla}_{X_1}\eta(X_3)v\varphi(X_2),X_4\right)$$
$$-g_1\left(\tilde{\nabla}_{X_2}\eta(X_3)v\varphi(X_1),X_4\right), \tag{2.28}$$

$$g_1\left(\tilde{R}(X_1,X_2)X_3,U_1\right)=g_1\left(v\tilde{\nabla}_{X_1}\mathcal{A}_{X_2}X_3,U_1\right)+g_1(\mathcal{A}_{X_1}h\tilde{\nabla}_{X_2}X_3,U_1)$$
$$+g_1(\eta\left(h\tilde{\nabla}_{X_2}X_3\right)v\varphi(X_1),U_1)+g_1\left(\tilde{\nabla}_{X_1}\eta(X_3)v\varphi(X_2),U_1\right)-g_1\left(v\tilde{\nabla}_{X_2}\mathcal{A}_{X_1}X_3,U_1\right)$$
$$-g_1\left(\mathcal{A}_{X_2}h\tilde{\nabla}_{X_1}X_3,U_1\right)-g_1\left(\eta\left(h\tilde{\nabla}_{X_1}X_3\right)v\varphi(X_2),U_1\right)-g_1\left(\tilde{\nabla}_{X_2}\eta(X_3)v\varphi(X_1),U_1\right)$$
$$-g_1(\eta(X_3)v\varphi([X_1,X_2]),U_1), \tag{2.29}$$

$$g_1\left(\tilde{R}(X_1,U_1)X_2,U_2\right)$$
$$=g_1\left(v\tilde{\nabla}_{X_1}\mathcal{T}_{U_1}X_2,U_2\right)+g_1\left(\mathcal{A}_{X_1}h\tilde{\nabla}_{U_1}X_2,U_2\right)+g_1(\eta(h\tilde{\nabla}_{U_1}X_2)v\varphi(X_1),U_2)$$
$$+g_1\left(\tilde{\nabla}_{X_1}\eta(X_2)v\varphi(U_1),U_2\right)-g_1\left(\hat{\nabla}_{U_1}\mathcal{A}_{X_1}X_2,U_2\right)+g_1\left(\eta\left(\mathcal{A}_{X_1}X_2\right)\varphi(U_1),U_2\right)$$
$$-g_1(\mathcal{T}_{U_1}h\tilde{\nabla}_{X_1}X_2,U_2)-\eta\left(h\tilde{\nabla}_{X_1}X_2\right)g_1(v\varphi(U_1),U_2)$$
$$-g_1(\tilde{\nabla}_{U_1}\eta(X_2)v\varphi(X_1),U_2)-g_1\left(\mathcal{T}_{[X_1,U_1]}X_2,U_2\right)-g_1(\eta(X_2)v\varphi([X_1,U_1]),U_2), \tag{2.30}$$

$$g_1\left(\tilde{R}(X_1,X_2)U_1,X_3\right)$$
$$=g_1(h\left(\tilde{\nabla}_{X_1}\mathcal{A}_{X_2}U_1,X_3\right)+g_1\left(\mathcal{A}_{X_1}v\tilde{\nabla}_{X_2}U_1,X_3\right)+g_1(\eta(v\tilde{\nabla}_{X_2}U_1)h\varphi(X_1),X_3)$$
$$+g_1(\tilde{\nabla}_{X_1}\eta(U_1)h\varphi(X_2),X_3)-g_1(h\tilde{\nabla}_{X_2}\mathcal{A}_{X_1}U_1,X_3)-g_1\left(\mathcal{A}_{X_2}v\tilde{\nabla}_{X_1}U_1,X_3\right)$$
$$-g_1\left(\eta\left(v\tilde{\nabla}_{X_1}U_1\right)h\varphi(X_2),X_3\right)-g_1\left(\tilde{\nabla}_{X_2}\eta(U_1)h\varphi(X_1),X_3\right)$$
$$-g_1\left(\mathcal{A}_{[X_1,X_2]}U_1,X_3\right)-g_1(\eta(U_1)h\varphi([X_1,X_2]),X_3), \tag{2.31}$$

$$g_1\left(\tilde{R}(X_1,U_1)U_2,U_3\right)=g_1\left(v\tilde{\nabla}_{X_1}\hat{\nabla}_{U_1}U_2,U_3\right)-g_1\left(\mathcal{A}_{X_1}U_3,\tilde{\mathcal{T}}_{U_1}U_2\right)+g_1(\eta(\tilde{\mathcal{T}}_{U_1}U_2)v\varphi(X_1),U_3)$$
$$-g_1\left(\tilde{\nabla}_{X_1}\eta(U_2)\varphi(U_1),U_3\right)+g_1\left(\mathcal{T}_{U_1}U_3,\mathcal{A}_{X_1}U_2\right)-g_1\left(\eta\left(\mathcal{A}_{X_1}U_2\right)v\varphi(U_1),U_3\right)$$
$$-g_1(\hat{\nabla}_{U_1}v\tilde{\nabla}_{X_1}U_2,U_3)+g_1\left(\eta\left(v\tilde{\nabla}_{X_1}U_2\right)\varphi(U_1),U_3\right)-g_1\left(\tilde{\nabla}_{U_1}\eta(U_2)h\varphi(X_1),U_3\right)$$
$$-g_1\left(\hat{\nabla}_{[X_1,U_1]}U_2,U_3\right)\ +g_1(\eta(U_2)\varphi([X_1,U_1]),U_3), \tag{2.32}$$

burada $U_1,U_2,U_3,U_4\in\Gamma(\mathcal{V}),X_1,X_2,X_3,X_4\in\Gamma(\mathcal{H})$.

(Demir, H. & Sarı, R., 2021)ve (Karataş, E. ve ark.,2025).

Önerme 2.1.7 (M_1, g_1) ve (M_2, g_2) Riemannian manifoldlar, $f: (M_1, g_1) \to (M_2, g_2)$ bir Q-RS olsun. $\tilde{S}$, S' ve $\hat{S}$ sırasıyla M_1, M_2, ve $(f^{-1}(x), \hat{g}_{1x})$ lifinin Ricci eğrilik tensörleri olsun. Bu durumda, aşağıdaki eşitlikler elde edilir:

$$\begin{aligned}\tilde{S}(U_1,U_2) &= \hat{S}(U_1,U_2) - g_1\big(\widetilde{\mathcal{N}}, \mathcal{T}_{U_1}U_2\big) + g_1\big(\eta\big(\widetilde{\mathcal{N}}\big)v\varphi(U_1), U_2\big)\\ &+\sum_i \{-g_1(\eta\big(\hat{\nabla}_{U_i}U_i\big)\varphi(U_1),U_2) - g_1\big(\tilde{\nabla}_{U_1}\eta(U_i)\varphi(U_i),U_2\big)\\ &+g_1(\eta\big(\hat{\nabla}_{U_1}U_i\big)(\varphi(U_i),U_2) + g_1\big(\tilde{\mathcal{T}}_{U_1}U_i, \mathcal{T}_{U_i}U_2\big) - g_1(\eta\big(\tilde{\mathcal{T}}_{U_1}U_i\big)v\varphi(U_i),U_2)\\ &+g_1\big(\tilde{\nabla}_{U_i}\eta(U_i)\varphi(U_1),U_2\big) + g_1(\eta(U_i)\varphi([U_1,U_i]),U_2)\} - \sum_j \{g_1\left(v\tilde{\nabla}_{X_j}\mathcal{T}_{U_1}X_j, U_2\right)\\ &-g_1\left(\mathcal{A}_{X_j}U_2, h\tilde{\nabla}_{U_1}X_j\right) + g_1\big(\eta\big(h\tilde{\nabla}_{U_1}X_j\big)v\varphi\big(X_j\big),U_2\big) + g_1\left(\tilde{\nabla}_{X_j}\eta\big(X_j\big)v\varphi(U_1),U_2\right)\\ &-g_1\left(\hat{\nabla}_{U_1}\mathcal{A}_{X_j}X_j,U_2\right) + g_1\left(\eta\left(\mathcal{A}_{X_j}X_j\right)g_1(\varphi(U_1),U_2)\right) + g_1\left(\mathcal{T}_{U_1}U_2, h\tilde{\nabla}_{X_j}X_j\right)\\ &-g_1\left(\eta\left(h\tilde{\nabla}_{X_j}X_j\right)g_1(v\varphi(U_1),U_2)\right) - g_1\big(\tilde{\nabla}_{U_1}\eta(X_j)v\varphi\big(X_j\big),U_2\big) - g_1\left(\mathcal{T}_{[X_j,U_1]}X_j,U_2\right)\\ &-g_1\big(\eta\big(X_j\big)v\varphi\big(\big[X_j,U_1\big]\big),U_2\big)\},\end{aligned} \tag{2.33}$$

$$\begin{aligned}\tilde{S}(X_1,X_2) &= S'(X_1',X_2')\circ f + g_1\big(\mathcal{N}, h\tilde{\nabla}_{X_1}X_2\big) - \sum_i \{g_1(v\tilde{\nabla}_{X_1}\mathcal{T}_{U_i}X_2,U_i)\\ &-g_1(\mathcal{A}_{X_1}U_i, h\tilde{\nabla}_{U_i}X_2)+g_1\big(\eta\big(h\tilde{\nabla}_{U_i}X_2\big)v\varphi(X_1),U_i\big) + g_1\big(\tilde{\nabla}_{X_1}\eta(X_2)v\varphi(U_i),U_i\big)\\ &-g_1\big(\hat{\nabla}_{U_i}\mathcal{A}_{X_1}X_2,U_i\big) + g_1\big(\eta\big(\mathcal{A}_{X_1}X_2\big)\varphi(U_i),U_i\big) - g_1\big(\eta\big(h\tilde{\nabla}_{X_1}X_2\big)v\varphi(U_i),U_i\big)\\ &-g_1\big(\tilde{\nabla}_{U_i}\eta(X_2)v\varphi(X_1),U_i\big) - g_1\big(\mathcal{T}_{[X_1,U_i]}X_2,U_i\big) - g_1(\eta(X_2)v\varphi([X_1,U_i]),U_i)\}\\ &+\sum_j \{-g_1\big(\mathcal{A}_{X_1}X_j,\mathcal{A}_{X_2}X_j\big) - g_1(\mathcal{A}_{X_1}X_2,\mathcal{A}_{X_j}X_j)+g_1\left(\eta\left(\mathcal{A}_{X_j}X_j\right)h\varphi(X_1),X_2\right)\\ &-g_1\big(\eta\big(\mathcal{A}_{X_1}X_j\big)h\varphi\big(X_j\big),X_2\big) + g_1\big(\tilde{\nabla}_{X_1}\eta\big(X_j\big)v\varphi\big(X_j\big),X_2\big)\\ &-g_1\left(\tilde{\nabla}_{X_j}\eta\big(X_j\big)v\varphi(X_1),X_2\right)\},\end{aligned} \tag{2.34}$$

$$\begin{aligned}\tilde{S}(X_1,U_1) &= \sum_i \{g_1\big(v\tilde{\nabla}_{X_1}\mathcal{A}_{X_i}X_i,U_1\big) - g_1\big(\mathcal{A}_{X_1}U_1, h\tilde{\nabla}_{X_i}X_i\big) + g_1(\eta\big(h\tilde{\nabla}_{X_i}X_i\big)v\varphi(X_1),U_1)\\ &+g_1\big(\tilde{\nabla}_{X_1}\eta(X_i)v\varphi(X_i),U_1\big) - g_1\big(v\tilde{\nabla}_{X_i}\mathcal{A}_{X_1}X_i,U_1\big) + g_1\big(\mathcal{A}_{X_i}U_1, h\tilde{\nabla}_{X_1}X_i\big)\\ &-g_1(\eta\big(h\tilde{\nabla}_{X_1}X_i\big)v\varphi(X_i),U_1) - g_1\big(\tilde{\nabla}_{X_i}\eta(X_i)v\varphi(X_1),U_1\big)\\ &-g_1(\eta(X_i)v\varphi([X_1,X_i],U_1)\} + \sum_j \{g_1\left(v\tilde{\nabla}_{X_1}\hat{\nabla}_{U_j}U_j,U_1\right)\end{aligned}$$

$$-g_1(\tilde{\nabla}_{X_1}\eta(U_j)\varphi(U_j),U_1)+g_1\left(\mathcal{T}_{U_j}U_1,\mathcal{A}_{X_1}U_j\right)-g_1(\eta(\mathcal{A}_{X_1}U_j)v\varphi(U_j),U_1)$$
$$-g_1(\hat{\nabla}_{U_j}v\tilde{\nabla}_{X_1}U_j,U_1)+g_1(\eta(v\tilde{\nabla}_{X_1}U_j)\varphi(U_j),U_1)-g_1(\tilde{\nabla}_{U_j}\eta(U_j)h\varphi(X_1),U_1)$$
$$-g_1(\hat{\nabla}_{[X_1,U_j]}U_j,U_1)+g_1(\eta(U_j)\varphi([X_1,U_j],U_1)$$
$$-g_1(\widetilde{\mathcal{N}},\mathcal{A}_{X_1}U_1)+g_1(\eta(\widetilde{\mathcal{N}})v\varphi(X_1),U_1)\},\qquad(2.35)$$

burada, $U_1,U_2\in\Gamma(\mathcal{V})$, $X_1,X_2\in\Gamma(\mathcal{H})$, $\widetilde{\mathcal{N}}=\sum_{j=1}^{r}\tilde{\mathcal{T}}_{U_j}U_j$, ve $\{X_i,U_j\}$ bir f −uyumlu çatıdır. (Karataş, E. , ve ark.,2025).

Teorem 2.1.8 (M_1,g_1) ve (M_2,g_2) Riemannian manifoldlar, $f:(M_1,g_1)\to(M_2,g_2)$ bir Q-RS olsun. $\tilde{\tau}$, τ', $\hat{\tau}$ sırasıyla M_1, M_2, ve $(f^{-1}(x),\hat{g}_{1x})$, lifinin skaler eğriliği olsun. Ayrıca $\{X_i,U_j\}$ f −uyumlu çatı olsun. Bu durumda, M_1 Riemann manifoldunun skaler eğriliği aşağıdaki gibidir: (Karataş, E. , ve ark., 2025).

$$\tilde{\tau}=\tau'\circ f+\hat{\tau}-g_1(\widetilde{\mathcal{N}},\mathcal{N})+\sum_i\{g_1(\mathcal{N},h\tilde{\nabla}_{X_i}X_i)-g_1(v\tilde{\nabla}_{X_i}\mathcal{T}_{U_i}X_i,U_i)-g_1(\mathcal{A}_{X_i}U_i,h\tilde{\nabla}_{U_i}X_i)$$

$$+g_1(\eta(\widetilde{\mathcal{N}})v\varphi(U_j),U_j)\}.\qquad(2.36)$$

3. Quarter Simetrik Non-Metrik Konneksiyonlu Riemann Submersiyonların Belirli Eğriliklerinin İncelenmesi

3.1 Conformal* Eğrilik Tensörü

M_1, n −boyutlu bir manifold olsun. Bu durumda, V uzayı n −boyutlu bir uzay olmak üzere, her $X, Y, Z \in \varkappa(M_1)$ için M_1'in conformal* eğrilik tensör alanı

$$C^*(X,Y,Z) = \tilde{R}(X,Y)Z - \frac{1}{(n-2)}\left[g_1(Y,Z)\tilde{Q}X - g_1(X,Z)\tilde{Q}Y\right]$$
$$+\frac{\tilde{\tau}}{(n-2)(n-1)}[g_1(Y,Z)X - g_1(X,Z)Y], \qquad (3.1.1)$$

şeklinde tanımlanır. Burada $\tilde{Q}$ ve $\tilde{R}$ sırasıyla Ricci operatorü ve Riemannn eğrilik tensörüdür (Jawarneh, M. & Tashtoush, M., 2011; Mishra, R.S. & Kushwaha R. D. S.,1971).

Teorem 3.1.1 (M_1, g_1) ve (M_2, g_2) birer Riemann manifoldu olmak üzere $f:(M_1, g_1) \to (M_2, g_2)$ bir Q-RS olsun. $\tilde{R}, R'$ ve $\hat{R}$; sırasıyla M_1, M_2 ve lifi $(f^{-1}(x), \hat{g}_{1x})$ olan manifoldun Riemann eğrilik tensörlerini; $\tilde{S}, S'$ ve $\hat{S}$ bu manifoldların Ricci tensörlerini; $\tilde{\tau}$ ise M_1'in skaler eğriliğini ifade etsin. Bu çerçevede $U_1, U_2, U_3, U_4 \in \varkappa^v(M_1)$ ve $X_1, X_2, X_3, X_4 \in \varkappa^h(M_1)$ için conformal* eğrilik tensörleri aşağıdaki gibidir:

$$g_1(\tilde{C}^*(X_1,X_2)X_3,X_4)$$
$$= g_1(R'(X_1,X_2)X_3,X_4) + g_1(\mathcal{A}_{X_2}X_4, \mathcal{A}_{X_1}X_3) - g_1(\mathcal{A}_{X_1}X_4, \mathcal{A}_{X_2}X_3)$$
$$+g_1\left(\eta\left(\mathcal{A}_{X_2}X_3\right)h\varphi(X_1),X_4\right) - g_1\left(\eta\left(\mathcal{A}_{X_1}X_3\right)h\varphi(X_2),X_4\right)$$
$$+g_1(\widetilde{\nabla}_{X_1}\eta(X_3)v\varphi(X_2),X_4) - g_1(\widetilde{\nabla}_{X_2}\eta(X_3)v\varphi(X_1),X_4)$$
$$-\frac{1}{(n-2)}\{g_1(X_2,X_3)[S'(X_1',X_4')\circ f + g_1(\mathcal{N}, h\widetilde{\nabla}_{X_1}X_4)$$
$$-\sum_i \{g_1(v\widetilde{\nabla}_{X_1}\mathcal{T}_{U_i}X_4,U_i) - g_1(\mathcal{A}_{X_1}U_i, h\widetilde{\nabla}_{U_i}X_4) + g_1(\eta(h\widetilde{\nabla}_{U_i}X_4)v\varphi(X_1),U_i)$$
$$+g_1(\widetilde{\nabla}_{X_1}\eta(X_4)v\varphi(U_i),U_i) - g_1(\widehat{\nabla}_{U_i}\mathcal{A}_{X_1}X_4,U_i) + g_1(\eta(\mathcal{A}_{X_1}X_4)\varphi(U_i),U_i)$$

İspat. Bu çalışmada yalnızca (3.1.2) eşitliğinin ispatı verilecektir; diğer denklemlerin ispatları ise benzer yöntemlerle kolaylıkla elde edilebilir.

$X_1,X_2,X_3,X_4\in\chi^h(M_1)$ olmak üzere (3.1.1) denklemi kullanılarak ilgili ifade X_4 ile çarpıldığında

$$g_1(\tilde{C}^*(X_1,X_2)X_3,X_4)=g_1(\tilde{R}(X_1,X_2)X_3,X_4)-\frac{1}{(n-2)}[g_1(X_2,X_3)\tilde{S}(X_1,X_4)$$
$$-g_1(X_1,X_3)\tilde{S}(X_2,X_4)]+\frac{\tilde{\tau}}{(n-2)(n-1)}[g_1(X_2,X_3)g_1(X_1,X_4)$$
$$-g_1(X_1,X_3)g_1(X_2,X_4)]$$

eşitliği elde edilir. Daha sonra (2.29) ve (2.35) eşitliklerinden yararlanılarak ispat tamamlanmış olur.

Not edelim ki, lifin ortalama eğrilik vektör alanı H olmak üzere $\mathcal{T}_UV=g_1(U,V)H$ eşitliği sağlanıyor ve $U,V\in\Gamma(\ker f_*)$ ise, bu durumda Riemann submersiyonu total umbilik liflere sahiptir (Şahin, B., 2013). Dolayısıyla $\mathcal{N}=0$ sonucu elde edilir. Ayrıca, Doğru'nun çalışmasından $\mathcal{N}=0$ ise $\mathcal{N}'=0$ sonucu görülür (Doğru, Y., 2011). Bu durumda tamamen umbilik liflerin durumuyla ilgili aşağıdaki sonuç sunulmuştur:

Sonuç 3.1.2 (M_1,g_1), (M_2,g_2) birer Riemann ve $f:(M_1,g_1)\to(M_2,g_2)$ Q-RS olsun. $\tilde{R},R'$ ve $\hat{R}$; sırasıyla M_1,M_2 ve lifi $(f^{-1}(x),\hat{g}_{1x})$ olan manifoldun Riemann eğrilik tensörlerini; $\tilde{S},S'$ ve $\hat{S}$ ise bu manifoldların Ricci tensörlerini, $\tilde{\tau}$ ise M_1'in skaler eğriliğini ifade etsin. O halde Riemann submersiyon total umbilik liflere sahipse bu durumda belirli vektör alanlarına göre conformal* eğrilik tensörleri aşağıdaki gibidir:

$$g_1(\tilde{C}^*(X_1,X_2)X_3,X_4)$$
$$=g_1(R'(X_1,X_2)X_3,X_4)+g_1(\mathcal{A}_{X_2}X_4,\mathcal{A}_{X_1}X_3)-g_1(\mathcal{A}_{X_1}X_4,\mathcal{A}_{X_2}X_3)$$

OVERVIEW ON URINARY TRACT INFECTION

K.Pooja, Dr.M.K. Vijayalakshmi
Bharath Institute of Higher Education and Research Faculty of pharmacy Chennai
Poojakumars11a@gmail.com

ABSTRACT:

Urinary Tract Infection (UTI) is a common bacterial infection affecting any part of the urinary system, including the kidneys, ureters, bladder, and urethra. UTIs are more prevalent in females due to anatomical and physiological differences, although they can affect individuals of all ages and genders. The most frequent causative agent is Escherichia coli, a bacterium normally found in the gastrointestinal tract. Symptoms of UTIs vary depending on the site of infection but commonly include dysuria, increased urinary frequency, urgency, and lower abdominal discomfort. Diagnosis is typically confirmed through urinalysis and urine culture. Treatment primarily involves antibiotics, with the choice depending on the severity and resistance patterns. Recurrent infections may necessitate further investigation to identify underlying causes. Preventive strategies, including proper hygiene, adequate hydration, and in some cases, prophylactic antibiotics, are important in reducing incidence. Understanding the pathogenesis, risk factors, and management of UTIs is crucial for effective treatment and prevention, particularly in populations at higher risk.

Keywords

Urinary tract Infection, Escherichia coli, prophylactic antibiotics, Urethiasis.

Introduction

Urinary Tract Infection (UTI) is one of the most common bacterial infections affecting millions of people around the world each year. It occurs when harmful bacteria, most often Escherichia coli (E. coli), enter the urinary tract and multiply, leading to infection. The urinary tract includes the kidneys, ureters, bladder, and urethra. Depending on where the infection occurs, UTIs can be classified as bladder infections (cystitis), urethral infections (urethritis), or kidney infections (pyelonephritis).

UTIs are more common in women than men due to anatomical differences, such as a shorter urethra which allows bacteria to reach the bladder more easily. However, men, children, and the elderly can also suffer from UTIs, especially when underlying health conditions are present. Risk factors include poor hygiene, sexual activity, certain contraceptives, diabetes, a weakened immune system, and urinary catheter use. The symptoms of a UTI can be uncomfortable and disruptive to daily life. Common signs include a burning sensation during urination, frequent urge to urinate, cloudy or strong-smelling urine, and lower abdominal pain. If the infection spreads to the kidneys, symptoms may worsen, including fever, chills, and back pain.

Prompt diagnosis and treatment are important to prevent complications such as kidney damage or recurrent infections. Most UTIs are easily treatable with a short course of antibiotics, but preventive steps like good hygiene, staying well-hydrated, and regular urination can help reduce the risk. Understanding the causes, symptoms, and prevention strategies of UTIs empowers individuals to seek timely medical attention and adopt healthy practices. Raising awareness about UTIs is vital for maintaining good urinary health and preventing serious complications, especially in vulnerable groups like pregnant women, the elderly, and those with chronic illness.

Types of UTIs

Urinary Tract Infections (UTIs) can occur in different parts of the urinary system, which includes the kidneys, ureters, bladder, and urethra. Depending on the location of the infection, UTIs are classified into three main types:

1.Cystitis (Bladder Infection)

Cystitis is the most common type of UTI. It occurs when bacteria enter the bladder and multiply, causing inflammation. Common symptoms include frequent urination, burning sensation during urination, lower abdominal pain, and cloudy or foul-smelling urine. Though uncomfortable, bladder infections are usually not serious if treated promptly.

2.Urethritis (Urethra Infection)

Urethritis affects the urethra, the tube that carries urine from the bladder to the outside of the body. This type of UTI can be caused by bacteria from the digestive tract or sexually transmitted infections (STIs). Symptoms include burning during urination and sometimes discharge. Urethritis is more common in men compared to other types of UTIs.

3.Pyelonephritis (Kidney Infection)

Pyelonephritis is a more serious UTI that occurs when bacteria travel up to the kidneys. It can develop from an untreated lower UTI. Symptoms include high fever, chills, nausea, vomiting, and pain in the back or side. Kidney infections require prompt medical treatment to avoid complications like kidney damage or sepsis.

In some cases, UTIs are classified as uncomplicated (in otherwise healthy individuals) or complicated (in people with structural abnormalities, kidney stones, diabetes, or catheter use). UTIs can also be acute (sudden onset) or chronic/recurrent (frequent repeat infections**.**

Epidemiology of Urinary Tract Infections (UTIs)

Urinary Tract Infections (UTIs) are among the most common bacterial infections affecting people of all ages and genders worldwide. According to global health data, an estimated 150 million UTIs occur annually, with a significant portion requiring medical attention. UTIs impose a considerable burden on healthcare systems due to high rates of doctor visits, antibiotic prescriptions, and sometimes hospitalization.

Age and Gender Distribution

UTIs are more prevalent in females, especially during their reproductive years. The lifetime risk of a woman developing a UTI is around 50–60%, and many women experience recurrent episodes. The higher prevalence in females is largely due to anatomical differences—specifically, the shorter urethra and proximity of the urethral opening to the anus, which facilitates easier entry of bacteria like Escherichia coli.

Men are less frequently affected, but the risk increases with age, particularly due to prostate enlargement (benign prostatic hyperplasia), which can cause urinary retention and infection. In infants, UTIs are more common in boys, especially if they are uncircumcised, but after infancy, girls are more susceptible.

Risk in Special Populations

Certain groups are at higher risk for complicated or recurrent UTIs. These include:

Pregnant women: Hormonal and physical changes increase the risk of bladder infection, which can lead to preterm labor if untreated.

Elderly individuals: Especially those in nursing homes or with indwelling catheters.

Diabetics: Weakened immune systems and poor bladder emptying increase infection risk.

People with urinary tract abnormalities or kidney stones.

Recurrent and Chronic UTIs

Recurrent UTIs, defined as two or more infections in six months or three in a year, are common in women and can significantly affect quality of life. Chronic infections may require long-term antibiotics or urological evaluation.

Geographical Variation

Incidence rates vary globally, influenced by hygiene practices, healthcare access, antibiotic use, and socioeconomic factors. Developed countries report more outpatient cases, while in developing nations, untreated UTIs may lead to severe complications.

Antibiotic Resistance

An alarming trend is the increasing antibiotic resistance of UTI-causing bacteria, particularly to commonly used drugs like trimethoprim and ciprofloxacin. This makes treatment more challenging and highlights the need for antibiotic stewardship.

Risk Factors for Urinary Tract Infections (UTIs)

Several factors can increase an individual's risk of developing a urinary tract infection (UTI). While UTIs can affect anyone, certain conditions and behaviors make some people more vulnerable.

1. Female Anatomy

Women are at a significantly higher risk due to their shorter urethra, which allows bacteria easier access to the bladder. The close proximity of the urethral opening to the anus also increases the chance of bacterial transfer.

2. Sexual Activity

Sexual intercourse can introduce bacteria into the urinary tract. Women who are sexually active, especially with new partners, are more prone to UTIs. Using spermicides or diaphragms can further increase the risk.

3. Poor Hygiene Practices

Improper wiping (back to front), inadequate personal hygiene, and holding urine for long periods can promote bacterial growth and infection.

4. Urinary Tract Abnormalities

Congenital abnormalities, kidney stones, or enlarged prostate can obstruct urine flow, leading to incomplete bladder emptying and increased infection risk.

5. Catheter Use

People who use urinary catheters for long periods are at high risk due to direct bacterial entry into the bladder.

6. Weakened Immune System

Conditions like diabetes, HIV, or cancer, as well as medications that suppress immunity, reduce the body's ability to fight off infections.

7. Hormonal Changes

Postmenopausal women may experience changes in the urinary tract lining, making it more prone to infection due to decreased estrogen levels. Understanding these risk factors is essential for early prevention and management of UTIs, especially in high-risk groups.

Signs and Symptoms of Urinary Tract Infections (UTIs)

The signs and symptoms of a urinary tract infection (UTI) can vary depending on which part of the urinary system is affected—urethra, bladder, or kidneys. Most UTIs involve the lower urinary tract (bladder and urethra), but if left untreated, the infection can spread to the upper tract (kidneys), leading to more serious complications.

Common Symptoms of Lower UTI (Cystitis/Urethritis):

- Burning sensation during urination (dysuria)
- Frequent urge to urinate, even when little urine is passed
- Cloudy or strong-smelling urine
- Pelvic pain or pressure, especially in women
- Blood in the urine (hematuria)
- Lower abdominal discomfort or cramping

These symptoms are typically mild to moderate and can be very uncomfortable but are usually treatable with antibiotics.

Symptoms of Upper UTI (Kidney Infection/Pyelonephritis):

- High fever and chills
- Pain in the side (flank), back, or groin
- Nausea and vomiting
- Fatigue and weakness
- Confusion or mental changes, especially in older adults
- Kidney infections are more serious and may require hospitalization if symptoms are severe.

Special Symptoms in Children and Elderly:

Infants and toddlers may present with fever, irritability, poor feeding, or foul-smelling urine. Elderly individuals may not show classic symptoms but may experience confusion, falls, or sudden changes in behavior. Because the symptoms of UTIs can overlap with other conditions, especially in older adults and children, proper medical evaluation is essential. Early detection and treatment can prevent complications such as recurrent infections, kidney damage, or sepsis.

Diagnosis of Urinary Tract Infections (UTIs)

The diagnosis of a urinary tract infection (UTI) is primarily based on a combination of the patient's symptoms, physical examination, and laboratory tests. When a person presents with classic symptoms such as burning during urination, increased frequency or urgency of urination, lower abdominal pain, and cloudy or foul-smelling urine, healthcare providers often suspect a UTI. In some cases, especially in children, elderly individuals, or those with atypical presentations, further evaluation is needed to confirm the diagnosis and determine the severity.

The first step in laboratory testing is a urinalysis, which is a simple test used to detect signs of infection in a urine sample. This test can identify the presence of white blood cells (leukocytes), red blood cells (hematuria), nitrites (produced by certain bacteria), and bacteria themselves. A positive test for nitrites and leukocyte esterase is strongly suggestive of a bacterial UTI. However, urinalysis alone is not always conclusive and may yield false positives or negatives depending on sample collection and storage. To confirm the presence of bacteria and determine the most effective antibiotic treatment, a urine culture is typically recommended, especially in cases of recurrent, complicated, or upper UTIs. In this test, the urine sample is incubated to allow bacterial growth, and the specific organism causing the infection is identified. A sensitivity test is often performed alongside the culture to check which antibiotics the bacteria are resistant or sensitive to, ensuring targeted treatment. It usually takes 24–48 hours for culture results.

For patients with recurrent UTIs, persistent symptoms despite treatment, or suspected structural abnormalities, imaging tests may be ordered. These may include an ultrasound of the kidneys and bladder to check for blockages, stones, or structural defects. In more complex cases, a CT scan or MRI of the urinary tract may be used for detailed visualization. For functional issues such as bladder emptying problems, a post-void residual urine test or urodynamic study may be conducted. In men, or in cases of suspected prostate involvement, a digital rectal examination (DRE) may be performed to check for prostate tenderness or enlargement. For women with

recurrent infections, pelvic examinations may be considered to rule out vaginal or gynecological causes contributing to infection risk.

In certain cases, especially in children or when a congenital anomaly is suspected, a voiding cystourethrogram (VCUG) may be advised. This is a specialized X-ray test that examines the bladder and urethra while the bladder fills and empties. Accurate diagnosis of a UTI is crucial not only for appropriate treatment but also for preventing complications such as kidney infections, scarring, or chronic urinary problems. Early testing and identification also help avoid unnecessary antibiotic use, which contributes to the growing issue of antibiotic resistance. Therefore, timely consultation with a healthcare provider and adherence to proper diagnostic protocols are essential in managing UTIs effectively.

Treatment of Urinary Tract Infections (UTIs)

The treatment of a urinary tract infection (UTI) depends on the type, severity, and whether it is a first-time or recurrent infection. Most uncomplicated UTIs are treated effectively with a short course of antibiotics, while complicated or upper urinary tract infections may require more intensive therapy.

For uncomplicated lower UTIs (such as cystitis), commonly prescribed oral antibiotics include:

- Nitrofurantoin
- Trimethoprim-sulfamethoxazole
- Fosfomycin
- Amoxicillin-clavulanate
- Ciprofloxacin (used with caution due to resistance)

The typical course lasts 3 to 7 days, depending on the drug and the patient's condition. It’s important to complete the full course even if symptoms improve early to prevent recurrence and resistance.

For complicated UTIs, kidney infections (pyelonephritis), or recurrent infections, stronger or longer-duration antibiotics may be required. In severe cases, intravenous (IV) antibiotics may be administered in a hospital setting, followed by oral antibiotics once symptoms improve.

In addition to antibiotics, supportive care includes:

- Drinking plenty of water to flush out bacteria
- Pain relief using medications like paracetamol or phenazopyridine (a urinary tract analgesic)
- Avoiding bladder irritants like caffeine, alcohol, and spicy foods

People with recurrent UTIs may be prescribed low-dose antibiotics for several months or advised to take antibiotics after sexual activity if that is a known trigger. Postmenopausal women may benefit from topical estrogen therapy.

Proper diagnosis, guided antibiotic selection (based on urine culture if needed), and preventive care are crucial for effective UTI treatment and avoiding long-term complications such as kidney damage or antibiotic resistance.

Prevention Tips for Urinary Tract Infections (UTIs)

Preventing urinary tract infections (UTIs) involves adopting simple lifestyle and hygiene practices that help reduce the chances of bacteria entering and multiplying in the urinary tract. These tips are especially important for individuals who are prone to recurrent infections.

1. Stay Hydrated

Drink plenty of water throughout the day to help flush out bacteria from the urinary system through regular urination.

2. Urinate Frequently

Do not hold urine for long periods. Emptying the bladder completely and often helps prevent bacterial growth.

3. Wipe from Front to Back

After using the toilet, always wipe from front to back to prevent bacteria from the anal region from reaching the urethra.

4. Urinate After Sexual Activity

Urinating after intercourse helps flush out any bacteria that may have entered the urethra during sexual activity.

5. Practice Good Hygiene

Keep the genital area clean and dry. Avoid using harsh soaps, douches, or scented feminine hygiene products that may irritate the urethra.

6. Wear Breathable Clothing

Choose cotton underwear and avoid tight-fitting clothes, which can trap moisture and encourage bacterial growth.

7. Avoid Irritants

Limit the intake of bladder irritants such as caffeine, alcohol, and spicy foods if you are prone to UTIs.

8. Consider Probiotics or Cranberry Products

Some studies suggest that probiotics (especially Lactobacillus) and unsweetened cranberry juice or supplements may help prevent UTIs in some people.

Adopting these preventive habits can significantly lower the risk of UTIs and improve urinary health, especially for those with a history of recurrent infections.

Complications of Urinary Tract Infections (UTIs)

While most urinary tract infections (UTIs) are mild and easily treatable, delayed diagnosis or improper treatment can lead to serious complications. These complications can affect various parts of the urinary system and sometimes extend to other organs.

1. Recurrent Infections

One of the most common complications is recurrence. Some people, especially women, experience multiple UTIs within a year. Recurrent infections may require long-term preventive strategies and can significantly affect quality of life.

2. Kidney Infection (Pyelonephritis)

If a lower UTI is not treated promptly, the bacteria may travel up the ureters and infect the kidneys. This condition, known as pyelonephritis, can lead to high fever, chills, nausea, vomiting, and back pain. Repeated kidney infections can cause permanent kidney damage and reduced kidney function.

3. Sepsis (Blood Infection)

In severe cases, particularly in the elderly or people with weakened immune systems, the infection may spread into the bloodstream, leading to urosepsis—a life-threatening condition requiring emergency care. It can cause shock, organ failure, and even death if not treated immediately.

4. Pregnancy Complications

UTIs during pregnancy, if untreated, can lead to preterm labor, low birth weight, and other serious maternal and fetal health problems. That's why routine urine checks are a part of prenatal care.

5. Urethral Narrowing in Men

Men who develop repeated urethritis (especially from sexually transmitted bacteria) may experience urethral stricture, which can cause difficulties in urination and may require surgical correction.

Preventing UTIs and seeking prompt medical treatment are key to avoiding these complications. Regular follow-up, proper hygiene, and adherence to prescribed antibiotics help reduce the risk of long-term health issues.

Conclusion

Urinary Tract Infections (UTIs) are common yet often underestimated medical conditions that affect millions of people across all age groups, with women being particularly vulnerable. Although most UTIs are easily treatable with antibiotics, they should never be ignored. Timely recognition of symptoms such as burning during urination, increased frequency, and pelvic discomfort is crucial for early intervention and effective treatment.

Proper diagnosis through urinalysis and urine culture ensures that the right antibiotic is selected, reducing the chances of recurrence and antibiotic resistance. Additionally, preventive measures like staying well-hydrated, maintaining good personal hygiene, and urinating after sexual activity play a significant role in minimizing infection risk.

While uncomplicated UTIs are usually harmless when treated promptly, untreated or recurrent infections can lead to serious complications such as kidney infections, sepsis, and in rare cases, permanent kidney damage. Pregnant women, elderly individuals, and people with chronic illnesses like diabetes are especially at risk and require closer monitoring and care.

Education and awareness about UTIs—how they occur, how to prevent them, and when to seek medical help—are key to reducing their burden on individuals and healthcare systems. Moreover, with the rising threat of antibiotic resistance, it becomes even more important to avoid self-medication and follow prescribed treatment regimens strictly.

In conclusion, UTIs are preventable and manageable health issues. With early detection, proper treatment, and good personal habits, most individuals can recover quickly and avoid complications. Empowering people with the right information will not only improve individual health but also contribute to better public health outcomes.

GRAFTING COMPATIBILITY AND MORPHOLOGICAL PERFORMANCE OF *Cupressus arizonica* AND *Calocedrus decurrens* ON *Cupressus sempervirens* UNDER MEDITERRANEAN CONDITIONS

Gjoke Vuksani[1], Angjelina Vuksani[2], Silvi Jano[1].
[1]Agricultural University of Tirana, Albania
[2]Barleti University, Albania

ABSTRACT

Grafting is an important technique for the clonal propagation of ornamental conifers, particularly for species with low rooting potential when using conventional cutting methods. This study evaluates the grafting compatibility, physiological integration, and post-grafting morphological performance of two conifer species: Cupressus arizonica and Calocedrus decurrens 'Aureovariegata, grafted onto a widely available Mediterranean rootstock, Cupressus sempervirens. Conducted in a controlled greenhouse environment, the experiment aimed to assess the biological viability and morphological outcomes of both intra- and intergeneric grafting combinations within the Cupressaceae family.

The results indicated a high grafting success rate of 87% for the C. arizonica/C. Sempervirens combination, demonstrating vigorous and uniform vegetative growth. This suggests strong physiological and taxonomic compatibility within the genus Cupressus. In contrast, the C. decurrens grafts had a success rate of 82%. Still, they showed signs of anatomical mismatch, including asynchronous growth patterns and stress indicators in the rootstock, reflecting limited intergeneric compatibility.

Quantitative assessments of plant height, leaf area, and biomass accumulation, along with relative growth rate (RGR) analyses, highlighted significant differences in growth dynamics between the two scion/rootstock combinations. The study includes graphical comparisons of RGR and shoot biomass accumulation to illustrate these differences.

These findings emphasize the importance of taxonomic proximity for achieving successful vascular integration and long-term physiological stability in grafting. The research contributes valuable knowledge to optimize vegetative propagation strategies for Mediterranean ornamental nurseries. Furthermore, it supports broader efforts to diversify the range of drought-tolerant coniferous species in the context of climate adaptation and sustainable landscape horticulture.

Keywords: vegetative propagation, graft compatibility, conifers, ornamental species, Cupressus, Calocedrus, Mediterranean climate.

Introduction

Grafting serves as a fundamental method for the vegetative propagation of ornamental conifers, particularly for species exhibiting limited rooting ability through cuttings. This study conducts a comparative analysis of grafting success and post-graft development of "Cupressus arizonica" and "Calocedrus decurrens" 'Aureovariegata' when grafted onto a common rootstock, "Cupressus sempervirens". The objective is to evaluate both biological compatibility and morphological performance in controlled environmental conditions. Given that vegetative propagation through grafting is essential for preserving the genetic integrity and ornamental characteristics of elite genotypes, this research seeks to enhance understanding of interspecific and intergeneric grafting responses among coniferous ornamentals.

Vegetative propagation, particularly through grafting, is a critical aspect of ornamental and forest tree improvement, especially when propagation via seeds or cuttings proves unreliable (Zobel & Talbert, 1984; Hartmann et al., 2002). Grafting, which entails the union of a scion and a rootstock, is widely utilized across the Cupressaceae family to enhance reproductive efficiency and improve morphological or physiological traits (Goldschmidt, 2014; Garner, 2013). Taxonomic affinity is a significant determinant of graft compatibility; however, recent studies indicate that interspecific and even some intergeneric combinations can yield successful results under specific conditions (Goldschmidt, 2014; Yin et al., 2022).

"Cupressus arizonica", indigenous to the arid regions of North America, is recognized for its drought tolerance, conical form, and appealing bluish foliage. Recently, it has been introduced as an ornamental species in Albania; however, vegetative propagation remains a challenge. While seed propagation is relatively straightforward, the rooting success of cuttings, particularly softwood cuttings, remains low. Grafting has emerged as a viable alternative. Vuksani et al. (2018) reported that grafting "C. arizonica" onto the native "C. sempervirens" var. horizontalis demonstrated good compatibility (Category A), suggesting substantial potential for mass propagation in Mediterranean climates.

"Calocedrus decurrens" (incense cedar), a native species of the western United States, is also gaining ornamental value in Albania. It produces viable seeds with high germination rates under controlled conditions (Stein, 1974), although natural vegetative reproduction is absent. While cuttings can be rooted with hormonal treatment (Nicholson, 1984), comprehensive protocols for large-scale propagation remain underdeveloped. Documented instances of grafting "C. decurrens" are rare; existing studies indicate only moderate compatibility with closely related genera, such as "Chamaecyparis lawsoniana" (Yin et al., 2022). To date, no systematic trials have assessed its compatibility with "Cupressus sempervirens", a rootstock readily available in Mediterranean nurseries.

Recent research by Yin et al. (2022) underscores that graft incompatibility in conifers is often associated with biochemical and anatomical mismatches at the graft union, particularly in intergeneric combinations. Their findings demonstrated that while compatibility among "Cupressus" species is commonplace, the compatibility with members of "Calocedrus" or "Chamaecyparis" is contingent upon hormonal signaling pathways and cambial alignment, factors that frequently become disrupted in distantly related taxa. Additionally, Zhou et al. (2020) emphasized the increasing importance of grafting for drought-resistant conifers in light of climate change, asserting that vegetative propagation not only ensures clonal fidelity but also reinforces resilience in urban and degraded environments. Dvorak et al. (2021) reviewed grafting practices across the Mediterranean Basin, concluding that a more systematic evaluation of scion-rootstock combinations is essential for non-traditional conifer genera, particularly for landscape applications.

Despite the rising horticultural significance of both species, scientific insights into grafting success and post-graft performance remain limited, particularly in the Mediterranean region, where seed propagation is increasingly challenged by irregular production and climate stressors. Furthermore, intergeneric grafting, such as that of “Calocedrus” onto “Cupressus”, remains largely unexplored in controlled trials, despite its potential to expand ornamental options and facilitate adaptive planting strategies.

This study seeks to address this research gap by conducting a comparative analysis of the grafting compatibility, morphological performance, and vegetative quality of “Cupressus arizonica” and “Calocedrus decurrens” when grafted onto Cupressus sempervirens. The anticipated findings aim to inform nursery propagation strategies and support the diversification of drought-tolerant coniferous ornamentals suitable for Mediterranean landscapes and beyond.

Materials and Methods

Two separate grafting trials were conducted under controlled greenhouse conditions at the Experimental Center of Lankas, near Tirana, Albania. The objective was to assess the grafting compatibility and early post-graft performance of two ornamental coniferous taxa when grafted onto a common Mediterranean rootstock.

In both experiments, the rootstock consisted of uniform, one-year-old seedlings of Cupressus sempervirens, cultivated in pots under standard nursery practices. The scion material was obtained from healthy, vigorously growing apical shoots of the following taxa:

Cupressus arizonica .

Calocedrus decurrens 'Aureovariegata' .

Scion collection was carried out early in the spring, during active vegetative growth, to maximize graft take and minimize desiccation. The whip-and-tongue grafting technique was applied, and all grafts were secured with grafting tape and maintained under high humidity and moderate light for the initial post-graft period.

To evaluate graft success and subsequent vegetative development, a consistent set of morphological and physiological parameters was monitored at 30, 60, and 90 days after grafting (DAG). These included:

Total plant height (cm)

Leaf surface area (cm^2)

Fresh and dry biomass (g) of both aerial and root parts

Relative Growth Rate (RGR)

Relative rate of growth (RGR), which reflects the ability of the plant to produce new dry matter in a specific period of time, was calculated as follows:

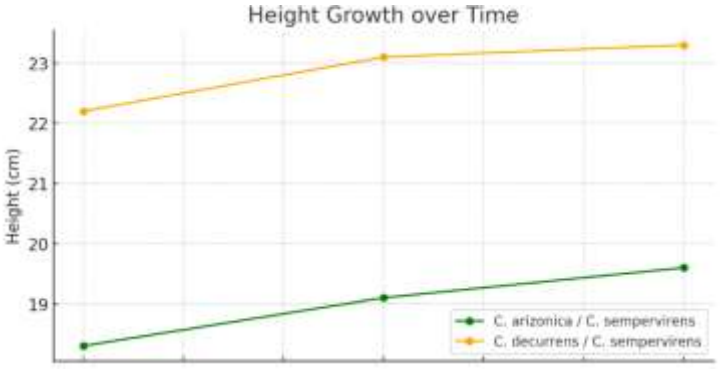
RGR = dW/W * 1/dt; in mg g -1 day-1W = dry weight of sample dt= d2 - d1 is the interval of time between samples of measure.

The Relative Growth Rates (RGR; g g–1 day–1) as a change in biomass per unit, of initial biomass per unit time((lnDMPlant2–lnDMPlant1)/(t2–t1)), were calculated for the growth period DAG 90 (post Grafting), (Hunt et al. 2002).
All data were collected using standardized protocols for morphometric and biomass analysis. Environmental parameters in the greenhouse (temperature, relative humidity, and light intensity) were recorded regularly to ensure consistent growth conditions across both trials

Results and Discussion

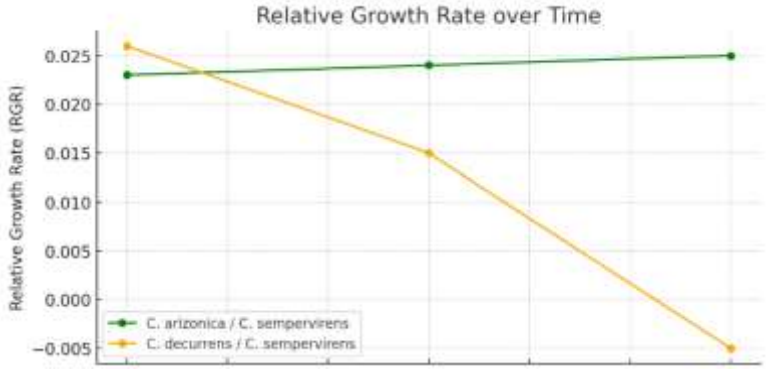
Grafting Success and Initial Morphological Trends.The grafting success rate was high for both combinations, with Cupressus arizonica / Cupressus sempervirens achieving 87% success, slightly outperforming Calocedrus decurrens / C. sempervirens (82%). These results suggest that both scion materials can initially establish graft unions under controlled conditions. However, morphological and physiological analyses over time reveal critical differences in growth performance and compatibility.

Height Growth and Relative Growth Rate (RGR).At 90 days after grafting (DAG), C. arizonica scions exhibited a modest but consistent increase in shoot height (from 18.3 cm at DAG 30 to 19.6 cm at DAG 90), corresponding to a relative growth of 7.1%.



Graf 1. Height growth over time.

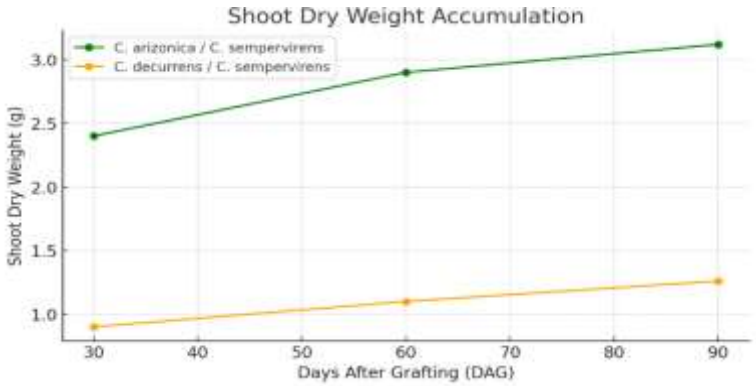
In contrast, C. decurrens scions showed minimal elongation (from 22.2 cm to 23.3 cm), with only a 4.9% relative increase, indicating a delayed or constrained physiological adjustment.



Graf 2. Relative Growth Rate over Time.

This divergence is more pronounced in the RGR trend: C. arizonica / C. sempervirens maintained a stable and positive RGR throughout the experimental period, whereas C. decurrens / C. sempervirens displayed an initially high RGR in the scion that declined sharply and became negative in the rootstock by DAG 90. This pattern may be indicative of metabolic imbalance or incomplete vascular integration.

Dry Biomass Accumulation. Shoot dry weight analysis at DAG 90 further highlights these differences. Grafts of C. arizonica accumulated significantly higher dry biomass (mean 3.12 g) compared to C. decurrens (mean 1.26 g).



Graf 3. Shot Dry Weight Accumulation.

This suggests that C. arizonica not only maintained better growth but also demonstrated superior photosynthetic performance and translocation efficiency. The lower biomass in C. decurrens grafts likely reflects physiological stress due to structural or hormonal incompatibility at the graft interface.

Physiological and Taxonomic Compatibility.The success of C. arizonica grafts can be largely attributed to the close taxonomic relationship between scion and rootstock, as both species belong to the same genus (Cupressus), facilitating better vascular alignment, hormonal synchronization, and long-term compatibility. In contrast, C. decurrens belongs to a different genus (Calocedrus), and the intergeneric nature of the graft likely contributed to delayed compatibility, as reflected by slower growth and declining physiological performance.

Variability and Stability. The standard deviation in growth parameters was moderate for C. arizonica grafts, indicating relatively uniform performance across replicates. Conversely, C. decurrens grafts displayed higher variability, which may be indicative of inconsistent graft union formation and heterogeneous physiological responses, a common issue in intergeneric combinations.

Morphological and Functional Integration. Cupressus arizonica / C. sempervirens grafts showed balanced development between aboveground and belowground parts, suggesting effective functional integration. Conversely, C. decurrens / C. sempervirens grafts exhibited signs of desynchronization, with the rootstock showing signs of resource depletion (negative RGR), which may compromise long-term graft stability.

Horticultural and Propagation Implications. From a horticultural perspective, grafting C. arizonica onto C. sempervirens emerges as a promising strategy for the clonal propagation of elite ornamental genotypes, particularly in Mediterranean regions where the rooting success of cuttings is often limited. In contrast, although C. decurrens offers attractive ornamental features, its use as a scion in grafting onto C. sempervirens rootstocks requires further long-term evaluation due to signs of physiological incompatibility.

Conclusion

This comparative study underscores the critical role of taxonomic affinity in graft compatibility and early vegetative performance of ornamental conifers.

The C. arizonica / C. sempervirens combination demonstrated superior morphological development, physiological integration, and propagation potential, validating its use in nursery practice.

The C. decurrens / C. sempervirens graft, despite its aesthetic value and acceptable initial success, showed limited growth and declining physiological stability, characteristic of intergeneric incompatibility. Its large-scale propagation should be approached with caution and supported by further long-term studies.

These findings contribute valuable insights into the propagation strategies of Cupressaceae taxa and provide a scientific basis for selecting compatible grafting partners in ornamental horticulture

MASS AND VOLUME MODELLING OF CASHEW (*Anarcardium occidentale* L.) FRUITS USING THEIR GEOMETRICAL ATTRIBUTES

Oyefeso, B. O., Tijani, B. F. and Edu, O. E.
Corresponding author: oyefesobabatunde@gmail.com
Department of Agricultural and Environmental Engineering, University of Ibadan, Ibadan, Nigeria

ABSTRACT

Physical properties of agricultural materials are very important in the design of their processing machines and handling systems. Models established based on these physical properties can be useful in the development of automated systems and ensure efficient processing. This study was therefore, designed to determine some physical characteristics of cashew fruits such as the linear dimensions (length, width and thickness), the projected areas along the three mutually perpendicular orientations, and predictive mathematical models for estimating its mass and volume of the fruits were developed using the geometrical attributes. Linear dimensions were within the range of 51.10-89.41 mm, while the projected areas were within the range of 10.51-89.21 mm^2. Average mass and volume were within the ranges of 51.10-156.40 g and 45.70-152.9 cm^3, respectively. The coefficient of determination was used to evaluate the fitness of the developed models. The mass and volume models were divided into three categories: single and multiple variable regression models based on axial dimensions, single and multiple variable regression models based on projected areas, and a single variable regression model based on volume (for mass prediction). In the first classification, mass and volume modelling based on thickness with R^2 ($\geq$ 0.746) was recommended while for the second classification, mass and volume models based on the projected area along the cross-sectional direction was the most suitable model with R^2 ($\geq$ 0.741). There was a good relationship between the mass and volume with R^2 of 0.998 in the third classification. The study's findings indicate that mass and volume modelling based on a single projected area is the most effective method because it relies on a single parameter in computation and is less expensive economically. The developed models can be used in an automated machine for sorting and packaging cashew fruits.

Keywords: Cashew, physical properties, mass/volume models, geometrical attributes, shape indicators

1. Introduction

Cashew (*Anarcardium occidentale* L.) is a tropical fruit native from Brazil, principally grown in the Northeast regions (Dedehou *et al*., 2016). It is a versatile tree crop that holds significant economic importance for developing nations including Nigeria, Benin Republic, Brazil, Cote D'ivore, Guinea Bissau, Ghana, India, Mozambique, Philippines, Sri Lanka, Tanzania, and Vietnam (Adeigbe *et al*., 2015). Cashew trees can grow up to 10-12 meters tall, featuring leathery, elliptical leaves arranged alternately on branches. They require sandy or sandy-loam soil and regular watering, with fruit-bearing typically commencing around the third year after planting. Harvesting occurs during the dry season when cashew apples ripen and fall.

Cashew trees were exploited mainly for apple with no commercial value attached to the nuts for a long period (Aliyu, 2012). In many developing nations where cashew is consumed, the majority of the processing operations are carried out manually. Mechanization of these unit operations through effective development of handling equipment and processing machines is therefore, necessary and highly recommended. However, proper development of these handling equipment and processing machines for cashew fruits rely on a thorough understanding of the engineering properties of the fruits.

Physical properties, such as size and shape, are among the crucial engineering characteristics that play a significant role in the cleaning, sorting, and grading of agricultural materials. Data on the physical characteristics of cashew is essential for proper design of these postharvest handling equipment and processing machines. Among the various physical characteristics of crops, geometrical attributes (axial dimensions and areas), mass and volume are among the important properties in machines for separation and classification of materials (Naderiboldaji *et al*., 2008). Establishing mathematical models among these physical characteristics could assist in ensuring proper handling and more efficient and economical processing (Oyefeso and Raji, 2024).

2. Materials and Methods

One hundred and seventy fresh cashew fruits used in this study were purchased from Oje market in Ibadan, Oyo State, Nigeria. The cashew fruits were sorted into two fractions according to their mass and labelled to facilitate accurate identification and documentation. Geometrical attributes such as length (L), width (W), and thickness (T), projected areas (PA_L, PA_W, and PA_T) along three mutually perpendicular axes were measured, and volume and individual mass of each cashew were also measured. The Geometric Mean Diameter (GMD), Equivalent Mean Diameter (EMD), and Arithmetic Mean Diameter (AMD) were determined.

2.1.Measurement of mass and volume

The individual mass of each sample was determined using an electronic weighing balance (METRA, model TL-5000, accuracy of 0.1 g). The volume was determined by the amount of water displaced (Lorestani *et al*., 2014). This involved immersing each cashew fruit in a known volume of water and measuring the volume of displaced water (Oyefeso and Raji, 2021).

2.2.Measurement of the geometrical attributes

The linear dimensions along three mutually perpendicular axes were measured using a digital caliper (Aerospace, 0-150 mm, 6-Inch, China) with a precision of 0.01mm. The projected areas along three orthogonal axes, specifically PA_L (along the longitudinal plane), PA_C (along the cross-sectional plane), and PA_T (along the transverse plane), were determined using image processing techniques (Khanali *et al*., 2007; Keramat-Jahromi *et al*., 2007). To accomplish this, digital images of the tubers were captured using a digital camera, and the projected areas were

subsequently computed by analyzing the images in the portable pixel map (ppm) format. This analysis was executed through a custom algorithm developed in the Python 3 programming language. The secondary diameters namely AMD, EMD, and GMD were calculated according to Equations 1, 2, and 3, respectively (Rashidi *et al*., 2018; Vivek *et al.*, 2017; Oyefeso and Raji, 2018).

$$AMD = \frac{(L+W+T)}{3} \quad (1)$$

$$\text{EMD} = \left[L \times \frac{(W+T)^2}{4}\right]^{\frac{1}{3}} \quad (2)$$

$$GMD = \sqrt[3]{(L \times W \times T)} \quad (3)$$

Where: AMD = Arithmetic Mean Diameter (mm); GMD = Geometric Mean Diameter (mm); EMD = Equivalent Mean Diameter (mm); L = length or longest diameter of the tuber (mm); W = width or the axial dimension perpendicular to the length (mm); T = thickness or diameter which is perpendicular to both length and width (mm).

2.3. Model development

Microsoft Excel (2013 version) with data analysis tool was used for the descriptive statistics, analysis of variance (ANOVA), and determine the suitable mathematical models between the variables of concern. Mass/volume prediction models for cashew were based on three namely axial dimensions, projected areas and volume (for mass models only).

3. Results and Discussion

Table 1 provides a summary of the physical properties of cashew fruits. These includes axial dimensions (length, width, thickness, AMD, GMD, and EMD), projected areas (PA_L, PA_W, and PA_T), criterion area, mass and volume.

3.1 Geometrical attributes of cashew

Table 1 shows the average values of length (L), width (W) and thickness (T) of cashew were 68.63±8.98, 51.25±6.06 and 53.03±5.82 mm respectively. The dimensional properties of the cashew fruits such as L, W, T, EMD, AMD, and GMD describe the shape and size of the fruit which is having application in the designing of the equipment and machines which are used in post-harvest processes such as grading, sorting, de-hulling, grinding, etc (Pathak et al., 2020). The results showed that the values of calculated AMD, GMD and EMD were very close for all the cashew fruits considered and this is similar to the report of Pathak *et al*. (2020) and Oyefeso and Raji (2024). Projected areas of cashew fruits namely PA_L, PA_c and PA_T, were within the ranges 10.51-34.39, 18.23-46.38 and 14.41-89.21 cm^2 respectively. Data on the projected areas are useful during heat treatments such as drying and cooling of cashew fruits.

Table 1: Physical properties of cashew fruits

Physical properties	Numbers of Samples	Mean	Range	Standard Deviation
L (mm)	100	68.63	51.10 - 89.41	8.98
W (mm)	100	51.25	38.33 - 66.63	6.06
T (mm)	100	53.03	40.40 - 66.33	5.82
AMD (mm)	100	57.64	45.10 - 72.88	5.95
GMD (mm)	100	57.03	44.60 - 72.24	5.88
EMD (mm)	100	57.05	44.60 - 72.24	5.88
PA_T (mm)	20	4.51	10.51 - 34.39	5.80
PA_C (mm)	20	6.36	18.23 - 46.38	6.27
PA_L (mm)	20	6.68	14.41 - 89.21	16.78
CPA (mm)	20	5.85	14.38 - 53.59	8.78
Mass (g)	100	100.96	51.10 - 156.4	24.29
Volume (cm^3)	100	96.13	45.70 - 152.9	24.56

3.2. Classification of mass and volume models for cashew fruits

Mass and volume modelling were done with respect to the linear dimensions of the cashew (L, W, T, AMD and GMD) for the first classification while the second classification was based the projected areas (PA_L, PA_c PA_T, and CPA). The third classification involved the mass modelling on the basis of volume (Oyefeso and Raji, 2024). Mass models established based on these classifications are presented in Table 2, while the corresponding volume models are as presented in Table 3.

Table 2: Mass models for cashew fruits based on selected physical properties

Model No.	Classification	Independent Variable	Relation	R^2
1	First	L	$M = 137.02\ln(L) - 477.3$	0.533
2		W	$M= 0.1143W^{1.7188}$	0.695
3		T	$M = 0.0277T^2 + 0.6606T - 12.779$	0.750
4		L, W, T	$M = 1.047L + 0.774W + 2.087T -121.243$	0.873
5		AMD	$M = 0.0165AMD^2 + 1.8722AMD- 62.412$	0.864
6		GMD	$M= 0.0168GMD^2 + 1.9217GMD - 63.777$	0.870
7	Second	PA_L	$M = 0.0721PA_L^2 - 0.2472PA_L + 50.882$	0.711
8		PA_C	$M = 0.0779PA_C^2 - 2.1741PA_C + 71.874$	0.741
9		PA_T	$M = -0.0236PA_T^2 + 3.2321PA_T + 8.9647$	0.664
10		PA_L, PA_C and PA_T	$M = 1.641PA_L + 1.577PA_W + 0.055PA_T$ -4.667	0.789
11		CPA	$M = -0.0397CPA^2 + 4.7168CPA - 16.72$	0.714
12	Third	V	$M = 0.9882V + 5.9667$	0.998

Table 3: Volume models for cashew fruits based on selected physical properties

Model No.	Classification	Independent Variable	Relation	R^2
1	First	L	$V = -0.0295L^2 + 6.1279L - 183.29$	0.535
2		W	$V= 0.0741W^{1.8157}$	0.688
3		T	$V = 0.0295T^2 + 0.4973T - 14.193$	0.746
4		L, W, T	$V= 1.062L+0.703W+2.176T -128.188$	0.870
5		AMD	$V = 3.8246AMD - 124.3$	0.858
6		GMD	$V = 3.8832GMD - 125.33$	0.864
7	Second	PA_L	$V = 0.0754PA_L^2 - 0.3361PA_L + 45.979$	0.713
8		PA_C	$V = 0.08PA_C^2 - 2.2553PA_C + 67.15$	0.741
9		PA_T	$V = -0.0239PA_T^2 + 3.284PA_T + 2.5861$	0.663
10		PA_L, PA_C, PA_T	$V = 1.682PA_L + 1.597PA_C + 0.058PA_T -11.418$	0.790
11		CPA	$V= -0.04CPA^2 + 4.7722CPA - 23.246$	0.714

3.2.1. First classification models (axial dimensions)

Tables 2 and 3 show that models numbered 1 to 3 produced lower R^2 values for estimating mass and volume based on axial dimensions (L, W, and T). However, multiple regression of the three axial dimensions (L, W, and T) resulted in a higher R^2 of approximately 0.870 for both mass and volume models. The AMD and GMD as independent variables consistently yielded higher R^2 (in excess of 0.858 for both mass and volume models). However, these models relied on the three axial dimensions and were more complex to compute.

Model numbered 3 based on thickness (T), among the single variable regression models based on axial dimension, was recommended as shown in Tables 2 and 3, despite slightly lower R^2 (in excess of 0.746) due to its feasibility, reduced labour requirements, and faster computation. Mass and volume models based on the thickness of the fruits are as shown in Figures 1 and 2, respectively.

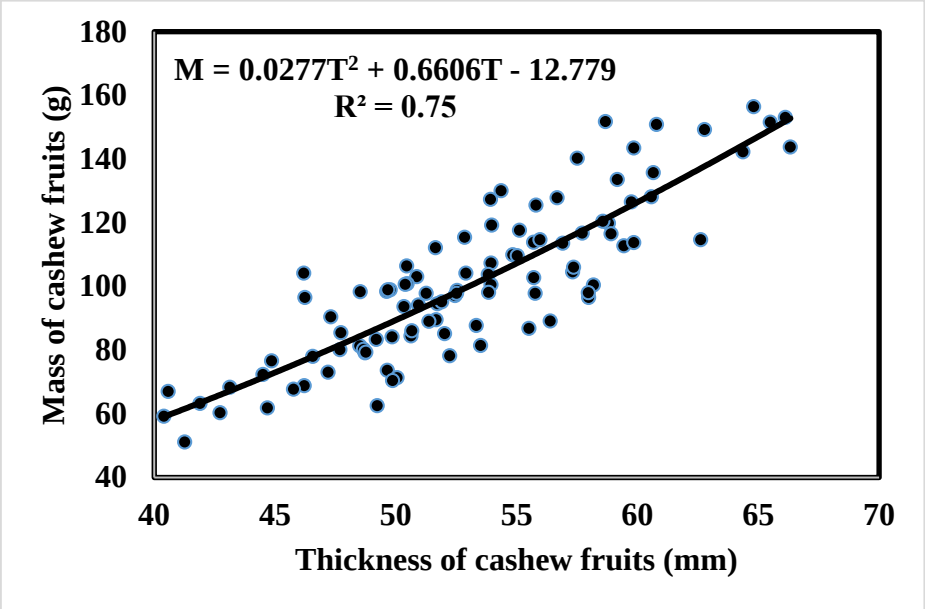

Figure 1: Mass model for cashew fruits on thickness

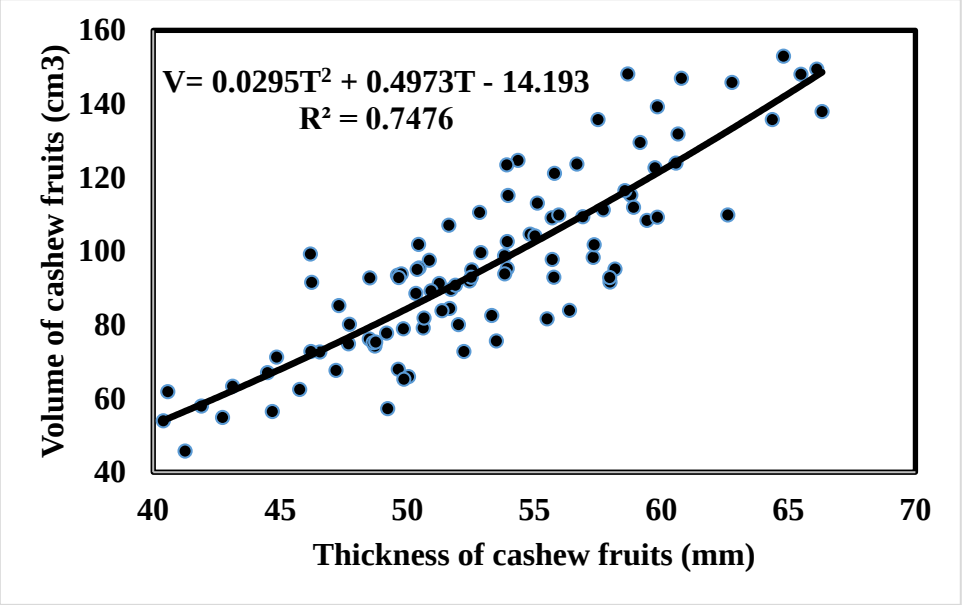

Figure 2: Volume model for cashew fruits on thickness

3.2.2. Second classification models (projected areas)

Among the regression models developed using projected areas and criterion area (models 7 to 11) as illustrated in Tables 2 and 3, model numbered 10 demonstrates the highest R^2 of 0.789 and 0.790 for mass and volume models, respectively, incorporating all three dependent variables. Consequently, the sizing mechanism is more expensive and complex to compute. However, individually, the best model for mass and volume estimation in the second classification is the projected area along the cross-sectional plane (PA_C).

3.2.3. Third classification model (Volume)

In the third classification, only volume was used as an independent variable in a linear regression developed to estimate the mass of cashew fruit (model numbered 12), as shown in Table 4.2. This model's high R^2 (0.998) suggests its suitability for mass prediction, as illustrated in Figure 5. Similar findings have been reported by previous studies (Jahromi *et al*., 2007; Ziaratban *et al*., 2017; Oyefeso and Raji, 2018, 2021 and 2024).

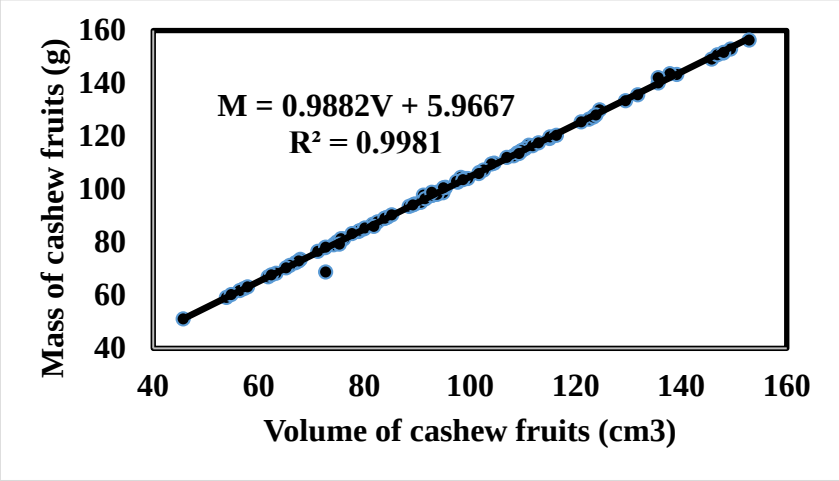

Figure 3: Mass model for cashew fruits on volume

Conclusions

Selected physical characteristics of cashew were determined in this study. Average length, width and thickness of cashew were 68.63, 51.25 and 53.03 mm, respectively. Projected areas ranged from 10.51 to 89.21 cm^2. Mass, and volume of cashew ranged from 51.10 to 156.4 g and 45.7 to 152.9 respectively. From the findings in this study, it can be concluded that the best models for estimating the mass and volume of cashew fruits among the linear dimensions and projected area were of polynomial form. There was a very good linear relationship between the mass and volume of cashew fruit, indicating that the mass of cashew fruits can be reliably predicted using its volume. Mass and volume modeling based on a single projected area are the most cost-effective models because they require the use of a single image-capturing device, allowing the entire measurement to be automated. The developed predictive mathematical models can be used in automating sorting and packaging of cashew fruits, which would ensure accurate classification, improved operational speed and overall efficiency.

ABSTRACT

In order to determine the agro-morphological characteristics of dry bean genotypes in Sivas ecological conditions, a total of 10 dry bean genotypes, including 6 registered varieties and 4 advanced dry bean lines, were used in the study conducted in the Sivas Science and Technology University Agricultural Research and Development Center in the 2024 dry bean vegetation period in a randomized block experimental design with three replications. In the conducted study, agronomic parameters such as plant height, first pod height, biological yield, number of pods per plant, number of seeds per plant, number of seeds per pod, hundred seed weight, harvest index and seed yield per plant were examined. As a result of the conducted study, it was determined that the dry bean genotypes had seed yields per plant between 20.58-95.57 g. In addition, depending on the dry bean genotypes, it was observed that the plant height was 42.98-68.22 cm, the first pod height was 13.28-26.60 cm, the biological yield was 46.22-104.35 g, the number of pods per plant was 15.00-39.00, the number of seeds per plant was 35.00-116.00, the number of seeds per pod was 3.45-4.80, the hundred-seed weight was 33.28-50.89 g and the harvest index was 42.19-59.11%. As a result; It was observed that the performance yields of the dry bean genotypes K-1044, K-1084 and A-27, which were brought to the advanced level, were higher than the other dry bean genotypes.

Keywords: Sivas, dry bean, variety, genotype, yield.

BAZI KURU FASULYE GENOTİPLERİNİN VERİM ÖĞELERİNİN BELİRLENMESİ ÜZERİNE BİR ARAŞTIRMA

ÖZET

Sivas ekolojik koşullarında kuru fasulye genotiplerinin agro-morfolojik özelliklerinin belirlenmesi amacıyla 2024 yılı kuru fasulye vejetasyon döneminde Sivas Bilim ve Teknoloji Üniversitesi Tarımsal AR-GE Merkezinde tesadüf blokları deneme deseninde üç tekrarlamalı olarak yürütülen çalışmada 6 adet tescilli çeşit ile 4 adet ileri düzeye kadar getirilmiş kuru fasulye genotipi olmak üzere toplam 10 adet kuru fasulye genotipi kullanılmıştır. Yürütülen çalışmada agronomik parametreler olan bitki boyu, ilk bakla yüksekliği, biyolojik verim, bitkide bakla sayısı, bitkide tane sayısı, baklada tane sayısı, yüz tane ağırlığı, hasat indeksi ve bitkide tane verimi özellikleri incelenmiştir. Yürütülen çalışma sonucunda kuru fasulye genotiplerinin 20,58-95,57 g arasında bitkide tane verimlerine sahip oldukları belirlenmiştir. Bunun yanında kuru fasulye genotiplerine bağlı olarak bitki boyunun 42,98-68,22 cm, ilk bakla yüksekliğinin 13,28-26,60 cm, biyolojik veriminin 46,22-104,35 g, bitkide bakla sayısının 15,00-39,00 adet, bitkide tane sayısının 35,00-116,00 adet, baklada tane sayısının 3,45-4,80 adet, yüz tane ağırlığının 33,28-50,89 g ve hasat indeksinin ise %42,19-59,11değerlerine sahip oldukları görülmüştür. Sonuç olarak; Zülbiye ve Önceler-98 kuru fasulye çeşitleri ile ileri düzeye kadar getirilmiş olan K-1044, K-1084 ve A-27 nolu kuru fasulye genotiplerinin performans verimlerinin diğer kuru fasulye genotiplerine nazaran daha yüksek olduğu görülmüştür.

Anahtar Kelimeler: Kuru fasulye, Çeşit, Genotip, Verim, Agronomik özellikler

1. GİRİŞ

Önemli tarla bitkisi ürünlerinden birisi olan kuru fasulye (*Phaseolus vulgaris L.*); mısır, ayçiçeği, patates ve tütün gibi ülkemize 1750'li yıllarda gelmiş Güney Amerika orijinli bir tür olmasına rağmen ülkemizde iyi adapte olmuş ve özellikle de İç Anadolu ve Karadeniz Bölgesinde geniş alanlarda yayılış göstermiş bir baklagil bitkisidir. Kuru fasulye, ülkemizin hemen her tarafında kuru tane amaçlı yetiştirilebilen ve milli yemeğimiz olacak kadar halkımız tarafından sevilerek tüketilen önemli bir tarımsal üründür. Tanelerinde bulunan yüksek protein içeriği (%18-35) ve karbonhidrat oranının (%56) yanında mineral madde ve vitaminlerce zenginliği (Şehirali, 1988) kuru fasulyeyi insanımızın hem eti hem ekmeği dedirtecek kadar önemli bir tarım ürünü haline getirmiştir. Taze baklaları ve kuru taneleri doğrudan, konserve veya dondurulmuş ürün olarak kullanılmaktadır. Yeşil ve kuru iken tohumları alınan bitki artıkları hayvan beslenmesinde protein oranı yüksek kaliteli kaba yem olarak değerlendirilebilmektedir (Özdemir, 2002).

Son yıllarda insanlar, bilgi ve teknolojinin gelişmesine paralel olarak gıda tüketirken bu gıdaların besleyici ve özellikle de sağlıklı olup hastalıklara karsı koruyucu etkiye sahip olmasını talep etmektedir. Önemli bir protein ve kalori kaynağı olan kuru fasulye, Latin Amerika'da yaygın kullanılan, Afrika, Doğu Avrupa ve Kuzey Amerika'lı insanların diyetlerinin olmazsa olmazlarındandır (Pachico, 1989). Kuru fasulye, besin öğeleri ve posa bakımından da zengin bir gıda kaynağıdır. Kuru fasulyenin koruyucu ve tedavi edici etkileri belgelenmiştir. Yapılan çalışmalar kuru fasulyenin serum kolesterol konsantrasyonunu azalttığını diyabeti birçok açıdan düzelttiğini ve metabolik fayda sağladığını, bunun da kilo kontrolüne yardımcı olduğunu göstermiştir.

FAO 2023 yılı verilerine göre kuru fasulye dünyada 37.75 milyon ha ekim alanı ve 28.5 milyon ton üretimi ile yemeklik baklagiller üretimi içerisinde ilk sırada yer almasına rağmen, ülkemizde 88.450 ha ekim alanı ve 240.000 ton üretimi ile nohut ve mercimekten sonra üçüncü sırada yer alır. Dünya kuru fasulye verim ortalaması dekara 75.5 kg iken, ülkemizde bu değer son yıllarda geliştirilen çeşitlerin performansı ve makineli tarımın yaygınlaşması ile 270 kg'a kadar ulaşmıştır. Dünyada kuru fasulye ekim alanı ve üretim miktarı verileri kadar dünya ve ülkemiz kuru fasulye ithalat ve ihracat rakamları da önem arz etmektedir. Dünyada 2023 yılında toplam kuru fasulye ithalatı 4.7 milyon ton olup parasal değeri 5.1 milyar dolara karşılık gelmektedir. Ülkemizde ise aynı yıl verilerine göre 102.421 ton ithal kuru fasulye karşılığında 127 milyon dolar yurt dışına ödeme yapılmıştır. Dünyada toplam kuru fasulye ihracat miktarı ise 4.9 milyon ton ve parasal karşılığı 4.9 milyar dolar iken, ülkemizde ise 2023 yılında 89.294 ton karşılığında 112 milyon dolar kazanç sağlanmıştır (FAO, 2023).

Ülkemizin tüm coğrafik bölgesinde iklim ve toprak istekleri bakımından yetiştirilebilme özelliğine sahip olan kuru fasulye, sıcak iklim koşullarında tınlı-kumlu toprak yapılarında çok iyi bir gelişme gösterebilmektedir. İşlenebilir tarım arazilerini artırma imkânının bulunmadığı günümüzde yetiştiriciliği yapılacak türlerin artışlarının birim alandan alınacak verimdeki artışlarla elde edilebileceği yadsınamaz bir gerçek olup bu kapsamda birim alandan alınacak verimin artırılması için izlenecek yollardan birisi de ekolojik koşullara uygun yüksek verim alınabilecek çeşit/çeşitleri yetiştirmektir. Diğer tarla bitkileri kültür türlerinde olduğu gibi kuru fasulye türünde de birim alandan elde edilecek verimi artırmada, diğer bir takım agronomik çalışmalar ile beraber ekolojik şartlara adapte olmuş standart kuru fasulye çeşitlerinin kullanılması da oldukça büyük önem taşımaktadır (Varankaya, 2011). Sivas ekolojisinde kuru tane yetiştiriciliği açısından kuru fasulye genotip/çeşitlerin verim öğelerinin ortaya konularak bölge ekolojik koşullarına uygun genotip/çeşitlerin belirlenmesi, bölgede kuru fasulye

yetiştiriciliğinin günümüz mevcudundan daha fazla artırılması ve dolayısıyla üretim hedefinin artırılmasına katkıda bulunulması amaçlanmıştır.

Bazı kuru fasulye genotip/çeşitlerin Sivas ekolojik koşullarında bir yıl süre ile verim ve verim öğeleri bakımından değerlendirilerek bölgeye uyum sağlayabilecek uygun kuru fasulye genotip/çeşitlerin ortaya konulması bu çalışmanın amacını oluşturmaktadır.

2. MATERYAL ve METOT

2.1. Materyal

Bu araştırmanın tarla denemeleri 2024 yılında bir yıl süreyle kuru fasulye vejetasyonu döneminde Sivas Bilim ve Teknoloji Üniversitesi'ne bağlı AR-GE Tarımsal Araştırma Merkezi'nin ıslah amaçlı deneme arazisinde yürütülmüştür. Araştırma yerinin denizden yüksekliği 1285 m olup 39.72072 enlem ve 36.91786 boylam dereceleri arasında yer almaktadır (Şekil 1).

Şekil 1. Araştırmanın yürütüldüğü deneme arazisi

Araştırmada, ülkemizde Tarımsal Araştırmalar ve Politikalar Genel Müdürlüğüne bağlı Tarımsal Araştırma Enstitüleri tarafından tescil ettirilmiş olan 6 adet kuru fasulye çeşidi (Göynük 98, Noyanbey 98, Önceler 98, Şahin 90, Yunus 90 ve Zülbiye) ile değişik yıllarda TÜBİTAK projeleri kapsamında köylerden toplanılarak saf hat seleksiyon yöntemiyle ileri düzeye kadar getirilmiş 4 adet kuru fasulye hattı (A.27, A.40, K.1044 ve K.1084) olmak üzere toplam 10 adet kuru fasulye genotipi kullanılmıştır.

2.2. Araştırma Yerinin İklim Özellikleri

Denemenin kurulduğu lokasyonun kuru fasulye vejetasyonu dönemine ait uzun yıllar ortalaması (1980-2023 yılları arası) ile çalışmanın gerçekleştirildiği 2024 yılına ait meteorolojik veriler Tablo 1'de verilmiştir. Tablo değerlendirildiğinde uzun yıllara ait ortalama değerler ile denemenin kurulduğu 2024 yılı verilerine ait aylık sıcaklık ortalamaları arasında aylar kapsamında farkların olduğu görülmektedir. Uzun yıllar ortalaması, en düşük aylık sıcaklık ortalamasının 13.5 °C ile Mayıs ayında, aylık en yüksek sıcaklık ortalamasının ise 20.2 °C ile Ağustos ayında olduğu görülmüştür. 2024 yılına ait deneme periyodundaki bu değerler 13.1 °C ile Mayıs ve 22.0 °C ile Temmuz ve Ağustos aylarında sıralanmıştır. Bunun yanında deneme yılına ait aylık toplam yağış değerlerinde Mayıs (60.0 mm), Temmuz (37.0 mm), Ağustos (10.2 mm) ve Eylül (27.8 mm) aylarına ait toplam yağış değerlerinin uzun yıllar ortalamasının üstünde kaldığı geriye kalan Haziran (11.6 mm) ayının ise uzun yıllar ortalamasının altında kaldığı, aylık ortalama nisbi nem verileri gözlendiğinde ise uzun yıllar ortalama verileri ile deneme yılı verilerinin birbirine yakın değerler elde ettikleri görülmüştür.

Tablo 1. Sivas ilinin 2024 yılı ile uzun yıllara ait iklim verileri

Aylar	Ortalama Sıcaklık (^{0}C)		Toplam Yağış (mm)		Ortalama Nispi Nem (%)	
	2024	Uzun Yıllar	2024	Uzun Yıllar	2024	Uzun Yıllar
Mayıs	13.1	13.50	60.0	52.04	63.71	60.86
Haziran	20.9	17.03	11.6	43.4	59.45	58.71
Temmuz	22.0	20.00	37.0	6.2	53.25	53.90
Ağustos	22.0	20.2	10.2	4.5	47.43	53.25
Eylül	18.6	16.2	27.8	16.6	54.38	55.59
Toplam			146.6	122.7		
Ortalama	19.3	17.39			55.64	56.46

2.3. Toprak Özellikleri

Çalışmanın yürütüldüğü deneme parselinin toprak yapısı incelendiğinde deneme parseli toprağının alkali seviyesinin hafif (7.28), organik madde içeriğinin orta (%1.7), alınabilir fosfor (3.40) ve potasyum düzeyleri (93.59) bakımından orta, tuz seviyesinin tuzlu (%0.33) ve kireç içeriğinin ise kireçli (19.6) olduğu ortaya konulmuştur (Tablo 2).

Tablo 2. Deneme yeri toprağına ait fiziksel ve kimyasal özellikleri

Yıl	Derinlik	Tekstür	pH	Kireç (% $CaCO_3$)	Toplam Tuz (%)	Fosfor (P_2O_5)	Potasyum (K_20)	Organik Madde (%)
2024	0-30 cm	Siltli killi tın	7.28	19.6	0.33	3.40	93.59	1.7

2.4. Yöntem

Yürütülen araştırma, tesadüf blokları deneme desenine göre 3 tekrarlamalı olarak kurulmuş olup ekim işlemi 23 Mayıs tarihinde gerçekleştirilmiştir. Ekimler 50 cm sıra arası mesafede çiziler markör ile açılarak tohumlar el ile ekilmiştir. Parsel büyüklükleri; 2.0 m x 5 m = 10 m² olacak şeklinde düzenlenmiştir. Parseli oluşturan 4 sıradan her iki yandaki birer sıra ve sıra başlarından 50 cm'nin içerisinde bulunan bitkiler kenar tesiri olarak gözlem dışı bırakılarak bütün işlemler 1 m x 4 m=4 m²'lik alan üzerinden yapılmıştır. Ekim işlemi ile birlikte deneme arazisi, saf azot ve saf fosfor olacak şekilde 15 kg DAP (Diamonyum Fosfat/18-46-0) ile gübrelenmiştir. Yürütülen araştırmada vejetasyon süresince damlama sulama yöntemiyle bitkilerin ihtiyacı olduğu dönemlerde sulama işlemi gerçekleştirilmiş olup aynı zamanda çiçeklenemeye kadar da iki defa da çapa yapılmıştır. Araştırma süresince her parselden seçilen 10'ar adet bitkide bitki boyu (cm), ilk bakla yüksekliği (cm), biyolojik verim (g), bitkide bakla sayısı (adet), bitkide tane sayısı (adet), baklada tane sayısı (adet), yüz tane ağırlığı (g), hasat indeksi (%) ve bitkide tane verimi (g) özellikleri saptanmış ve bu özelliklerin ortalamaları alınarak ortalama değerler bulunmuştur.

2.5. Verilerin Değerlendirilmesi

Araştırmadan elde edilen veriler varyans analizine tabi tutulmuş olup agronomik özelliklere ait eldeki veriler arasındaki farklılığın istatistiki kontrolünde JUMP.13 istatistiki paket programı uygulanmıştır. Genotipler arasındaki farklılığın ortaya konulması amacıyla LSD testi ($P<0.05$) yapılmıştır.

3. ELDE EDİLEN BULGULAR ve TARTIŞMA

3.1. Bitki Boyu

Bitki boyu kültür bitkileri içinde önemli bir etken olup verim unsurları içinde öncelikle ele alınan karakterlerden bir tanesidir. Bitki boyu özelliği her bir genotipe ait bitkinin kalıtsal özelliğinden ve çevre faktörlerinden etkilenebilmektedir. Aynı ekolojide ve toprak şartlarında yetiştirilen kuru fasulye çeşitleri farklı bitki boylarına sahip olabildikleri gibi aynı kuru fasulye çeşitleri farklı uygulamalarla değişik bitki boyları sergileyebilmektedirler. Fasulye de baklanın ve tohumun gelişimi için bitki boyu önemli kriterdir. Yürütülen araştırmada kuru fasulye genotiplerinin ortalama bitki boyları (cm) değerleri arasında ($p\leq0.05$) önemli fark bulunmuştur (Tablo 3). Tablo 3'de ortalama 53.69 cm olan bitki boyu değerlerinin ele alınan kuru fasulye genotiplerine göre 42.98-68.22 cm aralığında değişim gösterdiği ortaya konulmuştur. Yürütülen çalışmada en yüksek bitki boyu değeri Noyanbey 98 kuru fasulye genotipinden, en kısa bitki boyu değeri ise Zülbiye genotipinde belirlenmiştir. Baran (2018), verim ve verim özelliklerinin belirlenmesi amacı ile Gevaş/Van koşullarında bazı kuru fasulye (*Phaseolus vulgaris* L.) çeşitleri ve Ahlat yerel popülasyonu ile yürüttüğü çalışmasında tüm genotiplerin bitki boyu değerlerinin 40.42-56.74 cm arasında değişim gösterdiğini bildirmiş olup bu agronomik özellik üzerinde yürütülen diğer araştırmalarda Zeytun (1987) Çarşamba ekolojik koşullarında bodur çeşitlerde 32-58 cm, Bozoğlu (1995) Samsun ekolojik koşullarında 31.5-81.7 cm, Anlarsal ve ark. (2000) Adana ekolojik koşullarında 38.6-50.7 cm, Pekşen ve Gülümser (2005) Samsun ekolojik koşullarında 24.5-72.2 cm, Ceyhan ve ark. (2009) Konya ekolojik koşullarında 44.1-84.8 cm, Varankaya (2011) Yozgat ekolojik koşullarında 25.44-68.9 cm, Kahraman (2014) Konya ekolojik koşullarında 53.7-104.33 cm, Şentürk (2016) Çankırı ekolojik koşullarında 28.40-41.77 cm, Girgel ve ark. (2018) Bayburt ekolojik koşullarında 32.1-44.3 cm, Taşkesen (2019) Erzincan ekolojik koşullarında 52.5-105.7 cm, Tunç ve ark. (2020) Diyarbakır ekolojik koşullarında 55.8-162.7 cm, Öcal (2021) Aksaray ekolojik koşullarında 35.00-66.50 cm ile Kılınç ve Uslu (2024) Kahramanmaraş ekolojik koşullarında 37.0-113.3 cm değerlerine ulaşmışlardır.

Tablo 3. Kuru fasulye genotiplerinde bitki boyu değerlerine ilişkin ortalamalar (cm) ile oluşan istatistikî gruplar

Genotipler	Bitki Boyu	Genotipler	Bitki Boyu
K-1044	57.00 bc	Yunus-90	56.28 bcd

Önceler-98	57.44 b	Göynük-98	53.26 d
Noyanbey-98	**68.22 a**	A-40	45.50 ef
Ortalama	53.69		
Önemlilik	*		
CV	9.61		

3.2. İlk Bakla Yüksekliği (cm)

İlk bakla yüksekliği birinci derece genetik yapıdan etkilenen bir özellik olsa da çevre şartları da ilk bakla yüksekliğini önemli derecede etkilemektedir. Bunun yanında ilk bakla yüksekliği bitki boyuna da bağlı bir özellik olarak görülmektedir. Fasulye tarımında makineli hasat yapımında ilk bakla yüksekliği büyük önem taşımaktadır. Boyu uzun olan çeşidin ilk bakla yüksekliğinin de yüksek olması makine ile hasada elverişli olduğunu gösterir. İlk bakla yüksekliği yüksek olan çeşitlerin seçilmesi hasat kayıplarını aza indirir (Elkoca ve Çınar 2015). Yürütülen araştırmada kuru fasulye genotiplerinin ilk bakla yüksekliklerine (cm) ait değerler arasındaki farklılık önemli ($p \leq 0.05$) bulunmuştur (Tablo 4).

Tablo 4. Kuru fasulye genotiplerinde ilk bakla yüksekliği değerlerine ilişkin ortalamalar (cm) ile oluşan istatistikî gruplar

Genotipler	İlk Bakla Yüksekliği	Genotipler	İlk Bakla Yüksekliği
K-1044	**26.60 a**	Yunus-90	**13.28 g**
Zülbiye	18.07 e	A-27	24.50 b
K-1084	23.00 c	Şahin-90	16.74 ef
Önceler-98	19.05 de	Göynük-98	15.90 f
Noyanbey-98	21.35 d	A-40	23.00 c
Ortalama	20.15		
Önemlilik	*		
CV	9.89		

Tablo 4'de görüldüğü üzere tüm kuru fasulye genotiplerinde ortalama 20.15 cm olan ilk bakla yüksekliği ele alınan kuru fasulye genotiplerine göre 13.28-26.60 cm aralığında değişim göstermiştir. Çalışmada en uzun ilk bakla yüksekliği K-1044 nolu genotipte görülürken en kısa ilk bakla yüksekliği ise 13.28 cm ile Yunus 90 çeşidinde belirlenmiştir. Erzincan koşullarında 10 adet farklı kuru fasulye genotipinin 2017 yılında verim ve verim unsurlarını araştırmak amacı ile yürütülen çalışmada bitki boyunun 52.5-105.7 cm arasında değerlere sahip olduğu Taşkesen (2019) tarafından ifade edilmiş olup bu agronomik özellik üzerine yürütülen diğer çalışmalarda Düzdemir ve Akdağ (2001) Tokat ekolojik koşullarında 9.9-23.9 cm, Kahraman ve Önder (2009) Konya ekolojik koşullarında 4.60-20.25 cm, Pekşen (2012) Samsun ekolojik koşullarında 6.90-12.65 cm, Önder ve ark. (2013) Konya ekolojik koşullarında 3.56-6.67 cm, Elkoca ve Çınar (2015) Erzurum ekolojik koşullarında 12.9-19.7 cm, Baran (2016) Kayseri ekolojik koşullarında 8.48-12.83 cm, Şentürk (2016) Çankırı ekolojik koşullarında 9.9-23.9 cm, Saylam (2017) Kırşehir ekolojik koşullarında 13.20-17.23 cm, Serengül (2019) Bingöl ekolojik koşullarında 8.62-16.45 cm, Tunalı (2019) Sakarya ekolojik koşullarında 5-16.33 cm, İdikut ve Karabacak (2021) Elâzığ ekolojik koşullarında 12.9-27.05 cm ile Kılınç ve Uslu (2024) Kahramanmaraş ekolojik koşullarında 9.0-25.3 cm değerlerini elde etmişlerdir.

3.3. Biyolojik Verim (g)

Tane ağırlığının tüm bitkinin bütün organlarının ağırlığına bölünmesiyle elde edilen biyolojik verim, dikkate alınması gereken önemli özelliklerin başında gelmekte olup bir başka önemli özellik olan hasat indeksinin yüzde (%) olarak hesaplanmasında da biyolojik verim değerinden yararlanılmaktadır. Bunun yanında vejetasyon süresi ve hasat indeksi özellikleriyle beraber

biyolojik verimin tarla bitkileri türlerinde yürütülen ıslah çalışmalarında birim alandan en yüksek verimi almak için önemli agronomik özellikler olduğu görülmektedir. Verim ve verim öğeleri üzerine yürütülecek çalışmalarda bu üç parametrenin arasındaki ilişkiyi iyi bilmek gerekmektedir. Yürütülen araştırmada kuru fasulye genotiplerinin biyolojik verime (g) ait değerler arasındaki farklılık çok önemli ($p \leq 0.01$) bulunmuştur (Tablo 5).

Tablo 5. Kuru fasulye genotiplerinde biyolojik verim değerlerine ilişkin ortalamalar (g) ile oluşan istatistikî gruplar

Genotipler	Biyolojik Verim	Genotipler	Biyolojik Verim
K-1044	71.38 b	Yunus-90	64.22 c
Zülbiye	69.46 bc	A-27	56.71 d
K-1084	63.50 cd	Şahin-90	**46.22 e**
Önceler-98	67.35 bcd	Göynük-98	53.28 de
Noyanbey-98	62.38 cde	A-40	**104.35 a**
Ortalama	65.59		
Önemlilik	**		
CV	11.57		

Tablo 5'de görüldüğü üzere tüm kuru fasulye genotiplerinde ortalama 65.59 g olan biyolojik verim ele alınan kuru fasulye genotiplerine göre 46.22-104.35 g aralığında değişim göstermiştir. Çalışmada en fazla biyolojik verim A-40 nolu genotipte görülürken en düşük biyolojik verim ise 46.22 g ile Şahin 90 çeşidinde belirlenmiştir. Kırşehir ekolojik koşullarında 81'i yerel kuru fasulye genotipi ve 4'ü standart çeşit olmak üzere yetiştiriciliği yapılan 85 adet kuru fasulye genotipinin verim öğelerinin belirlenmesi üzerine yürütülen çalışma sonucunda ele alınan kuru fasulye genotiplerinin biyolojik verim değerinin 13.68-177.60 g aralığında değişim gösterdiği Sarıkaya (2020) tarafından ortaya konulmuş olup bu agronomik özellik üzerine yürütülen diğer çalışmalarda Akdağ ve Şahin (1994) Tokat ekolojik koşullarında 18.0-26.6 g, Önder ve ark. (2013) Konya ekolojik koşullarında 212-604 kg/da, Yohannes ve ark. (2020) Etiyopya ekolojik koşullarında 433.30-1767.00 kg/da ve Yılmaz (2024) Erzincan ekolojik koşullarında 423.60-1418.10 g değerlerini elde etmişlerdir.

3.4. Bitkide Bakla Sayısı (adet)

Verimi etkileyen önemli komponetler arasında yer alan bitkide bakla sayısı verim ile her zaman olumlu ve önemli ilişki içerisindedir. Bakla sayısı yüksek olan genotipler ıslahta verim adına her zaman önemli çeşit adaylarıdır. Bunun yanında bitkide bakla sayısı farklı yıl ve çevrelerde hâkim iklim tipine göre şekillenebilmektedir (Kahraman, 2014). Sivas ekolojik koşullarında yürütülen araştırmada kuru fasulye genotiplerinin bitkide bakla sayısı değerleri arasındaki farklılık çok önemli ($p \leq 0.01$) bulunmuştur (Tablo 6).

Tablo 6. Kuru fasulye genotiplerinde bitkide bakla sayısı değerlerine ilişkin ortalamalar (adet) ile oluşan istatistikî gruplar

Genotipler	Bitkide Bakla Sayısı	Genotipler	Bitkide Bakla Sayısı
K-1044	24.00 ef	Yunus-90	**39.00 a**
Zülbiye	36.00 b	A-27	24.00 ef
K-1084	29.00 d	Şahin-90	22.00 efg
Önceler-98	33.00 c	Göynük-98	25.00 e
Noyanbey-98	29.00 d	A-40	**15.00 f**
Ortalama	27.60		
Önemlilik	**		
CV	13.49		

Tablo incelendiğinde yürütülen araştırmada ortalama 27.60 adet olan bitkide bakla sayısı ele alınan kuru fasulye genotiplerine göre 15.00-39.00 adet aralığında değişim göstermiştir. Araştırmada en yüksek bitkide bakla sayısı Yunus 90 kuru fasulye çeşidinde tespit edilirken A.40 genotipi ise 15.00 adet ile en düşük bitkide bakla sayısı değerini elde etmiştir. Bursa ekolojik koşullarında bazı kuru fasulye genotiplerinin verim ve verim komponentlerinin belirlenmesi üzerine yürütülen bir çalışmada genotiplerin bitkide bakla sayısı değerlerinin 13.55-22.45 adet arasında değişim gösterdiği Azkan ve Yürür (1987) tarafından tespit edilmiş olup bu agronomik özellik üzerine yürütülen diğer çalışmalarda Vural ve ark. (1986) Bornova ekolojik koşullarında 14.4-30.6 adet, Özçelik ve Gülümser (1988) Samsun koşullarında 8.30-12.20 adet, Akdağ ve Şahin (1994) Tokat ekolojik koşullarında 6.25-11.96 adet, Yılmaz (2008) Erzincan ekolojik koşullarında 15.17-23.19 adet, Güneş (2011) Gevaş/Van ekolojik koşullarında 14.2-46.1 adet, Atıcı (2013) Şebinkarahisar/Giresun ekolojik koşullarında 10-22 adet, Baran (2016) Kayseri ekolojik koşullarında 9.97-21.50 adet, Saylam (2017) Kırşehir ekolojik koşullarında 11.80-35.06 adet, Serengül (2019) Bingöl ekolojik koşullarında 13.97-26.52 adet, Sarıkaya (2020) Kırşehir ekolojik koşullarında 6.00-61.00 adet, Yolcu (2020) Erciş/Van ekolojik koşullarında 21.0-28.70 adet, Öcal (2021) Aksaray ekolojik koşullarında 8.00-35.67 adet ile Kılınç ve Uslu (2024) Kahramanmaraş ekolojik koşullarında 4.7-33.3 adet değerlerine ulaşmışlardır.

3.5. Bitkide Tane Sayısı (adet)

Verimi etkileyen önemli parametreler arasında yer alan bitkide tane sayısı, verim ile her zaman olumlu ve önemli ilişki içerisindedir. Nitekim Cinsoy ve Yaman (1994), kuru fasulyede tane verimi üzerine bitkide tane sayısı ve ağırlığı ile yüz tane ağırlığının etkili olduğunu bildirmektedir. Bitkide tane sayısı yüksek olan genotipler ıslahta verim adına her zaman önemli çeşit adaylarıdır. Yürütülen çalışmada kuru fasulye genotiplerinin ortalama bitkide tane sayısı değerleri arasındaki farklılık çok önemli ($p \leq 0.01$) bulunmuştur (Tablo 7). Tablo incelendiğinde yürütülen araştırmada ortalama 74.30 adet olan bitkide tane sayısı ele alınan kuru fasulye genotiplerine göre 35.00-116.00 adet aralığında değişim göstermiştir. Araştırmada en yüksek bitkide tane sayısı 116.00 adet ile K-1044 nolu genotipinde tespit edilirken en düşük bitkide tane sayısı ise 35.00 adet ile A-40 nolu genotipte belirlenmiştir. Yozgat ekolojik koşullarında fasulye hat/çeşitlerin bazı tarımsal özelliklerinin belirlenmesi amacıyla yürütülen çalışmada kuru fasulye genotiplerinin bitkide tane sayısının 21.78-63.44 adet arasında değişim gösterdiği

Varankaya ve Ceyhan (2012) tarafından tespit edilmiş olup bu agronomik özellik üzerine yürütülen diğer çalışmalarda Akdağ ve Şahin (1994) Tokat ekolojik koşullarında 14.08-39.79 adet, Karasu (2003) Isparta ekolojik koşullarında 51.2 adet, Zirek (2015) Gürpınar/Van ekolojik koşullarında 32.1-96.86 adet, Saylam (2017) Kırşehir ekolojik koşullarında 40.70-116.9 adet, Bildirici ve Demir (2019) Hakkâri ekolojik koşullarında 27.26-48.30 adet, Serengül (2019) Bingöl ekolojik koşullarında 42.00-100.30 adet, Nadeem ve ark. (2020) Bolu ve Sivas ekolojik koşullarında 17.80-254.40 adet, Yolcu (2020) Erciş/Van ekolojik koşullarında 72.10-101.70 adet ile Peker ve Sözen (2022) Mucur/Kırşehir ekolojik koşullarında 40.70-116.90 adet değerlerini ortaya koymuşlardır.

Tablo 7. Kuru fasulye genotiplerinde bitkide tane sayısı değerlerine ilişkin ortalamalar (adet) ile oluşan istatistikî gruplar

3.6. Baklada Tane Sayısı (adet)

Kuru fasulyede baklada tane sayısı, tane verimini belirleyen en önemli özelliklerden birisidir ve kuru fasulye bitkisinde bakla tane sayısı artarken bitki başına verim dolayısıyla tane verimi de artmaktadır. Baklada tane sayısı özelliğinin verim üzerine etkileri genotiplere göre farklılıklar gösterebilmektedir. Yürütülen araştırmada materyal olarak yer alan 10 adet kuru fasulye genotipinin ortalama bakladaki tane sayısı değerleri Tablo 8'de verilmiştir. Varyans analizi sonucunda incelenen parametrelerden olan bakladaki tane sayısı açısından kuru fasulye genotipleri arasında önemli derecede ($P<0.05$) istatistiki farkın bulunduğu belirlenmiştir. Tablo 8, çalışmada yer alan kuru fasulye genotipleri bakımından incelendiğinde en yüksek baklada tane sayısı 4.80 adet ile A-40 ve K-1084 nolu genotiplerde belirlenirken bu genotipleri 4.60 adet ile K-1044 nolu genotipi izlemiş olup en düşük baklada tane sayısı ise 3.45 adet ile Yunus 90 genotipinde belirlenmiştir. Tüm yerel kuru fasulye genotiplerinin ortalama baklada tane sayısı değerinin ise 4.22 adet olarak belirlendiği ortaya konulmuştur. Ceyhan ve ark. (2009) tarafından Konya ekolojik koşullarında 16 adet kuru fasulye genotipi ile yürütülen araştırma sonucunda genotiplerin baklada tane sayılarının 4-6 adet arasında değiştiği ifade edilmiş olup bu özellik üzerine yürütülen diğer çalışmalarda Vural ve ark. (1986) Bornova ekolojik koşullarında 2.97-4.33 adet, Zeytun ve Gülümser (1988) Samsun ekolojik koşullarında 3.26-5.87 adet, Akdağ ve Şahin (1994) Tokat ekolojik koşullarında 2.54-4.11 adet, Düzdemir ve Akdağ (2001) Tokat ekolojik koşullarında 1.87-4.65 adet, Yılmaz (2008) Erzincan ekolojik koşullarında 2.50-3.87 adet, Güneş (2011) Gevaş/Van ekolojik koşullarında 3.12-5.76 adet, Yılmaz ve ark. (2011) Ordu ekolojik koşullarında 3.0-6.0 adet, Yılmaz ve ark. (2014) Giresun ekolojik koşullarında 3.97-5.43 adet, Zirek (2015) Van ekolojik koşullarında 2.66-4.73 adet,

Saylam (2017) Kırşehir ekolojik koşullarında 3.54-5.37 adet, Girgel ve ark. (2018) Bayburt ekolojik koşullarında 3.5-5.5 adet, Yohannes ve ark. (2020) Etiyopya ekolojik koşullarında 3.0-5.7 adet, Soydemir (2021) Bolu ekolojik koşullarında 3.45-4.55 adet ve Ankara ekolojik koşullarında 2.00-2.99 adet, Boydak ve ark. (2023) Bingöl ekolojik koşullarında ilk yıl 3.2-6.5 adet, ikinci yıl 3.7-4.7 adet ile Yılmaz (2024) Erzincan ekolojik koşullarında 3.26-5.16 arasında baklada tane sayısı değerlerine ulaşmışlardır.

Tablo 8. Kuru fasulye genotiplerinde baklada tane sayısı değerlerine ilişkin ortalamalar (adet) ile oluşan istatistikî gruplar

Genotipler	Baklada Tane Sayısı	Genotipler	Baklada Tane Sayısı

3.7. Yüz Tane Ağırlığı (g)

Verimi etkileyen önemli komponentler arasında yer alan yüz tane ağırlığı, verim ile önemli ve pozitif ilişki içerisindedir. Yüz tane ağırlığı yüksek olan genotipler ıslahta verim adına her zaman önemli çeşit adaylarıdır. Birçok araştırıcı kuru fasulyede en önemli verim öğelerinin yüz tane ağırlığı ile bitkide bakla ve baklada tane sayısı olduğunu belirtmişlerdir. Fasulyede tane verimi üzerine verim öğelerinin etkisinin araştırıldığı çalışmalarda tane veriminin yüz tane ağırlığı ve tane ağırlığı ile olumlu ilişkisi olduğu saptanmıştır (Paola ve ark.,1991). Koinov ve Radkov (1979), fasulyede yüz tane ağırlığının genotipe göre değiştiğini belirtmişlerdir. Yürütülen araştırmada yer alan ortalama yüz tane ağırlığı (g) değerleri arasındaki farklılık istatistiksel olarak çok önemli (P<0.01) bulunmuştur (Tablo 9).

Tablo 9. Kuru fasulye genotiplerinde yüz tane ağırlığı değerlerine ilişkin ortalamalar (g) ile oluşan istatistikî gruplar

Genotipler	Yüz Tane Ağırlığı	Genotipler	Yüz Tane Ağırlığı
K-1044	39.42 e	Yunus-90	**50.89 a**
Zülbiye	43.56 de	A-27	33.76 g
K-1084	49.03 b	Şahin-90	44.51 d
Önceler-98	**33.28 gh**	Göynük-98	37.88 ef
Noyanbey-98	46.72 c	A-40	37.59 f
Ortalama	41.66		
Önemlilik	**		
CV	4.36		

Araştırmada yer alan kuru fasulye genotiplerinin yüz tane ağırlığı değerlerinin 33.28-50.89 g arasında değişim gösterdiği tespit edilmiş olup en yüksek yüz tane ağırlığı Yunus 90 çeşidinde ortaya konulurken en düşük yüz tane ağırlığına sahip çeşidin ise 33.28 g ile Önceler 98 olduğu tespit edilmiştir. Ortalama yüz tane ağırlığı değeri ise tüm kuru fasulye genotipleri için 41.66 g olarak belirlenmiştir. İspir/Erzurum ekolojik koşullarında 2'si tescilli toplam 17 kuru fasulye genotipin verimleri ve verim özelliklerinin belirlenmesi üzerine yapılan araştırma neticesinde genotiplerin yüz tane ağırlığının 42.2-60.3 g aralığındaki değerlerden oluştuğu Aydoğan (2017) tarafından belirlenmiş olup bu özellik üzerine yürütülen diğer araştırmalarda Özçelik ve Gülümser (1988) Samsun ekolojik koşullarında 34.5-45.3 g, Karasu (2003) Isparta ekolojik koşullarında 49.6 g, Ceyhan ve ark. (2009) Konya ekolojik koşullarında 21.8-46.71 g, Varankaya (2011) Yozgat ekolojik koşullarında 25.92-46.9 g, Zirek (2015) Gürpınar/Van ekolojik koşullarında 27.6-62.1 g, Girgel ve ark. (2018) Bayburt ekolojik koşullarında 39.37-54.55 g, Bildirici ve Demir (2019) Hakkari ekolojik koşullarında 16.47-52.16 g, Sarıkaya (2020) Kırşehir ekolojik koşullarında 20.43-52.57 g, Yolcu (2020) Erciş/Van ekolojik koşullarında 40.58-46.76 g, Gürcan (2022) Eskişehir ekolojik koşullarında 25.25-56.86 g ile Boydak ve ark. (2023) Bingöl ekolojik koşullarında 16.2-36.0 g değerlerini elde etmişlerdir.

3.8. Hasat İndeksi (%)

Bitkideki tanenin verimini biyolojik verime bölerek bulduğumuz değerin (yüz) ile çarpılması sonucu % (yüzde) olarak elde edilen bu özellik yürütülen ıslah çalışmalarında seleksiyon kriteri olarak dikkate alınan tarımsal özelliklerinden bir tanesi olup genetik kapasitenin yanında çevresel faktörlerden de etkilenebilmektedir. Özellikle %50 ve üzeri hasat indeksi değerine sahip olan genotiplerin çeşit/çeşitler adayları olarak dikkate alınması gerekliliği ön görülmektedir. Yürütülen çalışmada kuru fasulye genotiplerinin ortalama hasat indeksi değerleri arasındaki farklılık önemli ($p \leq 0.05$) bulunmuştur (Tablo 10).

Tablo 10. Kuru fasulye genotiplerinde hasat indeksi değerlerine ilişkin ortalamalar (%) ile oluşan istatistikî gruplar

Genotipler	Hasat İndeksi	Genotipler	Hasat İndeksi
K-1044	58.50 ab	Yunus-90	43.35 de
Zülbiye	52.78 b	A-27	52.21 bc
K-1084	48.01 cd	Şahin-90	51.33 bcd
Önceler-98	**42.19 e**	Göynük-98	44.16 d
Noyanbey-98	48.93 c	A-40	**59.11 a**
Ortalama	50.06		
Önemlilik	*		
CV	6.82		

Tablo incelendiğinde yürütülen araştırmada ortalama %50.06 olan hasat indeksi ele alınan kuru fasulye genotiplerine göre %42.19-59.11 aralığında değişim göstermiştir. Araştırmada en yüksek hasat indeksi %59.11 ile A-40 nolu genotipinde tespit edilirken en düşük hasat indeksi ise %42.19 ile Önceler 98 çeşidinde belirlenmiştir. Kayseri koşullarında dokuz tescilli ve üç yerel popülasyon olmak üzere toplam 12 adet genotipin verim ve verim özelliklerinin belirlenerek tarımsal potansiyellerinin ortaya konulduğu çalışmada ele alınan kuru fasulye genotiplerinin hasat indeksi değerlerinin %17.0-28.8 aralığında değişiklik gösterdiği Baran

(2016) tarafından bildirilmiş olup bu agronomik özellik üzerine yürütülen diğer çalışmalarda Düzdemir ve Akdağ (2001) Tokat ekolojik koşullarında %23.9-46, Elkoca ve Çınar (2015) Erzurum ekolojik koşullarında %26.8-45.4, Serengül (2019) Bingöl ekolojik koşullarında %27.75-47.68 ve Öcal (2021) Aksaray ekolojik koşullarında %33.65-57.85 değerlerine ulaşmışlardır.

3.9. Bitkide Tane Verimi (g)

Tarla bitkileri ailesi içinde yer alan birçok türde yürütülen ıslah çalışmalarında geliştirilecek çeşit/çeşitlerin Türk tarımına kazandırılmasında seleksiyon ölçütü olarak dikkate alınan önemli öğelerden bir tanesi de bitkide tane verimidir. Hasat olgunluğuna gelmiş tek bir bitkinin sadece tanelerinin tartılması ve g olarak kaydedilmesi ile elde edilen bitkide tane verimi, üretimi yapılacak çeşit/çeşitlerin toplam üretim miktarının belirlenmesinde ve dekara tane verimlerinin ortaya konulmasında önemli özelliklerden birisi olarak görülmektedir. Bununla birlikte bu özellik, dekara tane verimini belirleyen birçok verim öğesi ile gerek olumlu gerekse önemli/çok önemli ilişkiler gösterebilmektedir. Yürütülen araştırmada ortalama bitkide tane verimi (g) değerleri arasındaki farklılık çok önemli ($P<0.01$) bulunmuştur (Tablo 11).

Tablo 11. Kuru fasulye genotiplerinde bitkide tane verim değerlerine ilişkin ortalamalar (g) ile oluşan istatistikî gruplar

Genotipler	Bitkide Tane Verimi	Genotipler	Bitkide Tane Verimi
K-1044	**95.57 a**	Yunus-90	26.80 cde
Zülbiye	36.66 bc	A-27	26.74 cde
K-1084	38.70 b	Şahin-90	23.72 d
Önceler-98	28.41 cd	Göynük-98	22.80 de
Noyanbey-98	30.86 c	A-40	**20.58 def**
Ortalama	35.08		
Önemlilik	**		
CV	13.26		

Tablo görüldüğü üzere ortalama 35.08 g olan bitkide tane verimi, ele alınan kuru fasulye genotiplerine göre 20.58-95.57 g aralığında değişim göstermiştir. Araştırmada en yüksek bitkide tane verim değeri K-1044 nolu genotipte tespit edilirken en küçük bitkide tane verimi değeri ise A-40 nolu genotipinde görülmüştür. Erzincan koşullarında yürütülen seleksiyon çalışmasında karşılaştırma için Karacaşehir-90, Şahin-90, Şehirali-90 ve Yunus-90 standart çeşitlerinin kullanıldığı bir araştırmada çeşitlerin bitkide tane verimlerinin sırasıyla 35.4 g, 23.0 g, 18.3 g ve 23.0 g olarak gerçekleştiği Dursun (1999) tarafından belirlenmiş olup bu özellik üzerine yürütülen diğer çalışmalarda Azkan ve Yürür (1987) Bursa ekolojik koşullarında 15-28.2 g, Düzdemir ve Akdağ (2001) Tokat ekolojik koşullarında 10.2-27.4 g, Pekşen (2012) Samsun ekolojik koşullarında 4.56-14.90 g, Özbekmez (2015) Ordu ekolojik koşullarında 51-178 g, Baran (2018) Gevaş/Van ekolojik koşullarında 8.83-17.77 g, Serengül (2019) Bingöl ekolojik koşullarında 20.5-32.65 g, Topal (2019) Eskişehir ekolojik koşullarında 14.20-40.33 g, Türkmen (2020) Kırşehir ekolojik koşullarında 9,63-32.27 g ile Peker ve Sözen (2022) Mucur/Kırşehir ekolojik koşullarında 15.75-36.42 g aralığında değerlere ulaşmışlardır.

4. SONUÇ

Sivas ekolojik koşullarında bazı kuru fasulye genotiplerinin tarımsal özelliklerinin ortaya konulması amacıyla 2024 yılında yürütülen çalışma sonuçlarına göre; Zülbiye ve Önceler-98 kuru fasulye çeşitleri ile ileri düzeye kadar getirilmiş olan K-1044, K-1084 ve A-27 kuru fasulye genotiplerinin bölgeye adaptasyon kabiliyetlerinin diğer kuru fasulye genotiplerine nazaran daha yüksek olduğu görülmüştür. Ancak bu tür yürütülen çalışmalarda daha sağlam tavsiyelerde bulunabilmek için bu tür çalışmaların en az 2< yıl daha tekrarlanmasının daha uygun olacağı sonucuna varılmıştır. Ancak yine de çalışma sonuçlarına göre K-1044, K-1084 ve A.27 nolu kuru fasulye genotiplerinin dikkat çekici olduğu ve bu kuru fasulye genotiplerinin göz ardı edilmemesi gerektiği belirlenmiştir.

ABSTRACT

The research conducted in 2024 in order to reveal the quality parameters of some dry bean genotypes in Sivas ecological conditions was established in the trial plots of the Research and Development Center of Sivas Science and Technology University. In the study, 10 dry bean genotypes were used, including 4 local dry bean genotypes selected by pure line selection method and 6 dry bean varieties registered by Agricultural Research Institutes in our country. The study, which was conducted for one year, was established in a randomized block experimental design with 3 replications. During the research, data of 6 quality traits (Water Uptake Capacity (g/seed), Water Uptake Index (%), Swelling Capacity (ml/seed), Swelling Index (%), Shell Ratio (%) and Protein Ratio (%)) belonging to dry bean genotypes were revealed. According to the results of the variance analysis, statistically significant or very significant differences were determined among the dry bean genotypes in terms of all characteristics within the quality parameters considered. In the study conducted, the highest protein rate was determined in the Noyanbey 98 variety with 23.07%, while the lowest protein rate was revealed in the Yunus 90 variety with 20.62%.

Keywords: Sivas, dry bean, genotype, variety, quality, protein.

BAZI KURU FASULYE GENOTİPLERİNİN KALİTE ÖZELLİKLERİNİN ORTAYA KONULMASI

ÖZET

Bazı kuru fasulye genotiplerine ait kalite parametrelerinin Sivas ekolojik koşullarında ortaya konulması amacıyla 2024 yılında yürütülen araştırma, Sivas Bilim ve Teknoloji Üniversitesinin AR-GE Tarımsal Araştırma Merkezine ait deneme parsellerinde kurulmuştur. Çalışmada saf hat seleksiyon yöntemi ile seçilmiş 4 adet yerel kuru fasulye genotipi ile ülkemizde Tarımsal Araştırma Enstitüleri tarafından tescil ettirilmiş 6 adet kuru fasulye çeşidi olmak üzere 10 adet kuru fasulye genotipi kullanılmıştır. Bir yıl süresince yürütülen çalışma tesadüf blokları deneme deseninde 3 tekerrürlü olarak kurulmuştur. Araştırma süresince kuru fasulye genotiplerine ait 6 adet kalite özelliğinin (Su Alma Kapasitesi (g/tane), Su Alma İndeksi (%), Şişme Kapasitesi (ml/tane), Şişme İndeksi (%), Kabuk Oranı (%) ve Protein Oranı (%)) verileri ortaya konulmuştur.

Yapılan varyansa analiz sonuçlarına göre ele alınan kalite parameteleri içinde tüm özellikler bakımından kuru fasulye genotipleri arasında istatistiksel anlamda önemli yada çok önemli farklılıklar belirlenmiştir. Yürütülen çalışmada en yüksek protein oranı %23.07 ile Noyanbey 98 çeşidinde belirlenirken en düşük protein oranı ise %20.62 ile Yunus 90 çeşidinde ortaya konulmuştur.

Anahtar Kelimeler: Sivas, kuru fasulye, genotipi, çeşit, kalite, protein.

1. GİRİŞ

Kuru fasulye, bir yemeklik tane baklagil bitkisi olarak ülkemiz dahil olmak üzere tüm Dünya coğrafyasında yaşayan insanların beslenmesinde çok önemli bir yer tutmaktadır. Bu türün çok önemli bir yer tutması kuru fasulyenin bitkisel kaynaklı protein ve karbonhidrat kaynağı olmasından kaynaklanmaktadır. Tanelerinde bulundurmuş olduğu %18-35 oranında protein ve %55-65 oranında karbonhidrat içerikleri nedeniyle özellikle insan beslenmesinde tercih edilmektedir. Ayrıca mineral (fosfor, kalsiyum ve demir) ve vitaminlerce (A, B1, B2 ve D) zenginliği insanların beslenmesine doğrudan etki yapmaktadır (Smithson ve ark., 1985). Sahip oldukları zengin diyet lifi içerikleri kapsamında kalp-damar rahatsızlıkları, Tip-II diyabet, obezite, kolon kanseri ve diğer bazı hastalıklara karşı son yıllarda koruyucu olarak uzmanlar tarafından tavsiye edilmektedirler. Kuru fasulye proteinlerinin sindirilebilirlik oranları %71-94 arasında değişmektedir (Perez ve ark., 1997).

Tüm yemeklik tane baklagillerde olduğu gibi kuru fasulye, toprak içinde bulunan besin maddelerini kazık kökleri ile toprağın üst katmanına çıkarabilmekte ve köklerinde bulunan ve havada serbest halde bulunan azotu fikse edebilme özelliğine sahip olan nodüller vasıtasıyla yetiştirildiği toprağı azot içeriği bakımından zenginleştirebilmektedir (Sprent ve Sprent, 1990). Bu sayede kuru fasulye, köklerindeki nodüller sayesinde ortalama yıllık 5 kg/da azotu toprağa fiske edebilmekte olup bu şekilde kendinden sonraki yetiştiriciliği yapılan bitki türlerinin azot ihtiyacını karşılayabilmesi ve münavebe açısından önemli bitki grubunu oluşturması bakımından sulu tarım havzalarında ekim nöbetine alınması gereken en önemli tarla bitkilerinin başında gelmektedir (Adams ve ark., 1985). Kuru fasulye iklim ve toprak istekleri bakımından seçiciliği en yüksek olan baklagil türü olup bir lokasyonda yetiştiriciliği yapılabilen kuru fasulyede gerek tane verimi gerekse kalite içeriklerini hem fiziksel (sıcaklık, yağış, gün uzunluğu, topografya, toprak tipi vs.) hem biyolojik (hastalık ve zararlılar) hem de sosyo-ekonomik faktörler etkileyebilmektedir (Peksen, 2005).

FAO 2023 yılı verilerine göre kuru fasulye dünyada 37.75 milyon ha ekim alanı ve 28.5 milyon ton üretimi ile yemeklik baklagiller üretimi içerisinde ilk sırada yer almasına rağmen, ülkemizde 88.450 ha ekim alanı ve 240.000 ton üretimi ile nohut ve mercimekten sonra üçüncü sırada yer alır. Dünya kuru fasulye verim ortalaması dekara 75.5 kg iken, ülkemizde bu değer son yıllarda geliştirilen çeşitlerin performansı ve makineli tarımın yaygınlaşması ile 270 kg'a kadar ulaşmıştır (FAO, 2023).

Tüketim kültüründeki değişimlere bağlı olarak son yıllarda kuru fasulye için tüketici isteklerinde de değişimler olabilmektedir. Kuru fasulye yetiştiriciliğinde tarımsal araştırmalarda ortaya konulan sonuçların pratikte bir anlam ifade edebilmesi için belirlenen gerek tane verimi gerekse kalite içerikleri yüksek çeşitlerin yetiştiriciler tarafından temin edilebilir olması da üretimin sürdürülebilirliği bakımından çok önemlidir. Yetiştiriciliğinin yapıldığı coğrafi bölgelerin iklim ve toprak özelliklerine uyum sağlayabilecek gerek verim gerekse kalite içerikleri bakımından daha yüksek kabiliyet gösterebilen kuru fasulye hat/çeşitlerin beslenme özellikleri bakımından taşıdığı önem sebebiyle geliştirilip üretimde ortaya konulması ülkemiz insan beslenmesinde son derece önem arz etmektedir.

Ülkemizde Tarımsal Araştırmalar ve Politikalar Genel Müdürlüğüne bağlı Tarımsal Araştırma Enstitüleri tarafından tescil ettirilmiş kuru fasulye çeşitleri ile değişik yıllarda TÜBİTAK projeleri kapsamında köylerden toplanılarak saf hat seleksiyon yöntemiyle ileri düzeye kadar getirilmiş kuru fasulye hatlarının bazı kalite öğelerinin belirlenmesi ile kalite öğeleri bakımından öne çıkabilecek kuru fasulye genotiplerinin saptanması bu çalışmanın amacını ortaya koymaktadır.

2. MATERYAL ve METOT

Bu araştırmanın tarla denemeleri 2024 yılı kuru fasulye vejetasyonunda Sivas ekolojik koşullarında yürütülmüştür.

2.1. Materyal

Araştırmada, ülkemizde Tarımsal Araştırma Enstitüleri tarafından tescil edilmiş olan 6 adet kuru fasulye çeşidi (Göynük 98, Noyanbey 98, Önceler 98, Şahin 90, Yunus 90 ve Zülbiye) ile 4 adet kuru fasulye hattı (A.27, A.40, K.1044 ve K.1084) olmak üzere toplam 10 adet kuru fasulye genotipi materyal olarak kullanılmıştır. Araştırmada kullanılan tüm kuru fasulye materyalleri (hat/çeşitler) genotip olarak ifade edilmiştir.

Deneme Alanının İklim ve Toprak Özellikleri

İklim Özellikleri

Denemenin kurulduğu lokasyonun kuru fasulye vejetasyonu dönemine ait uzun yıllar ortalaması (1980-2023 yılları arası) ile çalışmanın gerçekleştirildiği 2024 yılına ait meteorolojik veriler Tablo 1'de verilmiştir. Tablo değerlendirildiğinde uzun yıllara ait ortalama değerler ile denemenin kurulduğu 2024 yılı verilerine ait aylık sıcaklık ortalamaları arasında aylar kapsamında farkların olduğu görülmektedir. Uzun yıllar ortalaması, en düşük aylık sıcaklık ortalamasının 13.5 °C ile Mayıs ayında, aylık en yüksek sıcaklık ortalamasının ise 20.2 °C ile Ağustos ayında olduğu görülmüştür. 2024 yılına ait deneme periyodundaki bu değerler 13.1 °C ile Mayıs ve 22.0 °C ile Temmuz ve Ağustos aylarında sıralanmıştır. Bunun yanında deneme yılına ait aylık toplam yağış değerlerinde Mayıs (60.0 mm), Temmuz (37.0 mm), Ağustos (10.2 mm) ve Eylül (27.8 mm) aylarına ait toplam yağış değerlerinin uzun yıllar ortalamasının üstünde kaldığı geriye kalan Haziran (11.6 mm) ayının ise uzun yıllar ortalamasının altında kaldığı, aylık ortalama nisbi nem verileri gözlendiğinde ise uzun yıllar ortalama verileri ile deneme yılı verilerinin birbirine yakın değerler elde ettikleri görülmüştür.

Tablo 1. Sivas ilinin 2024 yılı ile uzun yıllara ait iklim verileri

Aylar	Ortalama Sıcaklık (^{0} C)		Toplam Yağış (mm)		Ortalama Nispi Nem (%)	
	2024	Uzun Yıllar	2024	Uzun Yıllar	2024	Uzun Yıllar
Mayıs	13.1	13.50	60.0	52.04	63.71	60.86
Haziran	20.9	17.03	11.6	43.4	59.45	58.71
Temmuz	22.0	20.00	37.0	6.2	53.25	53.90
Ağustos	22.0	20.2	10.2	4.5	47.43	53.25
Eylül	18.6	16.2	27.8	16.6	54.38	55.59
Toplam			146.6	122.7		
Ortalama	19.3	17.39			55.64	56.46

Toprak Özellikleri

Toprak yüzeyinin temizlenmesiyle açılan "v" şeklindeki çukurdan 5 cm kalınlığında 30 cm'lik toprak dilimleri deneme arazisini temsil edecek şekilde 3 ayrı yerden alınarak harmanlanmış ve harmanlanan toprak örneğinden 1.5 kg toprak bir torba içinde Karadeniz Tarımsal Araştırma Enstitüsü Müdürlüğü Toprak Analiz Laboratuvarında analiz ettirilmiştir. Araştırmanın yürütüldüğü deneme arazisinin kimyasal ve fiziksel yapılarına ilişkin toprak özellikleri Tablo 2'de verilmiştir.

Tablo 2. Deneme yeri toprağına ait fiziksel ve kimyasal özellikleri

Yıl	Derinlik	Tekstür	pH	Kireç (% $CaCO_3$)	Toplam Tuz (%)	Fosfor (P_2O_5)	Potasyum (K_20)	Organik Madde (%)
2024	0-30 cm	Siltli killi tın	7.28	19.6	0.33	3.40	93.59	1.7

Çalışmanın yürütüldüğü deneme parselinin toprak öğeleri incelendiğinde deneme parseli toprağının alkali seviyesinin hafif (7.28), organik madde içeriğinin orta (%1.7), alınabilir fosfor (3.40) ve potasyum düzeyleri (93.59) bakımından orta, tuz seviyesinin tuzlu (%0.33) ve kireç içeriğinin ise kireçli (19.6) olduğu ortaya konulmuştur (Tablo 2).

2.4. Yöntem

Araştırmanın yürütüldüğü deneme arazisinin ön bitkisi buğday olup buğdayın hasadı sonrasında deneme arazisi sonbaharda pullukla sürülerek kış yağmurlarına bırakılmıştır. Ekim öncesinde deneme arazisine önce kültivatör aletleri sokularak yabancı otlardan arındırılmış ardından rotovatör ile ekim işlemleri için hazır hale getirilmiştir. Araştırma, Tesadüf Blokları Deneme Deseninde 3 tekerrürlü olacak şekilde kurulmuş olup parseller 5.0 m x 2.0 m= 10 m^2 ebatlarına sahiptir. Genotiplerin parsellere dağıtımı tesadüfî olarak gerçekleştirilmiştir. Denemenin 23 Mayıs 2024 tarihinde tavlı toprağa ekimleri gerçekleştirilmiştir. Ekimler 50 cm sıra aralığında her bir sıraya 63 adet tohum düşecek şekilde markörle açılan sıralara 5 cm derinliğe elle yapılmıştır. Her parsel 4 sıradan oluşmuştur. Yabancı otlarla mücadele etmek üzere ekim sonrası çıkış öncesi yabancı ot ilacı uygulanmış ve vejetasyon süresince 2 sefer çapa yapılmıştır. Denemenin sulama ihtiyacını karşılamak üzere damlama sulama sistemi kurulmuş ve tüm vejetasyon boyunca sulamalar gerçekleştirilmiştir. Deneme alanına ekimle beraber dekara 15 kg DAP (2.7 kg N/da ve 6.9 kg P2O5/da) gübresi uygulanmıştır. Araştırmanın yürütüldüğü deneme alanındaki genotiplerin hasadı hasat olgunluğuna ulaştıkları dönem aralığı olan 1 Eylül-10 Eylül tarihleri arasında el ile yapılmıştır. Dörder sıradan oluşan her parselin her iki yanından birer sıra ile parsel başı ve sonundan 50 cm'lik kısımlar kenar tesiri olarak atılmak suretiyle 4.0 m x 1.0 m= 4 m^2'lik alanda yer alan bitkiler hasat edilmiştir. Her bir parselden hasat edilen bitkiler ayrı ayrı çuvallara konulup etiketlenerek hasat-harman sonrası gerekli ölçümler ve analizler yapılmak üzere Sivas Bilim ve Teknoloji Üniversitesi Tarım Bilimleri ve Teknoloji Fakültesi Tarla Bitkisi Bölümüne ait laboratuvara getirilmiştir. Hasat ve harman işlemleri yapıldıktan sonra (Eylül) ayı) her bir kuru fasulye genotipine ait 100'er adet tohumda laboratuvar koşullarında su alma kapasitesi (g/tane), su alma indeksi (%), şişme kapasitesi (ml/tane), şişme indeksi (%), kabuk oranı (%) ve protein oranı (%) gibi teknolojik özellikler değerlendirilmiştir. Araştırmadan elde edilen deneme sonuçları "JUMP 13.0" istatistik paket programında varyans analizine tabii tutulmuş olup önemlilik gösteren özelliklere ait ortalamaların karşılaştırılmasında "LSD Çoklu Karşılaştırma" testi kullanılmıştır.

3. ELDE EDİLEN BULGULAR ve TARTIŞMA

3.1. Su Alma Kapasitesi (g/tane)

Farklı kuru fasulye genotiplerine ait su alma kapasitesi ortalamaları ile istatistik gruplandırmalar Tablo 3'de verilmiş olup varyans analiz sonuçları değerlendirildiğinde kuru fasulye genotiplerinin su alma kapasitesi arasında ki farklar istatistiksel olarak önemli ($p \leq 0.05$) bulunmuştur.

Tablo 3. Kuru fasulye genotiplerinde su alma kapasitesi değerlerine ilişkin ortalamalar (g/tane) ile oluşan istatistikî gruplar

Genotipler	Su Alma Kapasitesi	Genotipler	Su Alma Kapasitesi
Noyanbey-98	**0,465 a**	A-40	0,442 b
Şahin-90	0,425 c	Göynük-98	0,425 c
K-1084	0,412 cd	Önceler-98	0,362 d
A-27	0,442 b	K-1044	0,442 b
Zülbiye	**0,322 e**	Yunus-90	0,441 b
Ortalama	0,418		
Önemlilik	*		
CV	6,68		

Tablo 3 incelendiğinde kuru fasulye genotiplerine ait su alma kapasitesine ait değerlerin 0.322-0.465 g/tane arasında değişim gösterdiği görülmüş olup Noyanbey 98 çeşidinden su alma kapasitesi bakımından en yüksek (0.465 g/tane) değer elde edilmiştir. Bu çeşidi sırasıyla A-27, A-40 ve K-1044 (0.442 g/tane) çeşitleri izlemiştir. Zülbiye çeşidi ise 0.322 g/tane su alma kapasitesi değeri ile tüm genotipler içinde en son sırada yer alırken tüm genotiplerin su alma kapasite ortalamasının ise 0.418 g/tane olduğu belirlenmiştir. Elkoca ve Çınar (2015), tescilli sekiz kuru fasulye çeşidi ile farklı kaynaklardan temin ettikleri yedi fasulye genotipinin Erzurum ekolojik koşullarına adaptasyonu, verim ve bazı tarımsal özellikleri ile taneye ait çeşitli fiziksel kalite özelliklerini belirlemek amacıyla iki yıl süreyle bir çalışma yürütmüşlerdir. Taneye ait teknolojik özellikler yönünden de genotipler arasında çok önemli farklılıklar tespit eden araştırıcılar su alma kapasitesinin 0.179-1.144 g/tane değerlere ulaştığını tespit etmişlerdir. Bunun yanında bu teknolojik parametre üzerine farklı çevresel koşullarda farklı genotiplerle yürütülen araştırmalarda Cengiz (2007) 0.168-0.487 g/tane, Kınacı ve ark. (2008) 0.18-0.48 g/tane, Yılmaz ve ark. (2011) 0.14-1.25 g/tane ve Özbekmez (2015) 0.146-0.809 g/tane değerlerine ulaşmışlardır.

3.2. Su Alma İndeksi (%)

Farklı kuru fasulye genotiplerine ait su alma indeksi ortalamaları ile istatistik gruplandırmalar Tablo 4'de verilmiş olup su alma indeksi (%) değerlerine ilişkin varyans analiz sonuçları değerlendirildiğinde kuru fasulye genotiplerinin su alma indeksi arasında ki farklar istatistiksel olarak önemli ($p \leq 0.05$) bulunmuştur.

Tablo 4. Kuru fasulye genotiplerinde su alma indeksi değerlerine ilişkin ortalamalar (%) ile oluşan istatistikî gruplar

Genotipler	Su Alma İndeksi	Genotipler	Su Alma İndeksi
Noyanbey-98	1,17 d	A-40	**1,09 g**
Şahin-90	1,12 f	Göynük-98	1,17 d
K-1084	1,21 c	Önceler-98	1,29 b
A-27	1,12 f	K-1044	1,15 def
Zülbiye	**1,42 a**	Yunus-90	1,16 de
Ortalama	1,19		
Önemlilik	*		
CV	3,75		

Kuru fasulye genotiplerine ait su alma indeksi değerlerinin %1.09-1.42 arasında değişim gösterdiği görülmüş olup ortalama su alma indeks değerinin ise %1.19 olduğu tespit edilmiştir. Zülbiye çeşidi su alma indeks değeri bakımından ilk sırada yer alırken bu çeşidi Önceler 98 (%1.29) ve K-1084 (%1.21) genotipi izlemiş olup A-40 genotipinin ise %1.09 su alma indeks değeri ile tüm genotipler içinde son sırada yer aldığı ortaya konulmuştur. Su alma indeksinin belirlenmesi üzerine yürütülen diğer çalışmalarda %0.257-1.390 aralığında değerlere ulaşılmıştır (Doğan ve ark., 2005; Shimelis ve Rakshit, 2005; Cengiz, 2007; Elkoca ve Çınar, 2015 ve Türkmen, 2020).

3.3. Şişme Kapasitesi (ml/tane)

Farklı kuru fasulye genotiplerine ait şişme kapasitesi ortalamaları ile istatistik gruplandırmalar Tablo 5'de verilmiştir. Tablo değerlendirildiğinde kuru fasulye genotiplerinin şişme kapasitesi arasında ki farklar istatistiksel olarak çok önemli bulunmuştur ($P<0.01$). Çalışmada yer alan kuru fasulye genotiplerine ait şişme kapasite değerlerinin 0.283-0.411 ml/tane arasında değişim gösterdiği tespit edilmiştir. Zülbiye çeşidi şişme kapasitesi bakımından tüm genotipler içinde ilk sırada yer alırken bu çeşidi A-40 (0.393 ml/tane) ve K-1044 (0.381 ml/tane) genotipi izlemiştir. Önceler 98 çeşidi ise şişme kapasitesi değeri olan 0.283 ml/tane ile son sırada kendine yer bulurken tüm genotiplere ait şişme kapasite ortalamasının ise 0.365 ml/tane olduğu ortaya konulmuştur. Kırşehir ekolojik koşullarında 5'i tescilli ve 6'sı ileri düzeye kadar getirilmiş kuru fasulye hattı olmak üzere 11 adet bodur formundaki kuru fasulye genotipinin verim ve kalite unsurlarını belirlemek amacıyla 2016 yılında Kırşehir ili Mucur ilçesinde yürütülen çalışmada bodur kuru fasulye genotiplerine ait şişme kapasitesinin 0.276-0.400 ml/tane arasında değerler aldığı Saylam (2017) tarafından ifade edilmiştir. Bunun yanında bu kalite parametre değeri üzerine yürütülen diğer çalışmalarda şişme kapasite değerlerinin 0.05-1.1 ml/tane arasında değiştiği ortaya konulmuştur (Cengiz, 2007; Özçelik ve Sözen, 2009; Çiftçi ve diğ., 2011; Yılmaz ve diğ., 2011).

Tablo 5. Kuru fasulye genotiplerinde şişme kapasitesi değerlerine ilişkin ortalamalar (ml/tane) ile oluşan istatistikî gruplar

Genotipler	Şişme Kapasitesi	Genotipler	Şişme Kapasitesi
Noyanbey-98	0,360 de	A-40	0,393 b
Şahin-90	0,387 bcd	Göynük-98	0,383 b-e
K-1084	0,363 d	Önceler-98	**0,283 ef**
A-27	0,293 e	K-1044	0,381 c
Zülbiye	**0,411 a**	Yunus-90	0,391 bc
Ortalama	0,365		
Önemlilik	**		
CV	6,81		

3.4. Şişme İndeksi (%)

Farklı kuru fasulye genotiplerine ait şişme indeksi ortalamaları ile istatistik gruplandırmalar Tablo 6'da verilmiştir. Tablo değerlendirildiğinde kuru fasulye genotiplerinin şişme indeksi arasında ki farklar istatistiksel olarak önemli bulunmuştur ($P<0.05$).

Tablo 6. Kuru fasulye genotiplerinde şişme indeksi değerlerine ilişkin ortalamalar (%) ile oluşan istatistikî gruplar

Genotipler	Şişme İndeksi	Genotipler	Şişme İndeksi
Noyanbey-98	2,21 b	A-40	2,08 e
Şahin-90	2,17 d	Göynük-98	2,21 b
K-1084	2,17 d	Önceler-98	**2,04 ef**
A-27	2,17 d	K-1044	2,16 de
Zülbiye	**2,26 a**	Yunus-90	2,19 c
Ortalama	2,16		
Önemlilik	*		
CV	3,16		

Çalışmada yer alan kuru fasulye genotiplerine ait şişme indeks değerlerinin %2.04-2.26 arasında değişim gösterdiği görülmüştür. Bir standart çeşit olan Zülbiye, %2.26 şişme indeksi değeri ile ilk sırada yer alırken bu çeşidi %2.21 ile Noyanbey 98 ve Göynük 98 çeşitleri izlemiş olup tüm genotiplere ait şişme indeksi ortalamasının ise %2.16 olduğu belirlenmiştir. Bunun yanında Önceler 98 çeşidi ise almış olduğu %2.04 şişme indeksi değeri ile tüm genotipler içinde son sırada yer almıştır. Farklı iklimsel koşullarda ve farklı çeşitlerin kullanıldığı pek çok araştırmada şişme indeksi değerlerinin %0.17-2.6 (Şehirali ve Atlı, 1993; Atlı ve diğ., 1994; Shimelis ve Rakshit, 2005; Cengiz, 2007; Çiftçi ve diğ., 2011; Saylam, 2017) aralığında değiştiği araştırmacılar tarafından ifade edilmiştir. Bu özellik üzerine yürütülen diğer

araştırmalarda Özçelik ve Sözen (2009) %1.35-2.69; Yılmaz ve ark. (2011) %1.3-2.6 ve Türkmen (2020) %1.78-2.11 şişme indeksi değerlerine ulaşmışlardır.

3.5. Kabuk Oranı (%)

Farklı kuru fasulye genotiplerine ait kabuk oranı ortalamaları ile istatistik gruplandırmalar Tablo 7'de verilmiş olup Tablo değerlendirildiğinde kuru fasulye genotiplerinin kabuk oranı arasında ki farklar istatistiksel olarak önemli bulunmuştur (P<0.05).

Tablo 7. Kuru fasulye genotiplerinde kabuk oranı değerlerine ilişkin ortalamalar (%) ile oluşan istatistikî gruplar

Genotipler	Kabuk Oranı	Genotipler	Kabuk Oranı
Noyanbey-98	8,67 c	A-40	7,65 e
Şahin-90	8,95 b	Göynük-98	8,88 bc
K-1084	8,53 cd	Önceler-98	**9,73 a**
A-27	8,04 de	K-1044	**7,29 f**
Zülbiye	8,74 bcd	Yunus-90	8,16 d
Ortalama	8,46		
Önemlilik	*		
CV	5,19		

Kuru fasulye genotiplerinden elde edilen kabuk oranı değerleri %7.29-9.73 arasında değişim göstermiş olup en yüksek kabuk oranı değeri Önceler 98 çeşidinden (%9.73) elde edilirken bu çeşidi sırayla Şahin 90 (%8.95) ve Göynük 98 (%8.88) çeşitleri izlemiş olup tüm genotiplere ait şişme indeksi ortalamasının ise %8.46 olduğu belirlenmiştir. Bunun yanında K-1044 nolu genotip ise almış olduğu %7.29 şişme indeksi değeri ile tüm genotipleri içinde son sırada yer almıştır. Bozoğlu ve Gülümser (2000), Samsun'un 7 farklı çevresinde 5 genotip ile 2 yıl süresince verim ve bazı verim karakterlerinin genotip-çevre interaksiyonlarını belirlemek üzere yürüttükleri çalışmalarında kuru fasulye genotiplerinin kabuk oranı değerlerinin %8.44-9.16 arasında değişim gösterdiğin belirlemişlerdir. Bu kalite parametresi üzerine yürütülen diğer çalışmalarda araştırmacılar kabuk oranı değerlerinin %6.7-17.2 (Akçin, 1974; Sözen, 2006; Özçelik ve Sözen, 2009; Cengiz, 2007; Saylam, 2017) arasında değişim gösterdiğini ortaya koymuşlardır.

3.6. Protein Oranı (%)

Farklı kuru fasulye genotiplerine ait protein oranı ortalamaları ile istatistik gruplandırmaların verildiği Tablo 8 değerlendirildiğinde kuru fasulye genotiplerinin protein oranı arasında ki farklar istatistiksel olarak çok önemli bulunmuştur (P<0.01).

Tablo 8. Kuru fasulye genotiplerinde protein oranı değerlerine ilişkin ortalamalar (%) ile oluşan istatistikî gruplar

Genotipler	Protein Oranı	Genotipler	Protein Oranı
Noyanbey-98	**23,07 a**	A-40	21,56 de
Şahin-90	23,01 ab	Göynük-98	20,93 e
K-1084	22,60 b	Önceler-98	20,87 ef
A-27	22,19 c	K-1044	20,69 f
Zülbiye	21,74 d	Yunus-90	**20,62 fg**
Ortalama	21,73		
Önemlilik	**		
CV	3,58		

Yürütülen araştırmada ele alınan kuru fasulye genotiplerine ait protein oranı değerlerinin %20.62-23.07 arasında değişim gösterdiği tespit edilmiştir. Protein oranı en yüksek Noyanbey 98 çeşidinden elde edilirken bu çeşidi bir standart çeşit olan Şahin 90 (%23.01) çeşidi ve K-1084 (%22.60) nolu genotip izlemiş olup tüm genotiplere ait protein oranı ortalamasının ise %21.73 olduğu belirlenmiştir. Buna karşın Yunus 90 çeşidinin ise %20.62 protein oranı değeri ile tüm genotipler içinde son sırada yer aldığı görülmüştür. Kuru fasulye genotiplerinin protein oranlarının çeşitli faktörlere bağlı olarak değiştiği ifade edilmekte olup bu faktörlerin başında iklim ve toprak faktörleri ile kültürel uygulamalar ve yetiştirme şartları gelmektedir. Aynı zamanda değişik şartlarda yetiştirilen kuru fasulyelerin protein oranlarının farklı olduğu belirtilmektedir (Önder, 1992). Yürütülen bir başka araştırmada ise Eskişehir koşullarında 13 adet fasulye (Horoz, Magnum, Nazende, Oturak Ayşe, Siyah Fasulye, Karacaşehir-90, Göynük-98, Ferasetsiz, Camgöz, Siyah Maş, Yılan Fasulye, Akın ve Yeşil Maş) genotipinin verim, agronomik ve kalite özelliklerinin belirlenmesi amacıyla 2017 yılında yürütülen çalışmada genotiplerin protein oranlarının %17.32-25.63 arasında değiştiği Çakır (2019) tarafından ifade edilmiş olup fasulye çeşitleri arasında en yüksek protein oranı Camgöz (% 25,63) çeşidinden elde edilmiş olup en düşük protein oranı değeri ise Siyah Maş (% 17,32) ve Yeşil Maş (%18,07) çeşitlerinde tespit edilmiştir. Protein oranı üzerine yürütülen diğer araştırmalarda Önder (1992) Konya ekolojisinde %20.04-27.12; Karasu (1988) Bursa ekolojsinde %22-36; Yılmaz ve Elmalı (2002) Konya ekolojsinde %20.48-23.93; Cengiz (2007) Eskişehir ve Sakarya ekolojilerinde %19.25-23.66; Ülker ve Ceyhan (2008) Konya ekolojisinde %23.83; Varankaya (2011) Yozgat ekolojisinde %18.57-26.80; Atıcı (2013) Giresun ekolojisinde %21.11-25.47; Kahraman (2014) Konya ekolojisinde %23.04-34.08 ve Özbekmez (2015) Ordu ekolojisinde %18.50-26.64 değerlerini elde etmişlerdir.

4. SONUÇ

Farklı kuru fasulye genotiplerinin bazı teknolojik parametrelerinin belirlenmesi amacıyla Sivas ekolojik koşullarında yürütülen araştırma sonucunda su alma kapasitesi, su alma indeksi, şişme indeksi ve kabuk oranı hariç bütün teknolojik özellikler bakımından kuru fasulye genotiplerinin arasında %1 düzeyinde önemli farklılıklar bulunmuştur. Araştırma içinde yer alan bu kuru fasulye genotiplerinde ortaya konulan bu farklılıkların genotiplerin genetik özelliklerinin yanında yetiştiriciliği yapılan bölgelerin iklimsel faktörlerinden de kaynaklanabileceği tahmin

edilmektedir. Yürütülen araştırmada birçok kalite özelliklerinden dolayı kuru fasulye çeşitleri (Noyanbey 98 ve Zülbiye) yanında K-1044, A-27 ve A-40 nolu kuru fasulye genotiplerinin diğer genotiplere nazaran öne çıktıkları ortaya konulmuştur. Bu kapsamda kalite özellikleri bakımından öne çıkabilecek yerel kuru fasulye genotiplerinin gen havuzuna alınması büyük önem arz etmektedir.

SUSTAINABLE MARINE TOURISM: THE CASE OF BURHANİYE

Meziyet NARİN
Lecturer, Balıkesir University Burhaniye Vocational School, Tourism and Hotel Management ProgramBalıkesir-Turkey (Responsible Author), ORCID: 0000-0001-8077-1507

ABSTRACT

The United Nations World Tourism Organization (UNWTO) defines sustainable tourism as "tourism that fully considers current and future economic, social and environmental impacts and meets the needs of the industry, the environment, visitors and host communities". The concept of sustainable is of vital importance as it protects long-term economic, environmental and social life. Marine tourism includes activities such as water sports, yacht and boat trips, etc. and related hospitality services. It is envisaged to create stable local development by promoting resource efficiency and environmental sustainability in this type of tourism, which is highly integrated with other types of tourism.

With its 8333 km. long coastline with a rich history and favorable climatic conditions, Turkey has a significant potential for sea tourism on both the Mediterranean and Aegean coasts. With its seas that can experience four seasons at the same time and maintain their warmth even in winter, it is a geologically very suitable country for sea tourism. The importance of the subject emerges with this potential. It is aimed evaluate the sea tourism potential of Burhaniye District of Balıkesir, located in the Edremit Gulf of our country, which has a sea tourism potential, in terms of alternative tourism and to extend the short season to the whole year. It is also important to direct young people to marine tourism activities. In addition, it will be emphasized on what needs to be done in terms of ensuring sustainability by revealing the problems, especially the pollution factor, which is one of the factors that pose a threat to the tourism in question. In this research, qualitative research method will be used, and document analysis will be made from secondary data. Document analysis will be created by scanning written sources such as newspapers, magazines, books, reports, articles and theses.

Keywords: Sustainable Tourism, Sea Tourism, Balıkesir, Burhaniye.

SÜRDÜRÜLEBİLİR DENİZ TURİZMİ: BURHANİYE ÖRNEĞİ

ÖZET

Birleşmiş Milletler Dünya Turizm Örgütü (UNWTO) sürdürülebilir turizmi "mevcut ve gelecekteki ekonomik, sosyal, çevresel etkileri tam olarak göz önüne alan; endüstrinin, çevrenin, ziyaret edenlerin ve ev sahibi toplumların ihtiyaçlarını karşılayan turizm çeşidi" olarak tanımlamıştır. Sürdürülebilir kavramı uzun vadeli ekonomik, çevresel, sosyal hayatı koruma altına aldığı için hayati öneme sahiptir. Deniz turizmi ise, su sporları,yat ve tekne gezileri vb. gibi faaliyetleri ve bunlara bağlı ağırlama hizmetlerini içermektedir. Diğer turizm çeşitleriyle entekrasyonu yüksek olan sözkonusu turizm çeşidinde kaynak verimliliğinin ve çevrenin sürdürülebilirliğinin teşvik edilerek istikrarlı yerel kalkınmanın oluşturulması öngörülmektedir.

Türkiye 8333 km. uzunluğunda zengin tarihi barındıran kıyıları ve kuygun iklim koşulları ile hem Akdeniz hem de Ege sahillerinde deniz turizmi açısından önemli potansiyele sahiptir. Aynı anda dört mevsimi yaşayabilen ve kışın dahi sıcaklığını koruyan denizleri ile, jeolojik açıdan deniz turizmine çok uygun bir ülkedir. Konunun önemi de bu potansiyel ile ortaya çıkmaktadır. Deniz turizm potansiyeline sahip ülkemizin Edremit Körfezinde yer alan Balıkesir'in Burhaniye İlçesi'nin alternatif turizm açısından deniz turizm potansiyelinin değerlendirilerek kısa sezonun bütün yıla yayılmasının sağlanması amaçlanmaktadır. Ayrıca deniz turizm etkinliklerine gençlerin yönlendirilmesi de önem arz etmektedir. Bunun yanında sözkonusu turizm açısından tehdit unsuru oluşturan faktörlerden kirlilik unsuru başta olmak üzere sorunların ortaya konularak sürüdürlebilirliğin sağlanması açısından yapılması gerekenler üzerinde durulacaktır. Bu araştırmada nitel araştırma yöntemi kullanılarak ikincil verilerden doküman analizi yapılacaktır. Doküman analizi geçmişe dönük gazete, dergi, kitap, rapor, makale ve tez gibi yazılı kaynaklar taranmasıyla oluşturulacaktır.

Anahtar Kelimeler: Sürdürülebilir Turizm, Deniz Turizmi, Balıkesir, Burhaniye.

GİRİŞ

Dünya çapında en önemli ve hızla büyüyen sektörlerden biri deniz turizmidir. Çünkü turistlerin ilgisini çeken çeşitli faaliyetleri sunma potansiyeline sahiptir. (Carvache-Franco vd., 2020; Chen ve Bau, 2016). İnsanların deniz ve kıyı alanlarının güzelliğini keşfetme konusunda büyük ilgilerinin olması sonucunda bu alanlardaki turizm sektörünün ekonomisi önemli ölçüde ilerlemektedir. (Dwyer, 2018)'e göre, Deniz ve kıyı turizminin geleceğe yönelik tahminlerinde; 2030 yılına kadar pazar payının yaklaşık %26'sını oluşturacak ve küresel denizcilik ekonomisinde 8,6 milyon kişiye istihdam fırsatı yaratacağı beklentisi mevcuttur. Balıkesir Burhaniye'de çalışanlar ve aileleri de dahil olmak üzere son yirmi yıldır giderek artış gösteren yaklaşık 68.000 kişinin kıyı ve deniz doğal kaynaklarının sürdürülebilir kullanımını temsil eden mavi ekonomiye bağlı olduğu kıyı turizmi için kullanılmayan önemli bir fırsat bulunduğunun göstergesidir (https://www.nufusune.com/burhaniye-ilce-nufusu-balikesir.E.T.08.06.2025.).

Bununla birlikte, büyük ölçüde kıyı ve deniz ekosistemlerinin kalitesine dayandığından, iklim değişikliği ve biyolojik çeşitlilik kaybı gibi tehditlere duyarlı hale geldiğinden, özellikle iklim değişkenliğinden kaynaklanan yüksek kırılganlıkla karşı karşıyadır (Karani & Failler, 2020). Deniz kıyısında yaşayan topluluklarının farklı geçim kaynakları önemli ölçüde tüm karar alma düzeylerinde kilit paydaşların katılımına ve kıyı hassasiyetlerinin azaltılmasına bağlı olduğundan, farklı paydaşların iklim değişikliğinin etkilerini nasıl algıladıklarını ve bunlara nasıl tepki verdiklerini anlamak çok önemlidir (Mamun vd., 2024; Sultana ve Luetz, 2022).

Turizmde sürdürülebilirlik, sürdürülebilir yaşam standartlarını geliştirmek için uzun vadeli uygulanabilirliği ve değer yaratmayı amaçlayan ekolojik, ekonomik ve sosyal hususları stratejik olarak ele alan kapsamlı bir çerçevedir (Sun vd., 2020). Hall (2019), 2017 yılının küresel ölçekte sürdürülebilir turizm yılı olarak ilan edilmesine rağmen, turizm sektörünün hâlihazırda daha az dirençli olduğunu iddia etmiştir. Sürdürülebilir turizmin, potansiyel olumsuz etkileri azaltırken aynı zamanda yerel halk ve turistler için çeşitli ve karşılıklı fayda sağlayan fırsatlar sunması gerektiği savunulmaktadır (Salazar ve Cardoso, 2019; Wani vd., 2024). Kıyı ve deniz alanlarına odaklanan sürdürülebilir turizm gelişimi, uzun vadede ekolojik koruma, ekonomik beklentiler ve sosyal adaleti vurgulayarak ev sahibi toplulukların ve destinasyonların yaşam kalitesini iyileştirmek için dengeli bir yaklaşım aramaktadır (Hanafiah vd., 2021). Turist talebi sürdürülebilir turizm için çok önemli olsa da, bu arz yönlü yaklaşım sürdürülebilirlik sorununu çözmeyecektir; bunun yerine, sürdürülemez uygulamaların yaygınlığını azaltmak için hükümetler, işletmeler ve yerel toplulukların ortak çabası gerekecektir (Batool vd., 2024). Bununla birlikte, daha önceki araştırmalar, kıyı ve deniz alanlarındaki sürdürülebilirlik girişimlerinin yararsızlığına ve ekolojik gelişmelere yönelik sektörler arası taahhüdün yokluğuna ilişkin önemli endişeleri dile getirmiştir (Dimitrovski vd., 2021).

Turizm uzmanları, turizm ve sürdürülebilir kalkınma arasındaki bağlantıyı kapsamlı bir şekilde analiz etmekte ve Sürdürülebilir Kalkınma Hedeflerini (SKH'ler) farklı bağlam ve düzeylere entegre etmektedir (Scheyvens, 2018). Dube (Dube, 2020), turizm sektörünün çevresel kaynakların tükenmesine karşı duyarlılığının altını çizerek, SKH'leri benimseme potansiyelini vurgulamaktadır. Odaklanmış GSTC Destinasyon Kriterleri (GSTC-D), destinasyon düzeyinde sürdürülebilir turizmin teşvik edilmesi konusunda, kirliliğin azaltılması, biyolojik çeşitliliğin korunması ve yerel toplulukların katılımının sağlanması için belirli standartlar oluşturarak deniz ve kıyı ortamlarının korunmasının öneminin altını çizmektedir (Konsey, 2019). Sürdürülebilir Kalkınma için 2030 Gündemi ile uyumlu destinasyonlar, her bir kriter belirli bir SKH ile ilişkili olduğundan, bu kriterlere bağlı kalarak on yedi SKH'ye olumlu katkıda bulunabilir. Birleşmiş Milletler, ekonomik büyüme (Hedef 8), sorumlu tüketim ve üretim

(Hedef 12), iklim eylemi (Hedef 13) ve deniz ve karasal kaynakların korunmasını (Hedef 14) vurgulayan çeşitli hedefler belirlemiştir (Birleşmiş Milletler Kalkınma Programı, 2019).

Sürdürülebilir turizm öncelikle ekonomik, sosyal ve çevresel boyutları kapsamakta olup, bu SKH'leri entegre etmek ve sürdürülebilir kalkınma girişimleri için sağlam bir platform oluşturmak için uygun politika alternatifleri olarak hizmet etmektedir (UNDG, 2013).

Avrupa, Afrika ve Güneydoğu Asya'daki ülkeler, turizm destinasyonlarındaki eşsiz kıyı habitatlarını, endemik türleri ve kültürel mirası korumanın önemini vurgulayarak sürdürülebilir kıyı turizmi stratejilerini giderek daha fazla entegre etmektedir (Drius vd., 2019; Fabinyi vd., 2022; Lowe vd., 2019; Mejjad vd., 2022; Rizzi vd., 2016). Bu eğilime rağmen, birçok ülke proaktif politika uygulaması ve kararlı eylemlerin eksikliği nedeniyle sürdürülebilir deniz ve kıyı turizmini sağlamakta zorlanmaktadır (Marafa, 2008).

Çok sayıda çalışma çok paydaşlı bir yaklaşım benimsemiştir, ancak çok az sayıda çalışma, gelecekteki anlaşmazlıkları ve büyüme beklentilerini belirlemek için çok önemli olduğu için, bu bütünleştirici yaklaşımı kullanarak sürdürülebilirliği ele almıştır.Bu çalışma, vurgulanan eksiklikleri gidermek amacıyla, paydaş teorisinden yararlanarak kıyı destinasyonları, özellikle de iklime eğilimli bir ülke olan Bangladeş üzerindeki ekonomik, sosyo-kültürel ve çevresel etkileri (hem olumlu hem de olumsuz) değerlendirmektedir. Ayrıca çalışma, çok paydaşlı katılım yoluyla afet riski taşıyan bölgelerde sürdürülebilir uygulamaları teşvik ederek kıyı ve deniz turizmi anlayışını genişletmeyi amaçlamaktadır. Araştırma, bu destinasyonların cazibesini artıran sürdürülebilir değerleri aydınlatmak için gözlem ve yüz yüze görüşmelerden yararlanarak iki vaka çalışması kullanmaktadır. Sonuçlar, sürdürülebilir deniz ve kıyı turizm sektöründen sorumlu, birbirine bağlı kritik ekonomik, sosyal ve çevresel stratejik konuları ortaya çıkarmıştır. Çalışma, hem konaklama alanındaki akademisyenler hem de turizm sektöründeki profesyoneller için ilginç bilgiler sunmakta ve hem olumlu hem de olumsuz ekonomik, sosyo-kültürel ve çevresel etkileri vurgulayan çeşitli paydaşların cevaplarını içeren kapsamlı bir inceleme sağlamaktadır.

Pırnar ve Özer Sarı (2017) de yaptıkları çalışmada, deniz turizminin içinde bulunduğu ortama etkileri ekonomik, ekolojik, toplumsal ve kültürel olarak gruplandırılmış, sürdürülebilir turizm yönetimi çerçevesinde açıklanmıştır. Ayrıca çalışmada, Ege Bölgesi deniz turizmi potansiyeli, sürdürülebilirlik kapsamında değerlendirilmiştir. Bu değerlendirmeler için GZFT analizi yapılmış ve bulgulara göre iyileştirme önerileri geliştirilmiştir. Kullanım izinleri ve yasalar ile ziyaretçi sayılarını sınırlayacak, zararlı faaliyetleri engelleyecek kuralların geliştirilerek yürürlüğe konulması, sürdürülebilir gelişmeye yönelik imar planlarının hazırlanması, yöre halkının bilincinin artırılması ve bunun için eğitimlerin ve eğitime katılımların sağlanması önerilerinde bulunulmuştur.

Doğal güzellikleri, tarihi yerleri ve kültürel mirası açısından zengin bir ülkenin, stratejik açıdan önemli bir coğrafyası olan Kuzey Egede yer alan Edremit Körfezinde yer alan Burhaniye'de turizm gelişimi için önemli bir potansiyele sahiptir. Batıda Ege Denizi, Kuzeyde Edremit, Güneyde Gömeç ve Ayvalık, güneydoğuda da Bergama ile komşu olan Burhaniye İlçesi, kuzeyinde yer alan Kaz Dağları ile doğu ve güneydoğusunda yer alan Madra Dağı arasında verimli topraklar üzerinde yer almaktadır (Harita.1). Denizden yüksekliği 10 metre 17 km. kıyı uzunluğunda ince kumsalları ile doğal plajlara sahiptir. Balıkesir İzmir Çanakkale yol ayırımı üzerinde bulunması, ilçe sınırları içinde yer alan Koca Seyit Havalimanının hizmet vermesi kara, hava ve deniz yolu ulaşımı açısından da önemli avantajlara sahiptir.

Harita:1.Burhaniye Turizm Haritası (http://www.burhaniye.gov.tr/kultur-ve-turizm.2025.)

Burhaniye'de bazı destinasyonlar aşırı kalabalık ve yetersiz altyapı gibi zorluklarla karşılaşmakta ve hassas kıyı ekosistemlerini korumak için sürdürülebilir kalkınma stratejilerinin uygulanmasını gerektirmektedir. Bununla birlikte, turizm potansiyeline sahip olmasına rağmen, Burhaniye'de deniz turizminin ilerlemesini engelleyen sürdürülebilir temeller ve çoklu paydaş katılımı konusunda eksiklikler devam etmektedir. Turizm sektörü, farklı paydaşları içeren koordineli, sürdürülebilir girişimlerin ve stratejik karar alma süreçlerinin yokluğu nedeniyle olgunluğa ulaşmada engellerle karşılaşmaktadır.

LİTERATÜR TARAMASI

1.1. Sürdürülebilir kıyı ve deniz turizmi

Sürdürülebilir deniz ve kıyı turizmi, hem kıyı hem de deniz ortamlarında, güneş, deniz ve kum deneyimi arayan turistlerin tercihlerine hitap eden çok çeşitli rekreasyonel faaliyetleri kapsamaktadır (M. K. Hasan vd., 2019; Sangpikul, 2018; Williams vd., 2016). Kıyı şeridinden 10 km içerideki plaj temelli faaliyetlere odaklanan kıyı turizmi, yaban hayatı gözlemleme, kıyı yürüyüşleri ve çeşitli su temelli faaliyetler için fırsatlar sunmakta, sosyal etkileşimi teşvik etmekte ve kültürel mirası desteklemektedir (Avrupa Komisyonu, 2016; Lueck & Orams, 2016; Yustika & Goni, 2020). Buna karşılık, deniz turizmi yelken, tüplü dalış ve deniz etkinlikleri gibi su temelli faaliyetleri vurgulamakta ve genellikle okyanusla ilgili cazibe merkezleri ve kaynaklar etrafında yoğunlaşmaktadır (Avrupa Komisyonu, 2016; Lueck & Orams, 2016). Tarihsel olarak turizm için popüler olan kıyı ve deniz alanları, benzersiz coğrafi, çevresel ve biyolojik özellikleri nedeniyle yenilik ve hayal gücü için merkezler olarak kabul edilmektedir (Romero-Padilla vd., 2016; Tan vd., 2018).

Burhaniye gibi gelişmekte olan destinasyonlarda deniz turizminin artan popülaritesine rağmen, sosyokültürel, ekonomik ve çevresel etkilerini inceleyen çok az sayıda araştırma bulunmaktadır (Cavallaro vd., 2021; Heslinga vd., 2017). Kuzey Marmara ve Ege'nin birleşiminde bulunan Burhaniye'nin kıyı ve deniz alanlarındaki turizm sektörünün büyümesi, altyapı gelişimi ve iş süreçlerinin yeniden yapılandırılmasıyla belirginleşen önemli sosyo ekonomik değişiklikleri beraberinde getirmiştir, ancak aynı zamanda çevresel duyarlılık, iklim değişkenliği ve turizm faaliyetlerini çevresel tehlikelerle dengeleme ihtiyacı gibi zorlukları da beraberinde getirmektedir (M. Hasan vd., 2015; Mondal, 2017; Papageorgiou, 2016). Ayrıca sektör, iklim değişikliği, aşırı avlanma ve habitat bozulması gibi insan kaynaklı etkilerle ilgili küresel zorluklarla karşı karşıyadır. Gelişmekte olan ülkeler özellikle hava ve iklim değişikliği, yükselen deniz seviyeleri, biyoçeşitlilik kaybı ve okyanus asitlenmesinin potansiyel sonuçlarına karşı savunmasızdır (Belhabib vd., 2016; Bennett vd., 2019; Rashid Sumaila vd., 2019). Bu zorlukların ele alınması, deniz ve kıyı turizminin kalkınma hedeflerine ulaşmak için kapsamlı stratejiler gerektirmektedir.

1.2. Paydaş Teorisi

Paydaş teorisi, paydaş yükümlülüklerinin türetilmesi için bir çerçeve ortaya koymakta ve yöneticilerin karar alma süreçlerinde paydaşların çıkarlarını göz önünde bulundurmaları gerektiğini vurgulamaktadır (Donaldson, 1999; Phillips vd., 2003). Edward Freeman'a göre (Freeman, 2010) paydaşlar, kuruluşun hedeflerini etkileyebilecek veya bunlardan etkilenebilecek herhangi bir kişi veya kuruluşu ifade etmektedir. Paydaş teorisine ve çok paydaşlı ağlardaki kurumsal rollere dayanarak, şirketler ya kendi refahlarına öncelik verirler ya da diğer toplumsal gruplar ve kuruluşlarla nasıl etkileşimde bulunduklarını etkileyen endişeleri ele alırlar (Roloff, 2008). Çok paydaşlı bir ağ, birden fazla toplumsal sektörü ve ulusu etkileyen belirli sorunları ele almak için iş birliği yapan iş dünyası, sivil toplum ve devlet temsilcilerini içerir (Fransen & Kolk, 2007; Roloff, 2008). Sürdürülebilir kalkınma ve turizmde, çoklu paydaş perspektifleri ve eylemleri paydaş teorisi tarafından yönlendirilmekte, bu da paydaş analizini sürdürülebilirlik girişimlerini anlamak ve etkili bir şekilde uygulamak için gerekli kılmaktadır (Waligo vd., 2013). Birçok araştırmacı çok paydaşlı yaklaşımı tartışmıştır (Brunetti vd., 2020; Eweje vd., 2021), ancak çok az sayıda çalışma, gelişmekte olan CMT alanlarında çok paydaşlı yaklaşımı kullanarak sürdürülebilirliği ele almıştır (Dimitrovski vd., 2021). Bu çalışmada, çok paydaşlı bir yaklaşımın potansiyel çatışmaları ve büyüme fırsatlarını belirleyerek kapsamlı bir deniz ve kıyı turizminin ekosistemi geliştirebileceği göz önünde bulundurularak, sürdürülebilir deniz turizminin teşvik edilmesinde çok paydaşlı katılımın önemi araştırılmıştır.

2. SÜRDÜRÜLEBİLİR KIYI VE DENİZ TURİZMİNİN ETKİLERİ

Sürdürülebilirlik açısından bakıldığında, olumlu veya olumsuz sonuçları olan üç boyut ekonomik, sosyokültürel ve çevresel etkiler daha önceki literatürde geniş bir şekilde tartışılmıştır (Hall, 2001; Lee ve Jan, 2019; Robinson vd., 2019).

2.1. Ekonomik etki

Deniz ve kıyı turizmi, coğrafi konum gibi faktörler de dahil olmak üzere ekonomik etkilerini vurgulayan çok sayıda çalışmanın kanıtladığı gibi küresel ekonomiye önemli ölçüde katkıda bulunmaktadır (Duffy vd., 2016; Liu vd., 2018). Kıyı ülkeleri, coğrafi konumları nedeniyle kara ile çevrili ülkelere kıyasla turizmden daha fazla ekonomik kalkınma faydası elde etme eğilimindedir; bu faydalar arasında reel GSYH, yabancı yatırımlar ve döviz kurları yer almaktadır (Adedoyin vd., 2022; Liu vd., 2018). Ayrıca, kıyı turizmi, özellikle geçim kaynaklarının balıkçılık gibi geleneksel sektörlerden turizme geçişinde ekonomik büyüme için potansiyel bir yol olarak tanımlanmıştır (Fabinyi, 2020). Bununla birlikte, kıyı turizminin sürdürülebilirliği kritik bir konudur. Kıyı destinasyonları, turizm akışlarında kaymalara ve altyapı koruma ve onarımlarıyla ilgili önemli ekonomik maliyetlere yol açabilecek iklim değişikliğinin etkilerine karşı savunmasızdır (Pandy & Rogerson, 2021). Turizm genellikle beklentileri karşılayamamakta, ekolojik bozulmaya, toplumsal kargaşaya ve sistemin bozulmasına önemli ölçüde katkıda bulunmaktadır (Lange, 2015). Daha önceki çalışmalarda, birçok araştırmacı Bangladeş ekonomisi bağlamında turizm endüstrisinin ekonomik etkisini vurgulamıştır (Hai & Alamgir, 2017). Sevinç ve Duran (2018) çalışmalarında, son yıllarda deniz turizminin; çevreye duyarlı olması, ulusal ve uluslararası düzeydeki yatırımların yapılması, geliştirilen iş hacminin genişlemesi, istihdam imkanlarının artması, döviz girdilerinin artması, sosyo-ekonomik ve sosyo-kültürel etkisinin geniş alanlara yayılması ile önemli hale geldiği ve bu nedenle de ülkelerde giderek artan şekilde deniz turizmine yönelik yatırım ve teşviklerin arttığı belirtilmiştir. Tüm bu gelişmeler sonucunda, deniz turizmi tüketim artışı kolaylaşmış ve tüketilebilen bir alana dönüştürülmesi, çevresel tehditlerin özellikle kıyı

ülkelerinde artış göstermesiyle konunun önemi daha da artmıştır vurgusu yapılmıştır. Çalışmada, kısır döngü haline gelen post modern tüketim kültür alışkanlıkları ve turizm uygulamaları da ele alınmış, deniz turizminin bir sonucu olarak dünyada hızla yayılan çöp adaları kavramsal çerçevede ele alınmış ve sürdürülebilir uygulamalara yönelik de önerilerde bulunulmuştur. Bu araştırmacıların analizlerinden, turizmin büyümesine yönelik ekonomik kaynaklar açısından Burhaniye'nin fırsatları en iyi şekilde değerlendirmek için sürekli çaba sarf etmesi gerektiği sonucuna varılmıştır.

2.2. Sosyo-kültürel Etkiler

Deniz ve kıyı turizminin gelişiminin doğasında bulunan sayısız sosyal sürdürülebilirlik sorununu ele almak karmaşık bir iştir, çünkü sosyal konular genellikle ekonomik ve çevresel kaygılara kıyasla daha az net bir şekilde tanımlanmıştır (Leposa, 2020). Turizm inovasyonlarında sosyal sürdürülebilirlik uygulamalarının geniş kapsamına rağmen, son araştırmalar sosyal eşitlik, entegrasyon, katılım, güvenlik ve refah gibi yönleri yalnızca kısmen araştırmakta ve yerel halkın duygusal refahına sınırlı ilgi göstermektedir (Dempsey vd., 2011; Jordan vd., 2019). Turizm endüstrisinin gelişimi önemli sosyo-kültürel değişimleri beraberinde getirmekte, sosyal reform, eğitim ve korumayı teşvik ederken aynı zamanda destinasyonları farklı yaşam tarzları, gelenekler, miras ve kültürel deneyimlerle zenginleştirmektedir (Aman vd., 2019; Kornilaki ve Font, 2019; Salazar ve Cardoso, 2019). Burhaniye'nin deniz turizminin sürdürülebilir büyümesinin yaşam standartlarını artırarak, altyapıyı geliştirerek ve kamu olanaklarını iyileştirerek toplumsal refahı sağlayabileceği tespit edilmiştir (Bhuiyan vd., 2020). Bununla birlikte, ziyaretçiler genellikle altyapı ve çevreyi takdir ederken Tourism and Hospitality Management, 31(2), pp, 2025 Quader, M.S., Hassan, H.M.K. & Mahbub, T. (2025). Yerel halk, özellikle evsizlik, kumar,

uyuşturucu kullanımı, fuhuş, artan şiddet, kirlilik, trafik sıkışıklığı ve aşırı kalabalık gibi sosyal konularla ilgili olarak turizm büyümesinin uzun vadeli faydaları konusunda şüpheci olabilir (Kim vd., 2013; Piuchan vd., 2018; Sroypetch, 2016). Ayrıca, turizm kaynaklı stres ve gerilim, yerel topluluklar arasında kültürel kimliği ve sosyal uyumu tehdit edebilir, refahlarını ve aidiyet duygularını etkileyebilir (Hai & Alamgir, 2017) . Kıyı bölgelerde, daha iyi şanslar aramak için yer değiştirmelerine ve sıklıkla yaşlı bakıcıları ve çocukları geride bırakmalarına neden olmuştur. Bu nedenle, deniz ve kıyı turizmi, sosyal değerleri ve kültürel deneyimleri zenginleştirebilirken, aynı zamanda yerel kimliğin ve sosyal uyumun korunmasını sağlamak için sosyo-kültürel etkilerinin dikkatli bir şekilde değerlendirilmesini ve yönetilmesini gerektirmektedir.

Deniz ve kıyı, sürdürülebilir kalkınmada önemli bir rol oynamakta, eğlence ve ekonomik büyüme için fırsatlar sunmakta, ancak sorumsuz turist davranışları nedeniyle önemli çevresel zorluklarla karşı karşıya kalmaktadır (Sultan vd., 2020). Koruma çabaları, doğal alanlar sağlayan ve turistleri çekerek bölgenin ekonomik refahına katkıda bulunan kıyı ekosistemlerini ve plajları korumak için gereklidir (Kenchington, 1993; Semeoshenkova ve Newton, 2015). Turistlerin kıyı destinasyonlarına yönelik duyarlılıklarını anlamak, etkili kıyı ve deniz yönetimi için hayati önem taşımaktadır (Juvan & Dolnicar, 2014). Bununla birlikte, deniz turizminin uzun vadeli sürdürülebilirliği, plaj erişilebilirliğini ve turizm talebini etkileyen yükselen deniz seviyeleri gibi iklim değişikliği etkileri nedeniyle tehdit altındadır (Franzoni, 2015; Lew, 2017). Burhaniye'de plansız turizm gelişimi, kıyı erozyonu ve Kazdağları ormanlarının bozulması da dahil olmak üzere çevre kirliliğine de yol açmaktadır (Dieke, 2003; Shampa vd., 2023). Bu zorluklara rağmen, doğaya dayalı rekreasyon faaliyetleri ve artan çevre bilinci, olumsuz etkileri en aza indirmek ve sürdürülebilir uygulamaları teşvik etmek için fırsatlar sunmaktadır. Çevresel

etkilerin azaltılmasının etkinliği, deniz ve kıyı turizminin altyapısının uzun vadeli sürdürülebilirliğini sağlamak için çevresel değerlendirme, kaynak yönetimi, kurumsal yönetişim ve kritik ekolojik sorunların ele alınmasına bağlıdır.

İnak ve Karadağ (2023) çalışmalarında, turizm sektörünün ve bu sektör içindeki turizm çeşitlerinden özellikle sürdürülebilir deniz turizminin önem verilmesi gereken bir hizmet kolu olduğuna dikkat çekmişlerdir. Çalışmada yazarlar, her geçen gün kaynakların tüketildiğini ve dünya genelinde milyarlarca turistin tüketimleri düşünüldüğünde, sürdürülebilirlik kavramının turizm sektörü açısından önemi vurgulanmıştır. Bu nedenle çalışmada yazarların amacı, birçok çalışmada bir destinasyon olarak ele alınan marinaların, deniz turizminde sürdürülebilirliği sağlama noktasında uyguladığı çevreci politikalar üzerinden önemini ortaya koymak olmuştur. Bu anlamda, marinacılık sektöründe gerçekleştirilen altın çıpa, mavi bayrak vb. sürdürülebilirlik uygulamaları irdelenmiş ve sektörün sürdürülebilir deniz turizmi açısından önemine değinilmiştir.

Sarıgül ve Sungur (2023) çalışmalarında, turizmin kaynağını oluşturan çevresel öğeler, küçük kentleri birçok turistin deneyimine açtığı ancak çevresel ve sosyo kültürel değerlerin sürekliliğinin bununla zarar gördüğünü iddia etmektedirler. Turizmin, bu yerlerin gelişimine olumlu katkı sağlayacağı, turizm sayesinde kentlerin görünürlüğünün artması gibi olumlu etkiler sağlamaktadır. Ancak, kent değerlerinin kaybedilmesi gibi risklere de yol açmaktadır. Çevresel kaynakların fazlasıyla tüketilmesi, doğal yapının bozulması, kirlilik ve atık durumu, kıyı alanları ve ormanların tahrip edilmesi, kültürel mirasın ve tarihi dokunun zarar görmesi gibi çevresel tahribatlar, turizm hareketliliğinin olumsuz etkilerini yansıttıklarını belirtmişlerdir. Çalışmada, küçük turizm kentlerinin doğal ve kültürel kaynaklarının geleceğe taşınması, sürdürülebilir bileşenlerle ve doğal çevre ile korunması için neler yapılabileceğini araştırmışlardır. Çalışmada geniş bir literatür taraması ve nitel analiz kullanılmıştır. Çalışma sonucunda, doğal çevrenin korunabilmesi için bileşenlerin ortak paydalarda geliştirilmesi gerektiğini belirtmişlerdir. Bunun için de işbirliğine gidilmesi, denetim ve koruma bilincinin birlikte ele alınarak, çevre bileşenlerine yönelik önlemlerin alınması gerektiğine ulaşmışlardır.

3. METODOLOJİ

Burhaniye'nin turizme kazandırılması için, mevcut bağlam göz önüne alındığında, deniz ve kıyı turizm endüstrilerinin faaliyetlerini 'nasıl' ve 'neden' sürdürülebilir bir şekilde gerçekleştirdiklerinin belirlenmesi gerekmektedir ve bunun için vaka çalışması yaklaşımının uygun olduğu düşünülmektedir. (Remenyi vd., 2014). Vaka çalışması yaklaşımı, klasik olguları gerçek yaşam bağlamında araştıran, olgu ile arka plan arasındaki sınırların belirgin olmadığı ve kanıt kaynaklarının kullanıldığı kanıta dayalı bir çalışmadır (Yin, 2018). Dahası, belirli bir koşul altında vaka çalışması, araştırmacıların dinamik bir bağlamda temel sorunların çok disiplinli özelliklerini analiz etmelerine, değerlendirmelerine ve görmelerine yardımcı olan son derece etkili bir mekanizmadır (Burton, 2012). Bu araştırma, sürdürülebilirliği vurgulayarak deniz ve kıyı turizminin mevcut manzarasını araştırmak için nitel, çoklu vaka çalışması metodolojisini benimsemektedir.

Bu araştırmada nitel araştırma yöntemi kullanılarak ikincil verilerden doküman analizi yapılarak önceden belirlenmiş araştırma hedeflerine ulaşmak amacıyla önceden hazırlanmış görüşme formlarının hazırlanarak elde edilen verilere göre deniz ve kıyı turizm sektörünün durum değerlendirilmesinin yapılması yanında iki farklı turistik destinasyondan iki vaka çalışmasını birleştirerek nitel bir araştırma metodolojisi uygulanması da sözkonusu olabilmektedir. Turizme kazandırılacak destinasyonların metodolojik değerlendirmede,

yorumlayıcı paradigma, paydaşların algılarına, beklentilerine, eylemlerine ve adaptasyonlarına özellikle vurgu yaparak gerçek deneyimlerinin incelenmesini sağlayan bir bakış açısı sunduğu için dikkate alınmıştır. Dahası, bu teknik kişisel deneyimleri ve bunların anlamlarını araştırarak insanların profesyonel yaşamlarını nasıl anlamlandırdıklarına ışık tutar ve sonuç olarak öznel gerçekliklere dayalı meşru bilgi üretir. Burhaniye'de deniz turizminin sürdürülebilirliği açısından görüşme tekniğinden de yararlanılarak araştırma sahasına yönelik hazırlanan görüşme formları tamamlanamadığı için bu tebliğ çalışmasında konu genel olarak ele alınmıştır. Söz konusu tebliğe atıfta bulunularak Burhaniye uygulaması makaleye dönüştürülmesi öngörülmektedir.

4.SONUÇ VE ÖNERİLER

Kitlesel turizm hareketlerinin önemli bir unsuru olan deniz turizmi, çevresel duyarlılığı, ulusal ve uluslararası düzeydeki yatırımları, geliştirdiği iş hacmi, istihdam olanaklarının olumlu etkisi ile, birçok ülkede deniz turizminin gelişmesinde etkili olmuştur. Üç tarafı denizlerle çevrili Türkiye'de; denize özel ilgisi olan, çevre duyarlılığı yüksek, özgürce hareket etmek isteyenlerin tercih ettiği bir turizm türü özelliğinde olan deniz turizminin geliştirilmesi gerekmektedir. Ancak, koruma kullanma dengesinin sağlanamadığı turizm yörelerinde, deniz ve kıyılara ilişkin sorunlar daha belirgin bir hale gelmiştir. Deniz turizmi, doğal çevreden en fazla etkilenen turizm türü olması özelliğine de sahiptir. Bu nedenle, denize kıyısı olan yerleşim yerlerinin sahip olduğu özelliklerinin bilinmesi, korunması ve yapılması gerekenlerin ortaya çıkarılması sektörün sürdürülebilirliğinin sağlanmasında önem arz etmektedir.

Bu çalışma, özellikle gelişmekte olan ülkelerde yenilikçi bir yaklaşım olarak görülen sürdürülebilir deniz turizm sektöründe sürdürülebilir kalkınmaya yapılan çağdaş küresel vurgunun altını çizmektedir. Bu tür turizmin olumlu sosyo kültürel ve ekonomik etkilerinin altını çizmekte ve sürdürülebilir turistik yerler, iyi organize edilmiş konaklama yerleri, çeşitli mutfaklar ve vergiden muaf geleneksel ürünler gibi önemli katkıları vurgulamaktadır. Etkili iletişim ve lojistik, sürdürülebilir turizm büyümesi için çok önemlidir ve genel performans, sosyo ekonomik ve operasyonel istikrarın korunmasına bağlıdır. Bu çalışma, uzun vadeli sürdürülebilir kalkınmanın sağlanması için ekonomik, sosyal ve çevresel faktörleri dikkate alan ve paydaşların aktif katılımını sağlayan kapsamlı bir planı savunmaktadır. Rekabetçi pazarda avantajlı bir konum elde etmek için kritik başarı faktörlerine vurgu yapılması ve politika ve uygulamaların uyumlaştırılması önerilmektedir.

Muslu (2018) çalışmasında, deniz turizminin ancak doğru yönetilebildiği zaman sürekli artan bir gelir sağlayacağı belirtilmiştir. Söz konusu turizm geniş bir yelpazede hizmet sunumu ile karmaşık bir sektör yapısı arz ettiği bu nedenle de kaynaklarının sürdürülebilir şekilde planlanması, turizm sektörü ve bu sektöre girdi sağlayan tüm sektörler için önemi vurgulanmıştır. Deniz turizmi arz verilerinden olan kıyı alanlarının ortak kullanımı, sürdürülebilirlik ve emniyet nedeniyle oluşturulan ulusal ve uluslararası düzenlemeler, deniz turizminde yönetişim ihtiyacını artıran gelişmeler olarak kaydedilmiştir. Türkiye'de deniz turizminin temel sorunları açısından sektör temsilcileriyle yapılan görüşmelerde yönetişim eksikliğinin ilk sıralarda yer aldığı da belirtilmiştir. Benzer sorunların yaşandığı araştırma alanı olan Burhaniye'nin de doğal güzelliklerini ve kültürel miras alanlarını keşfetmeleri için fırsatlar sunarak deniz turizmi için entegre destek sistemlerinin değerinin altı çizilmektedir. Balıkesir Burhaniye denize kıyısı olan bir yerleşim yeri olarak deniz turizmi için potansiyele sahip olmasına ragmen sürdürülebilir şekilde kullanılamadığının en önemli somut çıktısı kısa turizm sezonunun olmasıdır. Bunun en büyük nedeni ise denize yönelik aktivitelerin profesyonelce yapılamamasının önünde en büyük engel olarak deniz kirliliği gelmektedir. Sözkonusu kıyı

yerleşim yerinde karada yaşayan insanların sürdürülebilir çevre konusunda bilinçsiz olarak sergiledikleri yaşam tarzı buna neden olmaktadır. Özellikle 2020 yılından bu yana küresel iklim değişikliğine bağlı deniz yüzeyi sıcaklıklarının ortalamanın çok üzerinde seyretmesi, Marmara Denizi ve çevresinde yaşayanların maruz kaldığı müsilaj ve deniz salyası denilen ekolojik felaketin ortaya çıkması 40 yılı aşkın uygulanan yanlış atık yönetiminin sonucu olduğu konunun uzmanları tarafından ortaya konulmaktadır. (https://mustafasari.org/yazilar/1/.2025).

Yetkililer, dengeli ve sürdürülebilir ekonomik kalkınmaya ilişkin yönetimsel ve ekolojik kaygıları ele almaya teşvik edilmektedir. Burhaniye'de deniz turizminin sürdürülebilirliğini sağlamak için yetersiz planlama, kısa vadeli sürdürülebilirlik odağı, sınırlı toplum katılımı, ekolojik farkındalık eksiklikleri, etkisiz kirlilik kontrol önlemleri, paydaş entegrasyon eksiklikleri ve yetersiz tanıtım gibi kısıtlamaların da ele alınması zorunluluğu hayati önem arz etmektedir. (Nobi & Majumder, 2019).

Bu çalışmanın, sonuçları yorumlarken göz önünde bulundurulması gereken çeşitli kısıtlamaları vardır. İlk olarak, bulgular Burhaniye'de yapılan periyodik ziyaretler sırasında elde edilen ikincil veriler, gözlemler ve yüz yüze görüşmelerin bir araya getirilmesiyle elde edilmiştir. İkinci olarak, zaman ve bütçe kısıtlamaları nedeniyle, çalışma iki kıyı ve deniz destinasyonundan fazlasına odaklanmamış, bu da veri toplama ve yorumlamanın genişliğini ve derinliğini etkilemiştir. Üçüncüsü, turizm sektörünün genişliğine rağmen, bu çalışmada sadece deniz turizm destinasyonları incelenmiştir. Dördüncüsü, farklı kültürel, coğrafi ve ekolojik kimliklere sahip farklı turizm destinasyonlarını entegre ederek daha fazla araştırma yapma potansiyeli bulunmaktadır.

Sonuç olarak, bu çalışma nitel verilerin kullanımını vurgulamakta ve gelecekteki araştırmaların, bulgularını doğrulamak için uygun istatistiksel yöntemler kullanarak hipotez odaklı nicel analizler içermesi gerektiğini önermektedir. Gelecekteki araştırmalar, daha kapsamlı bir analiz elde etmek için farklı kültürel, coğrafi ve ekolojik özelliklere sahip bir dizi turizm destinasyonunu kapsamalıdır. Ayrıca, nitel bulguları doğrulamak için uygun istatistiksel yöntemler kullanan hipotez odaklı nicel analizler de içermelidir. Ayrıca, ikincil verileri gözlem ve görüşmelerden elde edilen birincil verilerle birleştiren karma yöntem yaklaşımlarının kullanılması araştırmanın sağlamlığını artırabilir. Sürdürülebilir bir rekabet avantajı elde etmek için kıyı ve deniz turizm kaynakları, ne kadar iyi entegre edildiklerine ve tahsis edildiklerine bağlı olarak sürdürülebilir kalkınma bakış açısıyla değerlendirilmelidir. Hükümet ve ilgili makamlar, sürdürülebilir kalkınma sorunlarını çözmek için uygulanabilir eylemler başlatmalı, böylece sağlam bir turizm iş mekanizması, rekabet avantajı ile güçlü bir marka kimliği sağlanabilecektir.

CULTURAL TOURISM POTENTIAL OF SAVAŞTEPE SARIBEYLER

Meziyet NARİN
Lecturer, Balıkesir University Burhaniye Vocational School, Tourism and Hotel Management ProgramBalıkesir-Turkey (Responsible Author), ORCID: 0000-0001-8077-1507

ABSTRACT

Culture is a set of tangible and intangible values that distinguishes a society from other societies, continues to change from past to present, gives an identity with its unique art, beliefs, customs, traditions, understanding and behaviors, and provides order by giving a sense of solidarity and unity. Cultural tourism is a type of tourism in which foreigners travel to experience cultural places, activities and artifacts in a region by seeing them on site. This tourism is also important as a type of tourism that develops conservation awareness and provides national and local economic gain

Located in the North Aegean, Balıkesir province is one of the prominent provinces in cultural tourism with its cultural heritage, historical artifacts, museums and ruins. The ancient cities of Antandros (Edremit-Altınoluk), Daskyleion (Bandırma-Ergili), Kyzikos (Erdek) have important historical heritage in terms of cultural tourism. However, despite its potential, Balıkesir cannot create economic, social and cultural value by highlighting its cultural heritage in tourism except for certain settlements. The aim of this study is to draw attention to the issue by revealing the tourism potential of Sarıbeyler Neighborhood in Savaştepe District of Balıkesir Province. Thus, it is envisaged to encourage the initiation of studies to contribute to the national economy with sustainable, four-season tourism income by bringing new tourism routes to the province and the region. The settlement in question is located in the North Aegean, which has hosted the oldest civilizations and has rich traditional values in terms of food culture and handicrafts. The subject is important in terms of evaluating the cultural richness of Sarıbeyler Neighborhood as tourism application areas, revealing new touristic products and transforming them into income-generating elements. In the study, archive/document scanning, one of the qualitative research methods, will be carried out and awareness will be raised by photographing the values on site, transforming them into visuals and writing these values down.

Keywords: Cultural Tourism, , Balıkesir, Savaştepe, Sarıbeyler.

SAVAŞTEPE SARIBEYLER'İN KÜLTÜR TURİZM POTANSİYELİ

ÖZET

Kültür, bir toplumu diğer toplumlardan ayıran, geçmişten günümüze değişerek devam eden, kendine özgü, sanatı, inançları, örf ve adetleri, anlayış ve davranışları ile bir kimlik kazandıran, dayanışma ve birlik duygusu vererek düzeni de sağlayan maddi ve manevi değerlerin bütünüdür. Kültür turizmi, yer yabancılarının bir yöredeki kültürel mekanları,etkinlikleri ve eserleri yerinde görerek deneyimlemek için seyahat ettiği bir turizm türüdür. Bu turizm aynı zamanda koruma bilincini geliştiren, ülkesel ve yerel ekonomik kazanç sağlayan bir turizm çeşidi olarak önem arz etmektedir.

Kuzey Ege'de bulunan Balıkesir ili sahip olduğu kültürel mirası, tarihi eserleri, müzeleri, Ören yerleri ile kültür turizminde öne çıkan illerden biridir. Antandros (Edremit-Altınoluk), Daskyleion (Bandırma-Ergili), Kyzikos (Erdek) antik kentleri bölgenin kültür turizmi açısından önemli tarihi mirasa sahiptir. Ancak sahip olduğu potansiyeline rağmen Balıkesir kültürel mirasını turizmde belli yerleşim yerleri dışında öne çıkararak, ekonomik, sosyal ve kültürel değer yaratamamaktadır. Bu çalışmanın amacı Balıkesir İli Savaştepe İlçesi, Sarıbeyler Mahallesi'nin kültür turizm potansiyelini ortaya koyarak konuya dikkat çekmektir. Böylece yeni turizm rotalarının il ve bölgeye kazandırılmasıyla sürdürülebilir, dört mevsim turizm geliri ile ülke ekonomisine katkı sağlamak için çalışmaların başlatılmasını teşvik etmek öngörülmektedir. Sözkonusu yerleşim yeri en eski medeniyetlere ev sahipliği yapmış, beslenme kültürü ve el sanatları açısından zengin geleneksel değerlere sahip Kuzey Ege'de yer almaktadır. Sarıbeyler Mahallesi'nin sahip olduğu kültürel zenginliklerin turizm uygulama alanları olarak değerlendirilmesi, yeni turistik ürünlerin ortaya çıkarılması ve gelir getirici unsurlara dönüştürülmesi açısından konu önem arz etmektedir. Çalışmada nitel araştırma yöntemlerinden arşiv/doküman taraması yapılacak ve yerinde değerlerin fotoğraflanması görsele dönüştürülmesi ve bu değerlerin yazılı hale getirilmesi yöntemiyle farkındalık artırılacaktır.

Anahtar Kelimeler: Kültür Turizmi, , Balıkesir Savaştepe, Sarıbeyler.

GİRİŞ

Kültür, bir toplumu diğerlerinden ayıran, geçmişten günümüze değişerek devam eden, kendine özgü sanatı, inançları, örf ve adetleri, anlayış ve davranışları ile bir kimlik kazandıran, dayanışma ve birlik duygusu vererek düzeni de sağlayan maddi ve manevi değerlerin bütünüdür. Kültür genel sözlük anlamıyla; tarihsel, toplumsal gelişme süreci içinde yaratılan bütün maddi ve manevi değerler ile bunları yaratmada, sonraki nesillere iletmede kullanılan, insanın doğal ve toplumsal çevresine egemenliğinin ölçüsünü gösteren araçların bütünü, hars, ekin, bir topluma veya halk topluluğuna özgü düşünce ve sanat eserlerinin bütünü anlamlarına gelmektedir. (https://sozluk.gov.tr/.2025.) Kültür turizmi, yer yabancılarının bir yöredeki kültürel mekanları,etkinlikleri ve eserleri yerinde görerek deneyimlemek için seyahat ettiği bir turizm türüdür. Bu turizm aynı zamanda kültürel mirasına sahip çıkma ve koruma farkındalığını geliştiren, ülkesel ve yerel ekonomik kazanç sağlayan bir turizm çeşidi olarak önem arz etmektedir.

Uçgun (2019) kültürel turizm için kültürel çekiciliğe sahip unsurların neler olduğunu tespit etmek için çalışmasını yapmıştır. Çalışmada tarihi yerler, müzeler, tarihsel ve geçmiş medeniyetleri barındırmış yerlerden kalan kalıntılar yanında fuar ve festivaller, yaşam şekilleri, gelenek ve görenekler, müzik ve eğlence türleri, el sanatları, yemek alışkanlıkları ve yemek türleri gibi kültürel turizmin en önemli ürünlerinden oluştuğu üzerinde durulmuştur. Ancak kültür turizmi açısından sahip olunan potansiyellerin kültürel ürüne dönüştürülmesi, müzeleştirilmesi, imaj ve marka yaratılması için çalışmaların yapılmasının önemine değinmiştir. Bunlar yapılabilirse, ilave olarak ta yeterli planlama ve iyi bir tanıtım sonucunda belirgin bir turizm çekiciliğinin yaratılacağını vurgulamıştır.

Günümüzde özellikle gelişmiş ülkelerin insanların turizm sektöründen beklentilerini karşılamak amacıyla yatırım, tüketim, istihdam, ihracat ve kamu gelirlerinin arttırılmasında, ulusal ve uluslararası ekonomik sorunların aşılmasında geleneksel kültürün önemle üzerinde durduğu bir sektör haline getirmiştir.

LİTERATÜR TARAMASI

Ukav (2012) Adıyaman'ın hem turizm potansiyeli hem de marka kent olarak tescil edilmiş olması nedeniyle, Adıyaman'ın turizme kazandırılması için bu çalışmayı yapmıştır. Yazar çalışmada, hem yerli hem de yabancı turistlerin ilgisini keşfedilmemiş yerlere çekerek turizme kazandırılmasında kırsal turizmin önemini vurgulamıştır. Çalışmada, gelir düzeyi çok düşük iller içinde yer alan Adıyaman'ın turizm kırsal turizm potansiyeli ve uygulamaları sayesinde turizme kazandırılması ve turizm gelirlerinin artırılması sonucunda ülke ekonomisine katkısının olumlu olacağı sonucuna ulaşılmıştır.

Çimen (2014), Ardahan'ın tarihsel, coğrafik ve kültürel açıdan başta olmak üzere birçok açıdan turizm çekiciliği bulunduğunu vurgulamıştır. Çalışmada her ne kadar turizm ve sanayi birlikte yürümese de, Ardahan'ın turizm potansiyelini ortaya çıkarmak ve böylece Ardahan'ın sosyal, kültürel, sportif, ve ekonomik katkısının artırılması amacıyla bu çalışmayı yapmıştır. Çimen çalışmasında, turistik talebin artırılmasında ulaşım, konaklama, tesisleşme, güvenlik ve bilinirlik gibi unsurların önemine dikkat çekmiştir. Ayrıca tüm turizm çeşitlerine ait etkinliklerin örneğin; botanik turizmi, yayla turizmi, gastronomi turizmi gibi yörede görselleştirilmesi gerektiğini ve bunun büyük bir eksiklik olduğunu belirtmiştir. Ardahan'ın turizmini geliştirmek için, özel turistik çekicilik listesinin güncellenmesi ve bunların iyi fotoğraflanması ve bunlara yönelik Ardahan Turist Rehberi'nin hazırlanması gerektiğini önemle vurgulamıştır. Yine çalışmada, özellikle kırsal turizm için cazibe merkezi olan Ardahan'ın bu turizm alanında da potansiyelinin ortaya çıkarılması için konaklama

kapasitesinin artırılması, tarım turizmi, eko turizm ve doğa turizmi gibi birçok turizm çeşidinin canlandırılması gerektiğini vurgulamıştır.

Bulut ve Tuncer'in (2019) da yaptığı çalışmada, Çatalhöyük'ün Arkeo-Turizm potansiyeli coğrafi perspektif açısından ele alınmıştır. Çalışmada arkeolojik açıdan önemini ortaya konmuştur. Bunun için yapılan geniş bir literatür taraması ve arazi çalışmaları birleştirilmiştir. Çalışma sonunda elde edilen veriler ışığında, arkeo-turizm alanında yapılması planlanan yatırımlara ve mevcut potansiyelin nasıl değerlendirilmesi gerektiğine yönelik SWOT analizi de gerçekleştirilmiştir.

Kılıç ve Başkaya (2018) yaptıkları çalışmada, Bilecik'te kırsal kalkınma açısından agro-turizmin geliştirilmesinin istihdam ve ekonomiye sağlayacağı katkıya dikkat çekmişlerdir. Bilecik'in, İstanbul, Kocaeli, Bursa, Sakarya, Eskişehir gibi büyük şehirlere yakınlığı, farklı iklim özelliği, dört farklı coğrafi bölgede topraklarının olması nedeniyle tarımsal ürün çeşitliliği gibi nedenlerden dolayı bulunan potansiyeli vurgulanmıştır. Ayrıca geleneksel Osmaneli evlerinin Kültür ve Turizm Bakanlığı'nca koruma altına alınması, Söğüt İlçesinde bulunan ve tarihi önemi olan Ertuğrul Gazi Türbesi'nin varlığı, Pazaryeri İlçesinin Kınık Köyü'nde geleneksel yöntemlerle yapılmaya devam eden çömlek yapımı, kırsal turizm bakımından önemli olduğu da belirtilmiştir. Çalışmada kırsal turizmle ilgili gelecekte yapılması düşünülen yatırımların neler olması gerektiğinin belirlenmesi için SWOT analizi yapılmıştır. Yapılan çalışmada, Bilecik'in; kırsal turizm, tarım festivalleri, Hıdrellez ve Ertuğrul Gazi'yi anma ve Söğüt şenlikleri gibi kültürel etkinler, tarihsel ve kültürel miras, içinde bulunan Harmankaya Kanyonu, tarım turizminin kendin topla kendin ye faaliyetleri açısından önemli bir potansiyele sahip olduğu da ortaya çıkmıştır.

Zayım (2018), çalışmasında Antalya'da bulunan Demre içinde yer alan Noel Baba Kilisesi, Myra ve Andriake Antik Kenti gibi birçok kültürel potansiyelin turistler açısından çekici bulunduğunu belirtmiştir. Diğer yandan Demre yüzyıllardır farklı uygarlıklara ev sahipliği yapmıştır. Ancak barındırdığı bu potansiyelin farkındalığının artırılması sayesinde kaynaklarının kullanımı, korunması, değerlerinin yataşılması ve gelecek nesillere aktarılmasıyla sürdürülebilirliliğin artırılmasının mümkün olacağını da belirtmiştir. Ayrıca çalışmada, turizm açısından büyümenin planlı ve öngörülebilir olmasının önemli olduğunu akti halde var olan doğal ve kültürel mirasın korunmasında çok ciddi sorunlarla karşılaşılabileceğinin altını çizmiştir.

Yılmaz (2017), çalışmasında Kapadokya bölgesindeki yerel beslenme kültürü ile entegrasyonu yüksek olan gastronomi ve turizm ilişkisinin mevcut durumu tespit etmeye çalışmıştır. Çalışmada nitel yaklaşımla veri toplama tekniği kullanılmıştır. Bu veri toplama tekniğinde doküman incelemesi, veri analizi ve özellikle içerik analizi yöntemleri kullanılmıştır. Yapılan veri toplama tekniğinde acenta yetkilisi, restoran işletmecisi, gazeteci, yazar, otel işletmecisi, şefler gibi yöneticilerin beş ana kategoride on beş alt kategoriden oluşan sorular yöneltilmiştir. İçerik analizleri sonucunda elde edilen bulgular üçü ana on altısı alt başlıkla ele alınarak yorumlanmıştır. Üç ana kategori içinde; turizm potansiyeli, yerel gastronomi faaliyetleri ve restoran uygulamaları yer almıştır. Çalışmada, gelecekte yapılacak çalışmaların, nitel yaklaşım odaklı bireysel ve odak grup görüşmeleri şeklinde yürütülmesinin detaylı analiz ve öneriler için çok faydalı olacağı ortaya çıkarılmıştır.

Çam ve Çılgınoğlu (2020)'nun çalışmalarında, kültür turizmi yanında bu turizm dalıyla yakından ilgili olan inanç turizmi de incelenmiştir. Çalışmada, Kastamonu'nun inanç turizmiyle ilgili unutulmaya yüz tutmuş turizm değerlerinin yaşatılması, turizm potansiyelinin değerlendirilmesi, avantajlarının ve dezavantajlarının ortaya konulması amaçlanmıştır. Araştırmada nitel metodoloji kullanılmıştır. Veriler görüşme formu tekniği ile toplanmış ve

analiz edilmiştir. Çalışma bulgularında; Kastamonu'da inanç turizminin temsilcisi olarak Hz.Pir Şeyh Şaban-ı Veli'nin önde geldiği, ayrıca kış, inanç, kültür, gastronomi, ormancılık ve tabiat turizminin gibi turizm çeşitlerinin de yapılabileceği vurgulanmıştır. Sonuç olarak; Kendine has doğal, tarihi ve kültürel çekiciliklerinin olması, bunların muhafaza edilmesiyle Kastamonu diğer illerle kıyaslandığında bir farkındalık ortaya koyabildiği bu nedenle de, Kastamonu ilinde birçok turizm türü uygulanabildiği tespit edilmiştir. Turizm türlerine; kültür turizmi, kongre turizmi, ormancılık ve tabiat turizmi, inanç turizmi, deniz turizmi, kış turizmi ve kitle turizmi örnek olarak verilebileceği de tespit edilmiştir.

Kaypak (2010) yaptığı çalışmada, kültürel turizm çeşitlerinden marka turizmini ele almış ve Hatay'ın potansiyelini ortaya koymaya çalışmıştır. Hatay'ın örnek olarak alınma nedeni olarak; zengin tarihi ve dini geçmişi, çok kültürlü yapısı, doğal alanları açısından kültürel turizme son derece uygun olmasından kaynaklanmıştır. Hatay'ın sahip olduğu kültürel potansiyeli nedeniyle "kültür marka kent" olarak sayılan iller arasında yer almasının da önemi vurgulanmıştır. Çalışmada, literatür taraması ile ikincil veriler toplanmış ve gözlem yoluyla da Hatay hakkında birincil veriler sağlanmıştır.

Sezer (2017) çalışmasında, kültürel mirasın önemli olduğu, Kastamonu İli Taşköprü İlçesinin derin tarihsel geçmişi ve birçok farklı medeniyeti yaşatmasından dolayı unutulmaz tarihsel izler taşıyan ciddi bir potansiyel olduğu belirtilmiştir. Belirtilen nedenlerden dolayı, Taşköprü kültürel mirasıyla kültür turizmi için elverişli bir yer olduğu belirtilmiştirTaşköprü'de antik kent kalıntısı (Pompeiopolis), tarihsel camiler, türbeler, kaleler, konaklar ve diğer sivil mimari örnekleri mevcuttur. Diğer yandan, bölgesel oyunlar, folklorik faaliyetler, festivaller, düğünler, eğlenceler, kıyafetler, el sanatları ve yemek kültürü ve çeşitleri kendine has özellikler taşımaktadır. Turizm açısından taşıdığı potansiyel ile Taşköprü'nün, sahip olduğu zengin kültürel miras zenginlikleriyle ve potansiyeli ile sürdürülebilir turizmin geliştirilmesi mümkündür. Bu bağlamda başta turistik altyapı olanaklarının iyileştirilmesi, turistik çekiciliklere erişim için ulaştırma imkanlarının artırılması ve konaklama faaliyetlerinin geliştirilmesi, markalaşma ve etkin tanıtım faaliyetlerine ağırlık verilmesi gerekliliği üzerinde durulmuştur. Böylece, Taşköprü ilçesinin kültür turizmi başta olmak üzere sürdürülebilir turizm türleri açısından daha iyi bir yere gelmesine zemin hazırlanabileceği ve gelecek nesillere emanet edebilecek nitelikte kültür varlığının yaşatılması için gereken önemin verilmesine dikkat çekilmiştir.

Günal (2013) çalışmasını önemli tarihi ve folklorik değerleri ile anılan Mardin'de yapmıştır. Mardin Hıristiyanlık kültürel mirasını yansıtan çok sayıda manastır ve kiliseleri ile ünlüdür. Ayrıca Türk-İslam eserleri de çok bulunmaktadır. Diğer yandan, geleneksel evler, el sanatları, yeme-içme kültürü gibi öğeler, Mardin ve Midyat gibi yerleşmelerin fiziksel görünümlerinin kültürel peyzaja dönüştüren önemli unsurlara da sahip olmuştur. Mardin'in kültürel turizm potansiyelinin daha iyi değerlendirilmesi için "turizm yönetim kurulu" oluşturulması gerektiği, böylece turizm altyapısının turistik ihtiyaca cevap verecek şekilde düzenlenmesi ikinci aşamada yapılması gerekmektedir. Ayrıca bu kurul tarafından ciddi pazarlama stratejilerinin benimsenmesi, sahaya uygun bir imaj ve marka oluşturulması, hitap edilecek turizm pazarının belirlenmesi, hedef Pazar tiplerinin saptanması, tanıtım programlarının ortaya konması, turizm bilgi hizmetlerinin sağlanması önemli konular olarak belirtilmiştir. Tabiidir ki, kültürel varlıkların korunması için de ciddi önlemlerin alınması, zengin turistik kültürel öğelerin tespit edilerek deneyimsel tüketime uygun hale getirilmesinin de zorunluluk olduğu vurgulanmıştır.

Akkuş ve Güneş (2016), çalışmada Aydıncık İlçesi niteliksel veri toplama yöntemi benimsenmiştir. Araştırmada ayrıca yarı yapılandırılmış mülakat yöntemine uygun açık uçlu

sorulardan oluşan görüşme formu da kullanılarak veriler toplanmıştır. Araştırma sonuçlarına göre; Aydıncık ilçesi Kültür Turizmi ve diğer özel ilgi turizmi türleri açısından güçlü bir potansiyele sahip olduğu, ancak bu potansiyelin değerlendirilmesi yönünde tedbirlerin alınması gerektiği ortaya çıkmıştır. Turizmin ilçede ivme kazanmaya başladığı zamanlarda taşıma kapasitesi aşılmamasına özen gösterilmesi gerektiği, çevre ve kıyı, kültürel dokuyu koruyucu önlemlerin mutlaka alınması önerisinde bulunulmuştur. Ayrıca, çalışmada İlçede turistlerin ihtiyaçlarına cevap verecek nitelikte konaklama, yeme içme, sosyal tesisler faaliyete başlaması için altyapı ve üst yapı problemlerinin çözümüne yönelik projeler üretilmesinin de elzem olacağı belirtilmiştir.

Büyük ve Can (2020) çalışmalarında, dünyadaki değişim ve dönüşümlerin ve küreselleşme olgusunun sonucunda, turizm sektörünün de değişime uğradığı, kültürel rotaların değişimin oluştuğu, yeni bölge ve rotaların tespit edilmesi gerekliliğinin ortaya çıktığı belirtilmiştir. Turizm çalışmaları literatüründe geçmiş on yıllık süreçte, zeytin ve zeytinyağının gıda olması dışında, toplumlar üzerinde ekonomi, sağlık, ekoloji, turizm ve kültür turizmi için önemli bir değer olduğu üzerinde durulmuştur. Bu nedenle, Zeytinyağı rotalarının zeytinyağı turizmi için, zeytin ağaçlarının yetişme alanlarınında geliştirilmesi önemle vurgulanmıştır. Ayrıca Çalışmada, dünyadaki zeytinyağı rotaları ele alanarak, Türkiye'de sertifikalı bir rota oluşturulması gerekliliği için teorik altyapı ortaya çıkarılarak öneride bulunulmuştur Çalışma, bu alanda yapılacak yeni araştırmalarda kullanılacak yöntem ve modellerin saptanmasında yol gösterici bir niteliğe sahip olduğu da iddia edilmektedir.

ÇALIŞMA ALANININ GENEL ÖZELLİKLERİ

Çalışmada ele alınan Balıkesir'in potansiyel kültürel mirası, tarihi eserleri, müzeleri, Ören yerleşim yerindeki antik tarihsel yerler açısından kültür turizmi için ciddi donanıma sahip olduğu söylenebilir. Antandros (EdremitAltınoluk), Daskyleion (Bandırma/Ergili), Kyzikos (Erdek) antik kentleri Balıkesir'in kültür turizmi mirasının göstergeleridir. Kuva-yı Milliye Müzesi ve Bandırma-Arkeoloji Müzesi gibi müzeleriyle de bölgenin yakın tarihi kapsayan önemli eserleri sergilenmektedir**.** (Balıkesir Turizmi (2022). tursab ar-ge birimi,s.8) (https://www.tursab.org.tr/assets/assets/uploads/sehir-raporlari/balikesir-turizmi-haziran-2022.pdf.2025).

Ancak sahip olduğu potansiyeline rağmen Balıkesir kültürel mirasını turizmde belli yerleşim yerleri dışında öne çıkararak, ekonomik, sosyal ve kültürel değer yaratamamaktadır. Bu yerlerden birisi de en eski medeniyetlere ev sahipliği yapmış, beslenme kültürü ve el sanatları açısından zengin geleneksel değerleri barındıran Kuzey Ege'de yer alan Balıkesir İli Savaştepe İlçesi sınırları içinde yer alan Sarıbeyler Mahallesidir. Sarıbeyler Mahallesi'nin nüfusu 992'si Erkek, 962'si Kadın olmak üzere 1.954 tır. (https://www.nufusune.com/148387-balikesir-savastepe-saribeyler-mahallesi-nufusu.2025). Yıllar içinde giderek artan işgücü göçü nedeniyle genç nüfusun azalması kültürel kimliğin yok olma riskini de beraberinde getirmektedir. Sözkonusu mahallenin (beldenin) kültür turizm potansiyelinin ortaya konularak yeni turizm rotalarının il ve bölgeye kazandırılmasıyla sürdürülebilir, dört mevsim turizm geliri ile ülke ekonomisine katkı sağlamak için çalışmaların başlatılmasını teşvik etmek öngörülmektedir .

Resim:1 Savaştepe Sarıbeyler Genel Görünüm Kaynak:Meziyet Narin arşivi (2024)

Bu çalışmanın amacı, Sarıbeyler Mahallesi'nin sahip olduğu kültürel zenginliklerin turizm uygulama alanları olarak değerlendirilmesi, yeni turistik ürünlerin ortaya çıkarılması ve gelir getirici unsurlara dönüştürülmesi açısından konu önem arz etmektedir. Savaştepe Sarıbeyler Körfez geçişli İstanbul-İzmir Otoyolu ile İstanbul İzmir ve Bandırma-İzmir Yüksek Hızlı Tren hatlarının üzerinde bir kavşak noktasında yer almaktadır. Savaştepe merkezden geçen Bandırma-Balıkesir-İzmir demiryolu güzergâhı ve hızlı tren hattı bulunması demiryolu erişilebilirliğinin olması da stratejik açıdan önemli bir konumda bulunduğunun göstergesidir.

Harita 1: Balıkesir İli Savaştepe İlçesi Sarıbeyler Mahallesi'nin (Nahiyesi) Bulunduğu Konum

MATERYAL VE YÖNTEM

Savaştepe Sarıbeyler yöresinin kültürel değerlerinin tespit edilmesi amacıyla doküman analizi tekniğinden faydalanılmıştır. Doküman analizi ise incelenen konuyla ilgili olgu ve olaylar hakkında bilgi içeren yazılı belgelerin analiz edilmesiyle veri sağlanmasını kapsamaktadır. Dökümanlar kişilere, topluluklara ya da kültürlere ilişkin önemli bilgiler içermektedir. Aynı zamanda bu söz konusu analiz yönteminden birbirinden farklı verileri de elde etmek amacıyla faydalanılmıştır (Yıldırım ve Şimşek:2016; Baş ve Akturan:2008). Bu bakımdan hem literatürdeki sözkonusu yörenin kültürel çekiciliklerini ele alan çalışmalar incelenmiş, hem de yörede bu konuya yönelik görsel bilgi kaynaklarından faydalanılmıştır. Konuyla ilgili kitap, tez, makale ve internetten toplanan verilerin dikkatlice bir araya getirilmesi ile gerçekleştirilmeye çalışılmasına rağmen Savaştepe Sarıbeyler Mahallesi'nin özellikle tarihsel geçmişine ait kaynakların sınırlı olduğu tespit edilmiştir.

BULGULAR ve TARTIŞMA

Savaştepe Sarıbeyler'in Kültür Turizm Kaynakları

1.Sarıbeyler'in Arkeolojik Çekicilikleri

Balıkesir ili Savaştepe ilçesi Sarıbeyler Beldesi bronz ve Demir çağları sürecinde Balkanlar ile bağıntılı yaşayışların varlığını gösteren arkeolojik verileri ve sitleriyle dikkat çeken bir bölge olması kadar kaya tapınakları (doğa odaklı inanış tarzını yansıtan) için de önemli bir potansiyel göstermesi bakımından da dikkat çekmektedir. Fakat yeterince çalışılmamış olması bu ilçe hakkında da bilgilerimizi kısıtlı ölçülerde bırakmıştır. **(**https://www.savastepe.bel.tr/savastepe/.2025**).**

Kerasa antik kenti de bunlardan birisidir. Keraseion Antik Kenti Balıkesir'in Savaştepe İlçesi'nde bulunmaktadır. Savaştepe'nin eski adı Giresun'dur. Giresun da önceleri Kerasai / Kerasa şeklinde telaffuz edildiği için bu antik kent de adını buradan almıştır.Kültür Varlıkları Savaştepe ilçesinde Keraseion Antik Kenti yer almaktadır. (https://www.gmka.gov.tr/dokumanlar/yayinlar/Balikesir-Turizm-Envanteri-Strateji-Calismasi.pdf.2025**).**

1.1 Sarıbeyler Sazlıkdere Höyüğü

Araştırma alanı içinde arkeolojik çekicilikler arasında yer alan 1. Derece arkeolojik sit alanı olarak tescillenmiş ama kazı çalışmaları başlatılamadığı için yeterli dökümana ulaşılamamış olan Sazlıkdere Höyüğü kültür turizmi açısından önem arz eden yerlerden biri konumundadır. (https://balikesir.ktb.gov.tr/TR-65876/savastepe.html.2025).

Yalçıklı (2015) çalışmasında Savaştepe Sarıbeyler Mahallesi sınırları içinde yer alan Sazlıkdere Höyüğü ile ilgili bilgilere yer vermiştir. Höyük, Sarıbeyler Köyü'nün yaklaşık 1.5 km. güneydoğusunda yer almaktadır. (Harita:2, Resim:2) olup, yaklaşık 200 m. doğusundan ise höyüğün adını aldığı Sazlık Dere akmaktadır. Höyük, yaklaşık 200x150 m. boyutlarında geniş bir alana yayılmış durumdadır ve ova seviyesinden 5-6 m. yüksekliğine sahiptir. Höyükte tarımsal faaliyetler sürdürülmekte olup, ağaçlardan oluşan yoğun bir bitki örtüsüyle çevrilmiştir. Parsellere ayrılmış höyüğün batısında, tarla zeminini düzeltme amacıyla yapılmış tahribat yer aldığı tespit edilmiştir. Sözkonusu alanda yapılan çalışmalar sonucunda, Sazlıkdere Höyüğü'nün batı (düzeltilmiş alanda) ve kuzey kesimlerinde Erken Tunç Çağı, tepe, doğu ve güney bölgelerinde ise yoğun olarak Helenistik, Roma ve Ortaçağ'a ait seramik parçalarının bulunduğu tespit edilmiştir.

Harita: 2 Sazlık Dere Höyüğü, Kaynak: Derya Yalçıklı (2015)

Resim: 2 Sazlık Dere Höyüğü, Kaynak: Derya Yalçıklı(2015)

1.2. Sarıbeyler Furuncuk Tepe Nekropolü

Beksaç (2022) çalışmasında Doğu ve Orta Avrupa Ülkelerinde görülen, Türkiye'de ise çok sınırlı örnekleri bulunan Madra Dağı'nın eteklerinde olduğu gibi, doğa odaklı inanış tarzını yansıtan "Kaya Sunakları" Sarıbeylerde de yer aldığını belirtmiştir. Savaştepe'de özellikle yoğun bir arkeolojik varlığa sahip bulunan Sarıbeyler ve çevresinde yaptığı araştırmalarda Düğmeli Tepe ve Furuncuk gibi kaya oyma tapınım alanlarını ortaya koymuştur. Burada yapılan tespitler benzerleri gibi yüksek bir kayalık tepe üstünde ve çevresinde yer alan bu tapınım alanları üzerinde altar düzenlemeleri, altarlar ve sunu çukurları yanında, kremasyon törenleri ile ilişkili olduğu izlenimini veren kaya oyma dikdörtgen çukurların da varlığının gözlemlendiği vurgulanmıştır. (Harita:3, Resim:3)

Balıkesir İli, Savaştepe İlçesi, Furuncuktepe Nekropol alanının I.derece arkeolojik sit olarak tescil edilmesi için Balıkesir Kuvay-ı Milliye Müze Müdürlüğü uzmanlarının tarafından hazırlanan rapor ve ekleri değerlendirilerek, hazırladığı rapor ve eki belgeler doğrultusunda, 1. Derece Arkeolojik Sit olarak tescil edilmiştir. Alınan bu karar ekinde, sit fişi ve şerh konulacak parseller listesinin ve tescil edilen I. derece arkeolojik sit sınırları içinde Kültür ve Tabiat Varlıklarını Koruma Yüksek Kurulu'nun 05.11.1999 tarih ve 658 sayılı ilke kararınca tescili onaylanmıştır. Böylece Savaştepe'nin turizmde taşıdığı potansiyel ve önem ile ilgili resmi olarak ciddi bir adım atılmıştır (Kültür ve Turizm Bakanlığı, 2018).

Harita:3 Furuncuk Tepe Nekropol Alanı

Resim:3 Furuncuk Tepe Nekropol resimleri

Kaynak:Kültür ve Turizm Bakanlığı Balıkesir Kültür Varlıklarını Koruma Bölge Kurulu,(2028).

2.Sarıbeyler Beslenme Kültürü

2.1 Savaştepe Sarıbeyler Seferberlik Çöreği

Hayvansal ve bitkisel gıda ürünlerinin temel hammadde kay nakları açısından zengin, verimli sulak araziler ve meraları ile Kuzey Ege sınırında stratejik açıdan önemli bir coğrafyada yer alan Savaştepe Sarıbeyler Mahallesi'nin sahip olduğu tarihi ve kültürel çekicilikler yanında ekolojik ve tarımsal üretimin arttırılma potansiyelinin de yüksekliği bulunmaktadır. Narin ve İnanöz (2016) Sözkonusu yörede gıdaların geleneksel yöntemlerle üretilerek, korunması ve kırsal kalkınma çalışmalarına destek olunması amacıyla beslenme unsurları konusunda çalışmalar yapılmıştır. Narin vd.(2014); Taşlı ve Karaman (2015) Bu konuda yok olmaya yüz tutmuş unsurlardan biri de Sarıbeyler Mahalle'sinin geçmişten günümüze geleneksel yöntemlerle doğal malzemeler kullanılarak imece usulü üretilen ve susamlı bir ekmek çeşidi özelliğinde Sarıbeyler Çöreği olarak bilinen beslenme unsurunun 2014 yılında "Sarıbeyler Seferberlik Çöreği" adı ile Somut olmayan Kültürel Miras Ulusal Envantesine alınmıştır. Söz konusu unsurun Balıkesir İl Kültür ve Turizm Müdürlüğünün girişimleriyle; Kültür ve Turizm Bakanlığı, Araştırma ve Eğitim Genel Müdürlüğü tarafından "Somut Olmayan Kültürel Miras İl Envanteri"ne kaydedilmesi ile ilgili bilgiye yer vermişlerdir. Yerel halkın yöre mutfağı hakkındaki algıları ve düşünceleri, söz konusu turizm kaynaklarının doğru kullanımı ve sunumu açısından önem arz etmektedir. Yüksel ve Kıralan (2024) çalışmalarında sözkonusu unsurun "Savaştepe Sarıbeyler Seferberlik Çöreği" olarak 12.09.2022 yılında Balıkesir Büyükşehir Belediyesi tarafından (6769 sayılı Sınai Mülkiyet Kanunu kapsamında) 1219 nolu mahreç işaretiyle tescil işleminin gerçekleştirildiğini belirtmiştir. Narin (2025) Savaştepe Sarıbeyler Seferberlik Çöreğinin hazırlanmasında geleneksel sürdürülebilir üretim yöntemlerinin kullanılması(Resim:4,5,6), uzun süre bayatlamaması, özel gün ve kutlamaların vazgeçilmezleri arasında yer alan alması, vb. özellikleri yöre beslenme kültürünün özgün örnekleri arasında yer almasında etken olduğu vurgulanmıştır.

2.3 Sarıbeyler Köy (Mezarlık) Hayırları

Savaştepe Sarıbeylerin günümüzde de uygulanan gelenekselleşmiş Köy Hayırları da sosyo-kültürel zenginlikler arasında bulunmaktadır. Kumartaşlıoğlu (2023) araştırmasında Köy hayırlarının günümüzde Balıkesir'in pek çok köyünde yaygın olarak yapılan geleneksel, dini ve sosyal pek çok unsuru içinde barındıran mevsimlik törenler olduğuna vurgulamıştır. Bu gelenek Türk kültürünün geçmişten günümüze taşıdığı ortak değerlerin ve kültürel mirasın olduğunu göstermektedir. Bu gelenek genellikle Nisan ayından itibaren bahar mevsiminde gerçekleştirilmesi, bu hayırların bahar bayramı ile bütünleşen bir tören olduğunu ortaya koymaktadır. Sarıbeyler'de de bahar aylarında gerçekleşen bu gelenek yağmurun yağması için iki ayrı mezarlıkta farklı günlerde "mezarlık hayırı" olarak organize edilmektedir. Bütün yöre halkından toplanan yardımlarla imece usülü hazırlanan geleneksel yemekler yenilip, dualar eşliğinde sosyo-kültürel bağların güçlendirildiği geçmişten günümüze yaşayan değerler arasında yer almaktadır.

Resim:7 Sarıbeyler Mezarlık Hayırı, Kaynak: Meziyet Narin arşivi (2025).

3.Sarıbeyler El Sanatları Kültürü

Savaştepe Sarıbeyler'de el sanatları açısından zengin bir kültüre sahip olduğu bilinmektedir. Özellikle keçecilik, mekikli dokuma, bitkisel örücülük (saz, hayıt, mısır yontusu, vb.) gibi yerel malzemelerden geleneksel bilgi kullanılarak ev ve kişisel tekstil ürünlerinin elde edilmesi yörede kültür turizmi açısından ayırt edici nitelikte kültür unsurları arasında yer almaktadır. Ekici (2023) çalışmasında geleneksel el sanatlarının; ortak kimlik, duygu ve aidiyet duygusu gibi özellikleri ile kendisini gösteren kültürel miras ve bu mirasın kodlarıyla oluşan kültürel belleğin bir unsuru, doğumdan ölüme hayatın her safhasında gerçekleşen gelenek, görenek ve adetlerin, toplumsal uygulama ve törenlerin vazgeçilmez eşyaları ve estetik değerlerin yansıdığı ürünler olduğunu vurgulamıştır. Sözkonusu araştırmada Savaştepe Sarıbeyler'de Mekikli dokuma ve keçecilik geleneğinin bir turizm çekiciliği olarak yok olmaya yüz tutmuş el sanatları kültürü ev tekstili ve kişisel kullanım için yaygın olarak üretilmese de yaşatılmaya çalışıldığı tespit edilmiştir.

2011 Yılında kurulan Sarıbeyler Turizm Derneğinin projesi olan Balıkesir Üniversitesi Burhaniye Meslek Yüksekokulu ve Savaştepe Halk Eğitim Merkezi ortaklığında; Bir Tohum Vakfı ve Savaştepe Belediyesinin istirakçisi olduğu "Gelenekten Geleceğe Yerel Türlerin Yolculuğu" isimli proje Birleşmiş Milletler Kalkınma Programı GEF-SGP fonu tarafından finansal olarak desteklenmiştir. 2023 Ekim ayında başlanan ve 18 ayda tamamlanan projenin yerel hammadde kaynakları olan pamuk ve koyun yününüm keçecilik ve dokumacılık el sanatında kullanılması ile bölgedeki sosyal ekolojik bilincin güçlendirilerek yerel ekonominin sürdürülebilirliğinin sağlanması öngörülmektedir.(Resim:8,9).

Narin(2025). https://sites.google.com/view/saribeylertd/kitap%C3%A7%C4%B1k?pli=1,2025.)

Resim:8 Sarıbeyler Çeyiz Keçesi, Kaynak:Meziyet Narin arşivi(2024).

Resim:9 Sarıbeyler Maraması, Kaynak:Meziyet Narin arşivi(2024).

4. Sarıbeyler Geleneksel Çocuk Oyunları

Narin (2023) Balıkesir Somut Olmayan Kültürel Miras Araştırmaları kapsamında geleneksel çocuk oyunlarına yönelik Savaştepe Sarıbeyler Mahallesinin de potansiyeli incelenmiştir. Bir yörede çocukluk döneminde kazanılan becerilerin gerek kişileri gerek se içinde bulunulan çevrenin de etkilenmesinden dolayı çocuk oyunları bir toplumun sahip olduğu kültürel zenginlikleri bünyelerinde barındıran değerler sistemi olarak tanımlanmaktadır. Geleneksel kültürün çocuk oyunlarının bir parçası olduğu geçmişte oynanan oyun malzemeleri, içerikleri ve süreçlerinde yetişkinlikte üstlenecekleri rolleri güçlendirecek bilgilerle donatıldığı ve sözkonusu yörenin geleneksel çocuk oyunları açısından da zengin bir kültüre sahip olduğu tespit edilmiştir. Günümüzde çoğunluğu unutulmaya yüz tutmuş olmasına rağmen Kuyu Kazmaca Oyunu, Evcik (Evcilik) Oyunu, Yüzük Oyunu, Kiremit Oyunu, Sekmenlik Oyunu, Kazık Oyunu, Üç Taş, Saklambaç, Kepçeci Oyunu, vb. oyunların varlığı bilinmektedir.

SONUÇ VE ÖNERİLER

Savaştepe Sarıbeyler'de bulunan arkeolojik çekiciliklerin güncel durumlarına baktığımızda, 1.derece arkeolojik sit alanı olarak tescil işlemleri yapılmasına rağmen gerekli olan kazı çalışmaları yapılamadığı bazılarının da âtıl durumda olduğu bilinmektedir. Yörede gerekli olan turizm işletmelerinin de bulunmaması ve seyahat acentelerinin tur programlarında da yer alamaması gibi nedenlerle turistlerin buraya gitmeleri söz konusu olamamıştır.

Dünyada günümüzde turizm amaçlı ziyaret edilen yerlerlerle ilgili yer yabancıları gittikçe farklılaşan beklentileri arasında özellikle farklı kültürleri merak edip, onları ziyaret etmek için kendilerine yeni rotalar belirlemektedirler. Bu değişen anlayışa hitap edebilecek yerlerden birisi de doğal ve kültürel çekicilikler açısından zengin bir potansiyele sahip Savaştepe Sarıbeylerdir. Ancak turizmin sözkonusu yerde geliştirilebilmesi için, var olan kültürel çekiciliklerin değişen turizm anlayışına göre düzenlenmesi ve bunlara birer turistik ürün özelliğinin kazandırılması da gerekir. Aynı zamanda, kültürel zenginlik öğelerinin turistler için kullanılabilir birer turistik ürün haline getirilmesi bir zorunluluktur. Bunun için araştırma alanı olan sözkonusu yerleşim yerinin kültürel zenginliklerinin koruma kullanma dengesi gözetilerek bilinçli ve planlı bir şekilde yürütülmesi gereken çalışmalara ihtiyaç bulunmaktadır.

Özellikle tescili yapılmış olan ve özel mülkiyet kapsamında yer alan Furuncuktepe Nekropol alanının kamulaştırılması yapılarak yüzey temizliğinin ve tabelalandırma çalışmalarının tamamlanması ivedilikle yapılması gereken çalışmalar arasında yer almaktadır. Çünkü sözkonusu alanın kaçak kazı ve tarımsal faaliyetler nedeni ile risk altında olduğu tespit edilmiştir. Benzer sorunları yaşayan arkoolojik çekicilik alanlarında birisi de Sarıbeyler Sazlıkdere Höyüğüdür. Bu alanın da en kısa sürede profesyonel kazı çalışmaları yapılarak yörenin kültür turizm çekim merkezine dönüştürülmesi gerekmektedir.

Sarıbeyler geleneksel el sanatları kültürünün zenginliği açısından da potansiyeli yüksek bir yerleşim yeridir. Özellikle yerel pamuk ve koyun yünlerinin işlenerek mekikli dokuma ve keçecilik el sanatı unutulmaya yüz tutmuş olsa da 2011 yılında kurulan Sarıbeyler Turizm Derneği'nin girişimleri ile yaşatılmaya çalışılmaktadır. Özellikle bitkisel örücülükle ilgili el sanatının da geçmişte olduğu gibi yerel malzemelerle yok olmaya yüz tutmuş geleneksel bilginin kullanılarak katma değerli ürünlerin üretilmesi gerkmektedir. Yerel halkın sözkonusu ürünlerden gelir elde etmelerinin desteklenmesi için kültür turizmine yönelik işletmelerin hayata geçirilmesi önem arz etmektedir. Bu konuda hız kazandırılması gereken çalışmalar arasında yerel yönetim tarafından başlatılan coğrafi işaretli ürünlerin el sanatlarında da gerçekleştirilerek sürdürülebilir kültür turizminin alt yapısının güçlendirilmesine destek olunabilecektir.

Stratejik açıdan önemli bir coğrafyada yer alan Savaştepe Sarıbeyler Mahallesi'nin sahip olduğu tarihi ve kültürel çekicilikler yanında ekolojik ve tarımsal üretimin arttırılma potansiyelinin de yüksekliği bulunmaktadır. Bu konuda Furuncuk Tepe Nekropol alanının bulunduğu mevkiide yer alan 1986 yılında açılan Sarıbeyler Sulama Barajının rekreasyon ve mesire alanı olarak kullanım potansiyelinin bulunması açısından önem arz etmektedir. Ancak sözkonusu alanda amacına uygun gerekli alt yapı çalışmaları yapılarak basit de olsa turistlerin ihtiyacını karşılayacak düzenlenmelerin yapılması gerekmektedir. Savaştepe Sarıbeyler geleneksel beslenme kültürü açısından da zengin bir yerleşim yeridir. Özellikle tescili yapılmış olan Savaştepe Sarıbeyler Seferberlik Çöreği'nin ve diğer yerel beslenme unsurlarının hammadde kaynaklarının üretilmesinin riske girmesine neden olunmaktadır. Bu konuda en büyük etken yörede yaşanan işgücü göçü nedeni ile tarım ve hayvancılığın azalması olarak görülmektedir. Balıkesir Büyükşehir Belediyesi (2024) 2025-2029 yıllarını kapsayan stratejik planında yörede belirli ürünlerinin marka değerlerinin arttırılması, satış ve e-ticaret gibi operasyonlarına kolaylık sağlanması amacıyla lojistik merkezi niteliğinde Savaştepe Gıda Üssü'nün kurulması konusunda çalışmalar yapılacak olması da olumlu gelişmeler arasında yer almaktadır.

Sarıbeyler'de Geleneksel çocuk oyunları kültürünün gelecek nesillere aktarılmasında sorunlar yaşanmaktadır. Yeni neslin sağlıklı, kendi kültürünün eğitimini almış, özgüvene sahip bireyler, toplumun sosyo-ekonomik ilerlemesinin de temelini oluşturacağının bilincinde olarak hareket etmeleri gerekmektedir. Ancak kentleşmenin hızla arttığı günümüzde başta aileler olmak üzere, eğitimciler doğa odaklı eğitim tarzı ile; seyahat planlayıcıları ekolojik tarım turizmi,vb. sektör ve yerel yönetim iş birliği ile top yekûn bir seferberlik başlatması yörede kültür turizm değerlerinin sağlıklı bir şekilde yaşatılması açısından önem arz etmektedir.

Araştırma alanı Savaştepe Sarıbeyler Akhisar zonunun etkisi altında bulunması ve 1. derece deprem bölgesinde yer almasından dolayı risk oluşturmasına rağmen kültür turizm çekicilikleriyle zengin ve diğer turizm çeşitleri ile de entegrasyonu yüksek bir potansiyele sahiptir. Saatcı, (2023) ve Şat (2024) çalışmalarında özellikle yöresel mutfak kültürünün metaforlarla tanıtılması) çalışmalarında ürünlerin tanıtımında simgelerin kullanımı tanıtıcı etiketler ve reklamlar yapılarak ambalajlanma, broşür hazırlanma yoluna gidilmesi destinasyonların markalaşmasını güçlendirerek, rekabet piyasasında pazarlama çalışmalarını olumlu olarak desteklemesi öngörülmektedir.

Yerel kültürel değerler yöre paydaşlarının da katkısı ile daha kalıcı olabilmektedir. Bu konuda yapılması gerekenler arasında "Sarıbeyler Kültürel Miras Festivali'nin hayata geçirilmesi hem yerel kültürün benimsenmesi hemde hem yörenin tanıtımı açısından önem arz etmektedir. Yapılacak olan çalışmalarla kültürel ve doğal kaynakların turizmde etkin kullanılabilecek olması hem sosyolojik hem de ekonomik bazı unsurları da beraberinde

getirektir. Sonuç olarak kültür turizminin şekillenmesinde gerekli altyapı çalışmalarının ve yatırımların hız kazanmasına katkı sağlanabilecektir.

ABSTRACT

Gas chromatography (GC) is a sophisticated analytical technique that separates and identifies volatile substances in a mixture using a mobile gas phase and a stationary phase, allowing for both qualitative and quantitative analyses. The purpose of this article is to provide a quick overview of the many applications of GC in food analysis in comparison to high-performance liquid chromatography (HPLC), as well as to discuss cutting-edge GC techniques utilized in the most common applications.analysis of food is required for several reasons, including detection of harmful components, monitoring legislation, detecting adulteration, formulation of controlled diets, managing formulation throughout product development and detecting changes in food during storage and processing . Finally, GC's high sensitivity, selectivity, and adaptability make it an invaluable tool for ensuring the safety of food supplies. As food analysis evolves, GC will remain an important tool for protecting consumers and maintaining the highest standards of food quality.One of the primary advantages of GC is its ability to handle complicated mixtures with precision, making it important in quantitative and qualitative analysis. Furthermore, combining GC with mass spectrometry (GC-MS) improves identification capabilities by providing structural information about analytes. However, GC is confined to thermally stable and volatile molecules, making it unsuitable for nonvolatile or strongly polar chemicals. Despite these limitations, gas chromatography is a fundamental component of analytical chemistry, providing unparalleled efficiency in chemical separation and analysis across a wide range of scientific disciplines.

Keywords : Gas chromatography, Food analysis , Qualitative, sensitivity and techniques.

INTRODUCTION

Food is a necessary component of life, we should know that the food which we consume are non toxic, free from chemicals. That should not cause any harmful effect to our body. Chemical analysis is the sole way to determine which chemicals are present in food and in what quantities. Only then can we determine the nutritional requirements for the various substances and their impact on health. Analytical chemistry has played a significant role in human progress by allowing for the identification and quantification of food components. Chromatography, in particular, has been critical for the separation of numerous organic compounds in food.

Introduction of Gas Chromatography (GC) GC was first employed 50 years ago to assist analyze food composition, identify nutritional needs, improve food quality, and introduce new foods. Furthermore, GC has been the sole effective method for measuring many of the organic pollutants found at trace levels in complex food and environmental samples. GC has played an important role in educating humans about the importance of using agricultural and industrial chemicals with prudence in order to protect our health, food supply, and the ecology on which we rely for survival. GC-aided scientific discoveries in agricultural and food sciences have resulted in more abundant and healthier food, longer and better lives, and a growing population of 6 billion people [1].

HISTORICAL BACKGROUND

Early in the 20th century, the groundwork for gas chromatography was established. In 1903, Russian botanist Mikhail Tsvet presented the fundamentals of chromatography by separating plant pigments using a column filled with adsorbents.

However, the development of gas chromatography as we know it today did not occur until the 1950s. Theoretical foundations for gas-liquid separations were established by Archer John Porter Martin and Richard Laurence Millington Synge, who first created liquid-liquid chromatography. The first gas-liquid chromatograph was created in 1952 by Anthony T. James and Archer J.P. Martin, opening up new possibilities for chemical analysis [2].

PRINCIPLE OF GAS CHROMATOGRAPHY

There are two steps towards the mishmash: a fixed phase and a mobile phase, also known as this mixture, which leads to the stationary phase utilizing only a carrier gas. Molecules in the mobile phase pass over to the stationary phase and interact. A magnitude, but every interaction's resonance towards the stationary phase varies due to each component's characteristics and structural peculiarities. As a result, depending on the pushing force, various elements have varying columns of residence time and exit in distinct sequences[3].

COMPONENTS OF GAS CHROMATOGRAPHY

1. Mobile phase
2. Sample injector
3. The separation column
4. Oven
5. Detectors
6. Data acquisition

★ **Mobile Phase**

Typically, three different gas chromatography make use of various types of gas:

Carrier Gas: Carrier gas is required for the transfer of the injected sample to the separation columns. Furthermore, they are still responsible for conveying separated components to the detectors after that. E.g: Helium, Hydrogen, and Nitrogen

Fuel gas: They support the flame in a hydrogen based flame ionization detector (FID).

Zero air: This is cleaned air that supports the combustion of the flame in the detector by acting as an oxidant. The above mentioned three are blended in the desired ratio before being introduced to the gas chromatographic apparatus.

★ **Sample Injector**

In gas chromatography, the sample that needs to be analyzed is injected using a sample injector. A representative has been infused utilizing such a calibrated syringe. A sampler and mobile phase should be in the same physical condition because they must travel together. Since the mobile phase in gas chromatography has been in a gaseous state, a sample must also be in a gaseous condition. A heater built inside the sample injector enables the vaporization of liquid samples. If the model is solid, it is crushed, ground, and transformed into a liquid state [4].

★ **Column:**

This is the heart of the GC system, where the separation of compounds occurs. It's a long, narrow tube packed or coated with a stationary phase. There are two main types:

Packed columns: Filled with a solid support coated with a liquid stationary phase.

Capillary columns: Have a thin layer of stationary phase coated on the inner wall.

★ **Oven**

The column is housed in an oven to maintain a precise and controlled temperature. Temperature control is crucial for achieving optimal separation. The oven can operate at a constant temperature (isothermal) or with a programmed temperature gradient.

★ **Detector:**

This component detects the separated compounds as they elute from the column. It generates an electrical signal proportional to the concentration of each compound.

Various types of detectors are used, including:

- Flame ionization detectors (FID)
- Thermal conductivity detectors (TCD)
- Electron capture detectors (ECD)
- Mass spectrometers (MS)

★ **Data Acquisition System:**

This is typically a computer that records and processes the detector signals, producing a chromatogram. The chromatogram displays peaks that correspond to the separated compounds, allowing for qualitative and quantitative analysis. These components work together to enable the separation, detection, and analysis of volatile compounds in a wide range of applications. Sources and related content [5].

NEED FOR FOOD ANALYSIS

Food analysis is done to verify the nutritional value and safety of food. Foods and raw materials shouldn't include any toxic ingredients or microbe concentrations that are unsafe. Eating out and purchasing food from the grocery store should be safe. An approved laboratory must analyze the food producers under official food control. Accredited laboratories also carry out numerous additional kinds of food analysis.

For instance, peanut butter in the USA must include at least 90% peanuts, a total fat level of no more than55%, and a maximum of 10% other components like salt and sugar. Everyone can meet and maintain these requirements with the help of food analysis, from product makers to ingredient suppliers

- **Protecting Consumers**

Consumer safety is a top priority in the food and beverage industry. Before they are placed on stores shelves for customer purchase, analytical procedures are employed to screen materials and completed goods. For instance, foodborne bacteria and viruses can be found in items like lettuce using polymerase chain reaction (PCR) assays. Toxins left behind by pesticides and herbicides, as well as traces of metal, wood, glass, and other pollutants, are also found using laboratory test [6].

- **Food Fraud Detection**:

Food analysis helps to identify food fraud, such as adulteration or mislabeling. This is important for protecting consumers and ensuring fair trade practices.

- **Shelf-Life Determination:**

Analyzing food helps to determine how long it will remain safe and of good quality. This is crucial for establishing "best before" and "use by" dates.

- **Quality Control:**

Food analysis ensures that products meet specific quality standards in terms of composition, texture, flavor, and appearance. It helps maintain consistency in production and ensures that consumers receive products that meet their expectations.

- **Nutritional Labeling:**

Accurate nutritional information is essential for consumers to make informed dietary choices. Food analysis provides the data needed for accurate labeling, including information on calories, fats, proteins, vitamins, and minerals [7].

APPLICATIONS OF GAS CHROMATOGRAPHY

- **Environmental Evaluation**

Pesticides, herbicides, industrial pollutants, and volatile organic compounds (VOCs) can all be found and measured in soil, water, and air using gas chromatography (GC).Finding dangerous gases like methane, toluene, and benzene in the surrounding air is known as air quality testing. Trace organic contaminants in drinking water and wastewater are identified through water analysis.

- **Forensic science;**

Finding drugs, poisons, and alcohol in biological samples (blood, urine, etc.) is known as toxicology. Analyzing flammable elements and accelerants from fire debris is known as arson investigation.

Explosives Detection: Finding traces of gunpowder and explosive remnants [8].

- **The pharmaceutical sector;**

Drug purity testing involves identifying and measuring contaminants and active pharmaceutical ingredients (APIs). Stability Studies: Tracking the byproducts of medication deterioration over time.

Regular examination of raw materials and finished goods is known as quality control.

- **The food and beverage sector**

Analysis of natural flavors, additives, and essential oils is known as flavor and aroma profiling. Finding pollutants, preservatives, and pesticide residues is known as residue analysis. Alcohol testing: Identifying fusel oils and ethanol in drinks.

- **Applications in medicine and biomedicine;**

Breath analysis is the process of finding volatile biomarkers to diagnose diseases like cancer and diabetes.

Monitoring the amounts of anesthetic gases used during surgery is known as anesthetic gas monitoring.

The process of analyzing biological fluids for diagnostic reasons is known as hormone and metabolite detection [9].

LIMITATIONS OF GAS CHROMATOGRAPHY

- **Limited to volatile and thermally stable compounds.**

Non-volatile or thermally labile substances (such as proteins, big polymers, and many medications) cannot be examined directly by GC because they break down before vaporization.The compounds must be in the gas phase at the working temperature.

- **Sample derivatization may be required.**

Some compounds (such as polar, acidic, or basic molecules) may require chemical alteration (derivatization) before becoming volatile or thermally stable. This adds more steps, time, and potential errors to the process [10].

- **High initial and maintenance costs.**

GC apparatus, particularly when combined with detectors such as mass spectrometers (GC-MS), are costly to purchase and operate. Carrier gases such as helium are expensive and require high purity.

- **Complex Sample Preparation.**

Before GC analysis, biological or environmental samples may need to be thoroughly pre-treated to eliminate water, particulates, or interfering chemicals.

- **Limited to inorganic analysis.**

GC is not suited for direct analysis of non-volatile inorganic substances, metals, or salts [11].

LATEST ADVANCEMENTS IN GAS CHROMATOGRAPHY COLUMN TECHNOLOGIES

1.Stationary Phase Innovations

In gas chromatography, the stationary phase is essential for analyte separation. Recent advances have sought to enhance selectivity, efficiency, and durability.

Novel Phases: Manufacturers have created phases with unique selectivity, such as mixed-mode phases that combine polar and non polar interactions. These phases improve separation of complex samples.

Porous Layer Open Tubular (PLOT) Columns: PLOT columns have a porous coating on the inner surface that enables for efficient gas separation. They have applications in environmental analysis and gas purity assessment [12].

2. Column Dimension Optimization

The dimensions of the column have a considerable impact on resolution, speed, and sensitivity. Shorter and narrower columns save analysis time while preserving or improving resolution. This trend is most visible in fast GC applications that demand rapid separations.

Microfabricated Columns: Advancements in microfabrication techniques have enabled the manufacture of microcolumns with smaller inner diameters.

3. Multidimensional Gas Chromatography (MDGC).

MDGC involves the use of multiple columns with varying selectivities to provide greater separation capabilities.

Comprehensive Two-Dimensional Gas Chromatography (GCxGC): combines two separate columns, resulting in increased peak capacity and resolution for complex materials

Heart-Cutting MDGC: transports only a fraction of the effluent from the first column to the second column. This method boosts the sensitivity of trace analysis [13].

4. Column Coating Technology

The column's coating alters the interactions between analytes and the stationary phase.

Chemically bound Phases: Columns with chemically bound phases exhibit greater stability and repeatability, resulting in longer column lifetimes and consistent performance.

Ionic Liquid Coatings: Ionic liquids provide good selectivity and thermal stability, allowing for the analysis of high-temperature samples while boosting column longevity.

5. Column Temperature Control

Precise temperature control is required for consistent and precise results.

Active Cooling and Heating Systems: Innovative column ovens with active cooling and heating systems provide quick temperature adjustments.

Programmable Temperature Ramps: Advanced temperature programming allows for accurate column temperature control, giving in excellent separations for a broad range of analytes.

6. Data management and automation

The advances in gas chromatography are not limited to column hardware. Software and automation play a crucial role.

Machine Learning Integration: Some recent GC systems include machine learning algorithms to analyze data in real time, boosting peak identification and overall dependability.

Automated Column Switching: Automated column switching systems allow for the use of numerous columns in a single assay, hence increasing the range of analytes that may be efficiently separated [14].

CONCLUSION

In conclusion, gas chromatography (GC) plays a vital role in food analysis due to its ability to separate, identify, and quantify complex mixtures of volatile compounds present in food products. It is particularly effective for analyzing flavor compounds, additives, preservatives, contaminants, and essential oils in food. The high sensitivity, precision, and versatility of GC make it an invaluable tool for ensuring food safety, quality control, and regulatory compliance. Its ability to provide detailed and accurate results also contributes to the ongoing advancement of food science and technology. However, the technique requires specialized equipment and expertise, which can limit i ts accessibility for some applications. Overall, GC remains one of the most reliable analytical techniques in food analysis.

ABSTRACT

Although the Quran provides definitive provisions on the obligation of zakat, it does not provide detailed information on who is obliged to pay zakat. Detailed information on the measure of wealth (nisab) is clarified through the hadiths and practices of the Prophet Muhammad. In the conditions of that day, who would be considered rich was determined in a way based on gold, silver and some other goods used as money. In the classical jurisprudence literature, the nisab of zakat is explained based on the practices of the Prophet Muhammad, based on gold, silver, animals and some land products. In the contemporary period, different ideas are expressed among Islamic jurists on how to determine the nisab of zakat, in addition to the classical understanding. This study focuses on the principles that should be valid in determining the measure of wealth in today's conditions. The criteria for wealth may vary in different economic and social conditions in Islamic societies and around the world. Within modern financial systems and global economic structures, the calculation and implementation of zakat may pose practical difficulties. However, the fundamental purpose of zakat remains the same: it should be used as a tool to strengthen the principles of social justice and solidarity in Islam and to maintain balance within society. Consequently, the importance of zakat and the criteria for wealth are among the fundamental elements that shape the social and economic order of Islam. Who is/should be considered rich may also change locally due to the social positions of the communities. From this point of view, it is not understood that the studies on who should be considered rich are important.

Keywords: İslamic law, Zakat, Nisab, Wealth, Social justice.

İSLAM HUKUKUNDA ZEKÂT VE ZENGİNLİK ÖLÇÜLERİ

ÖZET

Kur'an zekâtın farziyyeti konusunda kesin hükümler ortaya koymakla birlikte, kimlerin zekât yükümlüsü olacağı hakkında ayrıntılı bilgi vermemektedir. Zenginliğin ölçüsü (nisab) ile ilgili ayrıntılı bilgi Hz. Peygamber'in hadisleri ve uygulamaları ile açıklık kazanmaktadır. O günün şartlarında para olarak kullanılan altın, gümüş ve diğer bir kısım mallar üzerinden kimlerin zengin sayılacağı bir şekilde belirlenmiştir. Klasik fıkıh literatüründe de Hz. Peygamber'in uygulamaları esas alınarak altın, gümüş, hayvanlar ve bir kısım toprak mahsulleri üzerinden zekâtın nisabı açıklanmaktadır. Çağdaş dönemde İslam hukukçuları arasında zekâtın nisabının nasıl belirleneceği konusunda klasik anlayışın yanında farklı düşünceler de dile getirilmektedir. Bu çalışma günümüz şartlarında zenginliğin ölçüsünü belirlenme konusunda hangi esasların geçerli olması gerektiği konusu üzerinde durmaktadır. Zenginlik kriterleri, İslam toplumlarında ve dünya genelinde farklı ekonomik ve sosyal koşullar altında değişiklik gösterebilir. Modern finansal sistemler ve küresel ekonomik yapılar içinde, zekâtın hesaplanması ve uygulanması pratik zorluklar doğurabilir. Ancak zekâtın temel amacı, İslam'ın sosyal adalet ve dayanışma ilkelerini güçlendirmek ve toplum içindeki dengeleri korumak için bir araç olarak kullanılması gerektiği gerçeği değişmez. Sonuç olarak, zekâtın önemi ve zenginlik kriterleri, İslam'ın sosyal ve ekonomik düzenini şekillendiren temel unsurlardan biridir. Kimlerin zengin olarak kabul edileceği/edilmesi gerektiği toplumluların sahip oldukları sosyal konumları gereği mahallî olarak ta değişebilmektedir. Bu noktadan hareketle kimlerin zengin olarak kabul edilmesi gerektiği konusundaki çalışmaların önemli olduğu anlaşılmaktadır.

Anahtar Kelimeler: İslam Hukuku, Zekât, Nisab, Zenginlik, Sosyal Adalet.

Giriş

İslam'ın temel ibadetlerinden biri olan zekât, Müslümanlar için sosyal ve ekonomik bir sorumluluğu ifade eder. Zekât, kelime anlamıyla 'artırmak', 'temizlemek' anlamlarına gelir ve İslam toplumlarında malın temizlenmesi, artırılması ve paylaşılmasını simgeler. Bu ibadet, Müslümanlar arasında dayanışmayı, toplumsal adaleti ve fakirlerin desteklenmesini sağlamak amacıyla farz kılınmıştır. Kur'an-ı Kerim'de birçok ayette zekâtın önemi vurgulanır ve Müslümanlar bu ibadeti yerine getirerek Allah'a ibadet etmiş olurlar. Zekât, kişinin sahip olduğu belli mallardan belirli bir oranda fakirlere, yoksullara, yetimlere, muhtaçlara ve diğer ihtiyaç sahiplerine verilmesini ifade eder. Bu ibadet, İslam toplumlarında sadece bir ibadet pratiği değil, aynı zamanda toplumsal bir düzenleme ve refah paylaşımı aracı olarak da kabul edilir. Zekâtın özünde, zengin ile fakir arasında dengenin sağlanması ve toplumun her kesiminin refah seviyesinin artırılması hedeflenir. Kur'an -ı Kerim'de zekâtın kimlere verileceği haricinde zekât ibadeti hakkında ayrıntılı bir hüküm yoktur. Zekât ile ilgili ayrıntılı hükümler Hz. Peygamber (s.a.v.) tarafından belirlenmiştir. Bu hükümlerden biri de zekât nisaplarıdır. Altın, gümüş, ticaret malları, deve, sığır, koyun ve toprak mahsulleri için farklı nisaplar belirlenmiştir. Gümüşün para olma özelliğini kaybetmesi ve altının da zaman zaman değerinde ciddi düşüşler olması yakın tarihte zekât nisapları konusunda yeni arayışları ve tartışmaları beraberinde getirmiştir. Bu ifadelerden dolayı islam toplumunda zekatın nasıl bir konumda yer aldığını anlamak ve bu ibadetin toplumsal ve ekonomik yönlerini kavramlarla açıklayarak değişen dünya düzeninde ne gibi soru ve sorunlara kaynak olmayı bu bildirimiz amaçlamaktadır.

1.Zekat

Zekât, İslam hukukunun temel ibadetlerinden biri olup, toplumsal eşitlik ve adaletin sağlanmasında önemli bir rol oynar. Bu ibadet, bir Müslümanın belirli şartlar altında sahip olduğu malın bir kısmını, ihtiyacı olanlara vermesini ifade eder. Zekât, yalnızca bir mali yükümlülük olmanın ötesinde, insanın manevi gelişimine katkı sağlayan bir ibadettir. İslam, zenginlerin bu şekilde yoksullara yardımcı olmalarını teşvik ederek, toplumun ekonomik dengeye ulaşmasını hedefler. Bu yönüyle zekât, sadece bireyler arasında değil, toplum genelinde de barış ve huzurun tesisi için bir araç olarak görülür.[1]

Zekâtın İslam'daki yeri hem ibadet hem de hukuki bir yükümlülük olarak oldukça güçlüdür. İslam hukuku, zekâtın verilmesini, Müslümanlar arasında maddi eşitsizliklerin giderilmesi için bir araç olarak kabul eder. Bu bağlamda zekât, sadece mali bir yükümlülük değil, aynı zamanda kişisel ve toplumsal sorumluluk anlamına gelir. Bu sorumluluk, sadece fakirlere yardım etmeyi değil, toplumda sosyal adaletin sağlanmasını da amaçlar. Zekât, sosyal yardımlaşma ve dayanışmanın önemli bir göstergesi olup, kişileri cimrilikten uzak tutarak, infak kültürünü teşvik eder.[2]

Zekâta tabi mallar, belirli kriterlere göre sınıflandırılır. İslam hukukunda zekâtın verilmesi gereken mallar arasında ticaret malları, tarımsal ürünler, hayvanlar, altın ve gümüş gibi değerli metaller bulunur.[3] Her bir mal türü için zekât oranları ve şartları farklılık gösterir. Zekât, malın türüne göre hesaplanarak, nisap seviyesine ulaştığında verilmesi gereken bir oranda fakirlere

[1] Balta, Y. (2015). İslam Hukûku'nda Zekât Malları ve Nisapları. İstanbul Üniversitesi Sosyal Bilimler Enstitüsü, Yayınlanmamış Doktora Tezi, İstanbul, 114-124.
[2] Aktan, H. (1986). İslâmda madenlerin hukuki statüsü. Erzurum: Atatürk Üniversitesi Basımevi. 1986: 26.
[3] Zutiç, M. (2015). Kur'an'da zekat kavramı (Master's thesis, Uludağ Üniversitesi) 109-116.

yönlendirilir. İslam'ın bu düzenlemesi, toplumun ekonomik dengesinin sağlanmasına yönelik önemli bir katkı sağlar ve gelir dağılımındaki eşitsizlikleri ortadan kaldırmayı amaçlar.[4]

Zekât, belirli bir mal miktarına ve şartlara bağlı olarak farz kılınır. Müslümanların, sahip oldukları belirli mal ve mülkün zekâtını vermeleri gerekmektedir. Zekât, genellikle yıllık bir hesaplama ile yapılır ve bu malın üzerinden bir yıllık süre geçtiğinde zekâtın verilmesi gereken miktar hesaplanır. Zekâtın verilmesi gereken mallar, ticaret malları, tarım ürünleri, madenler, nakit para gibi farklı kategorilerde değerlendirilebilir. Zekât, bu malların belirli bir kısmını, genellikle %2,5 oranında, ihtiyaç sahiplerine verilmesi gereken bir ibadettir. Her bir mal çeşidi için farklı oranlar ve kurallar belirlenmiştir.[5]

1.1. Zekâtın Kapsayıcı Tanımı ve Amacı

İslam'da zekât, bir kişinin malının ve gelirinin bir kısmının fakirlere, yoksullara ve ihtiyaç sahiplerine verilmesi olarak tanımlanmaktadır, ancak bu tanım, zekâtın derin anlamını tam olarak yansıtmaz. Zekât, aslında bir nevi ruhsal arınma, kalbin temizlenmesi ve Allah'a yakınlaşma sürecidir. Bu açıdan zekât, kişisel gelişimle doğrudan ilişkilidir ve sadece dışsal bir aktarma işleminden ibaret değildir. Mal, bir bireyin sahip olduğu değerlerin ve gücün sembolüdür; zekât, bu gücün Allah'ın rızası için paylaşılmasıdır.[6]

Zekâtın amacı, malın ve servetin insanı yönlendiren değil, insanın malı yönlendiren bir güç olmasıdır. Bu, zekâtın manevi bir işlevi olup, malın, sahibinin sahip olduğu en büyük nimetlerden biri olduğu hatırlatılır. Zekât vermek, kişiyle Allah arasındaki ilişkiyi güçlendirir, aynı zamanda toplumda ihtiyaç sahiplerinin varlığını hissedip, onları ihmal etmeden adaletli bir paylaşım yapmayı sağlar.[7]

Zekâtın kapsayıcı tanımının en önemli unsuru, zenginlerin mallarının yalnızca fakirlere değil, toplumun tüm kesimlerine adaletli bir şekilde dağılmasıdır. İslam'da zekât, sadece bir yardımlaşma aracı değil, aynı zamanda toplumsal adaletin ve eşitliğin sağlanması için temel bir araçtır.[8] Bu yönüyle zekât, toplumdaki dengesizlikleri ve eşitsizlikleri gidermeye yönelik bir çözümdür. İslam toplumu, her bireyin kendi servetini belirli bir ölçüde paylaşmasını bekler. Bu, hem kişinin içindeki bencillikten arınmasını sağlar hem de toplumu daha adil bir yapıya kavuşturur. Zekât, zenginle fakir arasındaki uçurumu daraltır ve insanları daha eşit bir düzlemde buluşturur.[9]

1.1.2. Zenginlik Ve Nisap Kavramları

Zenginlik ve nisap kavramları, İslam hukukunun temel taşlarından biri olan zekâtın uygulanmasında büyük bir öneme sahiptir. Zenginlik, bir kişinin sahip olduğu mal varlığının, sosyal ve ekonomik bakımdan ne kadar değerli ve yeterli olduğunu belirleyen bir kavramdır.

Nisap ise, zekâtın farz olabilmesi için bir kişinin sahip olması gereken minimum mal miktarını ifade eder. Bu iki kavram, zekâtın kimlere ve hangi mal varlıklarına uygulanacağı konusunda belirleyici bir rol oynar. İslam hukukunda zenginlik, sadece parasal değer taşımayan, aynı zamanda sahip olunan malların çeşitliliği ve değerinin de göz önünde bulundurulması gereken bir kavramdır.[10]

Zenginlik ve nisap arasındaki ilişki, zekâtın temel prensiplerinden biridir. Nisap miktarı, çeşitli İslam mezheplerinde farklı yorumlara tabi tutulmuş olsa da genel olarak altın ve gümüşle yapılan ticaretin üzerinden hesaplanır. Hanefî mezhebi bu konuda altın ve gümüşün zekâta tabi mal sayıldığını vurgular. Nisap miktarına ulaşan her mal, zekâta tabi kılınır. Bu sistem, zenginlik ve sahip olunan malın kıymeti üzerinden zekâtın adil bir şekilde dağıtılmasını sağlar.[11]

Nisap, sadece maddi bir kavram olmanın ötesinde, bir kişinin toplumsal sorumluluğunu yerine getirebilmesi için bir eşik olarak görülür. Bu eşik, bireyin daha fazlasına sahip olmasının, onu zorunlu kılacak şekilde zekât vermesi gerektiğini ortaya koyar. Bununla birlikte, nisap miktarının günümüz koşullarında nasıl değerlendirileceği ve hangi malların bu sınır içinde yer alacağı, çağdaş İslam düşünürleri arasında farklı yorumlara yol açmaktadır. Özellikle, altın ve gümüşün değerinin dalgalanması, dijital varlıkların ortaya çıkması ve globalleşen ekonomiler, bu kavramların güncel yorumlarını etkilemektedir. Günümüzdeki ekonomik sistemlerde, sadece fiziksel varlıklar değil, finansal araçlar ve hatta kripto paralar da zekâtın kapsamına dahil edilebilir.[12]

Zenginlik, nisap kavramının ötesinde, İslam toplumlarında ekonomik dengeyi sağlama adına önemli bir işlev görür. Toplumun refahına katkı sağlama sorumluluğu olarak da değerlendirilir. Bu sorumluluk, zekâtın verilmesiyle yerine getirilir ve zenginlerin toplumdaki daha az şanslı bireylere destek olmasını teşvik eder. İslam'ın ekonomik eşitlik anlayışını güçlendiren bu model, toplumun tüm kesimlerinin ihtiyaçlarının gözetilmesini ve güçsüzlerin korunmasını amaçlar.[13]

Ancak zenginlik kavramının modern yorumları da göz ardı edilmemelidir. Çağımızda zenginlik, fiziksel malların ötesine geçerek yatırım araçlarına, gayrimenkul yatırımlarına ve dijital varlıklara kadar genişlemiştir. Bu durum, İslam dünyasında zekât uygulamalarını yeniden şekillendirmiştir. Modern ekonomi ve finansal sistemde zenginlik, sadece altın ve gümüşle ölçülmeyip, tüm değerli mal varlıkları ve gelirleri kapsayan geniş bir yelpazeye yayılmaktadır. Bu sebeple, zenginlik kavramının günümüz ekonomik şartlarında yeniden ele alınması, zekâtın nasıl uygulanması gerektiğine dair önemli soruları gündeme getirmektedir.[14]

Birçok çağdaş alim, nisap miktarının belirlenmesinde güncel ekonomik faktörlerin dikkate alınması gerektiğini savunur. Altın ve gümüşün değerindeki değişiklikler, nisap miktarını da etkiler. Bu bağlamda, İslam ülkelerinin ekonomi ve finans politikaları, zekâtın hangi mallar

[10] Balta, Y. (2015). İslam Hukûku'nda Zekât Malları ve Nisapları. *İstanbul Üniversitesi Sosyal Bilimler Enstitüsü, Yayınlanmamış Doktora Tezi, İstanbul*, 137-140.
[11] Özarslan, S. S. (2022). İslam Hukuk Sistemine Dahil Ülkelerden İran ve Arabistan Anayasalarında Verginin Kanuniliği İlkesine Dair Bir Bakış. *Bartın Üniversitesi İslami İlimler Fakültesi Dergisi,* (18), 32-50.
[12] Sözen, H. (2010). *İslam Hukukunda gayrimenkul malların zekatı* (Master's thesis, Ankara Universitesi (Turkey)), 12-16.
[13] Aydınbaş, Y. E. (2024). Ekonomik, sosyal ve hukuki boyutlarıyla Türkiye'de zekât analizi.
[14] Manav, A. B., & Haçkalı, A. (2020). Günümüzde Gayrimenkul Malların Zekâtına Dair Görüşlerin Değerlendirilmesi. *Trabzon İlahiyat Dergisi, 7*(2), 263-296.

üzerinden alınacağına dair çok önemli bir etki yapmaktadır. Örneğin, bazı ülkelerde para birimi ya da altın bazlı değerler üzerinden yapılan hesaplamalar, nisap miktarını daha doğru ve geçerli kılmak için güncellenebilir. Modern zamanlarda zenginliğin tanımlanmasında, kişinin sahip olduğu nakit ve malvarlıklarının yanında, sahip olunan finansal yatırımlar da göz önünde bulundurulmalıdır.[15]

Zenginlik ve nisap, İslam'ın ekonomik adalet anlayışını şekillendiren en önemli ilkelerden biridir. Bu ilkeler, bireylerin sorumlu bir şekilde mal biriktirmelerini ve kazançlarını toplumla paylaşmalarını sağlar. Nisap, sadece bireysel bir yükümlülük değil, toplumsal dayanışmanın temeli olarak da kabul edilir. Zenginlik, insanların sadece kendi çıkarlarını gözetmektense, toplumun refahına katkı sağlama bilincine sahip olmalarını teşvik eder. Bu anlayış, sosyal adaletin ve eşitliğin sağlanmasında kritik bir rol oynar ve her bireyin, sahip olduğu mal ve servetle toplumuna katkıda bulunmasını öngörür. Bu bakış açısı, İslam ekonomisinin sadece bireysel değil, toplumsal kalkınmayı da hedefleyen bir sistem olarak algılanmasını sağlar.[16]

2. Kur'an-ı Kerim'de Zekât ile İlgili Ayetler

Kur'an-ı Kerim, zekâtı çok önemli bir ibadet olarak kabul etmiş ve bunu çeşitli ayetlerle müminlere emretmiştir. Zekât, sadece malın bir kısmının fakirlere verilmesi olarak değil, bir nevi malın temizlenmesi ve sahibinin ruhsal olarak arınması olarak da tanımlanabilir. Bakara Suresi'nin 177. ayetinde, zekâtın yalnızca bir yardımlaşma aracı değil, aynı zamanda bir Allah'a yakınlaşma ve bir nevi arınma vesilesi olduğu ifade edilmiştir. "İhtiyaç sahiplerine, zekâtınızı verin" şeklinde belirtilen ayetler, zekâtın sosyal sorumluluk gereği yerine getirilmesi gereken bir yükümlülük olduğunu vurgular.[17] Zekât, aynı zamanda toplumsal adaletin sağlanması ve fakirlerin korunması için bir araç olarak da kullanılmıştır. Örneğin, Tevbe Suresi'nin 60. ayeti, zekâtın, ihtiyaç sahiplerinin yanı sıra çeşitli sosyal gruplara, yetimlere, fakirlere, yolda kalmışlara, kölelere ve diğer mağdur durumda olanlara verilmesi gerektiğini belirtir. Aynı şekilde, Zümer Suresi'nin 9. ayetinde, sadakanın ve zekâtın yalnızca maddi bir yardım olmadığını, manevi arınmayı sağlamak için de gerekli olduğuna dikkat çekilir. Kur'an'ın zekât ile ilgili bu ayetleri, Müslümanların birbirine yardım etmesi, toplumun dengesinin korunması ve zengin ile fakir arasındaki uçurumun ortadan kaldırılması için birer kılavuz olmuştur.

2.1. Hz. Peygamber'in Zekat Ve Zenginlik Tanımına Genel Bir Bakış

Hz. Peygamber'in zenginlik anlayışı, İslam'ın temel değerlerinden biri olan adaletin sağlanması ve toplumsal dayanışmanın güçlendirilmesi üzerine şekillenmiştir. Onun öğretileri, zenginliği sadece maddi varlıkların birikimi olarak değil, aynı zamanda bu varlıkların adaletli bir şekilde yönetilmesi ve ihtiyaç sahipleriyle paylaşılması gereken bir kaynak olarak ele almıştır. Hz. Peygamber'in hadislerinde ve yaşamında zenginlik, bireylerin sahip oldukları mal ve mülkten ziyade bu varlıkların nasıl kullanıldığı ve topluma nasıl katkı sağladığıyla ilgilidir. Hz. Peygamber'in zenginlik konusundaki öğretileri, Müslümanların mal ve mülk sahibi olmalarını teşvik ederken, aynı zamanda bu sahip olunanların toplumsal adalet ve dayanışma içinde nasıl

[15] Sözen, H. (2010). *İslam Hukukunda gayrimenkul malların zekatı* (Master's thesis, Ankara Universitesi (Turkey)), 21-22.

[16] Balta, Y. (2019). İslam Hukuku'nda Zekâta Konu Olması Açısından Mal Tanımı. Gaziosmanpaşa Üniversitesi İlahiyat Fakültesi Dergisi, 7(1), 45-72.
[17] Maçin, H. (2014). İslam Hukukunda zekat matrahları ve vergi ilişkisi (Doctoral dissertation, Necmettin Erbakan University (Turkey)), 45-50.

kullanılması gerektiğini de vurgular. Zenginlik, onun perspektifinde bireysel bir kazanç olarak değil, toplumun refahı için bir kaynak olarak görülür.[18]

Bu nedenle, zekât gibi ibadetler zenginlerin mal varlıklarının belirli bir oranını ihtiyaç sahipleriyle paylaşmalarını gerektirir, bu da zenginliğin sadece bireyin değil, toplumun ortak bir meselesi olduğunu gösterir. Hz. Peygamber'in zenginlik tanımı aynı zamanda bireylerin maddi varlıklarının yanı sıra manevi ve toplumsal varlıklarını da kapsar. Günümüzde, Hz. Peygamber'in zenginlik anlayışı, küresel düzeyde artan gelir eşitsizlikleri ve sosyal adalet sorunları karşısında önemli bir rehberlik sunmaktadır. İslam toplumlarında ve diğer toplumlarda, zenginlik yönetimi ve toplumsal sorumluluklar konusunda Hz. Peygamber'in öğretilerinin yeniden değerlendirilmesi ve uygulanması, sürdürülebilir kalkınma ve sosyal huzurun sağlanması açısından büyük önem taşımaktadır.[19]

2.1.1. Coğrafi Ve Kültürel Farklılıkların Zekât Uygulamalarına Etkisi

Coğrafi ve kültürel farklılıklar, zekât uygulamalarını etkileyen önemli faktörlerdir ve İslam toplumlarında zekâtın nasıl hesaplandığı, toplandığı ve dağıtıldığı üzerinde derin etkiler bırakır. Bu farklılıklar, zekâtın yorumlanmasını, uygulama şeklini ve etkilerini büyük ölçüde belirler. Coğrafi farklılıklar, ekonomik yapılar ve kaynak dağılımı üzerinde doğrudan etkiye sahiptir. Örneğin, kırsal ve tarım ağırlıklı bölgelerde zekâtın hesaplanması ve toplanması, tarım ürünlerinden elde edilen gelirler üzerinden yapılabilir. Bu bölgelerde zekât, tarım ürünlerinin hasat zamanında ve bu ürünlerin miktarına göre belirlenebilir. Diğer yandan, gelişmiş ekonomilere sahip şehirsel bölgelerde ise ticari mallar, altın ve diğer finansal varlıklar üzerinden zekât hesaplamaları daha yaygın olabilir. Bu farklı uygulamalar, zekâtın coğrafi bölgeye göre nasıl şekillendiğini ve toplum içinde nasıl algılandığını gösterir. Kültürel farklılıklar da zekât uygulamalarını etkileyen önemli bir faktördür. İslam'ın yaygın olduğu farklı kültürel çevrelerde, zekâtın yorumlanması ve uygulanması değişiklik gösterebilir. Örneğin, Arap ülkelerinde zekât, geleneksel İslam fıkhına dayanarak ve bölgesel geleneklere uygun olarak hesaplanabilir ve dağıtılabilir. Bu bölgelerde zekât, sosyal yardımlaşma ve dayanışma kültürü ile derin bir şekilde entegre olmuş olabilir. Kültürel farklılıklar aynı zamanda zekâtın etkileri üzerinde de belirleyici olabilir. Bir toplumda zekât vermek, bireyler arasında manevi bir itibar ve toplumsal statü kazandırabilirken, başka bir toplumda daha sadece bir ibadet görevi olarak değerlendirilebilir. Bu durumlar, zekâtın toplum içindeki kabul edilme biçimini ve bireylerin zekâta karşı tutumunu şekillendirir. Coğrafi ve kültürel farklılıkların zekât uygulamalarına etkisi, modern zamanlarda da gözlemlenir. Küresel ekonomik entegrasyon, göç hareketleri ve diğer faktörler, farklı toplumların zekât uygulamalarını etkileyen dinamik değişimlere yol açabilir. Bu bağlamda, zekâtın sürdürülebilir kalkınma ve sosyal adalet üzerindeki etkilerini anlamak için coğrafi ve kültürel bağlamların dikkate alınması önemlidir. Sonuç olarak, zekât uygulamalarının coğrafi ve kültürel farklılıklarla etkilenmesi, İslam toplumlarında ve dünya genelinde bu ibadetin nasıl anlaşıldığını ve uygulandığını büyük ölçüde belirler. Bu farklılıklar, zenginlik yönetimi, sosyal adalet ve toplumsal dayanışma açısından zekâtın rolünün ve etkilerinin çeşitlenmesine ve zenginleşmesine katkı sağlar.[20]

3. Hz. Peygamber'in Fıkhı Görüşleri

Hz. Peygamber'in yaşadığı dönemdeki uygulamaları, sözleri ve tavsiyeleri, İslam toplumlarında hukuki ve ahlaki prensiplerin belirlenmesinde büyük rol oynamıştır. Özellikle zenginlik, mal paylaşımı ve sosyal adalet gibi konularda pek çok hadis ve uygulama üzerinden çeşitli önerilerde bulunmuştur. Bu görüşler, İslam'ın toplumsal düzenini ve adalet anlayışını şekillendirmede önemli bir rol oynamıştır. Zenginlik konusunda mülkiyet haklarına saygı gösterirken, zenginlerin mal varlıklarını adaletli bir şekilde kullanmaları ve fakirlerle paylaşmaları gerektiğini vurgular. Hz. Peygamber'in hadislerinde, zenginliğin toplumsal sorumlulukları ve fakirlere karşı olan görevlerine dair pek çok örnek bulunabilir. Mal paylaşımı konusunda da Hz. Peygamber'in uygulamaları ve hadisleri önemlidir. İslam toplumlarında miras hukuku ve mal paylaşımı adaletli bir şekilde düzenlenir ve bu konuda Hz. Peygamber'in tavsiyeleri rehber alınır. Fakirlerin ve muhtaçların haklarını koruma, toplum içinde eşitlik ve adaletin sağlanması için yapılan pek çok uygulama ve öneri, Hz. Peygamber'in yaşamından ve sözlerinden kaynaklanır. İslam toplumlarında hukukun ve adaletin temel taşları olarak kabul edilir. Bu görüşler, zaman içinde farklı İslam hukuk mezhepleri tarafından yorumlanmış ve uygulamaya geçirilmiştir. Günümüzde de İslam hukukunun temel ilkeleri arasında yer alan Hz. Peygamber'in fıkhı görüşleri, Müslüman toplumlarında sosyal ve hukuki yapıların şekillenmesinde etkili olmaya devam etmektedir.[21]

3.1. Hz. Peygamber'in Zenginlik Ve Mal Paylaşımı Konusundaki Hadisleri

Hz. Peygamber'in zenginlik ve mal paylaşımı konusundaki hadisleri, İslam toplumlarında sosyal adaletin ve ekonomik dengelemenin nasıl sağlanması gerektiği konusunda önemli ipuçları sunar. Bu hadisler, Hz. Peygamber'in bireyler arası ilişkilerde adaletin ve toplumsal sorumluluğun nasıl yerine getirilmesi gerektiğine dair öğretilerini yansıtır. Hz. Peygamber'in hadislerinde zenginlik konusunda vurgulanan birçok önemli nokta bulunmaktadır. Örneğin, zenginlerin mal varlıklarını adaletli bir şekilde kullanmaları, fakirlere ve muhtaçlara karşı sorumluluklarını yerine getirmeleri gerektiği ifade edilir. Bu konuda yüce kitabımız peygamberimizin bu konudaki sözlerini destekler nitelikte Kur'an-ı kerimde şöyle zikredilmiştir: "Onların mallarında belli bir hak vardır." [22] Bu ayet, zenginlerin mal varlıklarının bir kısmını zekât olarak fakirlere vermeleri gerektiğini vurgular. Mal paylaşımı konusunda Hz. Peygamber'in hadisleri, miras hukuku ve malın adaletli bir şekilde paylaşılması konularında rehberlik sağlar. Hz. Peygamber'in uygulamaları ve tavsiyeleri, mirasın adaletli bir şekilde dağıtılması ve herkesin hak ettiği payı alması gerektiğini vurgular. İslam toplumlarında sosyal adaletin temel taşları olarak kabul edilir. Bu öğretiler, zenginlik ve fakirlik arasında adil bir denge kurulması gerektiğini ve zenginlerin toplumsal sorumluluklarını yerine getirmeleri gerektiğini vurgular. Sonuç olarak, Hz. Peygamber'in zenginlik ve mal paylaşımı konusundaki hadisleri, İslam'ın toplumsal yapılarını ve bireyler arası ilişkilerini düzenlemede önemli bir rol oynar. Bu hadisler, zenginlerin ve fakirlerin haklarının korunması ve toplum içindeki adaletin sağlanması için rehberlik eder. Bu çerçevede Hz. Peygamber'in öğretileri, günümüz Müslüman toplumlarında da hala geçerliliğini korumakta ve yol gösterici olmaya devam etmektedir. [23]

[22] Meâric 70/24.

[23] Dumlu, E. (2010). İslâm'ın ilk dönemlerindeki uygulamalar ekseninde kamusal bir gelir olarak zekât. Atatürk Üniversitesi İlahiyat Fakültesi Dergisi, Erzurum, 33, 91-116.

3.1.1 Zekât Uygulamalarındaki Güncel Tartışmalar ve Sorunlar

Zekât uygulamalarındaki güncel tartışmalar ve sorunlar, çağdaş finansal ve sosyal düzenlemelerin karmaşıklığından kaynaklanan çeşitli konuları içerir. Bu sorunlar genellikle zekâtın toplanması, dağıtımı, etkinliği ve adil uygulanmasıyla ilgilidir. Birincil tartışma konularından biri, zekâtın çağdaş finansal araçlar ve dijital varlıklar gibi modern varlık biçimlerine nasıl uygulanacağıdır. Geleneksel zekât kurallarının, günümüzde yaygın olarak kullanılan karmaşık finansal enstrümanlara ve dijital varlıklara uygun olup olmadığı konusunda tartışmalar vardır. Özellikle kripto para birimleri gibi dijital varlıkların zekâtı konusunda belirsizlikler bulunmaktadır. Zekâtın toplanması ve dağıtılması süreçlerindeki etkinlik ve şeffaflık konuları da önemli tartışma konularıdır. Bazı bölgelerde, zekâtı toplamak ve doğru kişilere dağıtmak için etkin mekanizmalar oluşturulmamış veya yetersizdir. Ayrıca, zekâtı toplama ve dağıtma kuruluşlarının şeffaflığı ve hesap verebilirliği konusunda da endişeler bulunmaktadır. Zekâtın adil bir şekilde uygulanması ve herkesin yükümlülüklerini yerine getirmesi konusunda yaşanan sorunlar da güncel tartışma konuları arasındadır. Zekât, belli bir miktardan fazla mal varlığına sahip olan bireyler üzerinde yükümlülük getirirken, bazı kişilerin bu yükümlülüklerini kaçırdığı veya kaçırdığına dair şüpheler bulunmaktadır. Ayrıca, zekâtın modern ihtiyaçlar ve gereksinimlere uyumu konusundaki tartışmalar da devam etmektedir. Geleneksel zekât kurallarının, günümüzdeki sosyal ve ekonomik yapıya uygun olup olmadığı ve gerektiğinde nasıl güncellenebileceği konusunda farklı görüşler bulunmaktadır. Son olarak, zekâtın etkili bir şekilde kullanılması ve toplumun genel refahına katkı sağlaması konusundaki tartışmalar da devam etmektedir. Zekât fonlarının doğru alanlara yönlendirilmesi ve yoksulluğun kalıcı olarak azaltılmasına yardımcı olacak projelere yatırılması konusunda çeşitli görüşler bulunmaktadır. Bu tartışmalar, zekâtın toplumsal etkisinin maksimize edilmesi için önemlidir.[24]

3.1.1.1 Modern Varlık ve Gelir Biçimlerinin Zekât Kapsamına Dahil Edilmesi

Modern varlık ve gelir biçimlerinin zekât kapsamına dahil edilmesi, geleneksel varlık türlerinin yanı sıra günümüzde ortaya çıkan yeni ekonomik unsurların zekât ödemesine tabi olup olmaması konusunda önemli bir tartışma noktasıdır. Geleneksel zekât pratikleri, genellikle altın, gümüş, para, ticari mallar, tarım ürünleri ve hayvanlar gibi fiziki varlıklara odaklanmıştır. Ancak, günümüzde ekonomik yapılar dijital varlıkları, kripto para birimlerini, hisse senetlerini ve diğer finansal araçları da içermektedir. Bu durum, zekâtın modern varlık ve gelir biçimlerine nasıl uygulanacağı konusunda yeni sorular ortaya çıkarmaktadır. Örneğin, kripto para birimlerinin zekâta tabi olup olmadığı, değerlerinin nasıl hesaplanacağı ve zekât ödemelerinin nasıl yapılacağı gibi konular hâlâ netlik kazanmamıştır. Bu nedenle, İslam hukukçuları ve ekonomistler arasında modern varlık biçimlerinin zekât hükümlerine uyumlu hale getirilmesi üzerine çalışmalar devam etmektedir.[25]

Dijital varlıkların zekâtı da bu bağlamda önemli bir tartışma konusudur. Dijital varlıkların, özellikle kripto para birimlerinin, geleneksel zekât prensipleriyle nasıl uyumlu hale getirileceği ve bu varlıkların değerlerinin nasıl belirleneceği konuları çeşitli görüşlerin çatıştığı alanlardır. Bazıları dijital varlıkların zekâta tabi olması gerektiğini savunurken, diğerleri ise bu tür varlıkların zekât dışında tutulması gerektiğini öne sürmektedir. Bu konudaki tartışmalar, dijital varlıkların doğası, dolaşımdaki hacimleri ve gelir sağlama potansiyelleri gibi faktörlerin dikkate

[24] Certel, H. (1997). Psiko-Sosyal Açıdan Zekât. *Atatürk Üniversitesi İlahiyat Fakültesi Dergisi*, (13).

[25] Turan, M. (2018). *Zekât Politikası*. Mevsimler Kitap, 152.

alınmasını gerektirir. Bu nedenle, dijital varlıkların zekâtıyla ilgili net bir konsensüs sağlanması için daha fazla çalışmaya ihtiyaç vardır.[26]

3.1.1.2. Zekâtın Toplanması ve Dağıtımında Yaşanan Sorunlar

Zekâtın toplanması ve dağıtımında yaşanan sorunlar da İslam toplumlarının karşılaştığı önemli zorluklardan biridir. Zekât, genellikle gönüllü olarak verilen bir ibadet olduğu için, toplumun tüm kesimlerinin bu sorumluluğu yerine getirmesi önemlidir. Ancak, zekât toplama ve dağıtım kuruluşlarının etkinliği ve şeffaflığı konusunda bazı sorunlar yaşanabilir. Zekât kuruluşlarının yetersiz yönetimi, kaynakların doğru bir şekilde toplanmasını ve dağıtılmasını engelleyebilir. Ayrıca, zekât gelirlerinin yeterince adil ve etkili bir şekilde dağıtılmadığına dair endişeler de bulunmaktadır. Bu nedenle, zekât toplama ve dağıtım kuruluşlarının rolü ve etkinliği konusunda sürekli bir denetim ve iyileştirme süreci gerekmektedir.[27]

3.1.1.3. Zekâtın Adaletli ve Verimli Dağıtımı İçin Yöntemler

Zekâtın adaletli ve verimli bir şekilde dağıtılması için çeşitli yöntemler bulunmaktadır. Bunlar arasında en önemlilerinden biri, zekâtın toplanması ve dağıtılmasında şeffaflığın sağlanmasıdır. Şeffaflık, zekât toplama ve dağıtım kuruluşlarının faaliyetlerinin açık ve izlenebilir olması demektir. Bu, toplanan zekât miktarının nasıl harcandığı konusunda toplumun güvenini artırır ve zekâtın adaletli bir şekilde dağıtılmasını sağlar. Ayrıca, zekâtın etkili bir şekilde dağıtılması için ihtiyaç sahiplerinin belirlenmesinde objektif kriterlerin kullanılması önemlidir. Bu kriterler, gelir düzeyi, aile durumu, sağlık durumu gibi faktörlere dayanarak ihtiyaç sahiplerinin belirlenmesini sağlar ve zekâtın en doğru şekilde kullanılmasını sağlar.[28]

4. Zekât Uygulamalarının Yeniden Değerlendirilmesi ve Güncellenmesi

Zekât uygulamalarının yeniden değerlendirilmesi ve güncellenmesi, modern ihtiyaçlar ve gereksinimlere uyum sağlamak için önemli bir adımdır. Zekâtın temel amacı, fakirlerin ve muhtaçların ihtiyaçlarını karşılamak ve toplumsal dayanışmayı güçlendirmektir. Ancak, zamanla toplum yapısında ve ekonomik koşullarda değişiklikler meydana gelmiştir. Bu nedenle, zekât uygulamalarının günümüzün ihtiyaçlarına cevap verebilmesi için güncellenmesi gerekmektedir.[29]

4.1. Zekâtın Modern İhtiyaçlar ve Gereksinimlere Uyumu

Zekâtın modern ihtiyaçlar ve gereksinimlere uyumu, toplumun sosyal ve ekonomik yapısının dikkate alınmasını gerektirir. Örneğin, teknolojik gelişmeler ve küreselleşme gibi faktörler, gelir ve servetin farklı şekillerde kazanılmasına ve kullanılmasına yol açmıştır. Bu durumda, zekâtın kapsamının ve hesaplama yöntemlerinin bu değişen koşullara uygun hale getirilmesi

[26] Dinçer, S. (2019). Yoksullukla Mücadelede Modern Zekât Modeli Ekseninde Zenginlik Ve Yoksulluk Ölçütü (Nisabı). *Hak İş Uluslararası Emek Ve Toplum Dergisi*, *8*(21), 183-200.
[27] Bilen, M. (2019). Türkiye'de Yoksulluk Sorunu İle Mücadelede Zekât Kurumunun Rolü Ve Gerekliliği Hakkında Camii Cemaati Üzerine Bir Araştırma. *İslam Ekonomisi Ve Finansı Dergisi (İefd)*, *5*(2), 133-167.
[28] Maçin, H. (2014). *İslam Hukukunda Zekat Matrahları Ve Vergi İlişkisi* (Doctoral Dissertation, Necmettin Erbakan University (Turkey)), 205.
[29] Beşel, F. (2015). Vergileme Amaçları Ve İlkeleri Açısından Zekât. In *International Congress On Islamic Economics And Finance* (Pp. 51-56).

gerekebilir. Ayrıca, zekâtın etkili bir şekilde toplanması ve dağıtılması için modern finansal araçlara ve yöntemlere de adapte olunması önemlidir.[30]

Sonuç:

Zekât, İslam'ın beş temel ibadetinden biri olarak inananlar için önemli bir sorumluluktur. İslam toplumlarında, zekâtın toplanması ve dağıtılması, sosyal dayanışmanın ve adil bir gelir dağılımının sağlanması açısından kritik bir rol oynar. Bu bağlamda, zekâtın rolü ve etkileri geniş bir yelpazede değerlendirilir ve bu ibadetin toplum üzerindeki sosyal, ekonomik ve insani etkileri incelenir.

Zekât, İslam'ın öngördüğü sosyal adaletin ve dayanışmanın bir ifadesidir. Zenginlerin mallarının belli bir oranını fakirlere ve ihtiyaç sahiplerine dağıtmaları, toplumda dengeli bir gelir dağılımının sağlanmasına katkıda bulunur. Bu da toplumun huzur ve istikrarını destekler. Bu bildirimizdeki temel hedeflerimizden hareketle nisap miktarlarından ve diğer bütün detaylardan daha öncelikli olan husus, zekât ibadeti konusunda toplumda bir bilinç oluşturmak ve temel ihtiyaçlarını rahatlıkla karşılayabilen toplum kesiminin kıt kanaat geçinen kesimlere kârınca kararınca malî yardım yapmasını sağlayabilmektir. Müslümanlara paylaşma duygusunun kazandırılmaması ve neme lazımcılığın yaygınlık kazanması halinde her hangi nisap esas alınırsa alınsın belirlenecek nisabın hiçbir anlam ve önemi yoktur.

Diğer yandan fıkhî konular, doğası gereği ihtilafa konudur. Tartışma konusu olan nisap da buna dâhildir. Dolayısıyla herkesin üzerinde uzlaşabileceği tek bir nisap tespiti için uğraş vermek takdire değer bir çabadır; ama zorunlu değildir. Önemli olan, insanların benimsedikleri ve belirlenen nisabı esas alarak zekât vermeyi toplumsal ve dinî bir ödev olarak görmelerini sağlayabilmektir. Bu durumda onları toplumsal dışlanmışlıktan kurtarır.

Hz. Peygamber'in fıkhi görüşleri, zenginliğin toplumsal sorumluluklarını ve etik boyutlarını oluşturur. Onun hadislerinde zenginliğin doğru ve adil kullanımı, toplum içindeki adaletin ve eşitliğin korunması gerektiği önemle vurgulanır. Bu bağlamda, zenginlik sahiplerinin mal varlıklarını paylaşma sorumlulukları ve bu sorumluluğun İslam toplumlarında nasıl uygulandığı derinlemesine incelenmelidir.

Hz. Peygamber'in zenginlikle ilgili fıkhı görüşleri ve uygulamaları, İslam'ın sosyal adalet ve eşitlik ideallerinin nasıl hayata geçirilmesi gerektiği konusunda önemli öneriler sunar. Zenginlik, sadece maddi bir varlık değil, aynı zamanda toplumsal bir sorumluluk ve adalet meselesi olarak ele alınmalıdır.
