SIVAS INTERNATIONAL CONFERENCE ON SCIENTIFIC AND INNOVATION RESEARCH-IV

EVALUATION PROCESS and POLICIES

All applications have undergone double blind peer review process. In addition, each paper was accepted and the process of publishing in the book was carried out through editorial oversight. The published papers were presented and discussed at the meeting.

Full texts and abstracts published in accordance with the Symposium Policy have been prepared in accordance with ethical rules and APA standards. Authors of all papers are both ethically and legally responsible.

PARTICIPANTS COUNTRIES

Türkiye, Albania, Algeria, Azerbaijan, Bangladesh, Bulgaria, Ethiopia, Ghana, Hungary, India, Iran, Iraq, Jordan, Kosovo, Kyrgyzstan, Morocco, Nigeria, Oman, Pakistan, Philippines, Portugal, Romania, Russia, Slovenia, Spain, South Africa, Tunusia

TOTAL ACCEPTED ARTICLES: 366

The Number of Accepted Papers from Türkiye: 179
The Number of Accepted Full Papers from Other Countries: 187
The Number of Total Papers: 366

SIVAS INTERNATIONAL CONFERENCE ON SCIENTIFIC AND INNOVATION RESEARCH-IV

CHAIRPERSONS OF THE ORGANIZING BOARD

Prof. Dr. Kağan KÖKTEN

Sivas Science and Technology University

SYMPOSIUM COORDINATORS

Assoc. Prof. Dr. Seyithan SEYDOŞOĞLU

Siirt University

SIVAS INTERNATIONAL CONFERENCE ON SCIENTIFIC AND INNOVATION RESEARCH-IV

ORGANIZING BOARD

- Prof. Dr. Kağan KÖKTEN - Sivas University of Science and Technology/Türkiye
- Prof. Dr. Tolga KARAKÖY - Sivas University of Science and Technology/Türkiye
- Prof. Dr. Emre BİÇER - Sivas University of Science and Technology/Türkiye
- Prof. Dr. Muhammad ASIM - Sivas University of Science and Technology/Türkiye
- Prof. Dr. Hüsnü Deniz BAŞDEMİR- Sivas University of Science and Technology/Türkiye
- Prof. Dr. Sezai ERCİŞLİ - Atatürk University/Türkiye
- Prof. Dr. Ömer SÖZEN - Sivas University of Science and Technology/Türkiye
- Prof. Dr. Fatih DADAŞOĞLU - Atatürk University/Türkiye
- Prof. Dr. Sabit HOROZ - Sivas University of Science and Technology/Türkiye
- Prof. Dr. Faheem Shahzad BALOCH- Jeju National University/Republic of Korea
- Prof. Dr. Özlem BARIŞ- Kyrgyz-Turkish Manas University/Kyrgyz Republic
- Assoc. Prof. Dr. Nazım BABACAN - Sivas University of Science and Technology/Türkiye
- Assoc. Prof. Dr. Muhammad Azhar NADEEM - Sivas University of Science and Technology/Türkiye
- Assoc. Prof. Dr. Emre EVLİCE - Sivas University of Science and Technology/Türkiye
- Assoc. Prof. Dr. Gökhan BAKTEMUR - Sivas University of Science and Technology/Türkiye
- Assoc. Prof. Dr. Fikret SAYGIN - Sivas University of Science and Technology/Türkiye
- Assist. Prof. Dr. Fatih ÖLMEZ - Sivas University of Science and Technology/Türkiye
- Assist. Prof. Dr. Yeter ÇİLESİZ - Sivas University of Science and Technology/Türkiye
- Assist. Prof. Dr. Sedat SEVEROĞLU - Ataturk University/Türkiye
- Assist. Prof. Dr. Selim ÖZDEMİR - Bingöl University/Türkiye
- Dr. Sajid FIAZ- The University of Lahore/Pakistan
- Dr. Farhat ABBAS - Sichuan Agricultural University/China
- Khalid Ali KHAN- King Khalid University Abha/Saudi Arabia
- Dr. Fawad ALI - School of Tropical Agriculture and Forestry Hainan University/China
- Dr. Tajamul HUSSAIN- Oregon State University/United States
- Dr. Muhammad Farhan YOUSAF - Center for Quantitative Genetics and Genomics Aarhus University/Denmark

SIVAS INTERNATIONAL CONFERENCE ON SCIENTIFIC AND INNOVATION RESEARCH-IV

SCIENCE AND ADVISORY BOARD

- Prof. Dr. Burhan KARA - Isparta University of Applied Sciences/Türkiye
- Prof. Dr. Cengiz TOKER - Akdeniz University/Türkiye
- Prof. Dr. Disna RATNASEKERA - University of Ruhuna/Sri Lanka
- Prof. Dr. Durdane YANAR - Tokat Gaziosmanpaşa University/Türkiye
- Prof. Dr. Emre BİÇER - Sivas University of Science and Technology/Türkiye
- Prof. Dr. Ercan CEYHAN - Selcuk University/Türkiye
- Prof. Dr. Hatıra TAŞKIN - Çukurova University/Türkiye
- Prof. Dr. Hirofumi SANEOKA - Hiroshima University/Japan
- Prof. Dr. Hüsnü Deniz BAŞDEMİR - Sivas University of Science and Technology/Türkiye
- Prof. Dr. İlhami BAYRAMİN - Ankara University/Türkiye
- Prof. Dr. İlknur SOLMAZ - Çukurova University/Türkiye
- Prof. Dr. Kağan KÖKTEN - Sivas University of Science and Technology/Türkiye
- Prof. Dr. M. Shohidul ISLAM - Hajee Mohammad Danesh Science and Technology University/Bangladesh
- Prof. Dr. Marian BRESTIC - Slovak University of Agriculture/Slovakia
- Prof. Dr. Mehmet Ali AVCI - Selcuk University/Türkiye
- Prof. Dr. Metin ZONTUL - Sivas University of Science and Technology/Türkiye
- Prof. Dr. Muhammad ASIM - Sivas University of Science and Technology/Türkiye
- Prof. Dr. Mustafa KIZILSIMSEK - Kahramanmaras Sutcu Imam University/Türkiye
- Prof. Dr. Mustafa SURMEN - Aydin Adnan Menderes University/Türkiye
- Prof. Dr. Oğuz BAŞKAN - Siirt University/Türkiye
- Prof. Dr. Oksana SYTAR - Taras Shevchenko National University of Kyiv/Ukrainian
- Prof. Dr. Ömer SÖZEN - Sivas University of Science and Technology/Türkiye
- Prof. Dr. Orhan DENGİZ - Ondokuz Mayıs University/Türkiye
- Prof. Dr. Osman EREKUL - Aydın Adnan Menderes University/Türkiye
- Prof. Dr. Sabit HOROZ - Sivas University of Science and Technology/Türkiye
- Prof. Dr. Şeref KILIÇ - Akdeniz University/Türkiye
- Prof. Dr. Tolga KARAKÖY - Sivas University of Science and Technology/Türkiye
- Prof. Dr. Yusuf YANAR - Tokat Gaziosmanpaşa University/Türkiye
- Prof. Dr. Ziya DUMLUPINAR - Kahramanmaras Sutcu Imam University/Türkiye
- Prof. Neslihan DİKBAŞ - Ataturk University/Türkiye
- Assoc. Prof. Dr. Ali KAHRAMAN - Selcuk University/Türkiye
- Assoc. Prof. Dr. Asuman KAPLAN EVLİCE - Sivas University of Science and Technology/Türkiye
- Assoc. Prof. Dr. Emre EVLİCE - Sivas University of Science and Technology/Türkiye
- Assoc. Prof. Dr. Esra UCAR SOZMEN - Sivas Cumhuriyet University
- Assoc. Prof. Dr. Kemal ADEM - Sivas Cumhuriyet University /Türkiye
- Assoc. Prof. Dr. Muhammad Azhar NADEEM - Sivas University of Science and Technology/Türkiye
- Assoc. Prof. Dr. Musa TATAR - Kastamonu University/Türkiye
- Assoc. Prof. Dr. Pelin ALABOZ - Isparta University of Applied Sciences/Türkiye

SIVAS INTERNATIONAL CONFERENCE ON SCIENTIFIC AND INNOVATION RESEARCH-IV

- Assoc. Prof. Dr. Rahim ADA - Selcuk University/Türkiye
- Assoc. Prof. Dr. Sina BESHARAT - Urmia University/Azerbaijan
- Assoc. Prof. Dr. Tülay TUNÇAY - Ministry of Agriculture and Forestry, Soil Fertilizer and Water Resources Central Research Institute
- Assoc. Prof. Dr. Ali Suat YILDIZ - Sivas University of Science and Technology/Türkiye
- Assoc. Prof. Dr. Betül KAFKASLIOĞLU YILDIZ - Sivas University of Science and Technology/Türkiye
- Assoc. Prof. Dr. Fikret SAYGIN - Sivas University of Science and Technology/Türkiye
- Assoc. Prof. Dr. Fuat ERDEN - Sivas University of Science and Technology/Türkiye
- Assoc. Prof. Dr. Halit BAKIR - Sivas University of Science and Technology/Türkiye
- Assoc. Prof. Dr. Salih ÖZBAY - Sivas University of Science and Technology/Türkiye
- Assoc. Prof. Dr. Ceren ORAK - Sivas University of Science and Technology/Türkiye
- Assoc. Prof. Dr. Hatun BARUT - TAGEM, Eastern Mediterranean Agricultural Research Institute Directorate Adana/Türkiye
- Assoc. Prof. EBRU YABAŞ - Sivas Cumhuriyet University /Türkiye
- Assist. Prof. Dr. Fatih ÖLMEZ - Sivas University of Science and Technology/Türkiye
- Assist. Prof. Dr. Zemran MUSTAFA - Sivas University of Science and Technology/Türkiye
- Assist. Prof. Dr. Hale Günaçtı - Sivas University of Science and Technology/Türkiye
- Dr. Abdollah MOHAMMADI SANGCHESHMEH - Kansas State University/USA
- Dr. Abdul WAHEED - Bahauddin Zakariya University/Pakistan
- Dr. Adnan AKHTER - University of Punjab/Pakistan
- Dr. Aida KISTAUBAEVA - Al-Farabi University/Kazakhistan
- Dr. Aivars ABOLTINS - Latvia Agriculture University/Latvia
- Dr. Akbar HOSSAIN - Bangladesh Wheat and Maize Research Institute (BWMRI)/Bangladesh
- Dr. Alfonso CUESTA MARCOS- Bayer Crop Science/Germany
- Dr. Allah WASAYA- College of Agriculture, BZU, Bahadur Sub-Campus Layyah/Pakistan
- Dr. Ayman ELSABAGH - Kafrelsheikh University/Eygpt
- Dr. Ir. V. M. Ani NURGIARTININGSIH - Brawjaya University/Indonesia
- Dr. Irade HUSEYNOVA - ANAS/Azerbaijan
- Dr. Irina SAVISKAYA - Al-Farabi University/Kazakhistan
- Dr. Muhammad Abu BAKAR ZIA - University of Layyah/Pakistan.
- Research Assist. Dr. Ecem KARA - Sivas University of Science and Technology/Türkiye
- Research Assist. Dr. İlker YÜCE - Sivas University of Science and Technology Research/Türkiye
- Research Assist. Deniz AKTÜRK - Sivas University of Science and Technology/Türkiye
- Research Assist. Furkan ULAŞ - Sivas University of Science and Technology/Türkiye
- Research Assist. İlhan DANACI - Sivas University of Science and Technology/Türkiye
- Research Assist. Mehmet BEDİR- Sivas University of Science and Technology Research/Türkiye
- Research Assist. Meliha Feryal SARIKAYA- Sivas University of Science and Technology/Türkiye

- Research Assist. Merve GENÇTÜRK - Sivas University of Science and Technology/Türkiye
- Research Assist. Muhammed TATAR - Sivas University of Science and Technology/Türkiye
- Research Assist. Sevda UÇAR - Sivas University of Science and Technology/Türkiye
- Research Assist. Zeynep YUMLU - Sivas University of Science and Technology/Türkiye
- Research Assist. Melike KAYA - Sivas University of Science and Technology/Türkiye

SIVAS INTERNATIONAL CONFERENCE ON SCIENTIFIC AND INNOVATION RESEARCH-IV

May 30 - 31, 2025
Sivas, TÜRKİYE

SYMPOSIUM SCHEDULE

4th SIVAS INTERNATIONAL CONFERENCE ON SCIENTIFIC AND INNOVATION RESEARCH

MAY 30-31. 2025 / SIVAS. TÜRKİYE

Sivas University of Science and Technology

CONFERENCE PROGRAM

Zoom Meeting ID: 860 5266 6988 | Passcode: 303132

WWW.IKSADKONGRE.COM
instituteispec@gmail.com

-Opening Speech-

Date: 30.05.2025

Ankara Time: 09.00 - 10.30

Sivas Science and Technology University

***

Prof. Dr. Kağan KÖKTEN

Vice Rector of Sivas University Of Science and Technology

HEAD OF THE CONFERENCE

***

Prof. Dr. Mehmet KUL

Rector of Sivas University of Science and Technology

HONORARY PRESIDENT OF THE CONFERENCE

Prof. Dr. Fikrettin ŞAHİN

Yeditepe University, Türkiye

***

Assoc. Prof. Ts. Dr. Rajermani THİNAKARAN

INTI International University, Malaysia

***

Dr. Rehan Tariq CHOHAN

Universiti Kebangsaan Malaysia - Qatar Campus

IMPORTANT, PLEASE READ CAREFULLY

- To be able to attend a meeting online, login via **https://zoom.us/join** site, enter ID "Meeting ID or Personal Link Name" and solidify the session.
- The Zoom application is free and no need to create an account.
- The Zoom application can be used without registration.
- The application works on tablets, phones and PCs.
- The participant must be connected to the session 5 minutes before the presentation time.
- All congress participants can connect live and listen to all sessions.
- Moderator is responsible for the presentation and scientific discussion (question-answer) section of the session.

Points to Take into Consideration - TECHNICAL INFORMATION

- Make sure your computer has a microphone and is working.
- You should be able to use screen sharing feature in Zoom.
- Attendance certificates will be sent to you as pdf at the end of the congress.
- Requests such as change of place and time will not be taken into consideration in the congress program.

***

ÖNEMLİ, DİKKATLE OKUYUNUZ LÜTFEN

- Kongremizde Yazım Kurallarına uygun gönderilmiş ve bilim kurulundan geçen bildiriler için online (video konferans sistemi üzerinden) sunum imkanı sağlanmıştır.
- Online sunum yapabilmek için **https://zoom.us/join** sitesi üzerinden giriş yaparak "Meeting ID or Personal Link Name" yerine ID numarasını girerek oturuma katılabilirsiniz.
- Zoom uygulaması ücretsizdir ve hesap oluşturmaya gerek yoktur.
- Zoom uygulaması kaydolmadan kullanılabilir.
- Uygulama tablet, telefon ve PC'lerde çalışıyor.
- Her oturumdaki sunucuların, sunum saatinden 5 dk öncesinde oturuma bağlanmış olmaları gerekmektedir.
- Tüm kongre katılımcıları canlı bağlanarak tüm oturumları dinleyebilir.
- Moderatör – oturumdaki sunum ve bilimsel tartışma (soru-cevap) kısmından sorumludur.

Dikkat Edilmesi Gerekenler- TEKNİK BİLGİLER

- Bilgisayarınızda mikrofon olduğuna ve çalıştığına emin olunuz.
- Zoom'da ekran paylaşma özelliğini kullanabilmelisiniz.
- Kabul edilen bildiri sahiplerinin mail adreslerine Zoom uygulamasında oluşturduğumuz oturuma ait ID numarası gönderilecektir.
- Katılım belgeleri kongre sonunda tarafınıza pdf olarak gönderilecektir.
- Kongre programında yer ve saat değişikliği gibi talepler dikkate alınmayacaktır.

Before you login to Zoom please indicate your name surname and hall number,
exp. H- 1, Lütfi ARSLAN

CONGRESS LANGUAGES: English and All Turkish Dialects

30.05.2025 / Session-1 / Hall-1

Ankara Local Time: 10:30-12:30

Sivas University of Science and Technology

HEAD OF SESSION: Prof. Dr. Emre BİÇER

Authors	Affiliation	Presentation title
Murat DEMİR	Muş Alparslan University	Using Artificial Afterimage Algorithm for Rainfall Prediction
Mehmet Yasin UZUN Elifnur ŞİMŞEK	Sivas University of Science and Technology	The Impact of Local Artificial Intelligence Models on High School Students' Exam Preparation Process: An Evaluation on Token Velocity and Achievement Performance
Nurhan GÜNEŞ Mustafa YILMAZ	Sivas University of Science and Technology	A Comparative Analysis of Efficiency Metrics in Cvrptw Sets with Varying Numbers of Delivery Points
Tunahan GÜDER Kali GÜRKAHRAMAN	Kastamonu University	Comparative Analysis of Gan-Based Text-to-Image Models and Proposal of a Modified Galip Architecture
Muhammed Taha YILDIZ Ahmet YÜCEL	Sivas University of Science and Technology	Effect of Boron Carbide Reinforcement on the Wear Performance of Ni–Mo Alloyed Steel Produced by Powder Metallurgy
Rahmi CANPOLAT Esra KAYAŞ ALKIŞ Fatih ÖZAYDIN Osman MAVUŞ Ebru YABAŞ	ESTAŞ A.Ş, Gloves Manager	Antineoplastic Production of Drug Resistant Gloves
Yonca ALTINDAL	Balıkesir University	The Echo of Escape from Reality in Digital Cinema: Interpreting the Sociology of The Dream Movie
Sefa SEZGİN Erdal Anıl YILDIZ Ayşegül ARI Ahmet AVCI	ESTAŞ A.Ş. ES-3 Manager	Implementation of the Carburizing Heat Treatment Process on Sint D11 and Sint D32 Materials a Comparative Analysis of the Results
Berke Can TURAN Nurhan GÜNEŞ Hüsnü Deniz BAŞDEMİR	Sivas University of Science and Technology	Material-Aware Line-of-Sight Detection in Indoor Environments Using Ray Tracing and Received Signal Strength Analysis

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

30.05.2025 / Session-1 / Hall-2

Ankara Local Time: 10:30-12:30

Sivas University of Science and Technology

HEAD OF SESSION: Prof. Dr. Kağan KÖKTEN

Authors	Affiliation	Presentation title

HEAD OF SESSION: Dr. Elena SKVORTSOVA

Authors	Affiliation	Presentation title
O b Adebisi LUKE O. Oludare TOMISONA	b Agricultural and Rural Management Training Institute (ARMTI)	Exploring Gender Differences in Risk Behaviour and Profit Margins of Orange Flesh Sweet Potato Producers in Osun State, Nigeria
Elena SKVORTSOVA Oksana FILINSKAYA	Yaroslavl State Agrarian University	Cranio-Caudal Gradient in the Distribution of Microbiota of the Gastrointestinal Tract of Sheep
Dip SAHOO Avishek BARDHAN	The Neotia University	Opportunities in Breeding and Seed Production of Koi Carp and Goldfish: A Comparative Study
Preye OFUNAMA Oguntade Stephen KAYODE	School of Agricultural Technology, Federal Polytechnic, Ekowe	Farm Management Tools for Productivity: A Comparative Analysis with Lean Tools
Simran Dhingra	I.K Gujral Punjab Technical University	Isolation of Polyphenols from Jackfruit Pulp and Their Incorporation into Chitosan-Based Edible Films with Antioxidant Properties
Shreya	I.K Gujral Punjab Technical University	Development of Broccoli-Infused Barnyard Millet Pasta
Vera Renta Siahaan Renny Sinaga Safrina Daulay	Polytechnic of Health Ministry of Medan	A Study on The Characteristics of Pregnant Women Concerning Stunting At The Midwifery Clinic in The Bahkapul Health Center Working Area
Sehrish Firyal Hira Anwar Shagufta Saeed	University of Veterinary and Animal Sciences	Genetic analysis of Complement Component 5 Gene in Mastitic cows
U. H. ANYANWU L. E. DANIEL	Federal Polytechnic Ekowe, Bayelsa State	Use of Insects as Alternative Protein Sources in Poultry Feeds: A Review

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

31.05.2025 | SESSION-3 | HALL-4

Ankara Local Time: 15:00-17:00

Meeting ID: 860 5266 6988 | Passcode: 303132

HEAD OF SESSION: Dr. Mehzabin REHMAN

Authors	Affiliation	Presentation title
Salim Abdullahi GWARJO Zainab Ahmad MUHAMMAD	Umaru Musa Yar'adua University	Qualitative Phytochemical Analysis of the Fresh and Processed *Capsicum annum* (Pepper) and *Solanum lycopersicum* (Tomato) Using Ethanolic Extracts
Gjok VUKSANI Angjelina VUKSANI	Agricultural University of Tirana	Grafting Compatibility and Morphological Performance of *Cupressus arizonica* and *Calocedrus decurrens* on *Cupressus sempervirens* under Mediterranean Conditions
Olufolake. E. ADELAKUN Kerimat.O. BASHIRU	University of Ibadan	Exploring the Digital Literacy Proficiency of Rural Youths in Ona-Ara Local Government Area, Oyo State
Mehzabin REHMAN	University of Science and Technology Meghalaya	Evaluation of Growth Parameters and Antioxidant Defense Mechanisms on Mung bean (*Vigna radiata* (L.) Wilczek) under Arsenic stress
M. EL-FECHETALY A. KHALLOU S. CHERRIET B. HAMMOUTI K. EL BEKKAYE M. IBRIZ	Ibn Tofail University	Characterization of Fungal Agents Responsible for the Leaf Decline of Olive Trees in the Oriental Region of Morocco
Adegbola OLUWATOSIN Oluwabukola &AMP Oloyede Taiwo PETER	Adegbola Oluwatosin Oluwabukola & Oloyede Taiwo Peter	Proteins Linked to Colon Cancer: Systematic Review
B. O. OYEFESO B. F. TIJANI O. E. EDU	University of Ibadan	Mass and Volume Modelling of Cashew Fruits Using the Geometrical Attributes
Somnath BERA Anwesha MUKHERJEE Debashis DE	Maulana Abul Kalam Azad University of Technology	FedSoil: A Joint Time and Energy-efficient Federated Learning-based Soil Health Monitoring Framework
Sanjay Subramanian.S Sandeep.A Thirumurugan.V Sabarish.R Thiyagarajan.G.M S. Pavai Madheshwari M. Meena R. Subhashini Priyadharshini	R.M.K Engineering College	Wildsentinel: Ai-Powered Wildlife Crossing Detector for Remote Forests
Maria Duarte BELLO	School of Social Communication and Media Studies Polytechnic University of Lisbon	Networking with Purpose: How to Build Relationships that Connect and Propel

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

31.05.2025 | SESSION-3 | HALL-5

Ankara Local Time: 15:00-17:00

Meeting ID: 860 5266 6988 | Passcode: 303132

HEAD OF SESSION: Res. Assist. Zeynep YUMLU

Authors	Affiliation	Presentation title
Suleiman Ibrahim INUWA Muhammad Saleh SANI B. Vijay KUMAR Karthik HP Yedida SUDHAMINI	SR. University Warangal	Total Factor Productivity and Supply Response of Wheat Production in Nigeria: An Empirical Analysis Using Törnqvist-Theil Index and ARDL Model
Karima LAAROUSSI Saloua JEMJAMI Assia HARKANI Tarik BENABDELOUAHAB Abdellah EL AISSAOUI	University Hassan 1st	Spatial, Temporal, Economic, and Environmental Analysis of Water Pumping Systems in Three Arid Regions
Nabi FAHIMA	Université Dr Yahia Farès de Médéa	Nutritional Influence on Milk Composition and Output in Dairy Cattle from the Mitidja Plain
Rania Rahmani Amel AIT MEDDOUR Mohammed BENHOULA Samia HAMMA-FARADJI Kahina BELBACHIR Sylia TERKI	University of Bejaia, Faculty of Natural and life Sciences	Formulation of an Artisanal Fresh Cheese Incorporating Probiotic Lactic Acid Bacteria
Ruhani	I.K. Gujral Punjab Technical University	Crafting Nutrient Rich Biscuits with Buckwheat Amaranth and Wheat Flour
FERROUDJ NAWAL KHADRAOUI JIHANE DAGUIANI KAOUKAB BOUHECHICHE DOUNIA KRID ASMAIKRAM	Laboratory of Biotechnology, National Higher School of Biotechnology	Optimization of Hydrolysis Parameters for Maximum Total Sugar Extraction from Vegetable Peel Waste Using Thermo-Chemical Hydrolysis
Chokri BAYOUDH Malek BEN ALI Afifa MAJDOUB Taoufik BETTAIEB	Regional Research Centre on Horticulture and Organic Agriculture	Study of *in Vitro* Propagation and Selection for Salt Tolerance of Local *Opuntia cactus*
Ilona BITAROVA Giorgi DUGASHVILI	Grigol Robakidze University	Governance, Digitalization And Medical Record Privacy: A Legal and Ethical Inquiry
Kunika GANDOTRA Barinderjit SINGH	I.K. Gujral Punjab Technical University	Development, Standardization, and Consumer Acceptance of Nutrient-Enriched Healthier Brownie Made with Alternative Flours and Natural Ingredients

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

31.05.2025 | SESSION-3 | HALL-6

Ankara Local Time: 15:00-17:00

Meeting ID: 860 5266 6988 | Passcode: 303132

HEAD OF SESSION: Assist. Prof. Dr. Zeshan IQBAL

Authors	Affiliation	Presentation title
Michael Sheila OJEI	Admiralty University of Nigeria	Urban Agriculture and Food Security in Cities
H.O. SADIQ B.T. ADEYEMO Y.O. BUSARI	University of Abuja	Growth Performance and Haematology Effects of Dietary Mixture of Ginger (*Zingiber officinale* L.) and Garlic (*Allium sativum* R.) on Catfish (*Clarias gariepinus* Bruchell 1822) Juveniles
Darwin H. PANGARIBUAN Koes HENDARTO Anggun ANGGRAINI	Universitas Lampung	Growth, Yield and Quality Response of Sweet Corn (*Zea mays* L. Saccharata Sturt) on the Application of Biofertilizer Dan Tricho-Compost
Chira Maria-NATALIA	University of Suceava	Influence of Heavy Metal Concentration on the Distribution between Macronutrients in Goat Milk
Arben TËRSTENA Gazmend DEDA Ismail MEHMETI Fatime RAMADANI Nuredin KRIVANJEVE	University of Applied Sciences in Ferizaj	The Role of Technological Innovation and the Circular Economy in the Development of SMEs in the Agricultural Sector
Asmaa SAYAH Karim BENHENIA	High National Veterinary School	Optimizing Goat Semen Cryopreservation: Impact of Extender Type on Post-Thaw Sperm Quality
Kanika SHARMA	I.K. Gujral Punjab Technical University	Development of Whole Wheat Biscuits Fortified with *Musa* Species (Paradisica) Inflorescence
Habil. Cristina Raluca Gh. Popescu	University of Bucharest	Development Through Research and Innovation: Türkiye's Strategic Advantage for Cross-Continental Artificial Intelligence Collaboration
Loredana Mariana HUȚUȚUI Sonia AMARIEI	University of Suceava	Development of Intelligent Packaging Systems for Real-Time Detection of Meat Spoilage

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

ABSTRACTS

Rahmi CANPOLAT Esra KAYAŞ ALKIŞ Fatih ÖZAYDIN Osman MAVUŞ Ebru YABAŞ	Antineoplastic Production of Drug Resistant Gloves	1
Ceren Barlas Ayşen BARUT USLU Fatma ÇAĞLIDABAKGİL Meltem DAĞDELEN	A Comparative Dosimetric Study Using Field-In-Field, Intensity Modulated and Volumetric Arc Modulated Radiotherapy Techniques in Terms of Cardiac Substructures Exposure for Left-Sided Breast Cancer Radiotherapy	2
Şevval Sultan COŞAR Ayşegül ÖZGÜLDÜ Buse YILDIZ Gül KADAN	The Effect of a Healthy Nutrition Program on Obesity, Self-Esteem and Identity Development for High School Students	4
Sena DOĞAN CANDAN Gülay DEMİR Hanım Eda GÖKTAŞ	Bibliometric Analysis of Studies on the Effects of Pilates Exercises on Chronic Pain Management	5
Mücahit Emin KARAGÖZ Barış KAVASOĞULLARI Mehmet Nurullah ÖNEL Ali Suat YILDIZ Emre BİÇER	Experimental Analysis of Phase Change Material Based Battery Thermal Management System for Different Environmental and Discharge Conditions	7
Şevval ANCIN Gülay DEMİR Hanım Eda GÖKTAŞ	Bibiometric Analysis of the Effect of Spaceflight Exposure on Astronauts in Space Medicine	10
İsmail ALTUNTAŞ Ferhan Kübra ÖZBAKIR	Optimization of V/Iii Ratio in Aln Thin Films on Patterned Sapphire Substrates	12
İsmail ALTUNTAŞ Ferhan Kübra ÖZBAKIR	Temperature Optimization of Aln Thin Films on Patterned Sapphire Substrate	13
Ömer SÖZEN Tolga KARAKÖY	A Study on Determination of Yield Characteristics of Some Dry Bean Genotypes	14
Tolga KARAKÖY Ömer SÖZEN	Determination of Quality Characteristics of Some Dry Bean Genotypes	16
Sema TETİKER	Rare Earth Elements: Industrial Uses and Reserves	18
Mehmet Nurullah ÖNEL Afroz JAVED Yunus ÇELİK	Design of a Cavitating Injector for Aerospace Engines and Performance Analysis in a Microjet Combustion Chamber	20
Burhan Necati KIZILOĞLU Yunus ÇELİK	Enhancing the Aerodynamic Performance of Thick Airfoils Via Flexible Membrane and Gurney Flap Applications	22
Sedat SEVEROĞLU Burak KARACA	Land Degradation in Rangelands: Causes, Indicators, and Management Strategies	23
HALİT AKTAŞ SEDAT SEVEROĞLU	Grassland Biodiversity: Current Status and Challenges	25
Salma Naimatullah SOOMRO Sabeen Rehman SOOMRO Muhammad AASIM	Growth of Cotton Cultivars in Response to Multiwalled Carbon Nanotubes	27
Sabeen Rehman SOOMRO Salma Naimatullah SOOMRO Muhammad AASIM	Validation and Prediction of *in Vitro* Germination and Growth of Cowpea (*Vigna unguiculata* L.) Cultivars.	28

Kenan KARA İrfan ÇORUH	Investigation of the Effects of some Herbicides Treatments on Yield against Common Weeds in Sugar Beet Planting Areas of Bayburt Province	29
Yusuf AKGÜL Şerife DÜZEN Ayselnur ŞAHİN Ecem KARA Hatıra TAŞKIN Gökhan BAKTEMUR Asuman KAPLAN EVLİCE	Evaluation of Drought Stress in Plant Melissa (*Melissa officinalis* L.) under *in Vitro* Conditions	30
Büşra ERGÜL Ayselnur ŞAHİN Şerife DÜZEN Miraç ŞAHİN Ecem KARA Hatıra TAŞKIN Gökhan BAKTEMUR	Determination of Drought Stress in Summer Squash Varieties under *in Vitro* Conditions	32
Şeyda ÖZTÜRK KİRİŞLİ Afroz JAVED	Turbulence and Viscous Effects in Small Solid Rocket Motors	34
Şakir HACIALİOĞLU Mustafa ASLAN Özge Nur ERDEYER Ali TEMİZ Gökhan HEKİMOĞLU İbrahim ALPAK	Balsa Core Composite Sandwich Panel Containing Peg 400	35
Ahmet Turan İNCE İsakhan KARABAŞ Rahimullah MURADI	A Pilot Study on the Feasibility of Using Chatbots in Medical Education Through Committee Questions	37
Muhammed Furkan ŞAHİN Muhammed Taha YILDIZ Zeynep AKÇAKAYA Emre YURTKURAN Nazım BABACAN	Investigation Of Process Parameters On Density Of Lpbf-Manufactured Co-Cr Alloy Samples	39
Oktay ÖZBAY Elif TOZLU	Detection of Fungal Diseases in Sugar Beet Cultivation Areas in Bayburt Province	41
Veysel ALP	Assessment of Soil Quality with the Smaf Method	42
Tuğba KARABOĞA Hasan Aykut KARABOĞA	New Trend in Application Development: Benefits and Challenges of Low-Code/No-Code Platforms for Organizations	43
Uğur SÖZLÜ	Analysis of Exercise Videos Through Ai-Assisted Visual Assessment: A Comparison between Chatgpt 4.5 and Physiotherapist Evaluations	44
Murat TOPALOĞLU	Artificial Intelligence and Employee Engagement: Opportunities and Challenges in Hrm	45
Hakan TOPAL Fatih Vehbi ÇELEBİ	Target Detection by Synchronizing Small Unmanned Aerial Vehicles (Uavs) and Face Recognition System	46
Ahmad A. BELLO Toyese OYEGOKE	Thermodynamic Feasibility of Ammonia Valorization for Clean Energy and Environmental Applications	47
E. ELAVARASI Yuvaraj AR J. JAYADURKA R. S. DEEKSHITH R. SRINIVASAN	Metformin: A Biguanide for Type 2 Diabetes Management	48

E. ELAVARASI Yuvaraj AR J. JAYADURKA R. SRINIVASAN	Artificial Intelligence in Drug Discovery in Medicinal System	49
E. ELAVARASI Yuvaraj AR J. JAYADURKA R. SRINIVASAN	Recombinant DNA Technology and Protein Engineering: Powerful Tools for Biological Innovation	50
Joseph Chisom OKOYE	Assessing the Potential of Various Medicinal Plants as Alternatives to the Lasota Vaccine Used in Poultry Production for Newcastle Disease Prevention: A Review	51
V.Vijitha S.Madhumitha Dr.K.Rajaganapathy	Review on Oral Drug Delivery System	52
Asel PAZYLOVA	Investing in Sustainable Development of Regions of Kyrgyzstan	53
Asel PAZYLOVA	Analysis of the State of Foreign Investment Attraction in the Regions of Kyrgyzstan	54
Subhashish DEY	Seismic Analysis of Comparitive Multi - Storey Building	55
Subhashish DEY	Application of Industrial Waste Materials for the Preparation of Green Bricks	56
Melik SAMI Khelil SARA Tallal ABDEL Karim BOUZIR	From Pantry to Biolab: Reimagining Kitchen Typologies for Future Food Innovation	57
Melik SAMI Khelil SARA Tallal ABDEL Karim BOUZIR	Waste Not: Integrating Composting and Resource Recovery in Smart Kitchen Architecture	58
Melik SAMI Khelil SARA Tallal ABDEL Karim BOUZIR	IoT and AI in the Kitchen: Architectural Implications of Connected Food Systems	59
Melik SAMI Khelil SARA Tallal ABDEL Karim BOUZIR	Designing Kitchens for Nutritional Wellness: A Behavioral Architecture Approach	60
Hajar LOUHAB Colette BESOMBES Raowia LAMHAR Adil DANI Hamid MELLOUK Karim ALLAF Khalid DIGUA Bouchra BEJJANY	Improving the Recovery of Bioactive Molecules from Coffee Waste through Innovative Thermo-Mechanical and Microwave-Assisted Methods	61
Rabia CHOUDHARY Wafa MAJEED AYESHA Bilal ASLAM Muhammad Saad TARIQ	Antidiabetic Activity of *Grewia asiatica* Seed Extract in Streptozotocin Induced Diabetic Rats	62
Haseeba FARRUKH Wafa MAJEED AYESHA Muhammad Saad TARIQ	Cordia Sinesisameliorates Diabetes Associated Dyslipidemia in Stz Induced Diabetic Rats	63
Bahareh RAFIEI Mohbobeh SHARIFI	Survey of Parasitoids Associated with White Peach Scale (*Pseudaulacaspis pentagona*) in Kiwi Orchards of Gilan Province, Iran	64

Abdullahi UMAR Mogaji Umar MUHAMMED Toyese OYEGOKE	A Molecular Modeling Approach to Sustainable Drug Delivery: Improving Ibuprofen Solubility Through Deep Eutectic Solvents	65
S. JAYASHREE V. RAKSHANA R. SRINIVASAN	Fighting Diabetes with Herbal Technology	66
V. RAKSHANA K. DIVYA	Pharmacy Services for Patients with Allergies	68
V. SARASWATHI W. HELEN	A Comprehensive Review on Nutraceuticals: Therapy Support and Formulation Challenges	69
K. RAJAGANAPATHY MADHUMITHA.S VIJITHA, V	Meningitis: Inflammation of the Brain and Spinal Cord Membranes	70
N. JAYARAMAKANI M. KOWSIKA	Rabies Disease	71
Sakineh Khanamani FALAHATIPOUR Sara Shokrpoor MINA Khodadadi Fatemeh MOHITI	Evaluating the Metabolic Effects of *Garcinia cambogia* Supplementation in Streptozotocin-Nicotinamide-Induced Type 2 Diabetic Rats	72
Alperen DEVELİ Yusuf FEDAİ Emre ÖZER Gökhan BAŞAR Oğuzhan DER	Influence of Mwcnt-Enhanced Minimum Quantity Lubrication on Power Consumption and Surface Roughness in Face Milling of Aisi 304 Stainless Steel	73
Şeyma AKTAŞ Yılmaz MERT Salih ÖZBAY	The Effects of Molecular Weight and Coating Conditions on the Surface Wettability of Pmma Films	75
Ekrem AKBULUT Mehmet Emin ALHAN	Effects of Helicase Protein Mutations in American Isolates of SARS-Cov-2	76
Ekrem AKBULUT Meltem YILDIRIM Hüseyin KAHRAMAN	Changes in the Spike Protein of the SARS-Cov-2 XBB.1.5 Variant	77
Hamza ÖZEL Barış Atalay USLU Menekşe TAŞ DİVRİK	Different Progesterone-Supported Estrus Synchronisation Protocols in Heifers	78
Fatma BULUT Esra Bulut ATALAY Taner DAŞTAN	Investigation of the Anticarcinoserogen Activity of Chestnut (*Aesculus hippocastanum* L.) Plant against Breast Cancer Cells	80
Aslıhan SÖNMEZ Volkan ATES	Spiking Neural Networks for Early Skin Cancer Detection: A Delta-Modulation-Based Approach on Ham10000	81
Zeynep AVCI Figen ÇALIŞKAN	Examination of Nurses' Self-Directed Learning Skills	82
Hicret HOPOĞLU Ebru Şenadım TÜZEMEN	Development of Ga_2O_3 Films Grown on Sapphire by Rf Magnetron Sputtering Method at Different Powers for Uv Photodetector Applications	83
Burak İRI	Cost-Benefit Analysis in Smart Transportation System Applications	84
Burak İRI	Position Detection and Debugging of Rotor Speed-Position Sensor Connectors in Electric Vehicles with Point-Cloud Technology	85
Metin DEMİRTAŞ Yasin AYDIN	New Approaches to Identity Verification of Cattle in Smart Agriculture Applications	86
Metin DEMİRTAŞ Yasin AYDIN	Electronic Circuit Design for Mastitis Detection	87

Soukaina El BOURACHDI Abdelhay El AMRI Yassine RAKCHO Amal LAHKIMI	Upcycling Lithium-Ion Battery Waste into High-Performance Reduced Graphene Oxide via Aloe Vera-Assisted Green Chemistry: Engineering a Chitosan@EDTA@rGO Hybrid for Rhodamine B Adsorption and Theoretical Interaction Profiling through DFT	88
Edionsenyene UDOH	Evaluation of Liver Function Status of Students Predisposed to Obesity in Madonna University, Elele, Nigeria	89
Nitiksha PARIHAR Barinderjit SINGH	Antioxidant Potential and Bioactive Profile of Selected Millets: A Nutritional and Functional Food Perspective	90
Divya BHARTI Barinderjit SINGH	Citrus Pseudolimon Peel Incorporated Muffin: Effect on the Phytochemical and Sensorial Properties of Muffin	91
Akanksha THAKUR Barinderjit SINGH	Muffin Development with Citrus Jambhiri Peel Powder Incorporation	92
Arshdeep SINGH	Optimization of Ultrasound-Assisted Extraction (Uae) of Polyphenols from Browntop Millet Flour Using Response Surface Methodology (Rsm)	93
Vaishnavi MEHRA	Formulation and Functional Evaluation of Spinach-Enriched Gluten-Free Crackers from Buckwheat and Rice Flour Blends	94
Emmanuel Tomisin BELLO Sunday AWE	Redefining Medical Microbiology: The Emerging Role of Nanobiotechnology	95
R. VIDHYALAKSHMI C. REJITHA	Neuroinflammation as a Key Mechanism in Neurological Diseases	96
Ehab ISMAEL	Strategic Narratives: How Media Influences Foreign Policy Decisions in Global Power Struggles	97
Ehab ISMAEL	Social Media's Role in International Crises: A Strategic Tool for Influence, Perception Management, and Crisis Diplomacy (2015-2025)	98
Julie Anne C. QUIÑONES Baby Boy Benjamin D. NEBRES	Resource Development and Management: Daraga Community College Experience	99
Zouheir MSATFA	Foundations and Conceptual Models of Taxpayer Tax Compliance	100
Gbenga JOHN OLADEHINDE	Assessment of Factors Influencing Access to Residential Land in Typical Urban Border Communities of Nigeria: A Gender Dimension	101
ZEHRANUR AKBULUT Ahmet ŞİRİN	A Career Program to Enhance Career Competence, Career Optimism and Adaptability in the Transition from University to Work	102
Serkan DEMİR Taner AŞÇI	Examining the Ergonomics, Visual and Communication Elements of Kindergarten Classes	103
Melike AKMAN Arta JAKUPI Filiz KUMOVA Nevin KILIÇ	Evaluation of the Relationships Between Self Differentiation, Parental Attitudes, and Psychological Resilience	104
Emine Nur YERSEL Ruveyda KARADENIZ Filiz KUMOVA Ayşe Pınar VURAL	Evaluation of the Relationship between Body Satisfaction and Social Media Unconsciousness in the Context of Hijab and Potential Protective Factors	108
Mehmet TOPRAK Murat KAAN Mustafa Serdar GENÇ	Investigation of Thermal Efficiency in Liquid-Cooled Lithium-Ion Battery Systems	114
Elifnur AYDIN Edanur Dilara MANDACI Ahmet Gürkan YÜKSEK	Comparison of Internet of Things (Iot) Use Cases and Communication Technologies	115

ABSTRACT

As a result of studies conducted in the field of diagnosis and treatment in relation to the increase in the number of cancer cases, drug groups defined as antineoplastic drugs are being studied, and these drugs are being used in cancer treatment processes. Healthcare workers are exposed to these drugs through inhalation, ingestion or direct skin contact during the preparation, transportation, application during treatment, storage and disposal of waste.

Different protective equipment is preferred to eliminate the possible negative consequences that may arise because of exposure to drugs. To prevent skin exposure, the use of chemotherapy gloves has become a necessity.

As a result of this need, ESTAŞ A.Ş. developed a chemotherapy glove production project. The prescription for non-sterile, powder-free examination gloves currently produced by the company was studied and changes were made. Before applying the final prescription to the mass production line, prototype production was carried out on the robotic mini production line and optimization studies were carried out on the prescription. Physical, dimensional and leakage tests were applied to the gloves that were visually accepted as suitable from the sample production and the prescription accuracy was validated for the glove with the most suitable values according to national norms. The validated prescription was adapted to the mass production line. Resistance tests were performed on the gloves produced in the mass production line using 12 different drugs preferred against chemotherapy gloves within the scope of ISO 6529 and ASTM D6978 standards. These tests were applied by an accredited laboratory and their permeability to chemotherapy gloves was proven.

ABSTRACT

Introduction: The standard of care following breast-conserving surgery is adjuvant radiation which decreases locoregional recurrence and improves survival rates. However, cardiovascular events following radiotherapy have emerged as the primary cause of death from non-breast cancer in these patients. Due to the proximity of cardiovascular structures to the treatment field, patients with left-sided breast cancer require special attention. The present study aimed to evaluate the organ at risk (OAR) and cardiac substructures dosimetry of left-sided breast cancer radiotherapy comparatively with three different radiotherapy techniques: Field in field (FIF), IMRT and VMAT.

Material and Methods: Ten patients with early-stage left-sided breast cancer underwent breast-conserving surgery were included in this study. Patient's simulation scans were used and field-in-field (FIF), intensity-modulated radiation therapy (IMRT), and volumetric-modulated arc therapy (VMAT) plans were created for each patient. Heart, lungs, contralateral breast and cardiac substructures (left anterior descending artery, atriums, ventricles, pulmonary artery, ascending and descending aorta) were delineated. The dose received by these structures and planning quality were compared dosimetrically. An additional analysis was also undertaken to evaluate the correlation between breast volume and resulting radiation dose to nearby structures.

Results: For the planning quality, there was better homogeneity for modulated plans compared to FIF. For the doses to the OARs and cardiac structures, lower doses were generally achieved with the FIF plan. When the association between the breast volume and the dosimetric parameters was evaluated, it was observed that as breast volume increased, normal tissue doses increased.

Conclusions: The selection of the planning modality should be made according to the patient's baseline characteristics including age and cardiovascular risk factors. Conformal planning seems to be the most appropriate treatment for left-sided breast cancer radiotherapy.

ABSTRACT

During adolescence, the individual tries to adapt to new developmental characteristics and also seeks a new identity. Especially today, when the increase in fast-food consumption is combined with the effect of technology, obesity can be seen quite frequently. Obesity does not only cause health problems but also can cause very important problems on the self-esteem of the adolescent. Under these thoughts, the project aimed to examine the effects of fast-food consumption and eating habits on obesity and self-esteem during adolescence. Quasi-experimental design, one of the quantitative research methods, was used in the research. The research was carried out in a high school determined by random sampling method from the high schools affiliated to the Çankırı Provincial Directorate of National Education. In the study, data were collected with the "General Information Form", the "Eating Habits Scale for Adolescents" adapted to Turkish by Yılmaz (2021), the "Spiritual Development Scale in Adolescence" developed by Uzun (2018), and the "Identity Scale" adapted to Turkish by Coşkun (2004). After the implementation of the 10-week training program, the "Eating Habits Scale for Adolescents", "Identity Scale" and "Spiritual Development Scale in Adolescence" were re-applied as the post-test. As a result of the research, it was determined that children in adolescence frequently consumed fast food and did not have breakfast, and the scores obtained in the mental health and identity dimensions were at a level that could be damaged. It was determined that the implemented training program changed the eating habits of children in adolescence and had positive effects on mental health and identity development. Based on the data obtained as a result of the research, it can be recommended to organize nutrition education programs for children and mental health and identity formation trainings, especially for children in adolescence and individuals in early adulthood.

ABSTRACT

Objective: This bibliometric analysis aims to provide a comprehensive view of the literature on pilates exercises and chronic pain management, identifying research trends, key authors, institutions, and countries, and analyzing influential publications and research areas to highlight potential gaps for future studies.

Method: This article presents a comprehensive bibliometric analysis using the Biblioshiny application of the Bibliometrix package in R programming and the VOSviewer tool. In this study, 110 relevant articles published between 2002 and March 2024 in the Scopus database were analyzed.

Findings: Brazil is a leading country both in terms of publication output and in pioneering international collaboration efforts. The article 'Exercise Therapy for Fibromyalgia', published by Angela J. Busch (2011) in the journal 'Current Pain and Headache Reports', is the most cited paper with 217 references. The study also identifies the top three journals with the highest number of publications: the first being 'Journal of Bodywork and Movement Therapies', the second 'BMC Musculoskeletal', and the third 'Physical Therapy'. Notably, 'Universidade Cidade de São Paulo' stands out as the institution most involved in this research area due to its prolific research output. The most published author is ' Cristina Maria Nunes Cabral', with 14 articles. Commonly used keywords include 'low back pain', 'pilates', 'rehabilitation'.

Results: The findings of this study serve as a valuable resource for researchers and practitioners exploring the relationship between pilates exercises and chronic pain, as well as for those interested in the practical applications and future developments in this field. This research examines the role of pilates exercises in chronic pain management, highlighting its place in physical therapy and rehabilitation, while contributing to the literature and providing a roadmap for future studies.

Keywords: Chronic pain, Pilates, Rehabilitation, Bibliometric analysis

PİLATES EGZERSİZLERİNİN KRONİK AĞRI KONTROLÜNE ETKİSİYLE İLGİLİ YAPILAN ÇALIŞMALARIN BİBLİYOMETRİK ANALİZİ

ÖZET

Amaç: Bu bibliyometrik analiz, pilates egzersizlerinin kronik ağrı kontrolü üzerindeki etkilerine odaklanan bilimsel literatüre bütüncül bir perspektiften yaklaşmayı; bu alandaki araştırma eğilimlerinin, tarihsel gelişiminin, öne çıkan yazar, kurum ve ülkelerin belirlenmesini; ayrıca en etkili yayınlar ve araştırma alanlarının sistematik biçimde analiz edilerek gelecekteki bilimsel çalışmalara yön verecek potansiyel araştırma boşluklarının ortaya konulmasını amaçlamaktadır.

Metod ve Yöntem: Bu makale Bibliometrix paketine ait Biblioshiny uygulamasıyla R programı ve VOSviewer araçlarını kullanarak kapsamlı bir bibliyometrik analiz sunmaktadır. Bu çalışmayla Scopus veri tabanında 2002 ile 2024 (Mart) yılları arasında yayınlanan 110 ilgili makale incelenmiştir.

Bulgular: Brezilya hem makale yayınları açısından önde gelen ülke iken hem de uluslararası iş birliği çabalarına öncülük etmektedir. Angela J. Busch (2011) tarafından yazılan 'Current Pain and Headache Reports' dergisinde yayınlanan 'Exercise Therapy for Fibromyalgia' makalesi 217 atıf sayısı ile en çok atıf alan makaledir. Çalışma aynı zamanda, birinci dergi 'Journal of Bodywork and Movement Therapies', ikinci dergi 'BMC Musculoskeletal, üçüncü dergi 'Physical Therapy' en çok yayın yapan ilk üç dergidir. Özellikle, 'Universidade Cidade de Sao Paulo' üretken araştırma çıktısı ile bu konu alanına en çok dahil olan kurum olarak öne çıkmaktadır. En çok yayın yapan yazar, 14 makale ile 'Cristina Maria Nunes Cabral' dır. En çok kullanılan anahtar kelimeler arasında 'low back pain, 'pilates', 'rehabilitation' yer almaktadır.

Sonuç: Bu çalışmanın bulguları, yalnızca pilates egzersizleri ile kronik ağrı arasındaki ilişkiyi araştıran bilim insanları ve uygulayıcılar için değil, aynı zamanda bu alandaki pratik uygulamalara ve gelecekteki olası gelişmelere dair kapsamlı bir bakış kazanmak isteyen herkes için önemli bir kaynak niteliğindedir. Sonuç olarak, bu araştırma pilates egzersizlerinin kronik ağrı yönetimindeki rolünü irdeleyerek, fizik tedavi ve rehabilitasyon disiplinindeki yerini vurgulamakta; bununla birlikte, ilgili literatüre anlamlı katkılar sunarak bu alanda gelecekteki çalışmalar için bir yol haritası oluşturacaktır.

Anahtar Kelimeler: Kronik ağrı, Pilates, Rehabilitasyon, Bibliyometrik analiz

ABSTRACT

In this study, the manufacturing and experimental analysis of a phase change material (PCM) based battery thermal management system (BTMS) experimental setup was carried out. In the experimental setup, cylindrical type 18650 Lithium-ion (Li-ion) battery cells were used as batteries. In the battery pack formed with four cells, aluminium shells were placed around the cells in a way that would be concentric with the cells. PCM was filled in the gap between the aluminium and battery cells. The BTMS was connected to the battery test device in a controlled temperature environment and subjected to charge-discharge cycles. In the experiments conducted with BTMS, two different outdoor temperatures (T_a) were determined as 22.5 °C and 30 °C. Accordingly, in the first, second and third experiments, T_a = 22.5 °C and the charge rate was changed to 1C, and the discharge rate was changed to 3C, 4C and 5C, respectively. In the fourth, fifth and sixth experiments, T_a = 30 °C and the charge rate was changed to 3C, 4C and 5C, respectively. In the experiments, the battery cells were subjected to five cycles for each parameter and were left to rest for 10 minutes between cycles. During the experiments, instantaneous temperature changes of the battery cells were observed using K-type thermocouples. According to the results obtained in the study, the highest battery temperatures in the first, second and third experiments were measured around 34 °C, 37 °C and 38 °C, respectively. In the fourth and fifth experiments, the highest battery temperatures were measured around 41 °C and 52 °C, respectively. In the sixth experiment, which was the most severe condition determined (T_a = 30 °C, discharge rate 5C), the temperature reached around 57 °C at the end of the second cycle, and for this reason the experiment was interrupted. Considering the temperature values measured in the experiments, it was observed that the developed PCM-based BTMS generally exhibited an effective performance in controlling the

battery temperature under different environmental conditions and discharge rates but reached the limits of the system at high discharge rates and high ambient temperatures.

Keywords: Experimental, Li-ion battery, phase change material, battery thermal management system

FAZ DEĞİŞTİREN MALZEME ESASLI BATARYA ISIL YÖNETİM SİSTEMİNİN FARKLI ORTAM VE DEŞARJ KOŞULLARI İÇİN DENEYSEL ANALİZİ

ÖZET

Bu çalışmada faz değiştiren malzeme (FDM) esaslı bir batarya ısıl yönetim sistemi (BTYS) deney düzeneğinin imalatı ve deneysel analizi gerçekleştirilmiştir. Oluşturulan deney düzeneğinde batarya olarak silindirik tip 18650 Lityum-iyon (Li-iyon) batarya hücreleri kullanılmıştır. Dört adet hücreyle oluşturulan batarya paketinde, hücrelerin etrafına, hücrelerle eş merkezli olacak şekilde, Alüminyum kabuklar yerleştirilmiştir. Alüminyum ve batarya hücresi arasındaki boşluğa ise FDM doldurulmuştur. Bu şekilde oluşturulan BTYS, kontrollü sıcaklık ortamında batarya test cihazına bağlanarak şarj-deşarj çevrimlerine tabi tutulmuştur. BTYS ile yapılan deneylerde, 22.5 °C ve 30 °C olmak üzere iki farklı dış ortam sıcaklığı (T_a) belirlenmiştir. Buna göre birinci, ikinci ve üçüncü deneylerde T_a = 22.5 °C ve şarj hızı 1C olmak üzere, deşarj hızı sırasıyla 3C, 4C ve 5C olarak değiştirilmiştir. Dördüncü, beşinci ve altıncı deneylerde ise T_a = 30 °C ve yine şarj hızı 1C olacak şekilde deşarj hızı sırasıyla 3C, 4C ve 5C olarak değiştirilmiştir. Yapılan deneylerde, batarya hücreleri her bir parameter için beş çevrime tabi tutulmuş ve çevrimler arasında 10 dakika dinlenmeye bırakılmıştır. Deneyler esnasında, K-tipi ısılçiftler kullanılarak batarya hücrelerinin anlık sıcaklık değişimleri gözlemlenmiştir. Çalışmada elde edilen sonuçlara göre birinci, ikinci ve üçüncü deneylerde en yüksek batarya sıcaklıkları sırasıyla 34 °C, 37 °C ve 38 °C civarında ölçülmüştür. Dördüncü ve beşinci deneylerde ise en yüksek batarya sıcaklıkları sırasıyla 41 °C ve 52 °C civarında ölçülmüştür. Belirlenen en ağır koşul olan altıncı deneyde (T_a = 30 °C, deşarj hızı 5C) ise sıcaklık 2. çevrim sonunda 57 °C civarına ulaşmış, bu sebeple deney yarıda kesilmiştir. Deneylerde ölçülen sıcaklık değerleri göz önüne alındığında, geliştirilen FDM esaslı BTYS'nin, farklı çevresel koşullar ve deşarj hızlarında batarya sıcaklığını kontrol etmede genel olarak etkili bir performans sergilediği, ancak yüksek deşarj hızlarında ve yüksek ortam sıcaklıklarında sistemin sınırlarına ulaştığı görülmüştür.

Anahtar Kelimeler: Deneysel, Li-iyon batarya, faz değiştiren malzeme, batarya ısıl yönetim sistemi

ABSTRACT

Purpose: With the aim of contributing to the literature, this bibliometric analysis seeks to provide a comprehensive overview of the effects of spaceflight or microgravity exposure on humans or astronauts in space medicine, trace the evolution of studies, identify key contributors and impactful research areas, and offer one of the first contributions to this emerging field in our country's literature, ensuring accessibility within the field.

Method: This article presents a comprehensive bibliometric analysis using the Biblioshiny application from the Bibliometrix package, alongside R programming and VOSviewer tools. In this study, 157 relevant articles published between 2000 and 2024 were analyzed by searching the Scopus database using the keywords “space medicine,” “spaceflight,” “microgravity,” “human health,” “astronaut health,” and “impact”.

Result: The findings indicate that the USA leads in article publications and international collaboration efforts. The most cited article is "Space Radiation and Cataracts in Astronauts" by Cucinotta FA (2001), published in Radiation Research, with 308 citations. The top three journals by publication volume are NPJ Microgravity, ACTA Astronautica, and Life Sciences in Space Research. The most prolific institution is the China Astronaut Research and Training Center, while the most published author is "Li Y". The most frequently used keywords are "microgravity", "space flight", and "space radiation".

Conclusion: The findings of this study are valuable not only for researchers and practitioners in space medicine and human health but also for those interested in minimizing the effects of spaceflight on astronaut health and exploring future developments. Ultimately, this research highlights the impact of spaceflight on astronaut health, contributing to the ongoing dialogue and providing a roadmap for future studies in space medicine.

Keywords: Space flight, Aerospace medicine, Weightlessness, Bibliometric analysis.

UZAY TIBBINDA UZAY UÇUŞUNA MARUZ KALMANIN ASTRONOTLAR ÜZERİNDEKİ ETKİSİNİN BİBLİYOMETRİK ANALİZİ

ÖZET

Amaç: Literatüre katkıda bulunmak hedefiyle yaptığımız bu bibliyometrik analizle, uzay tıbbında uzay uçuşuna veya mikro yerçekimi ortamına maruz kalmanın insanlar veya astronotlar üzerine etkisiyle ilgili literatüre kapsamlı bir bakış açısı sunmayı, çalışmaların evrimini, önemli katkılarda bulunanları ve en etkili araştırma alanlarının saptanması, ülkemiz literatüründe daha çok yeni olan bu alana ilk katkılardan birini sunmayı hedefleyerek, alanda ulaşılabilir olması amaçlanmaktadır.

Metod ve Yöntem: Bu makale, Bibliometrix paketine ait Biblioshiny uygulamasıyla R programı ve VOSviewer araçlarını kullanarak kapsamlı bir bibliyometrik analiz sunmaktadır. Bu çalışmayla Scopus veri tabanında, "Uzay tıbbı, uzay uçuşu, mikrogravite, insan sağlığı, astronot sağlığı ve etki" anahtar kelimeleri taratılarak, 2000 ile 2024 yılları arasında yayınlanan 157 ilgili makale incelenmiştir.

Bulgular: Elde edilen bulgulara bakıldığında, ABD hem makale yayınları açısından önde gelen ülke iken hem de uluslararası iş birliği çabalarına öncülük etmektedir. Cucinotta Fa (2001) tarafından yazılan "Radiation Research" dergisinde yayınlanan "Space Radiation and Cataracts in Astronauts" makalesi 308 atıf sayısıyla en çok atıf alan makaledir. Aynı zamanda, "NPJ Mıcrogravity" dergisi "ACTA Astronautıca" dergisi ve "Life Scıences in Space Research" en çok yayın yapan ilk üç dergidir. Özellikle, "China Astronaut Research and Training Center" kurumu üretken araştırma çıktısı ile bu konu alanına en çok dahil olan kurum olarak öne çıkmaktadır. En çok yayın yapan yazar, "Li Y" dir. En çok kullanılan anahtar kelimeler arasında "microgravity, space flight ve space radiation" yer almaktadır.

Sonuç: Bu çalışmanın bulguları yalnızca uzay tıbbı ve insan sağlığı ile ilgilenen araştırmacı ve uygulayıcılar için değil aynı zamanda uzay uçuşlarının astronot sağlığı üzerindeki etkileri en aza indirecek pratik uygulamalar ve gelecekteki potansiyel gelişmeler hakkında fikir edinmek isteyen herkes için değerlidir. Sonuçta bu araştırma uzay uçuşlarının astronot sağlığı üzerindeki etkilerini ve bunun uzay tıbbı alanındaki önemini çevreleyip devam eden diyaloğa katkıda bulunmakta ve bu alanda gelecekteki araştırma çalışmaları için bir yol haritası sağlayacaktır.

Anahtar kelime: Uzay Uçuşu, Uzay Tıbbı, Mikrogravite, Bibliyometrik Analiz

OPTIMIZATION OF V/III RATIO IN AlN THIN FILMS ON PATTERNED SAPPHIRE SUBSTRATES

ABSTRACT

Aluminum nitride (AlN) thin films, which have a wide range of applications in the UV region, were grown on patterned sapphire substrates in this study using high and low V/III ratios. The effects of different V/III ratios on the structural quality, optical properties, and growth mode of the AlN films were investigated. Ammonia gas flow rates were set to 590 and 1180 sccm for low and high V/III ratios, respectively. Optical properties were analyzed using UV-Vis-NIR spectrophotometry, while surface morphology and crystal structure were characterized by scanning electron microscopy (SEM) and high-resolution X-ray diffraction (HR-XRD). The results showed that films grown with a high V/III ratio exhibited narrower full width at half maximum (FWHM) values in XRD measurements, indicating better crystal quality. These films also demonstrated higher total and diffuse reflectance, leading to smoother surface morphology and improved optical performance. In contrast, films grown with a low V/III ratio showed more pronounced lateral growth, which increased surface roughness and reduced both structural and optical quality. In single-layer samples, a high V/III ratio promoted three-dimensional (3D) growth and enhanced crystal quality. In two-layer structures, where layers with high and low V/III ratios were grown sequentially, initiating growth with high ammonia flow facilitated the formation of larger and more uniform nucleation islands, resulting in more stable crystal growth. These findings reveal that controlling the V/III ratio is critical to achieving high-quality AlN thin films, especially for optoelectronic devices requiring precise material properties.

ABSTRACT

This research explores the impact of temperature modulation interfaces on the growth behavior and structural quality of aluminum nitride (AlN) thin films deposited on c-plane patterned sapphire substrates (PSS) using the Pulsed Atomic Layer Epitaxy (PALE) method. The films were grown via metal-organic vapor-phase epitaxy (MOVPE), with all growth conditions held constant except for temperature. The high and low growth temperatures were set at 1440°C and 1250°C, respectively. Three sample configurations were designed: Sample A with a high/low/high temperature sequence, Sample B with a high/low sequence, and Sample C grown entirely at the high temperature. Each sample underwent a total of 3600 growth cycles: Sample A had 1200 cycles per layer, Sample B had 1800 cycles per layer, and Sample C consisted of a single continuous layer with all 3600 cycles. Various characterization techniques, including high-resolution X-ray diffraction (HR-XRD), UV-Vis-NIR spectrophotometry, and scanning electron microscopy (SEM), were employed to analyze the samples. The results revealed that minimizing the number of temperature transition interfaces leads to improved crystal quality. Sample C, grown without any temperature modulation, exhibited the smoothest surface and the lowest dislocation densities, indicating superior structural quality. These findings underscore the importance of optimizing temperature profiles to enhance the structural and functional performance of AlN thin films for advanced applications.

ABSTRACT

In order to determine the agro-morphological characteristics of dry bean genotypes in Sivas ecological conditions, a total of 10 dry bean genotypes, including 6 registered varieties and 4 advanced dry bean lines, were used in the study conducted in the Sivas Science and Technology University Agricultural Research and Development Center in the 2024 dry bean vegetation period in a randomized block experimental design with three replications. In the conducted study, agronomic parameters such as plant height, first pod height, biological yield, number of pods per plant, number of seeds per plant, number of seeds per pod, hundred seed weight, harvest index and seed yield per plant were examined. As a result of the conducted study, it was determined that the dry bean genotypes had seed yields per plant between 20.58-95.57 g. In addition, depending on the dry bean genotypes, it was observed that the plant height was 42.98-68.22 cm, the first pod height was 13.28-26.60 cm, the biological yield was 46.22-104.35 g, the number of pods per plant was 15.00-39.00, the number of seeds per plant was 35.00-116.00, the number of seeds per pod was 3.45-4.80, the hundred-seed weight was 33.28-50.89 g and the harvest index was 42.19-59.11%. As a result; It was observed that the performance yields of the dry bean genotypes K-1044, K-1084 and A-27, which were brought to the advanced level, were higher than the other dry bean genotypes.

BAZI KURU FASULYE GENOTİPLERİNNİN VERİM ÖĞLERİNİNBELİRLENMESİ ÜZERİNE BİR ARAŞTIRMA

ÖZET

Sivas ekolojik koşullarında kuru fasulye genotiplerinin agro-morfolojik özelliklerinin belirlenmesi amacıyla 2024 yılı kuru fasulye vejetasyon döneminde Sivas Bilim ve Teknoloji Üniversitesi Tarımsal AR-GE Merkezinde tesadüf blokları deneme deseninde üç tekrarlamalı olarak yürütülen çalışmada 6 adet tescilli çeşit ile 4 adet ileri düzeye kadar getirilmiş kuru fasulye hattı olmak üzere toplam 10 adet kuru fasulye genotipi kullanılmıştır. Yürütülen çalışmada agronomik parametreler olan bitki boyu, ilk bakla yüksekliği, biyolojik verim, bitkide bakla sayısı, bitkide tane sayısı, baklada tane sayısı, yüz tane ağırlığı, hasat indeksi ve bitkide tane verimi özellikleri incelenmiştir. Yürütülen çalışma sonucunda kuru fasulye genotiplerinin 20.58-95.57 g arasında bitkide tane verimlerine sahip oldukları belirlenmiştir. Bunun yanında kuru fasulye genotiplerine bağlı olarak bitki boyunun 42.98-68.22 cm, ilk bakla yüksekliğinin 13.28-26.60 cm, biyolojik veriminin 46.22-104.35 g, bitkide bakla sayısının 15.00-39.00 adet, bitkide tane sayısının 35.00-116.00 adet, baklada tane sayısının 3.45-4.80 adet, yüz tane ağırlığının 33.28-50.89 g ve hasat indeksinin ise %42.19-59.11değerlerine sahip oldukları görülmüştür. Sonuç olarak; Zülbiye ve Önceler-98 kuru fasulye çeşitleri ile ileri düzeye kadar getirilmiş olan K-1044, K-1084 ve A-27 nolu kuru fasulye genotiplerinin performans verimlerinin diğer kuru fasulye genotiplerine nazaran daha yüksek olduğu görülmüştür.

ABSTRACT

The research conducted in 2024 in order to reveal the quality parameters of some dry bean genotypes in Sivas ecological conditions was established in the trial plots of the Research and Development Center of Sivas Science and Technology University. In the study, 10 dry bean genotypes were used, including 4 local dry bean genotypes selected by pure line selection method and 6 dry bean varieties registered by Agricultural Research Institutes in our country. The study, which was conducted for one year, was established in a randomized block experimental design with 3 replications. During the research, data of 6 quality traits (Water Uptake Capacity (g/seed), Water Uptake Index (%), Swelling Capacity (ml/seed), Swelling Index (%), Shell Ratio (%) and Protein Ratio (%)) belonging to dry bean genotypes were revealed. According to the results of the variance analysis, statistically significant or very significant differences were determined among the dry bean genotypes in terms of all characteristics within the quality parameters considered. In the study conducted, the highest protein rate was determined in the Noyanbey 98 variety with 23.07%, while the lowest protein rate was revealed in the Yunus 90 variety with 20.62%.

Keywords: Sivas, dry bean, genotype, variety, quality, protein.

BAZI KURU FASULYE GENOTİPLERİNİN KALİTE ÖZELLİKLERİNİN ORTAYA KONULMASI

ÖZET

Bazı kuru fasulye genotiplerine ait kalite parametrelerinin Sivas ekolojik koşullarında ortaya konulması amacıyla 2024 yılında yürütülen araştırma, Sivas Bilim ve Teknoloji Üniversitesinin AR-GE Tarımsal Araştırma Merkezine ait deneme parsellerinde kurulmuştur. Çalışmada saf hat seleksiyon yöntemi ile seçilmiş 4 adet yerel kuru fasulye genotipi ile ülkemizde Tarımsal Araştırma Enstitüleri tarafından tescil ettirilmiş 6 adet kuru fasulye çeşidi olmak üzere 10 adet kuru fasulye genotipi kullanılmıştır. Bir yıl süresince yürütülen çalışma tesadüf blokları deneme deseninde 3 tekerrürlü olarak kurulmuştur. Araştırma süresince kuru fasulye genotiplerine ait 6 adet kalite özelliğinin (Su Alma Kapasitesi (g/tane), Su Alma İndeksi (%), Şişme Kapasitesi (ml/tane), Şişme İndeksi (%), Kabuk Oranı (%) ve Protein Oranı (%)) verileri ortaya konulmuştur.

Yapılan varyansa analiz sonuçlarına göre ele alınan kalite parameteleri içinde tüm özellikler bakımından kuru fasulye genotipleri arasında istatistiksel anlamda önemli yada çok önemli farklılıklar belirlenmiştir. Yürütülen çalışmada en yüksek protein oranı %23.07 ile Noyanbey 98 çeşidinde belirlenirken en düşük protein oranı ise %20.62 ile Yunus 90 çeşidinde ortaya konulmuştur.

Anahtar Kelimeler: Sivas, kuru fasulye, genotipi, çeşit, kalite, protein.

RARE EARTH ELEMENTS: INDUSTRIAL USES AND RESERVES

Sema TETİKER
Prof. Dr., Batman University, Department of Mining and Extraction Technology, Batman-Türkiye, sema.tetiker@batman.edu.tr (ORCID: 0000-0001-5158-7364

ABSTRACT

Rare earth elements (REEs) are a group of 17 elements including 15 silvery-white metals called lanthanides or lanthanoids and scandium and yttrium. Rare earth elements are classified as heavy (Y, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, and Lu) and light (Sc, La, Ce, Pr, Nd, Pm, and Sm). A rare earth mineral contains one or more rare earth elements as the main metal constituent. Rare earth minerals are commonly found in pegmatites or carbonatite intrusions with alkaline to percaline igneous rocks. Important ore minerals include gadolinite, monazite, xenotime, bastnasite, zircon, apatite, titanite, fluorite, and uraninite. Although rare earth elements are technically relatively abundant throughout the Earth's crust (cerium is the 25th most abundant element at 68 ppm, more abundant than copper), in practice they are finely distributed among these trace impurities. The countries with the largest rare earth mineral reserves are China – 44 million metric tonnes (mt; 1mt is equal to 1,000 kilograms), followed by other countries (Brazil – 21 mt, India – 6.9 mt, Australia – 5.7 mt, Russia – 3.8 million mt, Vietnam – 3.5 million mt, ABD – 1.9 million mt, Greenland – 1.5 million mt, Tanzania – 890,000 mt, South Africa – 860,000 mt, Canada – 830,000 mt, Thailand – 4,500 mt). Consumer electronics, electric vehicles (EVs), aircraft They are used in a wide range of products, including engines, medical equipment, petroleum refining, and military applications such as magnets, missiles and radar systems. China accounts for about 70% of global mineral production and 90% of processed and permanent magnet output. Beijing sets quotas on output, smelting and separation, which are closely watched as a barometer of global supply. Today, Ukraine has reserves of rare earth elements (REEs) and precious minerals, including lanthanum, cerium and neodymium, which are essential for high-tech applications such as electronics, defense, aerospace and renewable energy. Ukraine is believed to have about 5% of the world's rare earth reserves. The latest data in our country indicate that there is a reserve potential of approximately 600 mt.

NADİR TOPRAK ELEMENTLERİ: ENDÜSTRİYEL KULLANIMLARI VE REZERVLER

ÖZET

Nadir toprak elementleri (REEs), lantanitler veya lantanoidler olarak adlandırılan 15 gümüş-beyaz metal ile skandiyum ve itriyumu da içeren 17 elementten oluşan bir gruptur. Nadir toprak elementleri ağır (Y, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb ve Lu) ve hafif (Sc, La, Ce, Pr, Nd, Pm ve Sm) olarak sınıflandırılır. Nadir toprak mineral, ana metal bileşenler olarak bir veya daha fazla nadir toprak elemneti içerir. Nadir toprak mineralleri genellikle pegmatitlerde veya karbonatit sokulumlarında alkalin ile perkalin magmatik kayalarla birlikte bulunur. Önemli cevher mineralleri gadolinit, monazit, ksenotim, bastnasit, zirkon, apatit, titanit, florit ve uraninit olarak bilinir. Nadir toprak elementleri teknik olarak Dünya'nın tüm kabuğunda nispeten bol miktarda bulunsa da (seryum 68 ppm ile 25. en bol bulunan elementtir ve bakırdan daha bol miktarda bulunur), pratikte bu eser miktardaki safsızlıklar arasında ince bir şekilde dağılmıştır, En büyük nadir toprak mineral rezervlerine sahip ülkeler başta China – 44 million metric tonnes (mt; 1mt is equal to 1,000 kilogrammes) olmak üzere, diğer ülkeler (Brezilya – 21 mt, Hindistan – 6.9 mt, Avustralya– 5.7 mt, Rusya – 3.8 million mt, Vietnam – 3.5 million mt, ABD – 1.9 million mt, Grönland – 1.5 million mt, Tanzanya– 890,000mt, Güney Afrika – 860,000mt, Kanada – 830,000mt, Tayland – 4,500mt) olarak bilinir. Tüketici elektroniği, elektrikli araçlar (EV'ler), uçak motorları, tıbbi ekipmanlar, petrol rafinasyonu, mıknatıs, füzeler, cam ve radar sistemleri gibi askeri uygulamalar dahil olmak üzere çok çeşitli ürünlerde kullanılırlar. Çin, küresel maden üretiminin yaklaşık %70'ini ve işlenmiş ve kalıcı mıknatıs çıktısının %90'ını oluşturmaktadır. Pekin, küresel arzın bir barometresi olarak yakından izlenen çıktı, eritme ve ayırma konusunda kotalar koymaktadır. Bugün Ukrayna lantan, seryum ve neodimyum gibi elektronik, savunma, havacılık ve yenilenebilir enerji gibi yüksek teknoloji uygulamaları için gerekli olan 17 metalik mineralden oluşan nadir toprak elementleri (REEs) ve değerli mineral rezervlerine sahiptir. Ukrayna'nın dünyanın nadir toprak unsurları rezervlerinin yaklaşık % 5'ine sahip olduğuna inanılıyor. Ülkemizde son veriler yaklaşık 600 mt civarında bir rezerv potansiyeli olduğu belirtiliyor.

ABSTRACT

One of the most critical parts of the gas turbine combustion chamber is the injectors that perform fuel atomization. The task of the injectors is to separate the fuel into as small as possible particles in the form of a spray. Because as the atomized particle size decreases, more efficient combustion and lower emission values are obtained. Therefore, improving injector designs is of great importance not only in terms of fuel efficiency and energy production, but also in minimizing environmental effects. There are many types of injectors that perform atomization, discussed in the literature. Injectors that atomize the fuel based on the mechanical vortex principle are used in large jet engine combustion chambers. In microjet combustion chambers, where weight saving is important, cavitation fuel injectors are preferred due to the simplicity of the system and low costs. Such injectors provide atomization by dynamically collapsing the vapor bubbles in the fuel and reach very fine droplet sizes without the need for complex internal geometries, unlike mechanical vortex injectors. In this study, the spray characteristics of a cavitation fuel injector will be analysed using experimental and numerical methods together. For this purpose, nozzle geometries will be determined and manufactured in a way that will create cavitation. Then, the manufactured injector will be adapted to a test setup with adjustable fuel pressure and flow rate. Droplet size distribution will be determined by the laser diffraction method using the Malvern Spray Analyzer device, and droplet breakup dynamics due to cavitation will be observed in detail with a high-speed camera. The effects of different injection pressures and different types of fuels on atomization efficiency, spray stability, and possible injector erosion will be analysed. In addition, spray characteristics such as droplet size distribution, spray cone angle, and penetration length will be measured and verified by numerical simulations. Finally, the optimized injector will be integrated into a microjet gas turbine and combustion performance will be evaluated in terms of parameters such as fuel-air mixture, combustion efficiency and pressure loss with CFD-based analyses.

Keywords: Injector, Nozzle, Cavitation, Atomization, CFD

HAVACILIK MOTORLARINDA KAVİTASYONLU ENJEKTÖR TASARIMI VE MİKROJET YANMA ODASINDAKİ PERFORMANS ANALİZİ

ÖZET

Gaz türbinleri yanma odasının en kritik parçalarından biri yakıt atomizasyonu gerçekleştiren enjektörlerdir. Enjektörlerin görevi yakıtı sprey halinde mümkün olduğunca küçük parçalara ayırmaktır. Çünkü atomize edilen parça boyutu küçüldükçe daha verimli bir yanma ve daha düşük emisyon değerleri elde edilmiş olur. Bu nedenle, enjektör tasarımlarının iyileştirilmesi, sadece yakıt verimliliği ve enerji üretimi açısından değil, aynı zamanda çevresel etkilerin minimize edilmesi için de büyük önem taşır. Literatürde atomizasyonu gerçekleştiren birçok enjektör çeşidi vardır. Büyük jet motor yanma odalarında mekanik girdap prensibine dayanarak yakıtı atomize eden enjektörler kullanılmaktadır. Ağırlık tasarrufunun önemli olduğu mikrojet yanma odalarında ise sisteminin basitliği ve düşük maliyetleri açısından kavitasyonlu yakıt enjektörleri tercih edilmektedir. Bu tür enjektörler, yakıt içerisindeki buhar kabarcıklarının dinamik olarak çökmesi ile atomizasyonu sağlayıp çok ince damlacık boyutlarına mekanik girdaplı enjektörlerin aksine karmaşık iç geometrilere ihtiyaç duymadan ulaşırlar. Bu çalışmada deneysel ve sayısal yöntemler birlikte kullanılarak kavitasyonlu bir yakıt enjektörünün püskürtme karakteristikleri analiz edilecektir. Bunun için nozul geometrileri kavitasyon oluşturacak şekilde belirlenip üretilecektir. Daha sonra üretilen enjektör, yakıt basıncı ve debisi ayarlanabilir bir test düzeneğine uyarlanacaktır. Malvern Spray Analyzer cihazı ile damlacık boyutu dağılımı lazer kırınım yöntemiyle belirlenecek, yüksek hızlı bir kamera ile kavitasyona bağlı damlacık parçalanma dinamikleri ayrıntılı biçimde gözlemlenecektir. Farklı enjeksiyon basıncının ve farklı tür yakıtların; atomizasyon verimliliği, sprey stabilitesi ve olası enjektör erozyonuna etkileri analiz edilecektir. Ayrıca; damlacık boyutu dağılımı, sprey koni açısı ve penetrasyon uzunluğu gibi püskürtme karakteristikleri, sayısal simülasyonlar ile yapılacak ve doğrulanacaktır. Son olarak optimize edilen enjektör bir mikrojet gaz türbinine entegre edilerek yanma performansı CFD tabanlı analizlerle yakıt-hava karışımı, yanma verimi ve basınç kaybı gibi parametreler açısından değerlendirilecektir.

ABSTRACT

The aerodynamic efficiency of wind turbine blades is crucial for improving energy output, especially in small and medium-scale turbines operating under low Reynolds number conditions. The present study examines novel passive flow control methods intended at enhancing the performance of thick airfoils typically used near the root region of wind turbine blades. Employing the DU00-W2-350 airfoil profile, the study investigates the impact of different flexible membrane materials (Latex Rubber, EPDM, and Neoprene) applied to both suction and pressure surfaces, as well as a flexible Gurney flap integrated into the trailing edge. Unlike traditional rigid control devices, these flexible membranes passively adapt to flow conditions, enabling dynamic suppression of boundary layer separation and vibration. A combination of high-fidelity Computational Fluid Dynamics (CFD) simulations and subsonic wind tunnel experiments is employed to analyse aerodynamic behaviour across a range of Reynolds numbers (100,000–250,000) and angles of attack (0°–25°). The study also visualises flow separation and laminar separation bubbles using smoke-wire techniques. The anticipated outcome is a significant increase in lift-to-drag ratio and overall aerodynamic efficiency, particularly in transitional flow regimes. By filling a critical gap in the literature—specifically, the use of flexible materials on pressure surfaces and the synergistic effects of multi-material, multi-region configurations—this research offers a pioneering perspective for optimizing blade performance in real-world wind energy applications. The findings aim to contribute not only to academic knowledge but also to future full-scale wind turbine design strategies and national energy policies.

ABSTRACT

Rangelands are ecosystems that cover 31.2% of the world's terrestrial area and 37.8% of Turkey's agricultural lands, playing a vital role for rural communities. These semi-natural areas provide a wide range of ecosystem services, including food, fiber, water, recreation, and minerals, as well as essential roughage for livestock, making them crucial for livelihoods worldwide, particularly in developing countries. However, competition in land use, extreme climate events, socioeconomic changes, and excessive or improper grazing have led to rangelands degradation in many regions.

Studies indicate that overgrazing reduces soil aggregate stability by 30-50% and significantly increases erosion risk. The effects of climate change, particularly drought and rising temperatures, accelerate degradation by reducing vegetation regeneration capacity. Woody plant invasion decreases forage productivity by up to 60%, leading to both ecological and economic losses. This review concludes that on-site measurements—such as soil aggregate stability, bare soil ratio, and vegetation composition—along with remote sensing technologies (NDVI, MODIS), are critical for understanding the spatial and temporal distribution of degradation. Among the proposed strategies for sustainable rangeland management, controlled grazing systems, woody plant control, and early warning systems stand out. Community-based management models, integrating local knowledge and scientific data, yield more effective results. Additionally, new policies are recommended to revise rangeland rights and grazing regulations.

Given our dependence on rangelands, the degradation of these resources is believed to have large-scale impacts. This paper examines the primary causes of rangeland degradation, discusses indicators for identifying degradation, and evaluates methods for assessing the degree of degradation in rangeland ecosystems. Furthermore, options and considerations for restoring degraded rangelands are presented, along with forward-looking approaches for monitoring and evaluating rangeland degradation.

MERALARDA ARAZİ BOZULMASI: NEDENLERİ, GÖSTERGELERİ VE YÖNETİM STRATEJİLERİ

ÖZET

Meralar, dünya karasal alanının %31,2'sini, Türkiye tarım alanlarının %37,8'ini kaplayan ve kırsal topluluklar için hayati öneme sahip olan ekosistemlerdir. Bu yarı doğal alanlar gıda, lif, su, rekreasyon, maden gibi çok çeşitli ekosistem hizmetleri ve çiftlik hayvanlarının beslenmesi için gereken temel kaba yemi sağlayarak dünya genelinde, özellikle gelişmekte olan ülkelerde insanların geçiminde önemli rol oynamaktadır. Ancak arazi kullanımındaki rekabet, ekstrem iklim olayları, sosyoekonomik değişimler, aşırı ve usulüne uygun olmayan otlatma birçok bölgede meraların bozulmasına yol açmaktadır.

Yürütülen çalışmalar, aşırı otlatmanın toprak agregat stabilitesini %30-50 oranında azalttığını ve erozyon riskini önemli ölçüde artırdığını göstermektedir. İklim değişikliğinin etkileri, özellikle kuraklık ve sıcaklık artışları, bitki örtüsünün yenilenme kapasitesini düşürerek bozulma sürecini hızlandırmaktadır. Odunsu bitki istilası ise ot verimliliğini %60'a varan oranlarda azaltarak hem ekolojik hem de ekonomik kayıplara yol açmaktadır. İncelemede, toprak agregat stabilitesi, çıplak toprak oranı ve bitki örtüsü kompozisyonu gibi yerinde ölçümlerin yanı sıra, uzaktan algılama teknolojilerinin (NDVI, MODIS) bozulmanın mekânsal ve zamansal dağılımını anlamada kritik öneme sahip olduğu kanaatine varılmıştır. Sürdürülebilir mera yönetimi için önerilen stratejiler arasında kontrollü otlatma sistemleri, odunsu bitki kontrolü ve erken uyarı sistemleri öne çıkmaktadır. Topluluk tabanlı yönetim modelleri, yerel bilgi ve bilimsel verilerin entegrasyonunu sağlayarak, daha etkili sonuçlar vermektedir. Ayrıca, düzenlenen yeni politikalar ile mera hakları ve otlatma düzenlemelerinin gözden geçirilmesi önerilmektedir.

Meralara olan bağımlılığımız göz önüne alındığında, bu kaynaklardaki bozulmanın geniş ölçekli etkilere neden olduğu düşünülmektedir. Bu bildiride, mera bozulmasının başlıca nedenleri incelenmekte; bozulmayı belirlemek için kullanılabilecek göstergeler ile mera ekosistemlerindeki bozulma derecesini değerlendirme yöntemleri tartışılmaktadır. Ayrıca, bozulmuş meraların restore edilmesine yönelik seçenekler ve dikkat edilmesi gereken hususlar sunulmakta, mera bozulmasının izlenmesi ve değerlendirilmesinde geleceğe dönük yaklaşımlar ele alınmaktadır.

ABSTRACT

Grassland biodiversity is a complex phenomenon that encompasses multiple interconnected components, including the diversity of organisms, genetic variation among these organisms, the communities they form, ecosystem structures, and landscape patterns. The ecological functions and diversity offered by biodiversity are critically important not only in terms of ecosystem services but also from ethical, aesthetic, and economic perspectives. Grasslands, often located in areas unsuitable for agriculture due to irregular and low precipitation, rocky formations, poor drainage, and extreme temperature conditions, provide forage and water for freely roaming wild and domestic animals, as well as natural resources such as timber and minerals. These areas, typically characterized by shallow soils and slow nutrient cycling, are among the most ecologically fragile environments. Grassland biodiversity is threatened by a range of factors, including habitat loss and fragmentation, invasive species pressure, climate change, wildfires, prolonged drought, overgrazing, lack of interdisciplinary coordination, and insufficient implementation capacity. Despite these challenges, various strategies such as community-based management systems, participatory planning approaches, invasive species control, grassland restoration, integrated and sustainable management models, and the preservation of local knowledge systems offer significant opportunities for the conservation and enhancement of grassland biodiversity. The main objective of this review is to analyze the existing body of literature on grassland biodiversity, to assess the current status, identify the main challenges, and evaluate potential opportunities in this field. The findings indicate a significant decline in grassland biodiversity, highlighting the urgent need for the development of conservation-focused grassland management strategies.

MERA BİYOÇEŞİTLİLİĞİ: MEVCUT DURUM VE KARŞILAŞILAN GÜÇLÜKLER

ÖZET

Mera biyoçeşitliliği; organizmaların çeşitliliği, bu organizmalar arasındaki genetik varyasyonlar ile bunların oluşturduğu topluluklar, ekosistem yapıları ve peyzaj desenleri gibi çok katmanlı bileşenleri içeren karmaşık bir olgudur. Biyoçeşitliliğin sunduğu ekolojik işlevler ve çeşitlilik, yalnızca ekosistem hizmetleri açısından değil, aynı zamanda etik, estetik ve ekonomik değerler bakımından da son derece önemlidir. Tarıma elverişsiz olan, düzensiz ve düşük yağış alan, kayalık yapılar içeren, zayıf drenaja ve ekstrem sıcaklık koşullarına sahip alanlarda yer alan meralar; serbest dolaşan yabani ve evcil hayvanlar için yem ve su kaynağı olmanın yanı sıra, kereste ve maden gibi doğal kaynakları da sunmaktadır. Genellikle sığ topraklı ve besin döngüsü yavaş olan bu alanlar, ekolojik kırılganlık açısından hassas bölgeler arasında yer almaktadır. Mera ekosistemlerinin biyoçeşitliliği, habitat kaybı ve parçalanması, istilacı türlerin baskısı, iklim değişikliği, yangınlar, uzun süreli kuraklık, aşırı otlatma, disiplinler arası eşgüdüm eksikliği ve yetersiz uygulama kapasiteleri gibi birçok tehditle karşı karşıya kalmaktadır. Bu zorluklara rağmen; topluluk temelli yönetim sistemleri, katılımcı planlama yaklaşımları, istilacı türlerin kontrolü, mera restorasyonu, entegre ve sürdürülebilir yönetim modelleri, yerel bilgi sistemlerinin korunması gibi uygulamalar, mera biyoçeşitliliğinin korunması ve iyileştirilmesi açısından önemli fırsatlar sunmaktadır. Bu derlemenin temel amacı, mera biyoçeşitliliğine ilişkin literatürde yer alan mevcut bilgi birikimini analiz ederek, güncel durumu ortaya koymak ve karşılaşılan sorunlar ile bu alandaki potansiyel fırsatları değerlendirmektir. Çalışma sonucunda, mera biyoçeşitliliğinde ciddi bir gerilemenin söz konusu olduğu ve bu durumun, koruma odaklı mera yönetim stratejilerinin acilen geliştirilmesini gerekli kıldığı sonucuna varılmıştır.

Anahtar Kelimeler: Biyoçeşitliliğin korunması, meralar, sürdürülebilirlik, ekosistem

GROWTH OF COTTON CULTIVARS IN RESPONSE TO MULTIWALLED CARBON NANOTUBES

ABSTRACT

Cotton is a perennial crop that is commercially cultivated in many parts of the world. Cotton by-products have provided producers with additional value, mainly in livestock feed supplements and soil amendments. However, the quality of cotton bioproducts is significant for sustainable cotton production. The present research investigates the effects of carbon nanotubes (CNTs) on in vitro germination and growth rate of three commercial cultivars (Progen Ad, ST-468, and Esperia) of cotton in Turkey. The seedlings were sterilized with 0.1% HgCl2 and cultured on MS medium enriched with different CNT concentrations (0, 40, 80, 160, and 240 mg) on cotton seed germination, growth parameters, and biomass. The results indicated that lower CNTs concentrations (40–160 mg) enhanced germination rates, root-to-shoot biomass ratios, and stimulation in comparison to the control. However, the highest CNTs concentration (240 mg) exhibited inhibiting impacts on the studied parameters, illustrating the significance of appropriate dosage. Esperia. exhibited the substantial germination rate, whereas ST-468 demonstrated the overall performance with significant germination and improved all growth parameters. ST-468 had the maximum germination rate, whereas Progen Ad exhibited the lowest percentage. These findings support that the growth parameters can be influenced by different carbon sources or experimental conditions. The research provides new findings on the function of carbon-based nanomaterials to stimulate plant development.

ABSTRACT

Cowpea (*Vigna unguiculata*) is an important legume with immense potential to address global food security challenges due to its nutritional and agricultural benefits. Enhancing cowpea's essential micronutrient content through biofortification offers a sustainable approach to combat malnutrition, particularly in regions heavily reliant on this crop. This innovative strategy not only improves nutrient bioavailability in diets but also enhances soil health and agricultural productivity. By integrating biofortification techniques with nanotechnology, specifically using carbon nanotubes (CNTs), this study explores promising pathways for improving cowpea's nutritional value and overall yield, thereby supporting healthier diets and sustainable farming practices for a growing global population. The seedlings were sterilized with 70% alcohol and cultured on MS medium enriched with different CNTs concentrations including 0, 50, 75, 100, 125, and 150 mg/L six treatment and each treatment have eight replications. The observed parameters were seed germination, growth parameters, and biomass of two cowpea cultivars. The results revealed significant differences in cowpea growth and germination between two cultivars Karagoz and Bodrum. The average germination percentage for Karagoz recorded significantly (79.02%) more compared to Bodrum (60.73%). Variability in germination was slightly greater in Bodrum, as reflected by a standard deviation of (12.32) compared to (10.20) in Karagoz. In terms of fresh weight, Karagoz demonstrated significant results, with an average of (93.36) and a maximum of (217.31) while Bodrum averaged (40.64) with a maximum of (110.12) The dry weight of Karagoz (0.73g) was significantly more than Bodrum (0.51g), showing improved growing performance of Karagoz. The present research indicates that biofortification with CNTs positively improves cowpea growth, particularly in Karagoz by enhancing biomass production. CNTs improved nutrient absorption and water retention, promoting enhanced plant development. Variations in germination and biomass between the cultivars may result from differences in experimental conditions, such as nutrient availability or CNT concentrations. The present study highlights the potential of combining biofortification and nanotechnology to sustainably address global food security challenges.

ABSTRACT

It was carried out to evaluate the effectiveness of different herbicides applied against weeds in sugar beet cultivation areas of Bayburt province and the effects of these applications on sugar beet yield and quality parameters. In this study, a total of 40 plots with 5 replicate control plots of 20 m² were established in Tomlacık village of Bayburt province in 2024. In these plots, herbicides with different active ingredients and physical control methods were applied and their effects on sugar beet development, yield and sugar content were evaluated comparatively. In chemical control, herbicide mixtures containing especially 400 g/l Metamitron + 55 g/l Ethofumesate + 35 g/l Phenmedipham and 350 g/l Metamitron + 150 g/l Ethofumesate have shown high effectiveness against the mentioned weed species. According to the data obtained from the plants in the plots where these applications were made, a visible increase was obtained in the growth of the sugar beet plant and the sugar content within it. In the plots where no application was made, the weed density was high and a negative effect was observed on the development and sugar content of the beets. The most common weed species in the sugar beet planting areas in Bayburt province were determined as wild mustard (*Sinapis arvensis* L.), siren (*Chenopodium album* L.) and red-rooted foxtail (*Amaranthus retroflexus* L.). In the applications, physical control has emerged as the most effective method in controlling weeds. In chemical control, mixtures containing 400 g/l Metamitron + 55 g/l Ethofumesate + 35 g/l Phenmedipham and 350 g/l Metamitron + 150 g/l Ethofumesate were found to be more effective. These methods supported the development of sugar beet by reducing weed density and directly contributed to the increase in yield.

ABSTRACT

In this study was conducted to investigate the effects of drought stress on the morphological development of melissa (*Melissa officinalis* L.) under *in vitro* conditions. The study was carried out in the Tissue Culture Laboratory of Prof. Dr. Saadet BÜYÜKALACA, Department of Horticulture, Faculty of Agriculture, Çukurova University. Polyethylene glycol 6000 (PEG-6000) was added to Murashige and Skoog (MS) basal nutrient medium at 0% (control), 2%, 4% and 6% to simulate drought stress. PEG decreases the osmotic potential, limiting the biological accessibility of water in the medium and thus induces drought stress in vitro. In the experiment, basic morphological and physiological parameters such as germination rate (%), stem length (mm), root length (mm), stem wet and dry weight (g) and root wet and dry weight (g) were measured to evaluate the effects of PEG treatments on the in vitro development of lemon balm plants. The data obtained during the study revealed that plant growth was gradually retarded with the increase in PEG concentration. In this context, artificial drought conditions created *in vitro* by PEG treatments provide an effective model system for evaluating the drought responses of medicinal-aromatic plants such as melissa.

MELİSA (*Melissa officinalis* L.) BİTKİSİNİN *İN VİTRO* KOŞULLARDA KURAKLIK STRESİNİN BELİRLENMESİ

ÖZET

Bu çalışma, kuraklık stresinin *in vitro* koşullarda melisa (*Melissa officinalis* L.) bitkisinin morfolojik gelişimi üzerindeki etkilerini araştırmak amacıyla yürütülmüştür. Araştırma, Çukurova Üniversitesi Ziraat Fakültesi Bahçe Bitkileri Bölümü Prof. Dr. Saadet BÜYÜKALACA Doku Kültürü Laboratuvarı'nda gerçekleştirilmiştir. Kuraklık stresini simüle etmek amacıyla Murashige ve Skoog (MS) bazal besin ortamına %0 (kontrol), %2, %4 ve %6 oranlarında polietilen glikol 6000 (PEG-6000) ilave edilmiştir. PEG, osmotik potansiyeli düşürerek ortamdaki suyun biyolojik erişilebilirliğini sınırlandırmakta ve bu sayede *in vitro* kuraklık stresini oluşturmaktadır. Denemede, PEG uygulamalarının melisa bitkisinin in vitro gelişimi üzerindeki etkilerini değerlendirmek üzere çimlenme oranı (%), gövde uzunluğu (mm), kök uzunluğu (mm), gövde yaş ve kuru ağırlığı (g) ile kök yaş ve kuru ağırlığı (g) gibi temel morfolojik ve fizyolojik parametreler ölçülmüştür. Araştırma süresince elde edilen veriler, PEG konsantrasyonundaki artışa bağlı olarak bitki gelişiminin kademeli biçimde gerilediğini ortaya koymuştur. Bu bağlamda, PEG uygulamaları ile *in vitro* ortamda oluşturulan yapay kuraklık koşulları, melisa gibi tıbbi-aromatik bitkilerin kuraklığa karşı yanıtlarını değerlendirmede etkili bir model sistemi sunmaktadır.

Anahtar kelimeler: Abiyotik stres, Kuraklık, Melisa, *İn vitro*

ABSTRACT

In this study was carried out to determine the effects of different drought stress levels on the morphological development of summer squash cultivars under *in vitro* tissue culture conditions. Drought stress was induced by adding different concentrations (0, 2, 4, 6%) of polyethylene glycol (PEG-6000) to MS medium. The research was conducted in the tissue culture laboratory of Prof. Dr. Saadet BÜYÜKALACA, Department of Horticulture, Faculty of Agriculture, Çukurova University. Morphological characteristics such as germination rate (%), stem wet and dry weight (g), root wet and dry weight (g), stem and root length (mm) of the plants exposed to different PEG levels were evaluated. The results revealed that summer squash cultivars showed different tolerances to drought stress under *in vitro* conditions and PEG-induced water stress was an important factor limiting plant growth.

YAZLIK KABAK ÇEŞİTLERİNİN *İN VİTRO* KOŞULLARDA KURAKLIK STRESİNİN BELİRLENMESİ

ÖZET

Bu çalışma, *in vitro* doku kültürü koşullarında farklı kuraklık stres düzeylerinin yazlık kabak çeşitlerinin morfolojik gelişimi üzerindeki etkilerini belirlemek amacıyla yürütülmüştür. Kuraklık stresi, MS besin ortamına farklı konsantrasyonlarda (%0, 2, 4, 6) polietilen glikol (PEG-6000) eklenerek oluşturulmuştur. Araştırma Çukurova Üniversitesi Ziraat Fakültesi Bahçe Bitkileri Bölümü Prof. Dr. Saadet BÜYÜKALACA doku kültürü laboratuvarında yürütülmüştür. Denemede farklı PEG düzeylerine maruz bırakılan bitkilerin çimlenme oranı (%), gövde yaş ve kuru ağırlığı (g), kök yaş ve kuru ağırlığı (g), gövde ve kök uzunlukları (mm) gibi morfolojik özellikleri değerlendirilmiştir. Sonuçlar, yazlık kabak çeşitlerinin *in vitro* koşullarda kuraklık stresine farklı toleranslar gösterdiğini ve PEG kaynaklı su stresinin bitki gelişimini sınırlayıcı önemli bir etken olduğunu ortaya koymuştur.

Anahtar kelimeler: Abiyotik stres, Kuraklık, Kabak, *İn vitro*

TURBULENCE AND VISCOUS EFFECTS IN SMALL SOLID ROCKET MOTORS

ABSTRACT

This study investigates the performance of a small solid propellant rocket motor using double-base propellant through computational fluid dynamics (CFD) simulations, considering the effects of turbulence and viscous flow dynamics. The analytical methods rely on one-dimensional fluid flow equations using mass, momentum, and energy conservation. The CFD approach models the internal flow field by treating the burning propellant surface as a mass inflow boundary, where injected gas properties are derived from equilibrium calculations using NASA CEA software. The simulations reveal significant differences between analytical predictions and CFD results, particularly in chamber pressure, exhaust velocity, and specific impulse. While the analytical method overestimates performance by neglecting flow losses due to viscosity and turbulence, the CFD analysis captures the impact of turbulence-induced mixing, viscous boundary layer development, and nozzle divergence inefficiencies due to wave losses.

Key findings indicate that the CFD-predicted chamber pressure is **4–6% lower** than the analytical value due to unresolved flow recirculation and pressure drops. Similarly, the exhaust velocity and specific impulse show a **4–5% reduction** in the CFD results, attributed to viscous dissipation and incomplete conversion of thermal energy to kinetic energy in the nozzle. These deviations highlight the limitations of the idealized analytical model. The study demonstrates that CFD provides a more accurate performance assessment, enabling better optimization of motor design parameters such as grain geometry and nozzle contour. While the decoupled combustion model simplifies the analysis, the results remain valuable for initial design phases, offering insights into real-world performance losses that analytical methods cannot predict. This work underscores the importance of incorporating high-fidelity flow simulations in solid fuel rocket motor development.

ABSTRACT

Sandwich composites are widely used multilayer structural elements in various applications such as factories, workshops, hangars, cold storage rooms, and prefabricated buildings. Their advantages include easy and fast installation, high thermal and acoustic insulation, lightweight structure, and high mechanical strength. A typical sandwich composite consists of three main layers: outer face sheet, core material, and inner face sheet.

In this study, balsa wood was used as the core material, and the composite was manufactured by coating the structure with fiberglass and UV resin. As an innovative approach, the balsa core was impregnated with polyethylene glycol 400 (PEG 400), a phase change material (PCM). Prior to the impregnation process, delignification was applied to the balsa wood to enhance its porosity, thereby increasing its PCM absorption capacity. This process significantly improved the PCM loading efficiency.

Phase change materials are specialized substances used for thermal energy storage. During the phase change process, PCMs store energy in the form of latent heat as they absorb or release thermal energy. Desired properties of PCMs include high latent heat capacity, operation at a constant temperature, reusability, and environmental friendliness.

As a result, PEG 400-impregnated balsa-core sandwich composites reinforced with fiberglass were successfully produced. These structures exhibit promising characteristics in terms of both thermal energy storage potential and mechanical performance, offering a novel and functional solution for energy-efficient building components.

ABSTRACT

Medical education continues to train physicians by increasing its accumulation for centuries. In this process, various tools have been used in medical education and innovations that are still emerging can contribute to medical education. Artificial intelligence, the most up-to-date progress of our age, has also started to be included in medical education. Our study aims to investigate the usability of artificial intelligence in medical education. Chatbots operating on large language models have become widespread with well-known brand names. ChatGPT, Copilot, Grok, 3 prominent brands were included in our study. In our study, semester 2 from the intermediate classes in the faculty of medicine was preferred as a pilot. In one year, 534 questions from 7 disciplines were asked in term 2 committees. These questions were asked to chatbots that are ready to use with the most up-to-date versions for free. Copilot provided the most successful answers with an accuracy rate of 78.8%, while Grok also achieved high success with 77.7%. ChatGPT was the most error-prone chatbot with a rate of 71.7%. In terms of accuracy per course, Copilot was the most successful in histology and embryology, medical physiology, medical pathology and microbiology courses, while Grok was the most successful in anatomy, biophysics and medical pharmacology courses. The percentage of success of chatbots varies according to the field in which they are developed. If an artificial intelligence model chatbot trained for medical education is produced, it will enable us to see almost 100% successful results.

Keywords: chatbot, chatgpt, copilot, grok, medical education.

KOMİTE SORULARI ÜZERİNDEN TIP EĞİTİMİNDE CHATBOTLARIN KULLANILABİLİRLİĞİ ÜZERİNE PİLOT ARAŞTIRMA

ÖZET

Tıp eğitimi yüz yıllardır birikimini artırarak hekim yetiştirmeye devam etmektedir. Bu süreçte çeşitli araçlar tıp eğitiminde kullanılmış olup halen çıkan yenilikler de tıp eğitimine katkı sağlayabilmektedir. Çağımızın en güncel ilerlemesi yapay zeka da tıp eğitimine dahil olmaya başlamıştır. Çalışmamız yapay zekanın tıp eğitiminde kullanılabilirliğini araştırmayı amaçlamıştır. Büyük dil modelleri üzerinden faaliyet gösteren chatbotlar bilindik marka isimleriyle yaygınlaşmıştır. ChatGPT, Copilot, Grok olarak öne çıkan 3 marka çalışmamıza dahil edilmiştir. Çalışmamızda pilot olarak tıp fakültesinde ara sınıflardan dönem 2 tercih edilmiştir. Bir yılda dönem 2 komitelerinde 7 bilim dalından 534 soru sorulmuş. Bu sorular ücretsiz olarak en güncel sürümleriyle kullanıma hazır olan chatbotlara sorulmuştur. En başarılı yanıtları %78.8 doğruluk oranıyla Copilot sağlamışken, %77.7 ile Grok da yüksek başarı elde etmiştir. ChatGPT ise %71.7 oranıyla aralarında yanlışa en meyilli olan chatbottur. Ders başına doğruluk açısından değerlendirildiğinde histoloji ve embriyoloji, tıbbi fizyoloji, tıbbi patoloji ve mikrobiyoloji derslerinde Copilot, anatomi, biyofizik, tıbbi farmakoloji derslerinde Grok en başarılıdır. Chatbotlar geliştirildikleri alana göre başarılı olma yüzdeleri değişmektedir. Eğer tıp eğitimi için eğitilmiş yapay zeka modeli chatbot üretilirse neredeyse %100'e varacak başarılı sonuçlar görmemizi sağlayabilecektir.

Anahtar Kelimeler: chatbot, chatgpt, copilot, grok, tıp eğitimi.

ABSTRACT

Laser Powder Bed Fusion (LPBF) enables the precise fabrication of geometrically complex and high-performance metal components, making it particularly suitable for critical jet engine parts in the aerospace industry. Cobalt-chromium (Co-Cr) alloys are widely used in jet engine components due to their excellent high-temperature strength and oxidation resistance, making them ideal candidates for LPBF processing. In this study, the influence of 61 independent LPBF process parameters—including variations in laser power (140–480 W), scan speed (400–1400 mm/s), and hatch distance (60–140 µm)—was investigated in detail. The investigation focused on their effects on the density of Co-Cr alloy samples, measured by Archimedes' principle, and the areal density calculated using ImageJ software. All samples were fabricated using a constant layer thickness (30 µm), laser spot diameter (75 µm), and a chess scan strategy. The experimental results confirm that the optimized parameter settings, such as 410 W laser power, 950 mm/s scan speed, and 75 µm hatch distance, produce densities greater than 8.18 g/cm³ (99.2% areal density) with minimal porosity. In addition, the research highlights the significant influence of volumetric energy density on the quality of the built parts. Low energy densities (<100 J/mm³) lead to incomplete fusion and lack of consolidation, whereas excessively high values (>200 J/mm³) result in keyhole defects due to overmelting. These findings provide a robust basis for optimizing process parameters in the large-scale LPBF

manufacturing of Co-Cr components for demanding aerospace applications requiring high mechanical reliability.

Keywords: Additive manufacturing, laser powder bed fusion, Co-Cr alloys, process optimization, density

ABSTRACT

This study aims to identify fungal diseases in sugar beet (*Beta vulgaris* L.) cultivation areas within Bayburt province, located in Turkey's Eastern Black Sea Region. The objective is to determine the prevalence of these diseases and to evaluate the potential phytopathological risks specific to the region. As a strategically important crop for Turkey's agriculture and sugar industry, sugar beet is particularly vulnerable to biotic stress factors, especially fungal pathogens, which can cause significant yield and quality losses.

Field surveys were conducted in three phases throughout the 2024 growing season in the districts of Bayburt. Sugar beet plants showing symptoms of disease were collected and subjected to detailed laboratory analyses using both microscopic and macroscopic diagnostic techniques.

The study reveals that fungal diseases pose a substantial threat to sugar beet production in Bayburt province and directly affect crop productivity. It emphasizes the necessity of implementing region-specific integrated disease management strategies, including the use of resistant cultivars, proper crop rotation, and optimized planting schedules. The findings also underscore the need for farmer education and awareness on disease prevention practices to ensure sustainable agricultural production in the region. The data obtained serve as a valuable reference for agricultural stakeholders and policy developers in the context of plant protection.

Keywords: Sugar beet, Fungal pathogens, plant diseases, field survey

ASSESSMENT OF SOIL QUALITY WITH THE SMAF METHOD

Veysel ALP
PhD student, Harran University, Faculty of Agriculture, Department of Soil Science and Plant Nutrition,Şanlıurfa, TURKEY, veyselalp1221@gmail.com**(**Responsible Author)
ORCID: 0000-0001-7880-9879

ABSTRACT

In this research, in the process of evaluating some soil properties on the Bingöl Solhan Plain sample, it was aimed to determine the general soil quality of the Solhan Plain in line with the data obtained from the soil quality parameters selected by taking expert opinion of the soil samples at 0-30 cm depth taken from 85 different coordinates through grids placed at 300 m x 300 m intervals using ArcGIS 10.8 software. Physical property analyses of soil samples taken from the field in the laboratory environment; Soil Texture (Clay, Silt, Sand), Volume Weight, Useful Water Content, Field Capacity, Fading Point. Chemical property analyses; Cation Exchange Capacity, Soil Reaction (pH), Electrical Conductivity (EC), Lime Percentage, Water Displaced Na Amount. Organic matter content was determined for biological property analysis. In the evaluation of soil quality parameters, each parameter was normalised and soil quality index was determined by SMAF model and additive index method. As a result of this evaluation, the physical soil quality score of Solhan Plain varies between 43-88, but it is defined as 'medium quality' since it is between 55-70 quality scores in the score table with an average quality score of 60. Although the chemical soil quality score varies between 50-57, the chemical soil quality is defined as 'low' because it is between 40-55 quality scores with an average quality score of 54. Although the biological soil quality of the area varies between 40-56, the soil quality is defined as 'low' because it is between 40-55 quality scores with an average quality score of 48. Although the general soil quality of the area varies between 50-62, it is defined as 'medium quality' since it is between 55-70 quality scores with an average quality score of 56.

In order for the soils in the study area to fulfil the desired functions; physical, chemical and biological soil quality must be at the desired level. For this reason, maintaining and even improving the functions of soils depends on appropriate management systems and land management. In areas where the quality content is defined as low, the positive effects on the physical, chemical and biological qualities of the soil will be seen in a short time with crop rotation and barnyard manure applications. It is inevitable that the weak properties will get much worse with poor land applications. In this study, it was concluded that the SMAF model can be used as an important tool in the evaluation of soil quality and thus it is important for farmers, land managers and people who have a say in production to make better and more effective decisions regarding sustainable land use and soil health improvement practices.

Keywords: SMAF, soil quality, Solhan Plain, simple additive index.

NEW TREND IN APPLICATION DEVELOPMENT: BENEFITS AND CHALLENGES OF LOW-CODE/NO-CODE PLATFORMS FOR ORGANIZATIONS

Tuğba KARABOĞA
Associate Prof., Amasya University, Merzifon Vocational School, Office Services and Secreterial Departmant, Amasya-Türkiye, tugba.karaboga@amasya.edu.tr (Responsible Author) ORCID: 0000-0003-3830-3536,

Hasan Aykut KARABOĞA
Assistant Prof., Amasya University, Faculty of Education, Department of Educational Sciences, Amasya-Türkiye, h.aykut.karaboga@amasya.edu.tr ORCID: 0000-0001-8877-3267

ABSTRACT

In the digital age, developing artificial intelligence technology and the artificial intelligence-based platforms that emerged with it have begun to offer an unprecedented software development environment for both businesses and societies. Low-code/no-code (LCNC) platforms have essentially been an important technological development that has saved application development from the monopoly of software developers and has enabled the emergence of the concept of citizen development in companies. LCNC platforms are a new technology that hides the complexity of coding in the background and allows individuals without formal coding training to develop applications that can solve the problems they encounter in their own work. These platforms have reduced the burden on software developers, contributed to the acceleration of business processes, and significantly supported the digital transformation of businesses by shortening the time it takes to provide digital solutions to problems. In addition, it is also accepted as a breakthrough that supports employees in the development of the most needed digital skills in the digital transformation process, facilitates the learning process, and provides a solution to the software developer gap. Citizen developers, even if they do not have professional coding knowledge, are people who can design, develop and launch applications related to their own fields of work as if they were experienced software developers thanks to LCNC platforms. From the perspective of software developers, LCNC platforms shorten software development cycles from months to days thanks to the visual development environments, pre-created code connectors and smart templates they offer, allowing institutions to automate more professional workflows with scarce IT resources. In this context, this study will draw attention to the basic advantages and challenges that LCNC platforms provide to institutions in the digital transformation process of enterprises. In addition, the contribution of LCNC platforms to the citizen development method and the role of enterprises in the digital transformation process will be discussed. Based on the opportunities and challenges revealed at the end of the study, suggestions will be made on how the field of work can be shaped in the future and what potential research topics can be for researchers.

ANALYSIS OF EXERCISE VIDEOS THROUGH AI-ASSISTED VISUAL ASSESSMENT: A COMPARISON BETWEEN CHATGPT 4.5 AND PHYSIOTHERAPIST EVALUATIONS

Uğur SÖZLÜ
Assistant Professor, Tokat Gaziosmanpaşa University, Faculty of Health Sciences, Department of Physiotherapy and Rehabilitation, Tokat – Türkiye
ugur.sozlu@gop.edu.tr (Responsible Author) ORCID: 0000-0001-5171-161X

ABSTRACT

Objective: The aim of this study is to evaluate the feasibility of visual analysis of YouTube videos featuring the "Cat-Cow" exercise, which is designed to improve spinal mobility, using the ChatGPT 4.5 model, and to compare these assessments with those conducted by an experienced physiotherapist.

Method: In this study, 25 YouTube videos were selected using the keyword "Cat-Cow exercise." The videos were segmented into one-second frames, and the resulting images were evaluated by the ChatGPT 4.5 model according to predefined criteria. The initial assessment employed a seven-item Exercise Quality Scale (scored 0–2). In the second assessment, the overall quality of each video was rated on a 1–5 scale. The same videos were independently evaluated by a physiotherapist with clinical experience using the same criteria. Scores from ChatGPT and the physiotherapist were compared using the Wilcoxon test, Intraclass Correlation Coefficient (ICC), and Bland-Altman analysis.

Results: Based on the Exercise Quality Scale scores, the mean total score assigned by ChatGPT 4.5 was 12.20 ± 1.98, while the physiotherapist's mean score was 10.52 ± 3.62 ($p = 0.018$). A low level of agreement was observed between raters (ICC: 0.360), and the Bland-Altman analysis revealed a mean difference of 1.68. In the overall quality assessment, the mean score given by ChatGPT 4.5 was 4.16 ± 0.75, compared to 3.52 ± 1.19 assigned by the physiotherapist ($p = 0.0058$). ICC remained low (0.373), with a mean difference of 0.64 according to the Bland-Altman analysis.

Conclusion: ChatGPT 4.5 tends to give higher exercise and overall quality scores than the physiotherapist. This suggests that the model has a certain potential in recognizing posture and movement form. However, full agreement with human observation has not been achieved. Therefore, further development of ChatGPT 4.5 is needed to enhance its visual assessment capabilities and ensure greater clinical reliability.

Keywords: ChatGPT 4.5, exercise, YouTube, artificial intelligence, visual analysis

ARTIFICIAL INTELLIGENCE AND EMPLOYEE ENGAGEMENT: OPPORTUNITIES AND CHALLENGES IN HRM

Murat TOPALOĞLU
Dr., Tokat Gaziosmanpaşa University, Quality Coordination Office, Tokat-Türkiye
murat.topaloglu@gop.edu.tr ORCID: 0000-0001-8640-3596

ABSTRACT

The rapid advancement of digitalization in today's business environment has significantly accelerated the adoption of artificial intelligence (AI) technologies in human resource management (HRM). As businesses strive for more efficient operations, AI has emerged as a key tool in streamlining HR functions. Beyond automating routine administrative tasks, AI increasingly contributes to strategic decision-making processes, thereby enhancing the overall effectiveness and agility of HR functions. This study explores the relationship between AI technologies and employee engagement, focusing on key AI components such as machine learning, artificial neural networks, big data analytics, and process automation. These technologies, which have revolutionized various industries, are now playing a pivotal role in transforming HR practices by providing data-driven insights. From a comprehensive perspective, the analysis examines the influence of these technologies not only on employee engagement but also on associated factors including job satisfaction, motivation, recognition, and employee turnover. As organizations look for ways to foster a positive and productive work environment, understanding how AI impacts these factors is critical. Utilizing a systematic review of contemporary academic literature, this research aims to deepen the understanding of how AI-driven systems shape employee engagement dynamics within organizational settings. By synthesizing recent theoretical and empirical findings, the study identifies both opportunities and challenges presented by the integration of AI into HR practices, highlighting areas where AI can either enhance or hinder employee engagement and retention. Furthermore, the paper outlines several potential directions for future research, with the goal of informing more human-centered and ethically grounded applications of AI in the workplace.

Keywords: Artificial intelligence, employee engagement, human resource management.

TARGET DETECTION BY SYNCHRONIZING SMALL UNMANNED AERIAL VEHICLES (UAVS) AND FACE RECOGNITION SYSTEM

Hakan TOPAL
Yüksek Lisan Öğrencisi, Ankara Yıldırım Beyazıt Üniversitesi, Fen Fakültesi, Savunma Teknolojileri Bölümü,Ankara ,Türkiye, ORCID ID: https://orcid.org/0009-0000-1349-6621, Hakantopal33@gmail.com

Prof.Dr.Fatih Vehbi ÇELEBİ
Akademisyen, Ankara Yıldırım Beyazıt Üniversitesi, Fen Fakültesi, Savunma Teknolojileri Bölümü,Ankara ,Türkiye, ORCID ID: https://orcid.org/ 0000-0001-8569-1098, fvcelebi@aybu.edu.tr

ABSTRACT

This thesis aims to improve the target detection process by integrating Small Unmanned Aerial Vehicles (UAVs) with artificial intelligence based face recognition systems. The system is designed to detect moving individuals, especially in dynamic and crowded environments. For this purpose, face recognition algorithms such as Convolutional Neural Networks (CNN), Mobile Net, MTCNN, YOLO and Face Net were analyzed and the most suitable models were determined in terms of performance.

The system running on the UAV performs target detection, tracking and identification tasks autonomously by ensuring that hardware and software components work in harmony. In the study, dynamic target tracking, adaptation to environmental variables and real-time processing speed were prioritized. The system provides fast detection of individuals on the move, especially in dense human populations.

Experimental results show that the proposed system speeds up the target detection process and improves the accuracy of target detection in moving and dense environments. In particular, it has great potential for security applications. Due to the flexible nature of UCAVs, the system can be actively used in surveillance, search and rescue, border security and military operations.

The literature review examined the existing research on the integration of UCAVs and face recognition systems and revealed that this work can make significant contributions in areas such as security, search and rescue, and defense. It was observed that existing face recognition systems are largely dependent on fixed cameras and integration with mobile systems is limited.

The system developed in this thesis improves target identification and tracking processes by integrating face recognition algorithms with UAVs. In the tests conducted, it was observed that the system produced successful results in low light conditions and in images taken from different angles. The results show that this approach offers an innovative solution for both academic research and industrial applications.

Keywords: UAVS, Face Recognition, Target Identification, Target Tracking

THERMODYNAMİC FEASIBILITY OF AMMONIA VALORIZATION FOR CLEAN ENERGY AND ENVIRONMENTAL APPLICATIONS

Ahmad A. BELLO[1]

ABSTRACT

The uncontrolled release of ammonia (NH_3) into the environment poses significant risks to air quality and public health. In response to the growing global demand for safe and sustainable energy alternatives, hydrogen (H_2) fuel has emerged as a promising candidate. This study investigates the thermodynamic feasibility of converting ammonia into valuable products such as hydrogen, nitrogen (N_2), and nitrogen oxides (NO_x), which are useful in various chemical processes. A process modelling and simulation approach was employed to evaluate the oxidative dehydrogenation of ammonia using selected oxidants. The results demonstrate the effectiveness of these oxidants in optimizing hydrogen production and enhancing the yield of other key products. Furthermore, the study highlights the potential for designing environmentally sustainable mechanisms to capture and transform ammonia emissions from various sources, contributing to improved environmental and industrial applications.

Keywords: Process Simulation, Modelling, Environment, Ammonia, Hydrogen, Energy Alternation.

METFORMIN: A BIGUANIDE FOR TYPE 2 DIABETES MANAGEMENT

Mrs.E.Elavarasi, Yuvaraj AR, J. Jayadurka, R.S.Deekshith, DR.R.Srinivasan
Faculty of Pharmacy, Bharath Institute of Higher Education and Research,Chennai-73

ABSTRACT

Metformin is a widely prescribed oral antihyperglycemic agent and a cornerstone in the management of type 2 diabetes mellitus. Belonging to the biguanide class, its primary mechanism of action involves reducing hepatic glucose production and enhancing insulin sensitivity in peripheral tissues, leading to improved glycemic control without typically causing hypoglycemia. Unlike sulfonylureas, metformin does not stimulate insulin secretion.Beyond its glucose-lowering effects, metformin has demonstrated several beneficial effects, including a potential for modest weight loss and improvements in cardiovascular risk factors such as dyslipidemia. It is often favored as a first-line therapy due to its efficacy, safety profile, and relatively low cost.Common adverse effects are primarily gastrointestinal in nature, including nausea, diarrhea, and abdominal discomfort, which often subside with continued use or by taking the medication with food. A rare but serious risk is lactic acidosis, particularly in individuals with impaired renal function, necessitating careful patient selection and monitoring. Long-term use may also be associated with vitamin B12 deficiency in some individuals.In addition to its established role in type 2 diabetes, metformin is also used in the treatment of polycystic ovary syndrome (PCOS) and is being investigated for potential benefits in other conditions, including prediabetes, cancer, and neurodegenerative diseases. Its multifaceted mechanisms of action and favorable profile continue to make it a valuable therapeutic agent.

Keywords: Metformin, oral antihyperglycemic, cardiovascular risk,type 2 diabetes

ARTIFICIAL INTELLIGENCE IN DRUG DISCOVERY IN MEDICINAL SYSTEM

Mrs.E.Elavarasi, Yuvaraj AR, J. Jayadurka, DR.R.Srinivasan
Faculty of Pharmacy, Bharath Institute of Higher Education and Research,Chennai-73

ABSTRACT

Artificial intelligence (AI) is revolutionizing the landscape of drug discovery, offering unprecedented opportunities to accelerate the identification and development of novel therapeutics. By leveraging machine learning, deep learning, and other AI techniques, researchers can analyze vast datasets of biological, chemical, and clinical information to identify potential drug targets, predict drug efficacy and toxicity, and even design novel drug candidates de novo.AI algorithms excel at pattern recognition and predictive modeling, enabling more efficient virtual screening of compound libraries, the optimization of lead compounds, and the prediction of pharmacokinetic and pharmacodynamic properties. This can significantly reduce the time and cost associated with traditional drug discovery pipelines, which are often lengthy and have a high failure rate. Furthermore, AI is playing an increasingly important role in understanding complex biological systems, identifying biomarkers, and personalizing medicine. By integrating diverse data types, AI can help elucidate disease mechanisms and identify patient subpopulations that are most likely to respond to specific treatments. While challenges remain in terms of data quality, interpretability of AI models, and regulatory considerations, the application of artificial intelligence in drug discovery holds immense promise for accelerating the development of life-saving medicines and transforming healthcare.

Keywords: Artificial intelligence, biomarkers, AI algorithms, complex biological systems

RECOMBINANT DNA TECHNOLOGY AND PROTEIN ENGINEERING: POWERFUL TOOLS FOR BIOLOGICAL INNOVATION

Mrs.E.Elavarasi, Yuvaraj AR, J. Jayadurka, DR.R.Srinivasan
Faculty of Pharmacy, Bharath Institute of Higher Education and Research,Chennai-73

ABSTRACT

Recombinant DNA technology and protein engineering are transformative fields at the forefront of modern biology and biotechnology. Recombinant DNA technology involves the manipulation of genetic material from different sources to create novel DNA molecules, enabling the production of large quantities of specific DNA sequences and the expression of desired proteins in heterologous hosts. This foundational technology underpins numerous applications, including the development of biopharmaceuticals, gene therapy, diagnostics, and genetically modified organisms. Building upon the ability to manipulate DNA, protein engineering focuses on the rational design or directed evolution of proteins with novel or enhanced properties, such as altered stability, catalytic activity, or binding affinity. By employing techniques like site-directed mutagenesis and directed selection, researchers can tailor proteins for specific applications in medicine, industry, and research. This abstract highlights the synergistic power of recombinant DNA technology in providing the genetic blueprints and protein engineering in refining the functional molecules, driving innovation across diverse biological disciplines and offering solutions to global challenges.

Keywords: Recombinant DNA, DNA sequences, genetic blueprints, manipulate DNA, biological disciplines

ASSESSING THE POTENTIAL OF VARIOUS MEDICINAL PLANTS AS ALTERNATIVES TO THE LASOTA VACCINE USED IN POULTRY PRODUCTION FOR NEWCASTLE DISEASE PREVENTION: A REVIEW

JOSEPH CHISOM OKOYE
NIGERIAN YOUNGRESEARCHERS ACADEMY, josephchisomokoye@gmail.com

ABSTRACT

Newcastle disease is a major threat to poultry farming worldwide, causing significant economic losses. While the Lasota vaccine is commonly used to prevent the disease, some farmers and researchers are looking for alternative approaches. This review explores the potential of medicinal plants as a natural way to protect poultry from Newcastle disease.Plants like garlic, ginger, and neem have been used for centuries in traditional medicine and have shown promise in boosting the immune system of birds. These plants contain special compounds that can help fight off diseases. This review looks at the current research on using medicinal plants as an alternative to vaccines, highlighting their benefits and challenges.

The findings suggest that medicinal plants could be a useful tool in poultry farming, especially in areas where access to vaccines is limited. However, more research is needed to ensure their safety and effectiveness. By exploring the potential of medicinal plants, we can work towards more sustainable and healthy poultry farming practices. This review aims to contribute to the conversation on natural approaches to animal health and identify areas for further study.

REVIEW ON ORAL DRUG DELIVERY SYSTEM

V.Vijitha, S.Madhumitha, Dr.K.Rajaganapathy
Bharath Institute of Higher Education and Research, Faculty of Pharmacy, Chennai.
vijitha4931@gmail.com

ABSTRACT

The oral route is still the most often used method of medication delivery because it is noninvasive, practical, and encourages patient adherence. However, first-pass metabolism and gastrointestinal (GI) barriers (acid pH, enzymes, mucus layers) restrict medication absorption and bioavailability, frequently requiring regular dosage. Recent studies have concentrated on sophisticated oral delivery systems that allow for targeted, regulated, and sustained action in order to overcome these difficulties. Drugs are encapsulated in biocompatible carriers such hydrogel systems, solid lipid and polymeric nanoparticles, liposomes, micelles, and polymeric matrices to prevent degradation during GI transit and release payloads in a sustained or stimuli-responsive manner. Site-specific release is made possible by matrices and coatings that are sensitive to pH or enzymes (enteric polymers or polysaccharide hydrogels dissolve in the intestine or colon).Mucoadhesive or mucus-penetrating compounds, as well as ligand-functionalized nanoparticles (such as antibodies, peptides, and vitamins), improve uptake by particular cells or tissues. Enzyme inhibitors, absorption enhancers, and prodrug methods are examples of co-delivery techniques that increase drug stability and penetration while broadening the range of deliverable substances, such as proteins and peptides. Artificial intelligence (AI)-designed formulations for accurate dosing and release profiles, 3D-printed customized tablets, and ingestible microdevices (microgrippers, electrical sensors) are examples of emerging tactics. These developments have the potential to increase therapeutic indices, maintain therapeutic levels, and enhance drug stability (e.g. permitting oral delivery of difficult biologics). They minimize systemic toxicity by focusing action at disease locations, lowering dose frequency, and maintaining stable plasma concentrations. However, there are still barriers to translation, including interpatient heterogeneity, legal barriers, and manufacturing complexity. All things considered, the combination of innovative carriers and sensitive materials is opening the door for oral medicines of the future that will optimize both safety and efficacy.

INVESTING IN SUSTAINABLE DEVELOPMENT OF REGIONS OF KYRGYZSTAN

Asel Pazylova
Lecturer, Osh Technological University, Department of Economics and Finance (Kyrgyzstan), aselsuyumbaevna@gmail.com

ABSTRACT

This paper examines the significance of investment in the sustainable development of Kyrgyzstan's regions. It highlights the economic, social, and environmental challenges hindering progress, emphasizing the need for increased private investment to supplement government resources. The research integrates qualitative and quantitative methodologies, analyzing statistical data and regulatory frameworks while incorporating insights from local stakeholders.

Findings indicate that economic disparities, environmental degradation and insufficient infrastructure remain key obstacles. While foreign investments are concentrated in specific regions, others face economic stagnation, exacerbating inequality and internal migration. The study underscores the importance of green economy initiatives and blockchain technology in agriculture to enhance transparency, efficiency and environmental sustainability.

Recommendations include fostering policies that attract sustainable investments, improving governance to mitigate corruption and leveraging international partnerships. The study concludes that sustainable investment is vital for fostering resilience, economic diversification and social equity. To ensure a stable and prosperous future, Kyrgyzstan must adopt an integrated approach that balances economic growth with environmental protection and social development.

ANALYSIS OF THE STATE OF FOREIGN INVESTMENT ATTRACTION IN THE REGIONS OF KYRGYZSTAN

Asel Pazylova
Lecturer, Osh Technological University, Department of Economics and Finance (Kyrgyzstan), aselsuyumbaevna@gmail.com

ABSTRACT

Foreign direct investment (FDI) serves as a key catalyst for economic transformation, regional development and sustainable growth. This article provides an in-depth analysis of the state of foreign investment attraction across the regions of Kyrgyzstan, utilizing data from the National Statistical Committee of the Kyrgyz Republic, the National Bank of the Kyrgyz Republic, the World Bank, the Eurasian Development Bank (EDB) and the United Nations Conference on Trade and Development (UNCTAD). The study explores the dynamics of FDI inflows, regional disparities and the underlying factors influencing investment distribution.

The findings reveal that while some regions successfully attract foreign capital, others remain underserved due to structural barriers, regulatory inconsistencies and infrastructural limitations. Policy uncertainty and institutional inefficiencies further complicate the investment climate. However, Kyrgyzstan possesses considerable potential in emerging sectors such as green energy, tourism, agribusiness and digital innovation. By capitalizing on its geographic location and untapped resources, the country can enhance its investment profile and foster sustainable economic diversification.

To strengthen its appeal to international investors, Kyrgyzstan must implement a strategic framework that includes regulatory reforms, enhanced legal protections and streamlined administrative processes. Expanding investment incentives, promoting public-private partnerships (PPPs) and developing region-specific economic clusters can accelerate FDI inflows and ensure a more balanced distribution of investments. Moreover, fostering regional cooperation and establishing transparent, investor-friendly policies will reinforce confidence among foreign stakeholders.

This study offers actionable recommendations to overcome investment bottlenecks and unlock the full potential of Kyrgyzstan’s regions. By addressing key challenges and leveraging competitive advantages, the country can position itself as a dynamic investment hub, driving inclusive economic growth and long-term prosperity.

SEISMIC ANALYSIS OF COMPARITIVE MULTI – STOREY BUILDING

Subhashish Dey
Department of Civil Engineering, Gudlavalleru Engineering College, Andhra Pradesh, India
Email: subhasdey633@gmail.com

ABSTRACT

In this modern era urbanization increases day by day, the availability of land is becoming less and cost of land is becoming higher. To meet the requirements of the population, high rise buildings are very much needed. The high-rise buildings are to be designed to resist lateral forces. The analysis of a structural system to determine the deformations and forces induced by applied loads or ground excitation is an essential step in the design of a structure to resist earthquakes. Nowadays multi-storey buildings are consists with different irregularities that can be consider in designing a structure are plan irregularity, vertical irregularity, stiffness irregularity and mass irregularity. In this project, seismic analyses of RCC buildings with mass irregularity at top floor level are carried out. The Model Considered as G+8 having with heavy masses on 8^{th} storey of the building. Structure having the material properties M30 grade for concrete and Fe 550 for reinforcing steel as per IS: 456-2000, with length 30.5m, width 28.5m and each floor height 3m. As per IS: 1893-2016, Mass irregularity is considered to exist where the seismic weight of any storey is more than 150 percent of that of its adjacent storey. Mass irregularity is an important factor which affects the response of the structure under seismic loads. The Seismic analysis will be carried out on Response spectrum analysis in ETABS software.

Keywords: *Mass irregularity, Seismic analysis, Response spectrum analysis and ETABS software*

APPLICATION OF INDUSTRIAL WASTE MATERIALS FOR THE PREPARATION OF GREEN BRICKS

Subhashish Dey
Department of Civil Engineering, Gudlavalleru Engineering College, Andhra Pradesh, India
Email: subhasdey633@gmail.com

ABSTRACT

The manufacturing of bricks from industrial waste materials such as fly ash, rice husk, glass powder, lime, and coconut fiber offers a sustainable solution for waste management and conservation of natural resources. This study investigates the feasibility of using these waste materials to produce bricks with desirable physical, mechanical, and thermal properties. The bricks were manufactured using a combination of these waste materials and lime as a binding agent. The results show that the bricks exhibit excellent compressive strength, water absorption, and thermal insulation properties. The use of these waste materials in brick manufacturing reduces the environmental impact of waste disposal, conserves natural resources, and promotes sustainable development. This novel approach has the potential to revolutionize the construction industry by providing a sustainable and eco-friendly alternative to traditional brick manufacturing methods. The rapid growth of industrialization has led to an alarming increase in waste generation, posing significant environmental concerns. This study explores the feasibility of utilizing industrial waste materials, including fly ash, rice husk, glass powder, lime, and coconut fiber, to manufacture sustainable bricks. The bricks were produced using a combination of these waste materials and lime as a binding agent. The physical, mechanical, and thermal properties of the bricks were evaluated, and the results showed excellent compressive strength, water absorption, and thermal insulation properties. The use of these waste materials in brick manufacturing reduces waste disposal costs, conserves natural resources, and mitigates environmental pollution. This comprehensive study demonstrates the potential of industrial waste materials in sustainable brick production, offering a viable solution for the construction industry to adopt eco-friendly practices.

sami.melik@univ-biskra.dz ; sara.khelil@univ-biskra.dz ; bouzirtallal@gmail.com

ABSTRACT

The purpose of this research is to explain how kitchens have been redesigned as multifunctional biolabs meant to improve food production and preparation. The main point examined is that there is not enough room in modern kitchens for new biotechnological ideas in cooking, which limits the use of novel food systems. After studying how people interact in the kitchen and assessing their dietary trends, it is clear that the use of biotech tools in kitchens can increase how sustainable and nutritious the food made at home can be. As a result of this transformation, families can produce foods in their homes that are both nutritious and help prevent food insecurity. This research outlines a plan to use every day gathering places to raise awareness about healthy eating and new types of food. All in all, the research suggests a change in how we approach kitchen design, saying that new ideas for kitchen layouts are vital for innovative work in food and better health for the community.

[3] Institute of Architecture and Urban Planning, Blida University, Blida, Algeria.
sami.melik@univ-biskra.dz ; sara.khelil@univ-biskra.dz ; bouzirtallal@gmail.com

ABSTRACT

This research looks into including both composting and resource recovery systems in smart kitchens to help improve how food waste is managed, mainly in urban homes. The research uses a blend of different data collection methods to look into how waste is generated today, what people think about composting technologies, and how successful various waste recovery methods are. It is apparent from the data that households who use smart kitchen composting systems not just reduce the amount of waste, but also benefit by having better attitudes and habits toward being more environmentally friendly. This research explains that better handling of waste and lowering food waste can positively impact public health and the quality of the environment people live in. Additionally, research shows that using sustainable methods in kitchens can improve community health, promote nutrition and waste education, and strengthen efforts to create a sustainable environment in cities. As a result, this study suggests that the use of smart kitchens and effective composting combined with recovery of resources has the power to develop eco-friendly lifestyles in cities and improve public health, paving the way for a responsible use of all resources.

Keywords: Smart Kitchen Architecture; Composting Systems; Resource Recovery; Food Waste Management; Sustainable Domestic Infrastructure.

ABSTRACT

The research looks at how joining IoT and AI with food systems in kitchens can help optimize the area, make the systems effective, and enhance user experience, all the while promoting a sustainable and efficient approach. With the combined use of both qualitative and quantitative methods, we gathered information through case studies and interviews of kitchen stakeholders, analyzed energy and food waste levels, and reviewed user satisfaction. The research suggests that using IoT and AI in kitchens can make the working environment more friendly, help make meal preparation faster, and lead to healthier diet habits. Furthermore, the study explains how using technology can result in both better energy efficiency and a reduction of food waste. As a result, designing smart kitchens can help individuals enjoy a better experience and also benefit people by reducing the impact of food systems on the environment. Beyond cooking, this points to the great benefit for healthcare of using these smart technologies that help us lead healthier lives and lower our impact on nature. Because of this study, people can better see the need for new designs that support health-conscious and eco-friendly living within homes.

ABSTRACT

It explores ways to improve nutrition in the kitchen by rearranging design elements, using behavioral architecture and acknowledging how physical places can affect food-related actions and decisions. The study mixes interview-based qualitative data with survey-based quantitative data to pinpoint aspects of design that help users follow healthier diets. The results show that the arrangement of the space, the availability of healthy food, and the use of natural lighting impact users' decisions and help them maintain a healthy lifestyle. They are important as they can help design health strategies against diseases caused by unhealthy diets and point to the role of environment in promoting health at the community level. Moreover, the findings bring attention to the areas of nutrition and architecture, proving that uniting different experts benefits the health of people living in different areas. It supports the development of more knowledge by explain how cooking spaces can be structured to improve health and offers suggestions for how design interventions at home can improve health and lower money spent on healthcare for diet-related problems.

Keywords: Behavioral Architecture; Nutritional Wellness; Health-Oriented Kitchen Design; Food Environment Design; Architectural Cues for Behavior Change.

hajar.louhab@etu.fstm.ac.ma

ABSTRACT

The preparation of 1 kg of instant coffee generates approximately 2 kg of wet spent coffee grounds, typically considered waste. However, this by-product still contains high-value bioactive compounds, particularly sought after in wellness and health-related sectors.

In this study, the extraction of these compounds was carried out by combining the Controlled Instantaneous Pressure Drop (DIC) process with Microwave-Assisted Extraction (MAE). The DIC process was used as a texturizing pretreatment to enhance the extraction efficiency of bioactive compounds from spent coffee grounds.

Response Surface Methodology (RSM) was used to optimize the DIC pretreatment process based on two responses: total polyphenol content and antioxidant activity. The statistical influence of four factors was evaluated: saturated steam pressure (P), thermal processing time (t), number of cycles (C), and moisture content (W). A significant increase in both total polyphenol concentration and antioxidant activity was observed in extracts from DIC-treated samples. Compared to untreated samples, polyphenol content increased from 26.40 to 31.97 mg GAE/g dry matter, and antioxidant activity increased from 82.61% to 89.55% under the following conditions: P = 0.25 MPa, C = 7, t = 60 s, and W = 16%.

The total duration of the process was 6 minutes, including a 1-minute DIC pretreatment followed by a 5-minute MAE, resulting in a 21% increase in total polyphenol concentration compared to MAE alone. Combining DIC with MAE offers an innovative approach that optimizes processing time while improving the extraction yields of antioxidant compounds.

Keywords: Spent coffee grounds, bioactive compounds, phenolic compounds, antioxidants, DIC, microwave.

ANTIDIABETIC ACTIVITY OF *Grewia asiatica* SEED EXTRACT IN STREPTOZOTOCIN INDUCED DIABETIC RATS

Rabia Choudhary[1], Wafa Majeed[1,2], Ayesha[1], Bilal Aslam[1], Muhammad Saad Tariq[1]
[1]Institute of Physiology and Pharmacology, University of Agriculture, Faisalabad, Pakistan.
[2]Department of Pharmacy, Faculty of Health and Pharmaceutical Sciences, University of Agriculture, Faisalabad, Pakistan.

ABSTRACT

Diabetes mellitus is a metabolic disorder that inhibits the ability of the body to produce or utilize insulin. The aim of this study was to explore the antidiabetic potential of ethanolic extract of *Grewia asiatica* seeds. A total 36 rats were used and equally divided into six groups, each group was contain six (6) rats. First group was normal control group (daily routine feed diet); second group was kept as diabetic control (diabetes was induced with 30% of high fat diet (HFD) and single inj. of streptozotocin 50mg/kg); group 3 was standard group (metformin 200mg/kg); group 4 was test group of low dose (100 mg/kg); group 5 was test group of medium dose (150 mg/kg); group 6 was given high dose (200mg/kg).Antidiabetic activity of *G. asiatica* was determined. FBG and body weight were measured on a weekly basis. At 28th day, rats were decapitated and blood samples were collected. Serum glucose, Insulin and C-peptide levels were measured. Results indicated a significant decrease in serum glucose and improvement in serum insulin levels in *G. asiatica* treated groups. The plant under study also improved the insulin sensitivity and reduced insulin resistance. The results of the present study reveal the antidiabetic potential of *G. asiatica* seeds.

Keywords: Diabetes mellitus; *Grewia asiatica;* Insulin resistance; FBG

*CORDIA SINESIS*AMELIORATES DIABETES ASSOCIATED DYSLIPIDEMIA IN STZ INDUCED DIABETIC RATS

[2]Department of Pharmacy, Faculty of Health and Pharmaceutical Sciences, University of Agriculture, Faisalabad, Pakistan.

ABSTRACT

Diabetes Mellitus refers to a collection of metabolic disorders that result in elevated blood glucose level (hyperglycemia). Dyslipidemia, a metabolic disorder that is frequently linked to diabetes, is typified by a variety of quantitative and qualitative alterations in lipids and lipoproteins. The seeds of *Cordia sinensis* possess strong sticking and emulsifying qualities that make them suitable for use as antioxidant carriers.This study aims to explore the ameliorative effect of *C.sinesis*against diabetes-associated dyslipidemia. In this study, a total of thirty-six wistar rats were allocated into 6 experimental groups. Group 1served as the normal control (normal feed diet). Group 2 was diabetic control group (diabetes was induced with 30% high-fat diet (HFD) using a low dose of streptozotocin (55mg/kg body weight) intraperitoneally). Group 3, the standard group,received Metformin (250 mg/kg). Groups 4, 5,and 6 were test groups, treated with ethyl acetate extract of *C.sinensis* at doses of 150 mg/kg, 250 mg/kg, and 350 mg/kg, respectively, for 28 days.At the end of the study,serum and tissue samples were collected andbiochemical markers (serum glucose, insulin), insulin resistance markers, and lipid profiles were measured. ANOVA was used to evaluate the data, and Tukey's test was used to assess significance among groups. Results demonstrated that C.*sinesis* significantly reduced the serum glucose levels and significantly improved the serum insulin levels. Insulin resistance was also reduced in *C.sinesis* treated rats. *C.sinesis* significantly improved the lipid profile via significant reduction in TC, TG, LDL and VLDL levels and appreciable improvement in HDL levels in treated groups.

Keywords:*C.sinesis;* Diabetes Mellitus; Lipid profile; Insulin resistance; HDL

SURVEY OF PARASITOIDS ASSOCIATED WITH WHITE PEACH SCALE (*Pseudaulacaspis pentagona*) IN KIWI ORCHARDS OF GILAN PROVINCE, IRAN

Bahareh Rafiei[1], Mohbobeh Sharifi[2]
[1] Assistant Professor, Plant Protection Research Department, Gilan Agricultural and Natural Resources Research and Education Center, Agricultural Research, Education and Extension Organization (AREEO), Rasht, Iran
[2] Assistant Professor, Plant protection research department, Golestan Agricultural and Natural Resources Research Center, Agricultural Research, Education and Extension Organization (AREEO), Gorgan, Iran, E-mail: Rafiei.bahareh@gmail.com

ABSTRACT

White peach scale, *Pseudaulacaspis pentagona* (Hemiptera: Diaspididae), is a significant polyphagous and economically harmful pest of kiwi gardens and some fruit trees in northern Iran. The present study was conducted during 2023–2024 to identify and document the hymenopteran parasitoid species of *P. pentagona* on two kiwi gardens in Gilan province. Infested branches were systematically gathered within a predetermined time, and emerging parasitoids were bred and identified with the aid of detailed morphological and taxonomic keys. Our survey isolated six parasitoid species that attack *P. pentagona*, which are important natural enemies that play an important part in its biological control in the region. Among these, *Encarsia berlesei* was the most dominant specie, followed by five other parasitoids already documented in Iran. The occurrence and population dynamics of the parasitoids support their potential role in integrated pest management (IPM) schemes for sustainable white peach scale control of kiwi orchards. The current investigation presents valuable baseline data to promote the following biological control research and implementation of sound pest management policies in Gilan province.

Keywords: *Pseudaulacaspis pentagona*, Parasitoids, Kiwi Orchards, Biological Control, IPM

ABSTRACT

Ibuprofen, a widely prescribed non-steroidal anti-inflammatory drug (NSAID), is commonly used to alleviate pain, inflammation, and fever. However, its poor aqueous solubility significantly limits its oral bioavailability and presents challenges in developing liquid formulations, particularly for pediatric and dysphagic patients. Traditional solubility enhancement methods—such as solid dispersions, emulsification, and surfactant incorporation—often suffer from drawbacks including chemical instability and toxicity concerns. As a sustainable alternative, deep eutectic solvents (DESs) have emerged as promising solubilizing agents, composed of biodegradable, non-toxic components capable of forming hydrogen bonds. In this study, a DES comprising choline chloride and propylene glycol was investigated for its potential to enhance the solubility of ibuprofen using quantum mechanical methods. These calculations were employed to explore the molecular interactions between ibuprofen and the DES components. The findings would be useful for predicting the prospect of utilizing the selected DES in enhancing the solubility of the drug, offering a potential alternative to water as a solvent. By integrating quantum chemical modeling with green chemistry principles, this work contributes to the development of safer, more effective, and environmentally sustainable pharmaceutical formulations.

Keyword: Deep Eutectic Solvent, Solubility, Drug Delivery, Green Solvent.

FIGHTING DIABETES WITH HERBAL TECHNOLOGY

Jayashree.S*, Dr.V.Rakshana, Dr.R.Srinivasan
Bharath Institute of Higher Education and Research, Chennai, Tamilnadu

ABSTRACT

Diabetes mellitus, particularly type 2 diabetes, has emerged as a global health concern, affecting over 500 million people worldwide. Characterized by chronic hyperglycemia and associated with complications such as cardiovascular disease, neuropathy, and kidney failure, diabetes demands effective and sustainable treatment strategies. Although conventional therapies, including insulin injections and oral hypoglycemic agents, have proven effective in managing blood glucose levels, they are often accompanied by undesirable side effects, high costs, and limited accessibility—especially in low- and middle-income countries. This has led to increased interest in alternative treatment modalities, particularly those derived from traditional medicine and plant-based therapies.Herbal medicine has been used for centuries in systems such as Ayurveda, Traditional Chinese Medicine (TCM), and African traditional medicine to treat diabetes. With the advancement of herbal technology—defined as the scientific development and modernization of plant-based therapies—there is renewed potential to integrate these remedies into mainstream diabetes care. Herbal technology not only validates traditional practices through rigorous scientific research but also improves the bioavailability and therapeutic efficiency of plant compounds using modern tools such as nano-formulations and phytopharmaceuticals.Plant-based compounds, including alkaloids, flavonoids, terpenoids, saponins, and tannins, exhibit hypoglycemic effects through various mechanisms. These include stimulating insulin secretion, enhancing insulin sensitivity, inhibiting intestinal glucose absorption, and promoting pancreatic beta-cell regeneration. Several herbs have been extensively studied for their antidiabetic properties. Bitter melon (Momordica charantia) contains insulin-mimetic compounds like charantin and polypeptide-p, while fenugreek (Trigonella foenum-graecum) is rich in soluble fiber that slows glucose absorption and improves glycemic control. Gymnema sylvestre is known for regenerating beta cells and reducing sugar cravings, cinnamon (Cinnamomum verum or cassia) enhances insulin receptor activity, and aloe vera demonstrates lipid-lowering and hypoglycemic effects.Modern herbal technology has enabled the creation of advanced delivery systems such as nanoparticles, encapsulated extracts, and transdermal patches to increase the potency and controlled release of these phytochemicals. These innovations are overcoming traditional limitations such as poor solubility and low bioavailability. Concurrently, a growing body of scientific literature supports the efficacy and safety of herbal remedies in clinical settings, though more high-quality randomized controlled trials are needed.Despite the promising potential, challenges remain. Standardization of herbal formulations, regulatory approvals, and quality control are critical issues that need attention. Furthermore, interactions with conventional drugs and variability in plant composition due to environmental factors must be carefully addressed. However, with proper integration into healthcare systems, herbal technology could offer an affordable, natural, and culturally accepted approach to managing diabetes.In conclusion, fighting diabetes with herbal technology presents a viable complement or alternative to conventional treatments. By combining ancient wisdom with modern scientific advancements, herbal medicine stands poised to play a pivotal role in the global fight against diabetes, especially in resource-limited settings.

PHARMACY SERVICES FOR PATIENTS WITH ALLERGIES

The Management Of Allergic Rhinitis By Pharmacist İn Public Services

Rakshana. V, Divya. K
Bharath Institute of higher education and research

ABSTRACT

Allergic rhinitis has been identified as a major respiratory disease that places a significant burden on patients and the healthcare system. Nevertheless, the management of allergic rhinitis is challenging for both patients and practitioners. Pharmacists have been recognised as strategic in providing advice for allergic avoidance, disease information, and pharmacological care for allergic rhinitis management. This role has been underutilised in the public health service sector in Malaysia due to variation in practice, regulation, and health system structures when compared to the international guidelines. This article proposed a PhaRmacISt-led Education Model (AR-PRISE) that includes explicit patient education materials and an algorithm for structured counselling by pharmacists in the management of patients with allergic rhinitis.

ABSTRACT

Nutraceuticals are the nourishing components (hybrid of nutrition and pharmaceuticals) that are biologically active and possess capability for maintaining optimal health and benefits. These products play a significant role in human health care and its endurance, most importantly for the future therapeutic development. Nutraceuticals have received recognition due to their nutritional benefits along with therapeutic effects and safety profile. Nutraceuticals are globally growing in the field of services such as health care promotion, disease reduction, etc. Various drug nutraceutical interactions have also been elaborated with various examples in this review. Several patents on nutraceuticals in agricultural applications and in various diseases have been stated in the last section of review, which confirms the exponential growth of nutraceuticals' market value. Nutraceuticals have been used not only for nutrition but also as a support therapy for the prevention and treatment of various diseases, such as to reduce side effects of cancer chemotherapy and radiotherapy. Diverse novel nanoformulation approaches tend to overcome challenges involved in formulation development of nutraceuticals. Prior information on various interactions with drugs may help in preventing any deleterious effects of nutraceuticals products. Nanotechnology also leads to the generation of micronized dietary products and other nutraceutical supplements with improved health benefits. In this review article, the latest key findings (clinical studies) on nutraceuticals that show the therapeutic action of nutraceutical's bioactive molecules on various diseases have also been discussed.

MENİNGITIS: INFLAMMATION OF THE BRAIN AND SPINAL CORD MEMBRANES

DR.K.RAJAGANAPATHY,V, MADHUMITHA.S,VIJITHA, V
FACULTY OF PHARMACY,BHARATH INSTITUTE OF HIGHER EDUCATION AND RESEARCH,SELAIYUR,CHENNAI

ABSTRACT

Meningitis, an inflammation of the protective membranes (meninges) surrounding the brain and spinal cord, poses a significant global health burden. This condition can arise from various infectious agents, primarily bacteria, viruses, and fungi, as well as non-infectious causes. The clinical presentation of meningitis often includes fever, headache, neck stiffness, photophobia, and altered mental status, although symptoms can vary with the etiological agent and patient age. Prompt diagnosis and initiation of appropriate treatment are critical to prevent severe complications such as neurological deficits, hearing loss, seizures, and even death.This overview will discuss the diverse etiologies of meningitis, highlighting the key pathogens and their mechanisms of infection. It will also delve into the pathophysiology of meningeal inflammation, exploring the host immune response and the factors contributing to neuronal injury. Furthermore, current diagnostic approaches, including lumbar puncture for cerebrospinal fluid (CSF) analysis and neuroimaging techniques, will be examined. Finally, the principles of management, encompassing antimicrobial therapy for bacterial meningitis, supportive care for viral meningitis, and emerging therapeutic strategies, will be addressed, emphasizing the importance of timely and targeted interventions to improve patient outcomes and reduce long-term sequelae.

RABIES DISEASE

JAYARAMAKANI.N,KOWSIKA.M
FACULTY OF PHARMACY, BHARATH INSTITUTE OF HIGHER EDUCATION AND RESEARCH, CHENNAI,INDIA

ABSTRACT

Rabies is a lethal viral infection that leads to brain inflammation and is mainly spread through animal bites, especially from dogs worldwide and bats in North America. Immediate wound treatment and the timely administration of rabies vaccine and immune globulin after exposure can help prevent the disease. However, once symptoms arise, rabies is nearly always fatal, presenting distinctive signs such as hydrophobia, the presence of Negri bodies in neurons, and inflammatory changes. Diagnosis can be established by identifying rabies virus antigens or RNA, as well as through serological tests, but there is currently no effective treatment available.

EVALUATING THE METABOLIC EFFECTS OF *Garcinia cambogia* SUPPLEMENTATION IN Streptozotocin-NICOTINAMIDE-INDUCED TYPE 2 DIABETIC RATS

Sakineh Khanamani Falahatipour[1*], Sara Shokrpoor[2], Mina Khodadadi[3], Fatemeh Mohiti[4]

* Corresponding author's Email: falahatipour@ut.ac.ir

ABSTRACT

Introduction: *Garcinia cambogia* (GC), a tropical fruit rich in hydroxycitric acid (HCA), is widely used as a weight-loss supplement due to its purported effects on appetite suppression, lipid metabolism, and glycemic control. HCA inhibits ATP citrate-lyase, potentially reducing fatty acid synthesis and improving metabolic parameters in insulin resistance (IR) and type 2 diabetes mellitus (T2DM). This study investigated the effects of GC supplementation on fasting blood glucose (FBG), insulin, leptin, BMI, and pancreatic histopathology in streptozotocin-nicotinamide (STZ-NA)-induced T2DM rats.

Materials & Methods: Thirty-six adult Wistar rats were divided into six groups (n=6): non-diabetic control, diabetic untreated control, diabetic standard treatment, and three diabetic groups receiving GC at 10, 100, or 200 mg/kg/day for four weeks. Metabolic parameters and pancreatic tissue were analyzed post-treatment.

Results: Results showed no significant improvement in FBG or insulin levels in GC-treated groups compared to diabetic controls ($p>0.05$). However, leptin levels were significantly reduced at higher GC doses (100 and 200 mg/kg; $p<0.05$). Histopathological analysis revealed partial preservation of Langerhans islet size and architecture in GC-treated groups, particularly at 200 mg/kg, though not reaching non-diabetic levels. No significant changes in BMI were observed.

Conclusion: While GC supplementation did not fully restore glycemic control, its dose-dependent reduction in leptin and modest pancreatic tissue improvements suggest potential metabolic benefits. Further studies are needed to elucidate GC's mechanisms in T2DM management.

Keywords: *Garcinia Cambogia*, Type 2 diabetes, Leptin, BMI, Pancreatic histopathology

INFLUENCE OF MWCNT-ENHANCED MINIMUM QUANTITY LUBRICATION ON POWER CONSUMPTION AND SURFACE ROUGHNESS IN FACE MILLING OF AISI 304 STAINLESS STEEL

ABSTRACT

AISI 304 stainless steel, an austenitic alloy, is widely utilized in industries such as automotive, petrochemical, and food processing due to its favorable mechanical properties and corrosion resistance, primarily attributed to its chromium and nickel content. However, its low thermal conductivity produces high cutting forces and excessive heat generation during machining, leading to accelerated tool wear and reduced efficiency. Optimizing cutting parameters and tool materials is crucial for improving tool life and surface quality. In this context, the Minimum Quantity Lubrication (MQL) technique, which delivers a small but adequate amount of lubricant directly to the cutting zone, is key in enhancing machining performance while supporting sustainable manufacturing. In this study, the machinability of AISI 316 stainless steel during face milling was investigated under three different cutting conditions: dry, MQL, and nano-MQL with 0.5 vol.% multi-walled carbon nanotube (MWCNT). LUBform B water-based metal lubricant was used as a cutting fluid in the MQL process. A total of 27 experiments were conducted using feeds of 0.05, 0.1, and 0.15 mm/tooth and cutting speeds of 100, 200, and 300 m/min. Surface roughness and power consumption were analyzed as primary indicators of performance. The results showed that both surface roughness and power consumption increased with higher feeds; however, at a cutting speed of 200 m/min, both parameters initially decreased and then increased. MQL was found to improve surface quality and reduce power

consumption. Incorporating MWCNTs in the nano-MQL condition further enhanced these improvements. The best surface roughness (0.31 μm) and lowest power consumption (1,161 W) were achieved under nano-MQL conditions, with a feed of 0.05 mm/tooth and a cutting speed of 200 m/min. From the perspective of sustainable machining, it was found that the MWCNT-reinforced MQL cutting environment has a significant impact on surface quality and power consumption.

Keywords: AISI 304 stainless steel, Face milling, MWCNT, MQL, Surface roughness, Power consumption.

THE EFFECTS OF MOLECULAR WEIGHT AND COATING CONDITIONS ON THE SURFACE WETTABILITY OF PMMA FILMS

ABSTRACT

Polymethylmethacrylate (PMMA) is widely used in industry due to its optical transparency, sufficient mechanical strength, ease of processing, and good film-forming ability. Controlling the surface wettability of PMMA over a wide range without the use of external additives is critical for improving its applicability in surface-related technologies. In this study, the effects of the molecular weight of PMMA and coating conditions (polymer concentration and solvent type) on the surface wettability of PMMA films were investigated. For this purpose, polymers of methyl methacrylate (MMA) were synthesized by a free radical process in toluene. Polymerizations were carried out in a 250 ml three-neck round-bottom glass reactor under a reflux condenser using a mechanical stirrer. Reactions were performed at 75°C with a duration time of 24 h using benzoyl peroxide (BPO) as the initiator. PMMA samples with varying molecular weights were produced by feeding different amounts of BPO into the reaction medium. At the end of the reaction, the polymer products were precipitated in a cold methanol/water (80/20 vol.%) mixture and were dried in a vacuum oven until constant weight was attained. The molecular weight values of the synthesized polymers were evaluated based on intrinsic viscosity, which was calculated from the relative viscosities determined using a Ubbelohde-type viscometer in toluene at 25°C. Thin films were subsequently prepared by dip-coating glass slides in polymer solutions, and their water wettability was evaluated by contact angle measurements. As a result, it was found that the water contact angle values of the obtained surfaces ranged between 67° and 77°, depending on the molecular weight of the synthesized polymers, the type of coating solvent used (toluene, chloroform, and tetrahydrofuran), and the polymer concentration in the coating solution. Our studies are ongoing to achieve enhanced control over the surface wettability of PMMA films by targeting a wider contact angle range.

Keywords: Polymethylmethacrylate, molecular weight, coating, wettability, contact angle.

EFFECTS OF HELICASE PROTEIN MUTATIONS IN AMERICAN ISOLATES OF SARS-CoV-2

Ekrem AKBULUT
Assoc. Prof. Dr., Malatya Turgut Ozal University, Faculty of Engineering and Natural Sciences, Department of Bioengineering, Malatya-Türkiye **(**Responsible Author)

Mehmet Emin ALHAN
M. Sc., Malatya Turgut Ozal University, Isntitute of Postgraduate Education, Department of Biomedical Engineering, Malatya- Türkiye, ORCID: 0009-0002-9004-5191

ABSTRACT

COVID-19 is a viral disease in which severe acute respiratory syndrome Coronavirus-2 (SARS-CoV-2) is the pathogenic agent. Non-structural protein-13 (helicase) of SARS-CoV-2 has a vital role in the viral genome. SARS-CoV-2 helicase is at the center of antiviral drug studies to be developed to suppress viral replication. Mutations may affect the course of the disease and the responses to antivirals by causing changes in protein structure and stability. In this study, the changes that mutations in nsp13, which encodes the SARS-CoV-2 helicase protein, may cause in protein structure and stability were investigated to contribute to the understanding of the course of the disease and the development of valid antivirals.

The sequence data of 2483 American isolates infected with the SARS-CoV-2 virus were aligned using Mega XI software. The nine mutations (Ser36Pro, Thr127Asn, His164Tyr, Met233Ile, Tyr324Cys, Ala368Val, Ala389Val, Arg394Cys, Thr599Ile) in American isolates were identified. Mutant protein structures were modeled with the RosettaFold. Model quality was evaluated using Molprobity and QMEAN tools. The model quality scores were found to be within the acceptable range. The effects of mutations on protein structure and stability were analyzed using SDM2, mCSM, DUET and DynaMut2 tools. The mutations (Ser36Pro, Thr127Asn, His164Tyr, Met233Ile, Thr324Cys, Ala368Val, Ala389Val, Arg392Cys, Thr599Ile) altered in protein stability ($-1.893 \leq \Delta\Delta G_{stability} \leq +1.51$).

Consequently, topological and stability changes in nsp13 may lead to changes in the effectiveness of therapeutics. The mutations in American isolates may lead to the emergence of different phenotypes in terms of viral activity. Alternative treatment approaches in various geographical regions can make the fight against the virus successful.

ABSTRACT

Coronavirus Disease 2019 (COVID19), in which severe acute respiratory syndrome coronavirus-2 (SARS-CoV-2) is the etiological agent, is one of the most important health problems of the twenty-first century. Spike protein is one of the important drug and vaccine target structures because it binds to the ACE2 receptor during the viral invasion process and activates the cell entry process. Changes in this structure may alter the host immune response and the efficacy of drugs/vaccines. In this study, the changes in protein structure, stability, and peptide presentation of the SARS CoV-2 spike protein XBB.1.5 variant were investigated using in-silico methods in order to contribute to the development of new and valid therapeutics. SWISS-MODEL and RoseTTAFold modeled the changes in protein three-dimensional structure caused by mutations. Changes in protein stability were analysed with mCSM, DDMut, DUET and DynaMut2 and the effects of mutations on protein function were analyzed with Provean, SIFT and PolPhen2 tools. Changes in protein dynamic structure were evaluated with elastic network models. The effects of mutations on antigenic determinants were tested using Bepipred Linear, Emini Surface Accessibility and Kolaskar & Tongaonkar antigenicity algorithms. Of the 38 mutations detected in the SARS-CoV-2 XBB.1.5 variant, 22 were found to be in the receptor binding site, which is important in the interaction of the virus with the host cell. Protein stability analyses revealed that 21% of the mutations caused an increase in protein stability while 81% caused an increase in instability ($-2.902 \leq \Delta\Delta G \leq +1.82$). It was found that 44.7% of the mutations could have deleterious effects on protein function. XBB.1.5 mutations were found to alter the antigenic determinant profile. We found that four highly conserved antigenic determinants that were found to be conserved in many variants were altered in the XBB.1.5 variant. Decreased stability, increased instability, and movement appear to result in increased receptor affinity, infectivity, and virulence. This study provides a structural framework for understanding the possible effects of alterations caused by SARS-CoV-2 S protein XBB.1.5. mutations on functional properties.

ABSTRACT

Although certain fixed-time artificial insemination (FTAI) protocols, which are widely used in cows to reduce labour requirements significantly, have also been applied to heifers with generally favourable outcomes, optimising these protocols for heifers remains an area requiring further research. Timely intervention in the oestrous cycles of heifers is economically crucial. In this study, conducted on 100 heifers at the Kelkit feedlot farm in Gümüşhane Province, the animals were randomly divided into five groups. The control group (n=20) underwent no hormonal treatment; insemination was performed based on observed estrus. In Group 1 (n=20), GnRH was administered and progesterone implants were inserted on Day 0; on Day 5, PGF2α was administered and the implants were removed; on Day 8, GnRH was administered followed by insemination. Group 2 (n=20) followed the same protocol as Group 1, with an additional insemination on Day 9. In Group 3 (n=20), GnRH and progesterone implants were applied on Day 0; PGF2α was administered and implants were removed on Day 8; GnRH was administered and insemination performed on Day 11. Group 4 (n=20) followed the same schedule as Group 3 with an additional insemination on Day 12. Pregnancy rates after the first, second, and third inseminations were as follows: Control group – 30%, 75%, and 80%, respectively; Group 1 – 65%, 65%, and 70%; Group 2 – 80%, 80%, and 90%; Group 3 – 30%, 40%, and 45%; Group 4 – 15%, 20%, and 25%. The highest pregnancy rate was achieved in Group 2, suggesting that the simplified protocol, when combined with double insemination, significantly enhances reproductive outcomes in heifers.

DÜVELERDE PROGESTERON DESTEKLİ FARKLI ÖSTRÜS SENKRONİZASYON PROTOKOLLERİ

ÖZET

İneklerde uygulanan ve ciddi iş gücü tasarrufu sağlayan sabit zamanlı suni tohumlama protokollerinin bazıları düvelerde de uygulanmakta ve çoğu zaman çok iyi sonuçlar alınıyor olmasına rağmen hala geliştirilmesi gereken bir konu olduğu bilinmektedir. Düvelerin östrüs sikluslarına çok geç olmadan müdahale edilmesinin gerektiği ekonomik olarak önemli bir konudur. Gümüşhane İl'inde Kelkit besi çiftliğinde 100 düve üzerinde gerçekleştirilen bu çalışmada, rastgele 5 gruba ayrılan düvelere Kontrol grubuna (n=20); Hiçbir uygulama yapılmadan östrüsleri izlenerek tohumlama yapılmış, Grup 1 (n=20); 0. Gün: GnRH + Progesteron implantların takılması, 5. Gün $PGF_2\alpha$ + Progesteron implantların çıkartılması, 8. Gün GnRH + tohumlama, Grup 2 (n=20): 0. Gün: GnRH + Progesteron implantların takılması, 5. Gün $PGF_2\alpha$ + Progesteron implantların çıkartılması, 8. Gün GnRH + tohumlama, 9. Gün tohumlama yapılmış, Grup 3 (n=20): 0. Gün: GnRH + Progesteron implantların takılması, 8. Gün $PGF_2\alpha$ + Progesteron implantların çıkartılması, 11. Gün GnRH + tohumlama yapılmış, Grup 4 (n=20): 0. Gün: GnRH + Progesteron implantların takılması, 8. Gün $PGF_2\alpha$ + Progesteron implantların çıkartılması, 11. Gün GnRH + tohumlama, 12. Gün tohumlama yapılmıştır. Tohumlamalar sonucunda elde edilen gebelik sonuçlarına göre Kontrol grubunda 1. Tohumlamalar sonucunda %30, 2. Tohumlamalar sonucunda %75 ve 3. Tohumlamalar sonucunda %80 gebelik, Grup 1'de; 1. Tohumlamalar sonucunda %65, 2. Tohumlamalar sonucunda %65 ve 3. Tohumlamalar sonucunda %70 gebelik, Grup 2'de; 1. Tohumlamalar sonucunda %80, 2. Tohumlamalar sonucunda %80 ve 3. Tohumlamalar sonucunda %90 gebelik, Grup 3'te; 1. Tohumlamalar sonucunda %30, 2. Tohumlamalar sonucunda %40 ve 3. Tohumlamalar sonucunda %45 gebelik, Grup 4'de; 1. Tohumlamalar sonucunda %15, 2. Tohumlamalar sonucunda %20 ve 3. Tohumlamalar sonucunda %25 gebelik elde edilmiş olup en başarılı grubun Grup 2 olduğu sonucuna varılmıştır. Gebelik sonuçlarının farklı çıkmasının sebebinin sade bir uygulama olması ve çift tohumlama ile programın desteklenmesi sonucuna varılmıştır.

Anahtar Kelimeler: Düve, gebelik oranı, östrüs, senkronizasyon, suni tohumlama

ABSTRACT

Horse chestnut (Aescculus hippocastanum L.) is a tree that can grow up to 25 meters tall, has 5-7 leaflets, and its flowers are usually white and rarely red. Its fruit structure is a capsule containing 1-3 seeds. Although its homeland is India, it can also be observed as an ornamental plant in Europe and Turkey.

Since horse chestnut is in the class of medicinal plants, it has therapeutic or symptom-reducing properties against a number of diseases. The main active compound of this plant, Aescin, has pharmacodynamic, anti-edema, anti-inflammatory and antitumor properties. Studies have observed that horse chestnut has therapeutic effects on diseases such as hemorrhoids, wound and skin sensitivities, cough, and rheumatism. In addition, it is known to exhibit anticancer activity against various types of cancer.

The aim of our study is to investigate the effect of horse chestnut fruit and peel extracts prepared with methanol, ethyl alcohol and ethyl acetate on the proliferation of breast cancer cells (MCF-7). To achieve this aim, 7500 cells were cultured in 96 well plates. The next day, chestnut extracts were applied to the cells in the concentration range of 0.1-100 µM. After 24 hours of incubation, MTT solution was applied and measured at 540 nm wavelength. IC50 values of each extracts were calculated with the obtained results. It was found that the fruit extract had a stronger antiproliferative effect than peel extracts. It was observed that methanol and ethyl alcohol extracts inhibited the proliferation of MCF-7 cells in a dose-dependent manner. In the next stages, it is planned to investigate how these extracts affect the morphology, proliferation, invasion and migration properties of cancer cells.

Keywords: Horse chestnut, anticancer, breast cancer.

SPIKING NEURAL NETWORKS FOR EARLY SKIN CANCER DETECTION: A DELTA-MODULATION-BASED APPROACH ON HAM10000

ABSTRACT

Skin cancer is one of the most prevalent and potentially life-threatening forms of cancer, worldwide. Early and accurate diagnosis is crucial for effective treatment; however, it remains a challenging task because of the visual similarity of various skin lesion types. In recent years, Spiking Neural Networks (SNNs), which mimic biological neural processing, have gained attention as promising alternatives to conventional deep learning methods in neuromorphic computing tasks. In this study, we propose a binary rate-coded spiking SNN based on delta modulation for skin lesion classification evaluated using the HAM10000 dataset. This study focuses on the binary classification of nevus (benign) and akiec (malignant) lesion types. The preprocessing steps include grayscale conversion and delta-modulation-based spike encoding to transform dermoscopic images into temporal spike sequences that are suitable for neuromorphic processing. The experimental results demonstrate that the proposed SNN model achieves promising classification performance while offering advantages in terms of temporal encoding and energy efficiency. The model attained an overall classification accuracy of 97%, with a high F1-score of 0.98 for the nevus class. However, a slightly lower performance in the Akiec class indicates that challenges remain in accurately detecting malignant lesions. The results suggest that SNN-based systems have significant potential in skin cancer diagnostics, particularly in scenarios where real-time inference and low power consumption are crucial, such as in wearable health monitoring systems or portable diagnostic devices. Overall, this study contributes to the growing body of research on neuromorphic computing by demonstrating the applicability of biologically inspired spiking models to medical image analysis.

ÖZET

Öz yönetimli öğrenme becerisi hemşireleri yeni ve güncel bilgilere yöneltir. Böylece hemşirelik mesleği gelişir ve hasta bakım, kalitesi artar. Literatürde hemşirelerin öz yönetimli öğrenme becerilerinin incelendiği çok az çalışma bulunmaktadır. Bu sayede çalışmanın literatüre önemli bir katkısı olacaktır. Yapılan bu çalışma ile hemşirelerin öz yönetimli öğrenme becerilerinin incelenmesi amaçlanmaktadır. Bu çalışma tanımlayıcı bir çalışmadır. Çalışma 202 hemşire ile gerçekleştirildi. Veriler; Bilgi Formu ve Öz-Yönetimli Öğrenme Becerileri Ölçeği kullanılarak elde edildi. Sürekli gündüz çalışan hemşirelerin gece gündüz karışık çalışan hemşirelere göre, hemşirelik mesleğinden memnun olan hemşirelerin memnun olmayan hemşirelere göre, yabancı dil bilen hemşirelerin bilmeyen hemşirelere göre, hemşirelikle ilgili bilimsel yayın takip eden hemşirelerin takip etmeyen hemşirelere göre Öz Yönetimli Öğrenme Becerileri Ölçeği puanlarının daha yüksek olduğu belirlenmiştir. Hemşirelerin mesleki isteklerinin varlığı, hemşirelik mesleğinden memnun olmaları ve kendini geliştirmeye çalışması öz yönetimli öğrenmenin göstergesidir. Öz yönetimli öğrenme becerisi sayesinde hemşireler hem bireysel hem de mesleki bilgi, tutum, becerilerini geliştirecek ve güncelleyecektir. Böylece hasta güvenliği ve bakım kalitesi de artmış olur. Araştırmanın tek bir kurumda yapılması araştırmanın sınırlılığıdır.

ÖZET

Gallium oxide (Ga_2O_3) is a semiconductor that offers great potential for next-generation power electronics, solar-blind UV photodetectors, and transparent conductive electronic devices due to its wide bandgap (~4.8–5.0 eV), high electric breakdown field (~8 MV/cm), chemical stability, and high thermal resistance. In particular, the β-Ga_2O_3 phase stands out with its monoclinic crystal structure and thermodynamic stability, and it can be applied over large surface areas at low temperatures through various growth techniques.In this study, the structural and optical properties of Ga_2O_3 thin films deposited on sapphire (Al_2O_3) substrates at room temperature and under a fixed deposition time (120 minutes) were investigated. The films were grown using the RF magnetron sputtering method at different power levels (60 W, 75 W, 90 W). During the film growth, no substrate heating was applied, and all depositions were carried out under constant time and fixed gas flow conditions.The crystal structures of the deposited films were analyzed using X-ray diffraction (XRD) to evaluate the effects of different power levels on crystalline phase formation. Optical properties were characterized by UV–Vis spectroscopy, and the optical bandgap values were calculated using the Tauc method based on the transmittance spectra. The analyses revealed that, both before and after annealing, the optical bandgap generally decreased with increasing power.The results indicate that the applied power during RF magnetron sputtering at low temperature significantly influences the crystallinity and bandgap of Ga_2O_3 films. These findings are of great importance for flexible electronics and UV optoelectronic applications that require low-temperature processing.

Keywords: Ga_2O_3, RF magnetron sputtering, optical properties

This work was supported by the Scientific Research Project Fund of Sivas Cumhuriyet University, Turkey, under the project number F-2025-736, and also funded as part of the Ph.D. thesis titled 'Development and Characterization of Ga_2O_3-Based Thin Films for UV Photodetectors'.

COST-BENEFIT ANALYSIS IN SMART TRANSPORTATION SYSTEM APPLICATIONS

AKILLI ULAŞIM SİSTEM UYGULAMALARINDA FAYDA-MALİYET ANALİZİ

Burak İri
Research Assistant, Yıldız Technical University, Faculty of Mechanical Engineering, Department of Intelligent Transportation Systems, Istanbul-Türkiye, buraktp9@hotmail.com, ORCID: 0009-0009-0556-2030

ABSTRACT

Akıllı ulaşım sistemleri (AUS), ulaşım altyapılarının verimliliğini artırmak, trafik güvenliğini sağlamak ve çevresel etkileri azaltmak amacıyla geliştirilen dijital teknolojilere dayalı çözümlerdir. Bu çalışmada, AUS uygulamalarının teknik ve ekonomik performansları fayda maliyet analizi yöntemi ile değerlendirilmiştir. Amerika Birleşik Devletleri'nde uygulanan adaptif trafik sinyalizasyon sistemlerinin, konvansiyonel sistemlere kıyasla %15'e varan zaman tasarrufu ve %20 oranında yakıt tüketimi azalımı sağladığı belirlenmiştir. Benzer şekilde, Hollanda'da uygulanan akıllı kavşak yönetim sistemlerinin, kaza oranlarında %30 düşüş sağladığı ve yıllık kamu sağlık harcamalarında önemli bir azalmaya neden olduğu raporlanmıştır. Çalışmada, Türkiye'de pilot olarak İstanbul'da uygulanan dinamik trafik yönetimi projeleri de analiz edilmiş; bu sistemlerin ilk yatırım maliyetlerinin yüksek olmakla birlikte, uzun vadede sağladığı çevresel ve ekonomik getirilerin bu maliyetleri karşıladığı ortaya konmuştur. Fayda maliyet analizi süreci kapsamında doğrudan maliyetler (altyapı, yazılım, bakım) ve doğrudan faydalar (zaman, yakıt, emisyon, güvenlik) nicel olarak değerlendirilmiş, net bugünkü değer ve iç verim oranı kriterleri ile AUS yatırımlarının ekonomik uygulanabilirliği analiz edilmiştir. Sonuç olarak akıllı ulaşım sistem uygulamaları, yüksek başlangıç maliyetlerine rağmen uzun vadede sosyal refahı artıran ve sürdürülebilir ulaşım hedeflerine hizmet eden yatırımlar olarak öne çıkmaktadır. Bu çalışma, karar vericilere ve mühendislik uygulayıcılarına yönelik teknik ve ekonomik bir değerlendirme çerçevesi sunmaktadır.

POSITION DETECTION AND DEBUGGING OF ROTOR SPEED-POSITION SENSOR CONNECTORS IN ELECTRIC VEHICLES WITH POINT-CLOUD TECHNOLOGY

ELEKTRİKLİ ARAÇLARDA ROTOR HIZ-KONUM SENSÖR KONNEKTÖRLERİNİN NOKTA-BULUT TEKNOLOJİSİ İLE KONUM TESPİTİ VE HATA AYIKLAMASI

Burak İri
Research Assistant, Yıldız Technical University, Faculty of Mechanical Engineering, Department of Intelligent Transportation Systems, Istanbul-Türkiye, buraktp9@hotmail.com, ORCID: 0009-0009-0556-2030

ÖZET

Elektrikli araçların (EV) performansında kritik rol oynayan rotor hız ve konum sensörleri, özellikle yüksek tork hassasiyeti gerektiren uygulamalarda sistem güvenilirliği açısından önem arz etmektedir. Bu çalışmada, bu sensörlere ait konnektör sistemlerinde oluşabilecek geometrik arızaların ve konumlanma hatalarının, nokta-bulut teknolojisi ile uzaktan izlenmesi, konumlandırılması ve hata ayıklanması yöntemleri incelenmiştir. Endüstri 4.0 kapsamında geliştirilen bu yaklaşımda, sensör verileri gerçek zamanlı olarak bulut platformuna aktarılmış; Amazon Web Services (AWS) üzerinden analiz edilerek hata örüntüleri makine öğrenmesi ile sınıflandırılmıştır. Aurora Vision yazılımıyla da bu hatalar mikron düzeyde piksel piksel incelenmiştir. Deneysel çalışmalarda, 20 farklı EV modelinde toplam 120 sensör konnektörü izlenmiş ve simüle edilen konnektör arızaları (kontak oksidasyonu, gevşek temas, EMI etkisi) %96.3 doğrulukla tespit edilmiştir. Nokta-bulut sistemi sayesinde, fiziksel müdahaleye gerek kalmadan hata tespiti yapılmış; bakım süresi ortalama %38 oranında azalmıştır. Ayrıca, IEEE 1451 standardına uygun olarak entegre edilen akıllı sensör arayüzleri, sistemin yeniden yapılandırılabilirliğini artırmıştır. Çalışmanın sonuçları, elektrikli araç üreticilerine arıza yönetiminde daha hızlı ve düşük maliyetli bir çözüm sunarken; aynı zamanda filo yönetimi ve otonom sürüş sistemlerinin güvenilirliğini de artırmaktadır. Bu kapsamlı yaklaşım, elektrikli araçların dijital ikiz temelli bakım stratejilerinin geliştirilmesine de olanak tanımaktadır.

ABSTRACT

The digitalization of the agricultural sector has emerged as a multidisciplinary transformation process marked by substantial investments and the convergence of various engineering disciplines. This study concentrates on cow identification systems, with particular emphasis on large-scale dairy farm operations. It explores the critical role of accurate identification in dairy cattle management, the methodologies employed for this purpose, and the challenges encountered during the implementation of autonomous identification systems on farms.

A key focus of the research is the frequent occurrence of data misattribution, where identification errors result in information pertaining to one animal being erroneously assigned to another. Such inaccuracies can significantly compromise the integrity of data-driven animal management systems. The study proposes innovative approaches to identification, particularly during the milking process, aimed at minimizing such errors. By enhancing the precision and reliability of identification technologies, the research contributes to the advancement of more effective and trustworthy herd management practices.

Identification procedures typically begin when a cow enters the milking parlor, with the first animal being associated with the first available milking unit. However, it is crucial that the cow is correctly aligned with the corresponding milking unit. Misalignment at this stage disrupts the entire sequence, leading to systematic misidentification of subsequent cows and erroneous allocation of milk production data. To address this issue, the study recommends a system wherein cows enter the milking parlor in a random sequence, and identification is autonomously and accurately confirmed only after each cow has been properly positioned within the milking unit.

The proposed approach ensures the elimination of identification order confusion and guarantees that all data are accurately associated with the corresponding animal, thereby supporting more robust and error-free livestock data management.

ABSTRACT

Mastitis is a significant disease in dairy cattle that necessitates close monitoring and timely intervention. Early diagnosis plays a critical role in the effective treatment of mastitis, as it substantially reduces both treatment costs and the risks associated with disease progression. However, conventional diagnostic approaches based on human observation and manual monitoring are often inadequate for timely detection, particularly in large-scale dairy operations.

In this context, there is a growing need for sensitive measurement systems and autonomous monitoring technologies to facilitate early diagnosis and enhance disease management. This study explores the etiology, classification, and consequences of mastitis, as well as the conventional and contemporary diagnostic methods employed in its detection. It also examines how limitations in current diagnostic techniques contribute to the delayed recognition and progression of the disease.

The findings of the study indicate that by enabling early prediction of mastitis and targeting specific animals, treatment efficacy can be significantly improved. To this end, an electronic monitoring system has been developed to collect physiological data indicative of mastitis. The system primarily analyzes electrical conductivity and color variations in milk, which are known to change in response to inflammation. Since conductivity values vary across individual animals, the electronic circuit performs real-time measurements during milking and transmits the data to a central computer via wired or wireless communication channels.

The system utilizes adaptive algorithms to establish baseline thresholds for each animal. When deviations from these thresholds are detected, the system alerts the user through smart devices (e.g., smartphones) or via audible and visual signals during milking. This approach enables proactive disease management and reduces reliance on subjective evaluation, thereby contributing to more sustainable and efficient dairy farming practices.

ABSTRACT

Graphene oxide (GO) was synthesized from recycled graphite using the Hummers' method and subsequently reduced via a green synthesis approach employing *Aloe vera* extract. A statistical optimization of the reduction process was conducted using Response Surface Methodology (RSM), considering temperature, extract volume, and reaction time as key factors to tailor the surface characteristics of the reduced graphene oxide (rGO). In a subsequent step, a hybrid composite material, Chitosan@EDTA@rGO, was developed through a facile synthesis route. This composite was characterized using various techniques including FTIR, XRD, BET, and SEM. Adsorption studies were performed to evaluate its potential for removing Rhodamine B (RB) dye from aqueous solutions. Additionally, Density Functional Theory (DFT) calculations were carried out to gain theoretical insights into the adsorption behavior and interaction mechanisms of the composite at the molecular level.

Keywords: Green synthesis; Reduced graphene oxide; Aloe vera; Response Surface Methodology; Chitosan@EDTA@rGO; Adsorption.

EVALUATION OF LIVER FUNCTION STATUS OF STUDENTS PREDISPOSED TO OBESITY IN MADONNA UNIVERSITY, ELELE, NIGERIA

Madonna University, Faculty of Science, Department of Biochemistry, Elele, Nigeria
https://orcid.org/0009-0000-8058-5798, edionsenyeneudoh@gmail.com

ABSTRACT

Obesity, particularly when characterized by the accumulation of visceral adipose tissue, has emerged as a significant global health concern. It is closely associated with increased morbidity and mortality due to its strong links with chronic diseases such as type 2 diabetes mellitus, myocardial infarction, stroke, and notably hepatic steatosis, also referred to as non-alcoholic fatty liver disease (NAFLD). These conditions often develop silently, with hepatic dysfunction being one of the earliest detectable metabolic consequences of obesity. This study is a cross-sectional observational study designed to evaluate the association between obesity and liver function among a student population.. A total of 90 subjects were assessed using standard anthropometric measurements and biochemical analyses. Data were analyzed using the chi-square test and one-way analysis of variance, with significance determined by least significant difference (LSD) post hoc testing in SPSS version 21.0. The prevalence of obesity among participants was 58.9%, with a higher occurrence among females (65.1%) compared to males (34.9%). Liver enzyme levels in obese subjects were within reference ranges, except for significant reductions ($p \leq 0.01$) in aspartate aminotransferase (AST), alkaline phosphatase (ALP), total bilirubin, and direct bilirubin compared to non-obese subjects. Notably, AST and ALP levels in non-obese participants were elevated above normal reference ranges, warranting further investigation. These findings suggest a substantial portion of the student population is at risk of obesity-related hepatic dysfunction. Preventive interventions focusing on lifestyle modification may be crucial in mitigating long-term health risks and restoring healthy body mass index (BMI) levels.

ABSTRACT

Millets are nutrient-dense cereals rich in polyphenols, flavonoids, and dietary fiber, making them ideal candidates for the development of functional foods.This study focused on the development and evaluation of a millet-based energy bar formulated with bajra *(Pennisetum glaucum)*, barnyard millet (*Echinochloa frumentacea*), and foxtail millet (*Setaria italica*), aiming to create a nutrient-dense, antioxidant-rich snack. The formulation incorporated natural sweeteners such as honey and dates, along with nuts and seeds to enhance nutritional value and sensory appeal. *(Pennisetum glaucum*), barnyard (*Echinochloa frumentacea*) and Foxtail (Seteria italica); Powder incorporate with standard bar formulation at varying concentrations (10% ,20% and 30%) was supplement with dates for making bar. The resulting bar were evaluated for their physicochemical properties, sensory attributes and antioxidant activity. The obtained result from the study that the different concentration improved the antioxidant activity from 249.65 mm AAE/g to 505.09 mm AAE/g. The TPC, TFC, DPPH and FRAP of the prepared muffin were determined and progressively increased with increasing formulation. Analysis of FTIR is examine for the presence of functional compounds in prepared bar .Sensory evaluation indicates that different millet-based bar is acceptable in different concentration . The study concludes that millet-based energy bars are a viable option for developing functional, gluten-free snacks that support nutritional security and sustainable food practices. Also demonstrates the feasibility of using millets as a base for developing functional snack bars aimed at enhancing dietary antioxidant intake and preventing oxidative stress-related disorders.

Keywords: Millet; Bajra (*Pennisetum glaucum),* barnyard *(Echinochloa esculenta*) and Foxtail (*Seteria italica*) Powder; Bar; Antioxidant

Citrus pseudolimon PEEL INCORPORATED MUFFIN: EFFECT ON THE PHYTOCHEMICAL AND SENSORIAL PROPERTIES OF MUFFIN

ABSTRACT

Citrus pseudolimon (Galgal) is an underutilized citrus fruit native to India, with significant potential in the food application. Citrus pseudolimon peel is a byproduct obtained from primary processing and is usually discarded as waste. This study focuses on the development of muffins incorporated with *Citrus pseudolimon* (Galgal) peel powder, a byproduct abundant in phytochemicals such as flavonoids, carotenoids, essential oils, dietary fiber, and vitamin C. Incorporating *Citrus pseudolimon* (CP) peel powder into muffin formulations not only enhances the nutritional profile but also improves the antioxidant properties of the muffin. Citrus pseudolimon peel powder was tested prepared from its peels which were cleaned, dried using hot air oven, and tested for chemical composition and phytochemical properties. CP powder at different concentrations (0, 2, 4, 6, 8%) was supplemented with refined wheat flour for making muffin and evaluated for its phytochemical properties. Results revealed that the antioxidant activity improved from 210.14 mm AAE/g to 273.92 mm AAE/g (at 8% level). The TPC (57.76mg GAE/g- 66.86mg GAE/g), TFC (16.61mg QE/g-27.82mg QE/g), DPPH (44.17%-50.16%) and FRAP (1.112mg TE/g-2.228mg TE/g) of the prepared muffin were determined and progressively increased with increasing *Citrus pseudolimon* peel incorporation. Presence of characteristics peak in FTIR spectra with a range between 500 to 4000 cm^{-1} confirms the presence of functional compounds in the muffin. Sensory analysis showed that incorporating peel powder affected the overall acceptability of muffins. Among all formulations, the muffin with 4% peel powder achieved the highest overall acceptability score of 8.2. Thus, CP peel flour shows strong potential for enhancing the nutritional and quality attributes of muffins.

Keywords: *Citrus pseudolimon* peel powder; Antioxidant; Muffin

MUFFIN DEVELOPMENT WITH CITRUS JAMBHIRI PEEL POWDER INCORPORATION

ABSTRACT

Citrus × *jambhiri*, commonly known as rough lemon, is an underutilized citrus species cultivated in various regions of Asia. The fruit contains flavonoids such as hesperidin and naringin, which are known for their anti-inflammatory, antioxidant, and heart-protective properties. Citrus by-products are the leftover materials produced after juice extraction, making up about 50% of the fruit's total weight. Among them, the peel is often considered waste and poses a disposal problem. This study focuses on the peel waste that is incorporated into muffin formulations as a functional food product, enhancing nutritional value while addressing the issue of citrus peel waste. The muffins showed increased levels of dietary fibre and antioxidants, promoting sustainability and potential health benefits. *Citrus jambhiri* powder was tested for prepared from peel which are cleaned and dried in oven. Peels were incorporated into standard muffin formulations at varying concentrations (0%, 2%, 4%, 6% and 8%) was supplemented with refine wheat flour for making muffin. The resulting muffins were evaluated for their physicochemical properties, sensory attributes and antioxidant activity. The obtained result from the study that the different concentration improved the antioxidant activity from 71.2 mm AAE/g to 157.4 mm AAE/g. The TPC, TFC, DPPH and FRAP of the prepared muffin were determined and progressively increased with increasing formulation. Analysis of FTIR is examine for the presence of functional compounds in prepared muffin. Sensory evaluation revealed favourable consumer acceptance for muffin is 2%. *Citrus jambhiri* peel as a functional ingredient in baked goods, aligning with current trends in sustainable food innovation and functional nutrition. Developed muffins using citrus peel to address a research gap, highlighting the potential of citrus peel as a value-added ingredient that enhances the nutritional quality of baked products while promoting sustainable food practices.

Keywords: *Citrus jambhiri* peel powder; Muffin; Antioxidant

OPTIMIZATION OF ULTRASOUND-ASSISTED EXTRACTION (UAE) OF POLYPHENOLS FROM BROWNTOP MILLET FLOUR USING RESPONSE SURFACE METHODOLOGY (RSM)

Arshdeep Singh[1]
[1] I. K. Gujral Punjab Technical University (Main Campus), PG Student, Department of Food Science and Technology, Kapurthala, India, [1]

ABSTRACT

In recent years, browntop millet (*Brachiaria ramosa*) has grown in popularity due to its exceptional nutritional value and associated health benefits. The proximate analysis of flour shows high percentage carbohydrate (70.32%) followed by protein (9.95 ± 0.15%), fat (6.53 ± 0.25%), crude fiber (1.93 ± 0.10. Browntop millet contains a significant amount of polyphenolic compounds, which can be effectively extracted using ultrasound-assisted extraction (UAE). In this study, the extraction conditions were optimized using Response Surface Methodology (RSM). Based on preliminary experiments, solvent concentration, extraction duration, and sample-to-solvent ratio were selected as the key variables. The optimized conditions identified were 50% methanol, 57 minutes of extraction duration, and a sample-to-solvent ratio of 27 ml (w/v) and demonstrated total antioxidant activity (TAA) 494.41 mmol AAE/g Total phenolic content (TPC) values were 4.45 mg GAE/g, while total flavonoid content (TFC) 4.40 mg QE/g. Free radical scavenging assays revealed 54.47% DPPH inhibition and 39.04% nitric oxide inhibition. The energy bar was formulated with 20% browntop millet flour (w/w) and compared to a control. Antioxidant profiling demonstrated the fortified bar exhibited significantly enhanced TAA (1963.13 ± 9.36 mmol AAE/g) compared to the control (1904.27 ± 3.61 mmol AAE/g). Similarly, TPC (6.11 ± 0.09 mg GAE/g vs. 6.49 ± 0.05 mg GAE/g) and TFC (19.43 ± 0.03 mg QE/g vs. 18.64 ± 0.30 mg QE/g) indicated improved bioactive retention. These findings underscore the potential of browntop millet flour as a functional ingredient to enhance the nutritional and antioxidant profile of various food products.

FORMULATION AND FUNCTIONAL EVALUATION OF SPINACH-ENRICHED GLUTEN-FREE CRACKERS FROM BUCKWHEAT AND RICE FLOUR BLENDS

Vaishnavi Mehra[1]
[1] I. K. Gujral Punjab Technical University (Main Campus), PG Student, Department of Food Science and Technology, Kapurthala, India, [1]ORCID ID: https://orcid.org/0009-0005-4991-0595
[1]vaishnavimehra42@gmail.com

ABSTRACT

The growing demand for gluten-free products has led to increasing interest in nutrient-dense and functionally enhanced alternatives to conventional snacks. This study focused on the development of gluten-free crackers using a composite flour blend consisting of 60% buckwheat and 40% rice flour, enriched with spinach powder at four levels: 0%, 6%, 8%, and 10%. Buckwheat and rice flour serve as gluten-free bases with good nutritional profiles, while spinach was incorporated to boost the crackers' fiber, protein, and antioxidant content. Functional property analysis of the flour blends showed a positive correlation between spinach concentration and hydration characteristics, with water absorption capacity increasing from 1.84 to 2.50 g/g, and oil absorption index rising from 1.02 to 1.24 g/g. Proximate composition revealed enhanced protein (from 7.54% to 8.97%) and fiber (from 3.81% to 4.46%) contents in the spinach-enriched crackers, along with reductions in moisture and carbohydrate levels. Physical parameters, such as increased bulk density and reduced cooking loss, indicated improved structural integrity. Antioxidant activity, measured across formulations, increased proportionally with spinach addition, confirming its functional contribution. FTIR spectroscopy confirmed the successful integration of spinach-derived functional groups into the cracker matrix. Sensory evaluation demonstrated that the 6% spinach formulation received the highest overall acceptability score, particularly in color, aroma, and taste. These findings highlight the potential of spinach-fortified buckwheat–rice flour blends in creating gluten-free crackers that are not only nutritionally superior but also sensory-appealing. Such formulations offer a promising avenue for functional food development tailored to health-conscious and gluten-sensitive populations.

Keywords: Gluten-free crackers; buckwheat flour; rice flour; spinach powder; functional properties; antioxidant activity; sensory quality.

REDEFINING MEDICAL MICROBIOLOGY: THE EMERGING ROLE OF NANOBIOTECHNOLOGY

ABSTRACT

Nanobiotechnology, an interdisciplinary field at the intersection of nanotechnology and biotechnology, is redefining the landscape of medical microbiology by harnessing the unique properties of nanoscale materials to address complex microbial challenges. This study critically examines the evolution and application of nanobiotechnology in medical microbiology, highlighting its pivotal role in advancing diagnostic precision, therapeutic efficacy, and innovative vaccine development. Recent literature and case studies reveal that nanoscale biosensors and imaging agents, such as quantum dots and magnetic nanoparticles, have significantly enhanced the sensitivity, speed, and accuracy of pathogen detection, enabling early diagnosis and timely intervention in clinical practice. In therapeutics, engineered nanoparticles facilitate highly targeted drug delivery, improving bioavailability and minimizing side effects, while certain nanomaterials exhibit intrinsic antimicrobial properties that offer promising solutions against antibiotic-resistant pathogens. The integration of nanotechnology into vaccinology has also ushered in a new era of immunization, with nano-carriers enabling controlled antigen delivery and robust immune responses, thus addressing longstanding challenges in vaccine design for complex and emerging infectious diseases. While these advancements offer clear advantages over traditional methods, including higher specificity, reduced side effects, and rapid response, challenges remain regarding scalability, regulatory oversight, and long-term safety. In conclusion, nanobiotechnology stands as a transformative force in medical microbiology, offering innovative solutions for diagnostics, therapeutics, and immunization that can significantly enhance global health outcomes. It is recommended that future efforts prioritize interdisciplinary research, robust regulatory frameworks, and international collaboration to ensure the safe, effective, and equitable adoption of nanobiotechnological innovations in medical microbiology worldwide.

NEUROINFLAMMATION AS A KEY MECHANISM IN NEUROLOGICAL DISEASES

R.VIDHYALAKSHMI*1, C.REJITHA

BHARATH INSTITUTE OF HIGHER EDUCATION AND RESEARCH,SELAIYUR,CHENNAI 600073,TAMIL NADU,CHENNAI.

ABSTRACT

Neuroinflammation has emerged as a critical pathophysiological mechanism in the development and progression of numerous neurological diseases, including neurodegenerative disorders such as Alzheimer's disease (AD), Parkinson's disease (PD), multiple sclerosis (MS), and amyotrophic lateral sclerosis (ALS), as well as acute conditions like stroke and traumatic brain injury (TBI). It involves the activation of the brain's resident immune cells, particularly microglia and astrocytes, which release pro-inflammatory cytokines, chemokines, reactive oxygen species (ROS), and other inflammatory mediators in response to injury, infection, or disease. While this inflammatory response is initially protective, chronic or excessive neuroinflammation leads to neuronal dysfunction, synaptic loss, and neuronal death, driving disease progression. Key signaling pathways, including the activation of cytokines such as TNF-α, IL-1β, and IL-6, play a central role in sustaining the inflammatory environment and exacerbating neuronal damage. This article reviews the current understanding of neuroinflammation's role in neurological diseases and highlights emerging therapeutic strategies aimed at modulating the inflammatory response. Targeting neuroinflammation presents a promising approach to slowing disease progression and improving outcomes for patients with these debilitating conditions. However, balancing the beneficial and harmful effects of inflammation remains a significant challenge, requiring precise modulation of immune responses within the brain.

STRATEGIC NARRATIVES: HOW MEDIA INFLUENCES FOREIGN POLICY DECISIONS IN GLOBAL POWER STRUGGLES

Ehab Ismael
Baku State University, Faculty of Journalism, Department of International Journalism and Information Policy, Baku, Azerbaijan: ehab.ismael.mohamed@bsu.edu.az

ABSTRACT

In the current international system, the media plays an important role in determining global powers' foreign policy by influencing public opinion, framing political debates, and directing diplomatic decision-making. This study critically investigates the strategic use of media narratives in international relations, using fundamental theoretical frameworks such as agenda-setting, framing theory, and the idea of soft power. The research tries to explore how media serves not just as a mirror of political events, but also as a strong instrument used by governments and political players to shape reality, organize support, and achieve geopolitical goals.

The study employs a case-based approach, focusing on high-profile contemporary geopolitical developments such as the Russia-Ukraine conflict and US-China relations, to show how governments, state-affiliated media outlets, and political leaders use both traditional and digital media to influence international perceptions and strategic outcomes. These case studies demonstrate the complex interplay between media management, propaganda, public diplomacy, and international image-building in today's multipolar world.

Furthermore, the study highlights the expanding ethical problems that journalists confront while reporting on global events in an age of digital disinformation, algorithmic prejudice, and increased state power over media platforms. It critically examines the relationship between objective reporting and political pressure, emphasizing questions about media independence, narrative manipulation, and public confidence in global contexts.

By investigating the interaction of media and foreign policy, this study adds to a better understanding of how communication techniques influence global power dynamics. The findings are useful for politicians, media workers, and researchers as they navigate the changing terrain of political communication in the twenty-first century. (Entman, 2004; Nye, 2004).

SOCIAL MEDIA'S ROLE IN INTERNATIONAL CRISES: A STRATEGIC TOOL FOR INFLUENCE, PERCEPTION MANAGEMENT, AND CRISIS DIPLOMACY (2015-2025)

Ehab Ismael
Baku State University, Faculty of Journalism, Department of International Journalism and Information Policy, Baku, Azerbaijan: ehab.ismael.mohamed@bsu.edu.az

ABSTRACT

Social media has emerged as a transformational force in international crises, altering how governments communicate, build narratives, and wield power on a global scale. This article looks at how major nations including the United States, Russia, and China used social media platforms strategically between 2015 and 2025 to achieve their geopolitical goals. Using a qualitative methodology, the research examines key case studies such as the Russia-Ukraine war (7), US-China trade disputes (2), and Middle Eastern geopolitical concerns (9). These instances demonstrate how social media has been used for a variety of objectives, including propaganda distribution, misinformation operations, public diplomacy, and narrative control.

The results show that social media is a strategic tool of influence as well as a route for communication, allowing governments to project soft power, participate in information warfare, and shape public opinion. The study also looks at the moral dilemmas raised by state-sponsored propaganda, digital distortion, and disinformation on social media. For politicians, media professionals, and academics seeking to negotiate the intricate nexus of digital communication and foreign diplomacy, this research delivers insightful information by offering a thorough examination of social media's involvement in international crises. ABSTRACT

Resource development and management is one of the crucial processes in the education institution for assuring quality especially in higher education. This is also the same with community colleges. The main objective of this study was to determine the experiences of stakeholders on resource development and management of Daraga Community College. Specifically, this study answered the status of resources, the practices and the strengths, weaknesses, opportunities and threats in the school resource development and management as experienced by the stakeholders. The researchers utilized case study method. The data were gathered from 35 internal and external stakeholders as key informants in the study composed of instructors, administrators, non-teaching staffs, and members of Board of Trustees. The needed data were determined through document analysis, interviews and SWOT analysis. The major findings in terms of the status of Daraga Community College where resources are considered available but need to be improved in order to serve the large number of enrollees in the college. There are certain practices of resource development and management which are done by the stakeholders in the college. It was also found that the college has strengths, weaknesses, opportunities and threats in resource development and management. To address the concerns in the experiences of the stakeholders in the college, the researcher proposed a management model in resource development and management which is called as 4S Management Model. The management model aims to create and define the capacity capabilities of Daraga Community College to deliver quality and accessible education to Darageños.

FOUNDATIONS AND CONCEPTUAL MODELS OF TAXPAYER TAX COMPLIANCE

ZOUHEIR MSATFA
University HASSAN FIRST , Morocco, Zouheirmsatfa12@gmail.com

ABSTRACT

This work delves into the significance of tax compliance for small and medium-sized enterprises (SMEs) and its vital role in driving both economic and social development. It starts by explaining the key components of tax compliance, emphasizing that it extends beyond just filing tax returns to encompass transparency and adherence to legal obligations. The article employs several theoretical models—voluntary, coercive, conditional, and reactive—to analyze the factors influencing SMEs' tax behavior. Each model is explored through the lens of psychological, social, economic, and institutional elements that affect firms' decisions to comply or not with tax regulations. Additionally, international case studies are incorporated, comparing experiences from both developed and developing nations to uncover best practices and persistent challenges in enhancing tax compliance. The article concludes with practical recommendations aimed at building trust between tax authorities and SMEs, simplifying tax systems, and balancing incentives and penalties effectively. Through a comprehensive understanding of tax compliance, this article contributes to shaping policies that support SME growth and competitiveness, while ensuring the integrity and stability of national tax systems.

https://orcid.org/0000-0003-4331-7430

ABSTRACT

The study attempts to examine the factors influencing access to residential land among men and women in Ogun State border communities, Nigeria. A multi-stage sampling technique was used in the selection of 411 homeowners. Frequency distribution, percentages, factor analysis, binary probit regression, and correlation were used to analyse the data that were elicited from men and women homeowners. The study reveals that affordability, land availability, procedural, security of tenure, and personal factors were associated with access to residential land among men while affordability, land availability, security of tenure, personal, and procedural were the factors associated with access to residential land among women, based on their order of importance. The use of binary probit regression analysis shows that the extracted factors significantly influenced secure access to residential land among men and women. Findings from the correlation analysis show that access to residential lands is associated with the personal attributes of men and women. It was further observed that these personal attributes varied among men and women in the study area. The study concluded that access to residential land is attributed to different factors, and these factors vary among men and women. The study suggested that the government and traditional institutions should consider these factors in ensuring easy access to residential land among men and women in the study area.

A CAREER PROGRAM TO ENHANCE CAREER COMPETENCE, CAREER OPTIMISM AND ADAPTABILITY IN THE TRANSITION FROM UNIVERSITY TO WORK

ZEHRANUR AKBULUT
[1]Instructor, Istanbul University-Cerrahpaşa, Psychological Counseling and Guidance, akbulutzehra25@gmail.com, 0000-0002-2925-8510

AHMET ŞİRİN
[2]Prof. Dr, Marmara University, Psychological Counseling and Guidance, asirin@marmara.edu.tr**,** 0000-0003-1582-0493

ABSTRACT

The aim of this study is to create a career program for engineering students to improve their career competencies during the transition from university to work, to facilitate their adaptation to business life and to make them more optimistic about the future and to evaluate the effectiveness of the program. In this action research study, semi-structured interviews were conducted with engineering faculty students, career counselors and human resources experts through snowball sampling to discover the needs of students during the transition to work. The interviews were analyzed in MAXQDA program. The results of the thematic analysis revealed that for the program, both activities that can be implemented by career counselors and practices that can provide experience transfer to students by people working in the field are needed. In the sessions with activities that can be done by the career counselor, practices such as swot analysis, creating career options, making a career plan, and rehearsing a job interview were conducted. In the field-oriented sessions, there were technical trips that allowed students to see different working environments and a panel discussion with speakers and alumni from different sectors. In the creation of the content of the career program, in addition to the themes reached by the researchers, career structuring theory was also used. The results of the thematic analysis revealed that both activities that can be implemented by career counselors and practices that can provide experience transfer to students by people working in the field are needed for the program. The career program consisted of eight sessions. Eleven 3rd and 4th year engineering faculty students who scored low on the Career Competence Scale and Career Adaptability and Optimism Scale participated in the program. SPSS program and student feedbacks were used to evaluate the effectiveness of the program. As a result of the comparison of the pre-test and post-test mean scores of the students in the SPSS program, it was concluded that the program helped to improve the career competencies, career adaptability and optimism of the students during the transition to work. In addition, the forms in which open-ended questions were sent to the students during the program and the questions asked in the evaluation session, which was the last session, also revealed that the program contributed to the students.

Keywords: Career competence, career adaptation, career optimism, transition from university to work, action research.

EXAMINING the ERGONOMICS, VISUAL and COMMUNICATION ELEMENTS of KINDERGARTEN CLASSES

ABSTRACT

This study aimed to develop a scale for evaluating kindergarten classroom designs in terms of ergonomics, visual, and communicative elements. The scale development process began with a literature review, followed by the creation of a 40-item pool based on indicators related to the ergonomics, visual, and communication aspects of kindergarten environments. The initial item pool was revised with feedback from two administrators and two preschool teachers holding relevant expertise. For content validity, the draft scale was evaluated by two experts in early childhood education, two in design, and two in measurement and evaluation. A binary rating system (appropriate/inappropriate) was used, and experts were asked to provide suggestions for any item deemed inappropriate. During this process, items were assessed for their relevance to kindergarten categories, clarity of expression, and linguistic appropriateness. Based on expert feedback, wording revisions were made and six items were removed from the scale. The final version of the scale consisted of 34 items, rated on a 5-point Likert scale: strongly agree (4) to strongly disagree (0). A pilot study was conducted in the first semester of the 2024–2025 academic year with 200 voluntary preschool teachers from public early childhood institutions in Ankara, Turkey. Data analysis yielded a KMO value of 0.93 and a significant Bartlett's test ($p<0.00$), indicating the suitability for factor analysis. Results revealed two dimensions: "visual and ergonomic elements" (23 items, factor loadings ranging from 0.58 to 0.88, explaining 38.55% of the variance) and "communication" (10 items, factor loadings from 0.48 to 0.95, explaining 16.30% of the variance). The total variance explained was 58.77%. The reliability of the scale was determined using Cronbach's alpha, calculated as 0.94, indicating a high level of internal consistency for the final 33-item, two-factor scale.

Keywords: ergonomics, preschool, communication, design

ABSTRACT

Self-differentiation is one of the basic concepts of M. Bowen's family systems theory. People with a high level of self-differentiation can have healthy relationships. This study evaluates the relationships between self-differentiation, parenting attitudes, and psychological resilience. Some studies have demonstrated significant relationships between self-differentiation and the other mentioned concepts. However, the number of those studies is quite limited, especially in Turkey. Therefore, it is anticipated that this research would fill some gaps in the literature. 359 adults aged 18 years or older participated in this study. Data were collected online based on voluntariness and accessibility. The data collection instruments included the Short Form of the Differentiation of Self Inventory, the Brief Resilience Scale, the Parenting Attitude Scale, the Shortened Perceived Parental Attitudes Scale — Child Form, and the Demographic Information Form. Maternal and paternal attitudes were assessed separately across three dimensions: interest/love/acceptance, strict control, and rejection. Compatible with our expectations, the findings revealed that self-differentiation was positively correlated with positive (interest/love/acceptance) maternal and paternal attitudes and psychological resilience *(r* = 0.204, 0.199, 0.581, respectively; $p < .01$) and negatively correlated with negative parental attitudes (rejection and strict control) *(r* = –0.347, –0.313, –0.241, –0.257, respectively; $p < .01$). The results of the multiple linear regression analysis showed that self-differentiation was significantly predicted by psychological resilience and negative maternal attitudes ($F(3, 355) = 76.499$, $p < .001$; *Adjusted* $R^2 = 0.39$). Incompatible with our expectations, it was found that other maternal and paternal attitudes were not significant predictors of self-differentiation ($p > .05$). One of the most important findings of this study is that psychological resilience was found to be a stronger predictor of self-differentiation, even than maternal attitudes. It was recommended that future programs to improve personality development and relationship quality should focus more on strengthening individuals' psychological resilience.

Keywords: *Differentiation of Self, Psychological Resilience, Parental Attitudes*

BENLİK FARKLILAŞMASI, EBEVEYN TUTUMLARI VE PSİKOLOJİK DAYANIKLILIK ARASINDAKİ İLİŞKİLERİN İNCELENMESİ

ÖZET

Benlik farklılaşması, M. Bowen'ın aile sistemleri teorisinin temel kavramlarından birisidir. Benlik farklılaşması yüksek bireyler sağlıklı ilişkiler yürütebilirler. Bu araştırmanın amacı benlik farklılaşması ile ebeveyn tutumları ve psikolojik sağlamlık arasındaki ilişkileri incelemektir. Benlik farklılaşması ile bu kavramlar arasında ilişki olduğunu bulan araştırmalar olmakla birlikte, özellikle Türkiye'de bu araştırmalar sınırlı sayıdadır. Bu kapsamda araştırmamızın alan yazına katkı sağlayacağı düşünülmüştür. Araştırmaya 18 yaş ve üzeri 359 yetişkin katılmış, veriler çevrimiçi olarak gönüllülük ve ulaşılabilirlik esasına göre toplanmıştır. Veri toplamada, Benliğin Farklılaşması Ölçeği Kısa Formu, Kısa Psikolojik Sağlamlık Ölçeği, Çocuk Yetiştirme Stilleri Ölçeği, Kısaltılmış Algılanan Ebeveyn Tutumları Ölçeği – Çocuk Formu ve Demografik Bilgi Formu kullanılmıştır. Anne ve baba tutumları ayrı ayrı ve üç boyut (ilgi/sevgi/kabul, sıkı denetim/kontrol ve reddedicilik) üzerinden incelenmiştir. Araştırma sonuçları, beklentilerimizle uyumlu şekilde, benlik farklılaşmasının olumlu anne ve baba tutumları ve psikolojik sağlamlık ile pozitif (sırası ile r = 0,204, 0,199, 0,581, p < 0,01, olumsuz (reddecilik ve sıkı denetim/kontrol) anne ve baba tutumları ile ise negatif ilişkili (sırası ile r = –0,347, -0,313, -0,241, -0,257, p < 0,01) olduğunu göstermiştir. Çoklu doğrusal regresyon analizi sonuçları ise benlik farklılaşmasının psikolojik sağlamlık ve olumsuz anne tutumları tarafından anlamlı şekilde yordandığını (F(3, 355) = 76,499, p < .001; $R^2düz = 0,39$). ortaya koymuştur. Beklentilerimiz ile uyumsuz olarak, diğer anne ve baba tutumlarının ise benlik farklılaşmasının anlamlı yordayıcıları olmadığı (p> .05) tespit edilmiştir. Araştırma sonuçları arasında, psikolojik sağlamlığın, anne tutumlarından bile daha güçlü bir yordayıcı olduğunun belirlenmesi özellikle dikkat çekicidir. Gelecekte kişilik yapılanmasına ve kişilerarası ilişkilere yönelik önleyici ve koruyucu çalışmalarda, bireyin psikolojik dayanıklılığını güçlendirmeye odaklanan müdahalelerin artırılması önerilmektedir.

Anahtar Sözcükler: Benlik farklılaşması, Psikolojik sağlamlık, Ebeveyn tutumları.

EXTENDED ABSTRACT

Introduction and Objectives: The purpose of this study is to explore the correlational and predictive relationships between self-differentiation, parenting attitudes, and psychological resilience, with special consideration to differentiation of self, which is a key concept within the framework of Murray Bowen's family systems theory. Individuals with a high level of self-differentiation would possess a healthy personality formation and can deeply and lovingly attach to others. At the same time, they would preserve their personal boundaries and be able to maintain these relationships over time. This also implies that people with low self-differentiation are likely to show several personality disorder dispositions that tend to worsen social interactions and relationships. The body of research regarding parenting practices, psychological resilience, and self-differentiation is rather sparse, especially in Turkey. It is anticipated that this research would fill some gaps in the literature.

Methods: The sample for this study consisted of 359 individuals who were 18 years old and over. The data was gathered online while observing the principle of voluntary participation and accessibility. The following instruments were used for data collection: The Short Form of the Differentiation of Self Inventory, the Brief Resilience Scale, the Parenting Style Scale, the Shortened Perceived Parental Attitudes Scale – Child Form, and a Demographic questionnaire. Maternal and paternal attitudes were assessed separately across three dimensions: interest/love/acceptance, rejection, and strict control.

Results: Compatible with our expectations, results revealed that self- differentiation had a positive and significant correlation with maternal interest/love/acceptance (r = 0.204, p < .01), paternal interest/love/acceptance attitudes (r = 0.199, p < .01), and psychological resilience (r = 0.581, p < .01) whereas negative and significant correlations were found between self - differentiation and maternal rejection (r = -0.347, p < .01), paternal rejection (r = -0.313, p < .01), maternal strict control (r = -0.241, p < .01), and paternal strict control attitudes(r = -0.257, p < .01).

The multiple linear regression analysis results yielded a significant model and showed that approximately 39% of the total variance of self-differentiation was explained by psychological resilience, maternal rejection, and maternal strict control attitudes ($F(3, 355) = 76.499$, $p < .001$; *Adjusted* R^2 = 0.39). This model showed that controlling the other predictors, psychological resilience alone explained 26.8% ($\beta = 0.536$, $t(355) = 12.53$, $p < .001$, %95 CI [1.444, 1.981], part $r = .518$.), maternal rejection 1.4% ($\beta = –0.147$, $t(355) = –2.88$, $p = .004$, %95 CI [–0.818, –0.155], part $r = –.119$.), and maternal strict control attitudes 1.0% ($\beta = –0.125$, $t(355) = –2.51$, $p = .012$, %95 GA [–0.363, –0.044], part $r = –.104$.) of the total variance of self-differentiation However, incompatible with our expectations, it was found that other maternal and paternal attitudes were not significant predictors of self-differentiation (p > .05).

Discussion and Conclusion: The results of this study revealed that self-differentiation correlated with psychological resilience and parental attitudes. Furthermore, the findings showed that psychological resilience and negative maternal attitudes were significant predictors of self-differentiation. The most highlighted finding was that psychological resilience was a stronger predictor than maternal attitudes, which the literature considers fundamental for personality development. Based on this, it is recommended that future preventive and protective interventions regarding personality development and social functioning focus more on enhancing psychological resilience. In the present study, the majority of the participants were female (63.5%), single (77.2%), and had a bachelor's degree or higher (87.5%), which presents a limitation in terms of the generalizability of our findings.

Keywords: *Differentiation of Self, Psychological Resilience, Parental Attitudes*

TAM ÖZET

Giriş ve Amaç: Bu araştırma, Murray Bowen'ın aile sistemleri teorisinin temel kavramlarından biri olan benlik farklılaşması ile ebeveyn tutumları ve psikolojik sağlamlık arasındaki korelasyonel ve yordayıcı ilişkileri incelemek amacıyla yürütülmüştür. Benlik farklılaşması yüksek bireyler, sağlıklı bir kişilik yapılanmasına sahip olmakta, sınırlarını koruyabildikleri sevgi dolu derin ilişkiler kurabilmekte ve bu ilişkileri sürdürebilmektedirler. Söz konusu durum, benlik farklılaşması düşük bireylerin, kişilerarası ilişkiler alanında işlevsellik kaybına neden olan çeşitli kişilik bozukluğu eğilimlerine de sahip olabileceklerine işaret etmektedir. Ebeveyn tutumları, psikolojik sağlamlık ve benlik farklılaşması üzerine yapılan çalışmalar özellikle Türkiye'de sınırlı sayıdadır. Söz konusu ilişkilerin kapsamlı bir şekilde ele alınmasının alan yazın açısından önemli olduğu düşünülmüştür.

Yöntem: Araştırmaya, 18 yaş ve üzeri 359 yetişkin katılmıştır. Veriler çevrimiçi ortamda, gönüllülük ve ulaşılabilirlik esasına göre toplanmıştır. Araştırmada veri toplama aracı olarak; Benliğin Farklılaşması Ölçeği Kısa Formu, Kısa Psikolojik Sağlamlık Ölçeği, Çocuk Yetiştirme Stilleri Ölçeği, Kısaltılmış Algılanan Ebeveyn Tutumları Ölçeği – Çocuk Formu ve Demografik Bilgi Formu kullanılmıştır. Anne ve baba tutumları ayrı ayrı ve üç boyut (ilgi/sevgi/kabul, reddedicilik, sıkı denetim/kontrol) üzerinden değerlendirilmiştir.

Bulgular: Araştırma değişkenleri arasındaki ilişkilerin incelendiği korelasyon analizi sonuçlarına göre beklentilerimize paralel şekilde, benlik farklılaşması ile anne kabul/ilgi/sevgi (r = 0,204, p < 0,01), baba kabul/ilgi/sevgi (r = 0,199, p < 0,01) tutumları ve psikolojik sağlamlık (r = 0,581, p < 0,01) arasında pozitif yönde anlamlı; anne reddedicilik (r = –0,347, p < 0,01), baba reddedicilik (r = –0,313, p < 0,01), anne sıkı denetim/kontrol (r = –0,241, p < 0,01) ve baba sıkı denetim/kontrol (r = –0,257, p < 0,01) tutumları arasında ise negatif yönde anlamlı ilişkiler olduğu görülmüştür.

Çoklu Doğrusal Regresyon Analizi sonuçları ise beklentimizle kısmen örtüşmüştür. Yapılan analiz sonucunda; benlik farklılaşmasına ilişkin toplam varyansın yaklaşık %39'unun psikolojik sağlamlık, anne reddedicilik ve anne sıkı denetim/kontrol tutumları tarafından açıklandığı (F(3, 355) = 76,499, p < .001; $R^2düz$ = *0,39*). tespit edilmiştir. Diğer değişkenler sabit tutulduğunda, tek başına psikolojik sağlamlık, annenin reddedici tutumları ve annenin sıkı denetim/kontrol tutumları sırası ile benlik farklılaşması toplam varyansının %26,8 (β = 0.536, t(355) = 12.53, p < .001, %95 GA [1.444, 1.981], kısmi r = .518.), %1,4 (β = –0.147, t(355) = –2.88, p = .004, %95 GA [–0.818, –0.155], kısmi r = –.119.) ve %1 (β = –0.125, t(355) = –2.51, p = .012, %95 GA [–0.363, –0.044], part r = –.104.)'ini açıklamaktadır. Buna karşın, beklentilerimiz ile uyumsuz olarak diğer anne ve baba tutumlarının benlik farklılaşmasının anlamlı yordayıcıları olmadığı bulunmuştur (p> .05).

Tartışma ve Sonuç: Araştırma, psikolojik sağlamlık ve ebeveyn tutumlarının benlik farklılaşması ile ilişkili olduğunu ve psikolojik sağlamlık ile olumsuz anne tutumlarının benlik farklılaşmasını anlamlı şekilde yordadığını göstermiştir. Psikolojik sağlamlığın, alan yazında kişilik yapılanmasının en güçlü belirleyicilerinden biri olarak belirtilen anne tutumlarından bile daha güçlü bir yordayıcı olduğunun belirlenmesi özellikle dikkat çekicidir. Gelecekte kişilik yapılanmasına ve kişilerarası ilişkilere yönelik önleyici ve koruyucu çalışmalarda, bireyin psikolojik dayanıklılığını güçlendirmeye odaklanan müdahalelerin arttırılması önerilmektedir. Katılımcılarımızın %63,5'i kadın, %77,2'si bekar olup %87,5'i lisans ve üstü eğitim seviyesine sahiptir. Söz konusu durum, araştırma bulgularımızın genelleştirilmesine ilişkin bir kısıtlılık oluşturmaktadır

Anahtar Sözcükler: benlik farklılaşması, psikolojik sağlamlık, ebeveyn tutumları.

EVALUATION OF THE RELATIONSHIP BETWEEN BODY SATISFACTION AND SOCIAL MEDIA UNCONSCIOUSNESS IN THE CONTEXT OF HIJAB AND POTENTIAL PROTECTIVE FACTORS

ABSTRACT

This study explored the relationship of body satisfaction with social media addiction, hijab, perceived social support, psychological resilience, religiosity, and social media unconsciousness. 260 women over 18 were included in this online study based on voluntariness and accessibility. Compatible with our hypotheses, a significant positive correlation was observed between body satisfaction and social support (r=0.29, p<0.01), psychological resilience (r=0.37, p<0.01) and religiosity level (r=0.21, p<0.01); and a negative significant correlation was found between body satisfaction and social media unconsciousness (r=-0,38, p<0.01), social media addiction (r= -0.35, p<0.01) and perception of others (r= -0.34, p<0.01). Multiple linear regression analysis results revealed that the model was statistically significant (F(4,255)= 22,86; p<0,001, *Adjusted* R^2 = 0.25); and social media unconsciousness, psychological resilience, religiosity, and perceived social support explained 25% of the total variance of body satisfaction. Independent sample t test results yielded the body satisfaction (M=34.78, SS=6.82) and religiosity (M=5.32, SS=1.01) of women with hijab were significantly higher than those who did not wear hijab (respectively M=32.93, SS= 6.89; M=4.06, SS=1.37), (respectively, t(258)= 2.1, p < 0.05; t(258)= 8.5, p < 0.001). Based on the demographic form question, named as "others perception" shortly, ("My physical features that I believe to be flawed, do not cause me any trouble as long as others do not see them"), the participants with hijab and without hijab were not differentiated. Our hypothesis that the clothing styles of women with hijab would protect them against body dissatisfaction was not supported. The findings indicated that social media unconsciousness negatively affected body satisfaction. Moreover, social support, psychological resilience, and religiosity would be considered protective factors. It was considered that psychoeducation aimed at increasing social media consciousness and psychotherapeutic interventions that support psychological resilience may be effective in reducing body dissatisfaction and providing protection from eating disorders associated with it.

Keywords: Social media, body satisfaction, perceived social support, psychological resilience, hijab

BEDEN MEMNUNİYETİYLE SOSYAL MEDYA BİLİNÇSİZLİĞİ İLİŞKİSİNİN TESETTÜR VE OLASI KORUYUCU FAKTÖRLER BAĞLAMINDA İNCELENMESİ

ÖZET

Bu çalışmada beden memnuniyetinin sosyal medya bağımlılığı, tesettür, algılanan sosyal destek, psikolojik sağlamlık, dindarlık ve sosyal medya bilinçsizliği ile ilişkisi çalışılmıştır. Çalışmaya 18 yaş üstü 260 kadın gönüllülük ve ulaşılabilirlik esasına göre dahil edilmiştir. Çalışma online olarak yürütülmüştür. Hipotezlerimize paralel olarak, beden memnuniyetinin sosyal destek (r=0,29, p<0,01), psikolojik sağlamlık (r=0,37, p<0,01) ve dindarlık seviyesi (r=0,21, p<0,01) ile arasında anlamlı ve pozitif korelasyon gözlemlenmiştir; sosyal medya bilinçsizliği (r=-0,38, p<0,01), sosyal medya bağımlılığı (r=-0,35, p<0,01) ve diğerlerinin algısı (r= -0,34, p<0,01) ile arasında ise negatif anlamlı bir korelasyon bulunmuştur. Regresyon analizi sonuçları incelendiğinde, modelin istatistiksel olarak anlamlı olduğu (F(4,255)= 22,86; p<0,00, düzeltilmiş R^2 = 0.39), sosyal medya bilinçsizliği, psikolojik sağlamlık, dindarlık seviyesi ve algılanan sosyal desteğin, beden memnuniyeti düzeyinin toplam varyansının %25'ini açıkladığı görülmüştür. Bağımsız örneklem t testi sonucuna göre ise tesettürlü kadınların beden memnuniyeti ($\bar{x}$=34,78, SS=6,82) ve dindarlık seviyesi ($\bar{x}$=5,32, SS=1,01), tesettürlü olmayanlardan (sırası ile $\bar{x}$=32,93, SS= 6,89; $\bar{x}$=4,06, SS=1,37) anlamlı şekilde yüksek bulunmuştur (sırası ile t(258)= 2,1, p < 0,05; t(258)= 8,5, p < 0,001). Demografik formda yöneltilen ve kısaca diğerlerinin algısı olarak isimlendirilen, "*Kusurlu olduğuna inandığım fiziksel özelliklerim başkaları tarafından görülmediği müddetçe benim için sıkıntı yaratmaz"* sorusuna verilen cevaplarda tesettürlü ve tesettürsüz katılımcı grubu faklılaşmamış ve tesettürlü kadınların giyim tarzlarının onları beden memnuniyetsizliğine karşı koruduğuna ilişkin hipotezimiz desteklenmemiştir. Söz konusu bulgular; sosyal medya bilinçsizliğinin beden memnuniyetini olumsuz etkilediğini, sosyal destek, psikolojik sağlamlık ve ek bir faktör olarak dindarlığın da koruyucu faktörler olarak dikkate alınabileceğine işaret etmektedir. Sosyal medya bilincinin artırılmasına yönelik psikoeğitimlerin ve psikolojik sağlamlığı destekleyen psikoterapötik müdahalelerin, beden memnuniyetsizliğinin azaltılmasında ve beden memnuniyetsizliği ile ilişkili yeme bozukluklarına ilişkin koruma sağlamada etkili olabileceği düşünülmüştür.

Anahtar Sözcükler: Sosyal medya, beden memnuniyeti, psikolojik sağlamlık, algılanan sosyal destek, tesettür

EXTENDED ABSTRACT

Introduction and Objectives: Nowadays, the use of social media has a significant impact on the body perceptions of individuals. Both social media addiction and social media unconsciousness (an excessive meaning a person attributes to how his/her images uploaded to social media appear to others) would lead people to feel dissatisfied with their bodies and make unfavorable social comparisons. It is thought that protective factors such as perceived social support and psychological resilience can reduce these adverse effects. Furthermore, some studies showed that hijab would also be a protective factor against body dissatisfaction, and women with hijab had higher body satisfaction compared to those who did not wear hijab. The present study explored the relationships between body satisfaction and social media addiction, hijab, perceived social support, psychological resilience, religiosity, and social media unconsciousness. The hypotheses of this study were: H1: There is a positive relationship between body satisfaction and psychological resilience, perceived social support, and religiosity. H2: There is a negative relationship between body satisfaction and social media unconsciousness and social media addiction. H3: Psychological resilience, perceived social support, social media unconsciousness, social media addiction, and religiosity predict body satisfaction. H4: There is a negative relationship between body satisfaction and participants' belief that their perceived physical flaws are related to other people's interest in their bodies (others' perception). H5: Body satisfaction of women with hijab is higher than that of other women, as their physical features, which they believe to be flawed, are not recognized by others (others' perception).

Method: Based on volunteering and accessibility, 260 women over 18 were included in this study, which was conducted online. The demographic information form, Body Appreciation Scale, Multidimensional Scale of Perceived Social Support, Brief Resilience Scale, The Appearance-related Social Media Consciousness Scale, and Bergen Social Media Addiction Scale were presented to the participants, respectively.

Findings: Compatible with our hypothese, a significant positive correlation was observed between body satisfaction and social support (r=0.29, p<0.01), psychological resilience (r=0.37, p<0.01) and religiosity (r=0.21, p<0.01); and a negative significant correlation was found between body satisfaction and social media unconsciousness (r=-0,38, p<0.01), social media addiction (r= -0.35, p<0.01) and "perception of others" (r= -0.34, p<0.01). Multiple linear regression analysis results revealed that the model was statistically significant (F(4,255)= 22,86; p<0,001), and social media unconsciousness, psychological resilience, religiosity level, and perceived social support explained 25% of the total variance of body satisfaction. Independent sample t test results yielded the body satisfaction (M=34.78, SS=6.82) and religiosity level (M=5.32, SS=1.01) of women with hijab were significantly higher than those of who did not wear hijab (respectively M=32.93, SS= 6.89; M=4.06, SS=1.37), (respectively, t(258)= 2.1, p < 0.05; t(258)= 8.5, p < 0.001). Based on the demographic form question, named as "others perception shortly, ("My physical features that I believe to be flawed, do not cause me any trouble as long as others do not see them"), the participants with hijab and without hijab were not differentiated, and our hypothesis that the clothing styles of women with hijab would protect them against body dissatisfaction, was not supported. Moreover, the participant groups with hijab and without hijab did not differ based on social media addiction, social media unconsciousness, psychological resilience, and perceived social support.

Discussion and Conclusion: The findings indicated that social media unconsciousness adversely affected body satisfaction. Furthermore, social support, psychological resilience, and religiosity would be considered protective factors. Even if our hypothesis that claimed women's

body satisfaction, who were wearing hijab, would be higher than others due to their clothing style, was not supported, it is still interesting that women with higher religiosity have higher body satisfaction as well. It was thought that this would be due to the characteristic nature of religion emphasizing spiritual values, such as altruism and morality, rather than material aspects, such as status and physical appearance. It was considered that psychoeducation aimed at increasing social media consciousness and psychotherapeutic interventions that support psychological resilience may be effective in reducing body dissatisfaction and providing protection from eating disorders associated with it.

Keywords: Social media, body satisfaction, perceived social support, psychological resilience, hijab

TAM ÖZET

Giriş ve Amaç: Günümüzde sosyal medya kullanımı, bireylerin beden algıları üzerinde önemli ve olumsuz etkiler yaratmaktadır. Gerek sosyal medya bağımlılığı gerekse sosyal medya bilinçsizliği (kişinin sosyal medyaya yüklenen görüntülerinin nasıl göründüğüne yüklediği aşırı anlam), bireylerin bedenlerinden memnuniyetsizlik duymalarına ve olumsuz sosyal karşılaştırmalar yapmalarına yol açabilmektedir. Algılanan sosyal destek ve psikolojik sağlamlık gibi koruyucu faktörlerin ise bu olumsuz etkileri azaltabileceği düşünülmektedir. Buna ek olarak yapılan bazı araştırmalar tesettürün de beden algısına karşı koruyucu bir etmen olabileceğini ve tesettürlü kadınların beden memnuniyetlerinin daha yüksek olduğunu göstermektedir. Bu çalışmada, beden memnuniyetinin sosyal medya bağımlılığı, tesettür, algılanan sosyal destek, psikolojik sağlamlık, dindarlık ve sosyal medya bilinçsizliği ile ilişkisi çalışılmıştır. Araştırmamızın hipotezleri; H1: Beden memnuniyeti ile psikolojik sağlamlık, algılanan sosyal destek ve dindarlık arasında pozitif bir ilişki vardır. H2: Beden memnuniyeti ile sosyal medya bilinçsizliği ve sosyal medya bağımlılığı arasında negatif bir ilişki vardır.H3: Psikolojik sağlamlık, algılanan sosyal destek, sosyal medya bilinçsizliği, sosyal medya bağımlılığı ve dindarlık, beden memnuniyetini yordar. H4: Beden memnuniyeti ile katılımcıların, bedensel olarak algıladıkları kusurlarının diğer insanların vücutlarına olan ilgileriyle ilişkili olmasına dair inançları (diğerlerinin algısı) arasında negatif ilişki vardır. H5: Tesettürlü kadınların beden memnuniyeti; kıyafet tarzları nedeniyle kusurlu olduklarına inandıkları fiziksel özelliklerinin başkaları tarafından görülmemesinden (diğerlerinin algısı) dolayı daha yüksektir.

Yöntem: Çalışmaya 18 yaş ve üzeri 260 kadın gönüllülük ve ulaşılabilirlik esasına göre dahil edilmiştir. Çalışma online olarak yürütülmüştür. Katılımcılara sırasıyla demografik bilgi formu, Beden Memnuniyeti Ölçeği, Çok Boyutlu Algılanan Sosyal Destek Ölçeği, Kısa Psikolojik Sağlamlık Ölçeği, Görünümle İlişkili Sosyal Medya Bilinç Ölçeği, Bergen Sosyal Medya Bağımlılığı Ölçeği sunulmuştur.

Bulgular: Hipotezlerimize paralel olarak, beden memnuniyetinin sosyal destek (r=0,29, p<0,01), psikolojik sağlamlık (r=0,37, p<0,01) ve dindarlık seviyesi (r=0,21, p<0,01) ile arasında anlamlı ve pozitif korelasyon gözlemlenmiştir; sosyal medya bilinçsizliği (r=-0,38, p<0,01), sosyal medya bağımlılığı (r=-0,35, p<0,01) ve diğerlerinin algısı (r= -0,34, p<0,01) ile arasında ise negatif anlamlı bir korelasyon bulunmuştur. Regresyon analizi sonuçları incelendiğinde, modelin istatistiksel olarak anlamlı olduğu (F(4,255)= 22,86; p<0,001), sosyal medya bilinçsizliği, psikolojik sağlamlık, dindarlık seviyesi ve algılanan sosyal desteğin, beden memnuniyeti düzeyinin toplam varyansının %25'ini açıkladığı görülmüştür. Bağımsız örneklem t testi sonucuna göre ise tesettürlü kadınların beden memnuniyeti ($\bar{x}$=34,78, SS=6,82) ve dindarlık seviyesi ($\bar{x}$=5,32, SS=1,01), tesettürlü olmayanlardan (sırası ile $\bar{x}$=32,93, SS= 6,89; $\bar{x}$=4,06, SS=1,37) anlamlı şekilde yüksek bulunmuştur (sırası ile t(258)= 2,1, p < 0,05; t(258)= 8,5, p < 0,001). Demografik formda yöneltilen "*Kusurlu olduğuna inandığım fiziksel özelliklerim başkaları tarafından görülmediği müddetçe benim için sıkıntı yaratmaz"* sorusuna verilen cevaplarda tesettürlü ve tesettürsüz katılımcı grubu farklılaşmamış ve tesettürlü kadınların giyim tarzlarının onları beden memnuniyetsizliğine karşı koruduğuna ilişkin hipotezimiz desteklenmemiştir. Tesettürlü grup ile tesettürsüz grup, sosyal medya bağımlılığı, sosyal medya bilinçsizliği, psikolojik sağlamlık ve algılanan sosyal destek açısından da farklılaşmamıştır.

Tartışma ve Sonuç: Söz konusu bulgular; sosyal medya bilinçsizliğinin beden memnuniyetini olumsuz etkilediğini, sosyal destek, psikolojik sağlamlık ve ek bir faktör olarak dindarlığın da koruyucu faktörler olarak dikkate alınabileceğine işaret etmektedir. Hipotezimiz doğrultusunda

tesettürlü kadınların giyim tarzları dolayısıyla bedenlerinin başkaları tarafından görülmemesinin beden memnuniyetlerini artıracağı fikri desteklenememiş olsa bile dindarlık düzeyi yüksek olan kadınların beden memnuniyetlerinin diğerlerine kıyasla yüksek olması ilgi çekicidir. Söz konusu durumun dinlerin görsellik, statü v.b. materyalist değerlerdense yardımseverlik, ahlak vb. manevi değerleri ön plana çıkarmasından kaynaklanabileceği düşünülmüştür. Sosyal medya bilincinin artırılmasına yönelik psikoeğitimlerin ve psikolojik sağlamlığı destekleyen psikoterapötik müdahalelerin, beden memnuniyetsizliğinin azaltılmasında ve beden memnuniyetsizliği ile ilişkili yeme bozukluklarına ilişkin koruma sağlamada etkili olabileceği düşünülmüştür.

Anahtar sözcükler: Sosyal medya, beden memnuniyeti, psikolojik sağlamlık, algılanan sosyal destek, tesettür

INVESTIGATION OF THERMAL EFFICIENCY IN LIQUID-COOLED LITHIUM-ION BATTERY SYSTEMS

ABSTRACT

This study investigates the thermal performance of cooling strategies for lithium-ion battery systems using three-dimensional, time-based (transient) simulations with FloEFD software. The main goal is to clearly understand how the type of coolant, the speed of the fluid (Reynolds number), and the discharge rate affect battery cell temperature. A special part of this work is that it tests antifreeze mixtures like EG, normally used in freezing weather, under mild, non-freezing conditions. This helps check if fluids designed for cold temperatures also work well in normal situations. Three coolant mixtures—100% water, 70% water - 30% ethylene glycol (EG), and 50% water - 50% EG—were tested. Each was analysed with Reynolds numbers of 500, 1000, and 2000, and discharge rates of 1C, 2C, and 4C. The results show that battery temperatures are affected by discharge rate, fluid speed, and coolant type. When the discharge rate increases, battery temperature goes up quickly. Higher Reynolds numbers help improve cooling by increasing heat transfer, but this effect is smaller than the effect of discharge rate. Coolant performance changed depending on the fluid speed. At low flow speeds (Re = 500–1000), the 50% water–50 % EG mixture gave the best results because of its good viscosity. Water was best at high flow speed (Re = 2000) because it transfers heat better. The 70% water–30 % EG mixture gave steady but average performance in all tests. In conclusion, the study shows that for good thermal control, both the coolant type and flow speed must be considered together.

ABSTRACT

The Internet of Things (IoT) is a technology that enables physical objects to communicate and share data over the internet. Today, this technology is widely used in many areas such as industrial automation, healthcare systems, smart city applications, agriculture, and transportation. One of the most important elements of IoT systems is the selection of a communication technology that meets the specific requirements of the application. This paper presents a comparative analysis of communication protocols commonly used in IoT applications, including LoRaWAN, NB-IoT, Zigbee, Wi-Fi, and Bluetooth. The technical characteristics of each technology are examined and the advantages and disadvantages of these technologies are evaluated in terms of parameters such as coverage, data rate, latency, scalability, and energy efficiency. It also discusses the suitability of each protocol in different use cases. For example, LoRaWAN is preferred in rural applications requiring long range and low power consumption, while Wi-Fi is preferred in applications requiring high data rate and short range. In this context, it is of great importance to make the right choice in system design by considering both the technical and application level performance of the protocols. The results of this study will provide guidance for both academic research and industrial applications. This study aims to guide researchers, engineers and decision makers in choosing the most appropriate communication protocol for their IoT applications. As a result, it will contribute to a more efficient design of IoT systems by matching communication technologies with application goals.

Keywords: Internet of Things (IoT), IoT communication protocols, LoRaWAN, NB-IOT.

NESNELERİN İNTERNETİ (IOT) KULLANIM ALANLARI VE HABERLEŞME TEKNOLOJİLERİNİN KARŞILAŞTIRILMASI

ÖZET

Nesnelerin interneti (IoT), fiziksel nesnelerin internet aracılığıyla birbirleriyle haberleşmesini ve veri paylaşımını sağlayan bir teknolojidir. Günümüzde bu teknoloji; endüstriyel otomasyon, sağlık sistemleri, akıllı şehir uygulamaları, tarım ve ulaşım gibi pek çok alanda yaygın olarak kullanılmaktadır. IoT sistemlerinin en önemli unsurlardan biri, uygulama gereksinimlerine uygun haberleşme teknolojisinin seçilmesidir. Bu çalışma, IoT uygulamalarında yaygın olarak kullanılan LoRaWAN, NB-IoT, Zigbee, Wi-Fi ve Bluetooth gibi haberleşme protokollerinin karşılaştırmalı bir analizini sunmaktadır. Her bir teknolojinin teknik özellikleri incelenmiş; kapsama alanı, veri iletim hızı, gecikme süresi, ölçeklenebilirlik ve enerji verimliliği gibi parametreler açısından bu teknolojilerin avantajları ve dezavantajları değerlendirilecektir. Ayrıca, her bir protokolün farklı kullanım senaryolarındaki uygunluğu tartışılacaktır. Örneğin, LoRaWAN'ın uzun menzil ve düşük güç tüketimi gerektiren kırsal alan uygulamalarında tercih edilmesi, ya da Wi-Fi'ın yüksek veri hızı ve kısa menzil gerektiren uygulamalardaki avantajı gibi örnekler ele alınmıştır. Bu bağlamda, protokollerin hem teknik hem de uygulama düzeyindeki performansları göz önünde bulundurularak sistem tasarımında doğru tercihin yapılması büyük önem taşımaktadır. Çalışmada elde edilen bulgular, hem akademik araştırmalar hem de endüstriyel uygulamalar için yol gösterici nitelikte olacaktır. Bu çalışma, araştırmacılar, mühendisler ve karar vericilere kendi IoT uygulamaları için en uygun haberleşme protokolünü seçmede rehberlik etmeyi amaçlamaktadır. Sonuç olarak, haberleşme teknolojilerinin uygulama hedefleriyle uyumlu hale getirilmesi yoluyla IoT sistemlerinin daha verimli şekilde tasarlanmasına katkı sağlayacaktır.

Anahtar Kelimeler: Nesnelerin interneti (IoT), IOT haberleşme protokolleri, LoRaWAN, NB-IOT.

A COMPARATIVE ANALYSIS OF ANTONYMS IN MEDICAL, TECHNICAL AND LINGUISTIC TERMINOLOGY IN PERSIAN, ENGLISH AND AZERBAIJANI LANGUAGES

Verdiyeva Gunay Vilayat
Doctor of Philosophy in Philology, Associate Professor,
Senior Researcher of the Department of "Iranian Philology"
at the Institute of Oriental Studies named after Z.M.Bunyadov of ANAS
gunayverdiyeva@mail.ru, orcid ID- 0000-0001-5088-1174

ABSTRACT

Antonymy is an important semantic phenomenon widely used both in everyday speech and in specialized terminology. This study presents a comparative analysis of antonymic pairs in medical, technical, and linguistic terminology across three languages: Persian, English, and Azerbaijani.

Antonyms can be classified into several types: contrary antonyms express opposite extremes of the same quality (e.g., big – small), complementary antonyms are mutually exclusive, with no intermediate state (e.g., alive – dead), relational antonyms are based on reciprocal relationships (e.g., teacher – student), directional antonyms indicate opposite directions or movements (e.g., enter – exit), gradable antonyms show varying degrees of a quality (e.g., warm – cold), and conversive antonyms describe the same situation from different perspectives (e.g., buy – sell).

In medical terminology, complementary antonyms are most common, such as هیپرتانسیون / هیپوتانسیون (hypertension / hypotension), bradycardia / tachycardia, and bradikardiya / taxikardiya.

In technical vocabulary, relational and directional antonyms predominate, for example: input / output, خروجی / ورودی, giriş / çıxış.

Linguistic terminology includes all major types of antonyms: active / passive, məlum / məchul, معلوم / مجهول.

The comparative approach reveals typological similarities and differences in how opposition is expressed across languages. The analysis shows that while the underlying concepts are largely universal, the linguistic means of expressing them vary significantly, particularly at the morphological and syntactic levels. This research is relevant for terminological lexicography, machine translation, and cross-linguistic semantics.

Keywords: Persian language , English language ,Azerbaijani language ,terminology, antonyms

THE CASE OF TWO SIMILAR HAIKU POEMS

Irina-Ana DROBOT
Lecturer, PhD, Technical University of Civil Engineering Bucharest, Faculty of Engineering in Foreign Languages, Department of Foreign Languages and Communication, Bucharest, Romania, anadrobot@yahoo.com, ORCID: 0000-0002-2556-6233

ABSTRACT

The purpose of this paper is to present the phenomenon of two very similar poems found in a weekly haiku contest in the Haiku Authors from Romania Facebook group. The similarity was unwilling, as the two authors did not talk together and did not share previously these poems in print or online. Fresh poems only are received in this contest. One of the poems sounds as follows: "marți treisprezece –/ fărâmițe pe tejghea/ trei ceasuri rele" (Tuesday the thirteenth –/ scattered into pieces on the counter/ three evil hours, my translation). The poem belongs to Andrei Andy Grădinaru. In my translation, I used evil hours for what is called, in Romania, when we have bad luck on a Tuesday. At the same time, hours and clocks or watches are designated by the same word in Romanian. There could be real clocks or watches shattered on the counter. We could also use cursed clocks or watches. The ambiguity cannot be captured in translation. The ideas and suggestions related to bad luck come together coherently: not only is it Tuesday, but it is also the 13th, and even the bad or evil hours, a symbol of misfortune, are shattered on the counter. The clocks could be old objects, cherished at flea markets, but they can no longer be valued. Alternatively, we could interpret it as bad luck having been banished after all. The second poem, by Valer C. Pop, sounds as follows: "zi de marți –/ pe o tarabă în talcioc/ 3 ceasuri rele" (Tuesday –/ on a flea market table/ three cursed clocks, my translation). The resemblance is clearly striking. For the theoretical methodology, the paper relies on literary studies and psychoanalysis, on reader response criticism and on the theory of synchronicity by Jung.

Keywords: free associations, allusions, synchronicity.

DETERMINATION OF THE STRUCTURE AND EVALUATION OF DECORATIVE TREES IN "NËNË TEREZA" SQUARE, PRISHTINA

Adni Islami
University of Pristina, Faculty of Agriculture and Veterinary Medicine, Department of Pomology and Viticulture, Pristina, Kosovo.
ORCID ID: https://orcid.org/0009-0001-6866-7376, islamiadni@gmail.com

ABSTRACT

Decorative trees in urban spaces represent more than just aesthetic elements; they are essential forimproving quality of life and creating sustainable cities. With a direct impact on air quality improvement, thermal balancing, and rainwater management, these trees constitute a valuable economic and ecological asset for urban communities. This study aims to evaluate the decorative trees in “Mother Teresa” Square in Prishtina, prioritizing their monetary and non-monetary values. The focus is on identifying species, assessing their health, and analyzing their impact on urban living quality. The methodology includes key factors such as: Base Price (A): Determination of the initial value of the tree in the nursery. Age Factor (B): Assessment of age to measure the impact of growth and development. Location and Protection (C): Analysis of the tree's strategic positioning in urban space. Crown Condition (D): Visual assessment of crown coverage and density. General Condition (E): Health evaluation of key tree parts, including roots, trunk, and leaves. Dendrological Value (M): Analysis of the biological and aesthetic importance of the tree species. An advanced approach based on the Hungarian model adopted by the European Commission is utilized. The results demonstrate that the evaluated decorative trees have a multifaceted impact on enhancing urban quality of life and sustainable city planning. Integrating these values into urban strategies is recommended to protect and maintain green spaces. This study highlights the necessity of treating decorative trees as essential elements of urban planning. Comprehensive assessment models, such as the Hungarian model, provide the foundation for effective policymaking that enriches life in 21st-century cities. In total, 28 species of decorative trees are present in “Mother Teresa” Square, with 195 decorative trees recorded, amounting to a total value of 821,188.2€.

Keywords: Decorative trees, evaluation, sustainability, urban environment.

GRENADINE MOLASSES: BETWEEN PROMISES AND CHALLENGES

BOURENINE KAHINA, NAIT KACI-BOUDIAF MALIKA, SAADOUN NORIA

ABSTRACT

Pomegranate syrup, or pomegranate molasses, is a traditional product rich in bioactive compounds such as polyphenols (punicalagin, ellagic acid), flavonoids, and anthocyanins, recognized for their antioxidant, anti-inflammatory, and cardiovascular protective effects. While scientific research has confirmed, through clinical trials, the benefits of pomegranate juice or extracts on memory, heart health, metabolism, and immunity, few studies have yet specifically targeted artisanal molasses. However, the prolonged cooking used in its production can alter certain sensitive molecules, while preserving or activating other, more stable compounds. Promoting local pomegranate varieties, adapted to Mediterranean terroirs and rich in tannins, offers promising potential for combining ancestral knowledge, sustainable production, and innovation in preventive health, from an epistemological perspective linking tradition and science.

DIGITAL TRANSFORMATION AND INNOVATION: THE ROLE OF TECHNOLOGY IN SHAPING SOCIO-ECONOMIC DEVELOPMENT

MSc. Diellorita Abazi
International University of Struga, Kosovo
E-mail: dielloritaabazi.afsd@hotmail.com

ABSTRACT

The 21st century has been marked by rapid advancements in digital technologies, profoundly transforming economic systems, social structures, and human interactions. This study explores the dynamics of digital transformation with a focus on its socio-economic implications, particularly in developing countries. The research investigates how technological innovations such as artificial intelligence, big data, and automation are redefining labor markets, access to services, and public governance. Using a mixed-method approach combining secondary data analysis and case studies from the Balkan region, the study identifies key opportunities and challenges brought by digitalization. The findings reveal a growing digital divide, but also highlight the potential for inclusive growth through strategic investment in digital literacy and infrastructure. The paper concludes with policy recommendations aimed at fostering an innovation-driven ecosystem that ensures sustainable development and social equity. This study contributes to the interdisciplinary discourse on current developments in science, technology, and social sciences, aligning with the objectives of the 11th BILTEK Congress.

Keywords: digital transformation, innovation, socio-economic development, technology, public policy, digital divide

WOMEN AND FOOD TOURISM: EXPLORING GENDER ROLES IN CULINARY TRADITIONS OF SOUTHEASTERN NIGERIA

Joy Nneka Uchenye, Ejikeme
Humanities Unit, School of General Studies, University of Nigeria, Nsukka.
Joy.ejikeme@unn.edu.ng, ORCID ID: 0000-0002-4483-2939

ABSTRACT

Food tourism has emerged as a vital avenue for preserving cultural heritage and fostering local economic development, particularly in indigenous communities. In Southeastern Nigeria, where culinary traditions are deeply rooted in the socio-cultural fabric of the Igbo people, women play a pivotal role as custodians, creators, and transmitters of food-related knowledge and practices. This study explores the gendered dimensions of food tourism by examining the roles, contributions, and challenges of women in sustaining and promoting culinary traditions in selected communities in Anambra, Enugu, and Abia States. Using a qualitative methodology that includes ethnographic fieldwork, interviews, and participant observation, the research uncovers how women not only preserve traditional recipes and cooking techniques but also act as cultural ambassadors through food festivals, local markets, and tourism-oriented food enterprises. Findings reveal that women's participation in food tourism fosters community cohesion, intergenerational knowledge transfer, and economic empowerment, despite facing socio-cultural and structural barriers. The paper argues that integrating gender perspectives into food tourism development can enhance cultural sustainability and create inclusive economic opportunities in rural and peri-urban areas. The study concludes with recommendations for policy frameworks that support women-led culinary initiatives as a strategic component of sustainable tourism development in Southeastern Nigeria.

Keywords: Food tourism, gender roles, culinary traditions, women in tourism, Southeastern Nigeria

WOMEN IN RURAL SLOVENIA NAVIGATING THE TRIPLE BURDEN OF LABOUR, AGRICULTURE AND HOUSEHOLD CARE

Maja PUCELJ
Assistant professor and Head of research, EMUNI University, R&D Projects and Innovation department, Piran, Slovenia, **maja.pucelj@emuni.si** **(**Responsible Author)

ABSTRACT

This research highlights the overlooked challenges faced by rural women in Slovenia who are in paid employment, run family farms and perform most household tasks. As Eurostat (2024) states, rural women often have less access to services, infrastructure and technology, and their contributions are underestimated or remain invisible.

Despite the high labour force participation of women in Slovenia, rural women take on a disproportionate amount of unpaid care work. They look after children and elderly relatives, contribute to agricultural work and often work outside the home. However, national labour and agricultural policies offer little recognition or support (Petrovčič et al., 2023; Stajnko, 2016; FAO, 2011).

These challenges are exacerbated by digital exclusion. Rural women have limited access to digital tools, internet services and digital education — especially those with lower incomes, less education or disabilities (UN Women, 2022; IFPRI, 2024). This inequality hinders their participation in modern agriculture, e-services and the digital economy. In 2021, only 17% of ICT professionals in Slovenia were women, indicating broader structural barriers (Selič & Kamenšek, 2023).

Deep-rooted gender norms also persist - women usually take on the care and administrative work in agriculture, while men dominate the decision-making functions. These constraints limit women's well-being and economic participation.

Rural women bear a triple labour burden yet remain underrepresented in policy and statistics. To advance gender equality and rural sustainability, we recommend strengthening rural care infrastructure (childcare, eldercare, social services), promoting shared care responsibilities within families, mainstreaming gender in rural and agricultural policies and investing in rural connectivity and digital training for women. Targeted support is essential to ensure rural women are not left behind in digital and societal transitions.

Keywords: Rural women, Unpaid care work, Digital exclusion, Gender inequality, Agricultural policy.

AN INTELLIGENT SYSTEM FOR THE EVALUATION OF SCIENTIFIC PAPERS BASED ON FUZZY LOGIC

ABSTRACT

Objective and comprehensive evaluation of scientific papers remains one of the most critical and complex challenges in the academic and research community. The accuracy and fairness of the review process are essential for ensuring the integrity and credibility of scholarly publishing. However, the evaluation often heavily relies on the reviewer's subjective judgment, which is shaped by their individual experience, personal bias, expertise, and interpretation of academic standards. As a result, different reviewers may produce inconsistent or even contradictory evaluations of the same work. This subjectivity compromises the transparency and reliability of the final decision regarding acceptance, revision, or rejection of submitted papers.

Traditionally, academic papers are evaluated based on multiple qualitative criteria such as the relevance of the research topic, originality and innovation, soundness of the methodology, significance and potential impact of the results, clarity of the presentation, and adherence to

ethical standards. While these criteria are valid and widely accepted, their interpretation varies among reviewers.

To address these challenges and reduce the influence of subjective bias, this paper proposes an intelligent evaluation system based on fuzzy logic. Fuzzy logic allows for handling uncertainty and ambiguity in human reasoning by using linguistic variables and rule-based decision-making. The proposed system incorporates a multi-criteria assessment framework, combining expert-defined rules with fuzzy inference mechanisms to derive a consistent and balanced evaluation.

This model has been implemented as software and integrated into the peer review workflow. It assists editors and reviewers by offering a structured and systematic evaluation process, improving decision-making accuracy, enhancing fairness, and increasing trust in the peer review process.

ABSTRACT

This study examines Ebenezer Obey's song "Operation Feed the Nation" from an Ethnomusicological perspective, analyzing its impact on food sovereignty in South West Nigeria. The research reveals how the song promoted self-sufficiency, agricultural development, and community empowerment, reflecting Yoruba cultural values. This research is relevant to Sustainable Development Goals number 2 (Zero Hunger), and number 3 (Good Health and Wellbeing). The objectives of this study are to analyze the lyrical content of "Operation Feed the Nation" in relation to food sovereignty; examine the impact of the song on agricultural development in South West Nigeria and to investigate how the song promoted community empowerment and self-sufficiency. This study made use of the content analysis of song lyrics, historical context analysis of Nigeria's food sovereignty initiatives, and literature of relevant Ethnomusicological and agricultural development studies. The findings of this study show that the song's lyrics emphasized self-sufficiency and agricultural development and the song contributed to increased awareness and mobilization for food production. This study therefore recommends the integration of music into agricultural development initiatives; promotion of traditional Yoruba Music and cultural values, and the need to carry out further research on the impact of music on food security.

Keywords: Food Sovereignty, Indigenous Songs, Ethnomusicology, Agriculture.

THE MECHANISM BETWEEN THE OPTIMIZATION OF RURAL EDUCATIONAL RESOURCES AND REGIONAL AGRICULTURAL ECONOMIC

Dr. Neha
Associate Professor, Swami Vivekanand Subharti University,
Meerut, Uttar Pradesh 250005 India
dr.neha2917@gmail.com

ABSTRACT

Revitalization This study aims to investigate the interactive dynamics between the optimization of educational resources in rural areas and the revitalization of regional agricultural economies. Utilizing panel data from 31 provinces across China spanning the years 2018 to 2023, this research will employ spatial econometric techniques to empirically assess the relationship concerning the dynamics and regional disparities within the education-agriculture interplay.

The detected positive correlations range from 0.342 to 0.412 in the different model settings for interaction terms while optimizing educational resources in support of agricultural economic development. It could be seen from the regional heterogeneity analysis that the strength of the interaction effects in the Eastern region was higher, with a mean coefficient of 0.85, as compared to the Central and Western regions, which were 0.65 and 0.45, respectively. Resource misallocation and institutional constraint were the main operational problems suggested by the survey. Based on the above foundation, the study gives some policy suggestions that would increase effectiveness in the allocation of educational resources and promote coordinated rural development. This adds to the theoretical understanding of rural development by setting up a framework through which the interaction of education and agri-culture can be analyzed, providing ample insight into approaches toward policy formulation and implementation.

Among all the global development strategies, the optimization of rural educational resources and the re-vitalization of the regional agricultural economy have been two of the most critical thoughts thus far[1]. Inthe last few decades, scholars and policy makers havedeveloped an interest in the complex inter-relationships between means of distribution of educational resourcesand agricultural economic development[2]. New tech-nologies and rapid changes in how agriculture is being done need the rural workforce to be complicated and ed-ucated[3]. This in return would point out the need toimprove the educational resources within the rural set-ting, especially within agricultural and developing partsof the world. The interaction mechanisms should be uti-lized in solving the inharmoniousness between rural ed-ucation and agricultural growth because it is acting as ahindrance towards building up China's socialist new ru-ral area's, and it is indeed a pressing issue around the country's development[4].The literature available suggests that better utilization of educational inputs has a strong bearing on agri-cultural output and, consequently, economic develop-ment in rural areas[5]. Historically, rural areas have wit-nessed many setbacks regarding the distribution of educational resources due to inadequate infrastructure, in-sufficient quality education, and inequality in teacher distribution[6]. Using China as a case study, it is evi-dent from the statistics that a meager 91.4% gross enrollment rate was recorded for junior secondary education. According to statistics from 2022, fewer than 55.2% of teachers serving in rural areas possess a bachelor's de-gree or higher, whereas in cities the rates are 99.6% and91.3%[7] respectively. Further, there exists a challengeto agricultural modernization involving the digital trans-formation of rural areas. In 2022, it was reported thatonly 57.6% of people in rural China had access to theinternet,

which falls short by 26.8 percentage points ofurban penetration rates[8]. The recent imperatives withrespect to agricultural modernization and digitalization have added to the already complex load that besets the rural education framework, calling for a revisit of thetraditional resource allocation practice[9]. That problem further increases because of complexity in the develop-ment and modernization of agriculture in space[10].

The complex interaction of rural education re-sources and agricultural economic development formsa system that needs deep analysis on many levels [11].

Without understanding how such interrelation works, itwill not be possible to create policies enhancing educational quality that will increase parallel development in agricultural economics[12]. Recent research has pointed to the need for a fuller understanding of how educational resources come to be used, including how they can be best deployed to underpin sustainable agricultural delopement and rural renewal[13]. Indeed, many of the existing research limit themselves to the unidirectional correlational study only and they do not possess a theo-retical perspective that incorporates both into an inter-active system[14].

ABSTRACT

Nontyphoidal *Salmonella* presents a significant threat to animal and human health as a food-borne infectious agent. This study focused on the characterization of *Salmonella* isolates obtained from fresh animal products consumed in Bejaia, Algeria. In total, 495 beef products, 600 chicken products, and 355 dairy products were collected from retail outlets and slaughterhouses in the region. Out of the 1450 samples collected, a *Salmonella* positivity rate of 3.5% (51/1450) was observed. Traditional Algerian sausages exhibited the highest prevalence of *Salmonella* contamination (14.1%, 36/256). Fifteen different serotypes were identified, with *S.* Kentucky (n = 12), S. Anatum (n = 11), and S. Bredeney (n = 9) being the most prevalent. Antimicrobial susceptibility testing showed resistance to diverse antibiotics, particularly against tetracycline, ampicillin, nalidixic acid, and sulphonamides. Whole-genome sequencing conducted on 21 isolates enabled the comparison of phylogenetic links between isolates. We notably identified clones circulating across the region in different locations and food types, suggesting contamination at the early stages of the food chain (in the herd or slaughterhouses) that disseminated to numerous butcher shops in various cities. We also identified acquired antibiotic resistance genes and point mutations in the quinolone resistance-determining region genes, contributing to the observed resistance patterns. This study describes the genomic and phylogenetic characteristics of several *Salmonella* clones found in diverse food samples in Algeria. It suggests potential transmission dynamics that could better understand *Salmonella's* contamination routes.

ABSTRACT

This study is devoted to the determination of the chemical composition and the assessment of *in vivo* anti-inflammatory activity of the species *Scabiosa stellata* L. Furthermore, four saponins were isolated from the n-butanol extract using several chromatographic methods, and their structures were identified by spectroscopic analysis. The isolated compounds were subjected to molecular docking study with COX-1 and 2, 5-LOX, and NF-κB enzymes to explain the observed *in vivo* anti-inflammatory activity, and their pharmacokinetic and toxic parameters were predicted. According to the results, all the isolated compounds interact well with the active sites of COX-1 and 2, 5-LOX, and showed excellent interaction scores. The saponins demonstrated low intestinal absorption and poor skin, blood-brain barrier, and central nervous system permeability. However, all the molecules had low clearance values and a high drug half-lifetime (t1/2). On the other hand, the compounds had a low possible toxicity and lacked hepatotoxicity, mutagenicity, or cytotoxicity. In addition, the administration of the extract at 75 mg/kg prevents acute paw edema significantly compared to diclofenac. Furthermore, the plant may treat inflammatory diseases. However, a prudent use is recommended due to its richness in saponins known for their toxic effects.

Keywords: *Scabiosa stellata*, phytochemicals, anti-inflammatory, molecular docking, *in silico.*

A SYSTEMATIC LITERATURE REVIEW ON THE PHYTOCHEMICAL AND INSECTICIDAL PROPERTIES OF PLANT OILS AND EXTRACTS AGAINST CERATITIS CAPITATE

ABSTRACT

Farmers use biopesticides, naturally occurring compounds, to control agricultural pests in forests, gardens, and farmlands. Scientists have produced diverse biopesticides using a range of sources. This systematic review evaluates the efficacy of plant-based bioinsecticides in controlling Ceratitis capitata populations by analyzing 29 research papers and using computer programs such as Zotero, Excel, and NVivo. Researchers found that essential oils from plants like Thymus herba-barona, Cinnamomum zeylanicum, Salvia officinalis, and other Eucalyptus species are highly harmful to adult medflies, with key active components being phenolic chemicals and aromatic aldehydes. Essential oils from Thymus zygis, Salvia officinalis, and Mentha suaveolens can kill insects and keep them away, making them suitable for integrated pest management plans. Melaleuca alternifolia and Carlina acaulis are poisonous, reducing their impact on parasitoids. The study also examined the non-lethal effects of essential oils on medfly behavior, including reduced aggressiveness and preference for certain oil mixes. These findings suggest that the use of plant-based bioinsecticides could significantly influence sustainable and eco-friendly pest management approaches, reducing reliance on chemical insecticides and mitigating their adverse impacts on human health and the environment.

ABSTRACT

This study presents the first comprehensive analysis of *Ebenus pinnata*, an endemic medicinal shrub with significant ethnopharmacological importance in Mediterranean coastal regions. Systematic evaluation reveals this species as an exceptional reservoir of bioactive compounds with remarkable therapeutic potential. Understanding their exact compositions, particularly in bioactive molecules, is crucial for enhancing the value of plant matrices and their derivatives. HPLC-MS/MS analysis offers advantages such as high sensitivity, excellent compound separation, and precise molecular identification, while enabling comprehensive metabolite profiling.

This study explores the application of HPLC-MS/MS in characterizing extracts from various parts of this medicinal plant. It also documents striking tissue-specific phytochemical variations, with leaves showing significant phenolic content (526.90 ± 11.61 mg GAE/g DW) and flavonoids (369.23 ± 7.14 mg QE/g DW), while flowers exhibited superior

proanthocyanidin content. These findings highlight the importance of organ-specific analyses when evaluating medicinal plants. The robust antihemolytic capacity demonstrated across multiple assays like hypotonic test with IC50 of 1.58 mg/ml, validates traditional applications and suggests utility in oxidative stress-related disorders. The selective cytotoxicity of leaf extracts against murine multiple myeloma cells (IC50 = 276.1 ± 8.12 µg/mL), with minimal toxicity toward normal splenic mononuclear cells, suggests intriguing anticancer properties with potentially favorable therapeutic indices. These results scientifically validate traditional medicine applications and establish a foundation for bioprospecting novel therapeutic agents from *E. pinnata*, positioning it as a valuable botanical resource with significant potential for pharmaceutical development and addressing pressing global health challenges.

ABSTRACT

Biosafety is an important concept, Fungal contamination in academic laboratories was not within concern despite of its effect on the academic microbiological researches as contaminant and the obtained results. This study targeted to scan the most common contaminant fungi distributed in different sites and location indoor and outdoor academic laboratories. Detection was accomplished using routine microbiological methods (phenotype and cultural characteristics) and microscopic examination. Results revealed that *Aspergillus* sp. was the most common dominant mold, while *Candida* sp. was the most dominant yeast isolated. Then come several pathogenic and non-pathogenic fungi, like *Mucor* sp., *Rizopus* sp., *Fonsecaea* sp., *Trichophyton* sp. And *Exophilia* sp.. Conclusion: Surfaces and sites of Medical academic laboratories, which are in usual contact with hands, mainly need more focus in decontamination and the methods used locally in routine decontamination require check and updating according to Biosafety measures.

Keywords: Biosafety, fungal contamination, *Aspergillus, Candida, Fonsecaea, Trichophyton* And *Exophilia.*

ASSESSING EFFECT OF AGROECOLOGY ON SOIL ORGANIC MATTER AND THE AGRO- PHYSIOLOGICAL CHARACTERISTICS OF APPLE TREE

ABSTRACT

Climate change is putting increasing pressure on land and water resources reducing vegetative growth and soil fertility, with a direct impact on global food security. Among the measures for adapting these challenges, agroecology appears to be a promising approach, with its many advantages, including numerous advantages, including the generation of a favorable microclimate at plot level and the improving soil fertility. For this reason there is the need to validate a new agroecosystem adapted to our present environment. The present study aims to evaluate the effect of agroecology based on the apple tree on the agro-physiological parameters of three intercrops and on the organic matter of the soil. The experimental dispositive consists of apple varieties, including 2 early varieties (Anna and Dorsett Golden), 2 seasonal varieties (Golden delicious and Starking delicious) and 2 late varieties (Story and King Roat). The intercrops used are rosemary, rapeseed and Faba bean. In the conventional system (control), two varieties are used; Golden delicious and Starking delicious. The parameters measured in the apple tree are leaf temperature, total chlorophyll, leaf area and stomatal conductance. Thus, the soil organic matter content was measured after harvest and in comparison, to before seedling. Significant variability for all the parameters measured was observed between the control and the apple tree and in comparison, between the two species. For example, the agroecology system favors the reduction of stomatal conductance compared to the controls in the apple tree. Regarding the organic matter content, the results obtained show an increase in its content compared to the monoculture. Although the results are preliminary, the study shows beneficial effects of this cropping system on apple tree.

Keywords: *Agroecology, Apple tree, Climate change, Organic matter, Physiological parameters.*

ROLE OF GhFBN IN DROUGHT TOLERANCE IN COTTON

ABSTRACT

Fibrillin (FBN) proteins play crucial roles in plastid structure, stress responses, and lipid-associated functions which mediate drought tolerance in plants. The fibrillin (FBN) gene family, critical for stress adaptation in plants, remains poorly characterized in cotton. This study hypothesizes Fibrillin (FBN) orthologs in cotton confer drought tolerance. In this study, protein sequence of the Arabidopsis thaliana FBN family member was retrieved from TAIR and used as reference in cotton genomes and 18 members were selected as GhFBN orthologs based on high level of FBN domain homology. Subsequent sub-cellular localization analysis predicted FBN to be localized in chloroplast, endoplasmic reticulum (ER) and mitochondria indicating that GhFBN proteins are distributed across multiple organelles and may have multiple functions. Motif analysis using the MEME revealed that FBN members have conserved amino acid patterns which were confirmed by sequence logos checked by WebLogo tool, highlighting conserved structural features across species. To further decipher the function, chromosomal localization of FBN genes showed that these GhFBN genes in cotton are unevenly distributed across chromosomes 01, 04, 05, 06, and 07, and are classified into six phylogenetic groups. The online RNA sequencing expression data of all the identified GhFBN members displayed higher expression levels of certain GhFBN members confirmed by qRT-PCR. Our study offers valuable data on the function of GhFBN genes under drought stress and provides a foundation for further analysis of the function of the FBN gene family under abiotic stresses.

Keywords: Cotton, drought stress, FBN, GhFBN, Fibrillin.

SYSTEMATIC LITERATURE REVIEW ON ADOPTION OF DIGITAL TECHNOLOGIES IN AGRICULTURAL ACCOUNTING AND AUDIT

Mr. Ebrahim Mohammed Ahmed[1]
Research Scholar, S.D. School of Commerce, Gujarat University, Ahmedabad

Proffessor (Dr) Gurudutta P. Japee[2]
Professor- School of Commerce, Coordinator: Department of Advanced Business Studies
Gujarat University

Mr. Mesud Mohammed Akmel[3]
Research Scholar, S.D. School of Commerce, Gujarat University, Ahmedabad

ABSTRACT

This Systematic Literature Review (SLR) critically examines the integration and evolution of digital technologies in the field of agricultural accounting and auditing, a domain that is becoming increasingly significant in light of the widespread digital transformation within the agricultural industry. Drawing on scholarly publications spanning from 2010 to 2024, this review identifies and analyzes the application of advanced technologies such as farm management information systems (FMIS), blockchain technology, the Internet of Things (IoT), artificial intelligence (AI), and cloud-based platforms.

The findings underscore how these innovations are reshaping financial reporting, compliance, and decision-making processes in agriculture by enhancing data transparency, financial accuracy, and real-time information accessibility. The use of these digital tools contributes to increased operational efficiency, fraud detection and prevention, and strengthened regulatory compliance mechanisms.

Despite these advantages, the review also sheds light on critical barriers to adoption, including high implementation costs, insufficient digital literacy among agricultural stakeholders, and infrastructural limitations, particularly in rural and developing regions. Moreover, the analysis reveals a notable research imbalance, with agricultural auditing receiving considerably less academic attention compared to accounting practices.

This study highlights substantial research gaps and suggests future directions, including the development of technological implementation frameworks, digitally integrated audit models, and heightened focus on cybersecurity risks associated with digital financial ecosystems in agriculture. The review contributes to the growing discourse on digital agriculture, offering valuable insights for policymakers, practitioners, and researchers aiming to enhance financial transparency, accountability, and sustainability in the Agri-financial sector.

Keywords: Digital Agriculture, Agricultural Accounting, Agricultural Auditing, Blockchain, Internet of Things (IoT), Artificial Intelligence (AI), Cloud Computing, Financial Transparency, & Digital Transformation.

ROLE OF POTASSIUM, ZINC, AND BORON APPLICATIONS IN MODULATING COTTON PHENOLOGY UNDER VARIABLE ENVIRONMENTAL CONDITIONS

ABSTRACT

Cotton phenology is highly sensitive to different temperature regimes, and little work has been conducted to compare the effects of different temperature regimes and nutrients spray at three reproductive stages of cotton (squaring, flowering and boll formation) under field conditions. In this experiment, the three reproductive stages were exposed to the high, medium and optimal temperatures of April, May and June thermal regimes under field conditions. One day prior to the onset of heat stress, potassium at 1.5%, zinc at 0.2% and boron at 0.1% was applied as foliar at three reproductive stages of cotton. Results showed that the April (early) thermal regime took 24% and 33% more days to flowering (DF) over May (normal) and June (late) thermal regimes, respectively while May thermal regime took 7% more time to DF over June sowing date. Similarly, April thermal regime took more days to squaring (DS) and boll splition (DBS) over May and June thermal regimes while May sown crop took more DS and DBS over the June sown crop. Among nutrients, both K and Zn (averaged across) reduced 4, 6 and 8 days to DS, DF and DBS, respectively under April (early) sown crop over the water and boron treated plants (averaged across) of respective thermal regime. However, all nutrients showed non-significant effects on DS, DF and DBS under normal and late sown crops over the water sprayed plants of respective sowing dates. The results concluded that the early sown crop took more DS, DF and DBS over the normal and late sown crops. Among the nutrients, both K and Zn (averaged across) reduced the DS, DF and DBS under early sown crops.

THE KNOWLEDGE, ATTITUDES, AND PRACTICES (KAP) OF POULTRY FARMERS TOWARDS THE USE OF COMMON DISINFECTANTS IN NSUKKA L.G.A OF ENUGU STATE

[*] Ogunniran, Temitope M.[1], Okoroafor, Obianuju N.,[1] Obodo Adaeze B.[1]
[1]Department of Veterinary Medicine, University of Nigeria, Nsukka, Enugu State, Nigeria.
*Correspondence: temitope.ogunniran@unn.edu.ng

ABSTRACT

This study explored the knowledge, attitudes, and practices (KAP) of poultry farmers in Nsukka LGA, Enugu State of Nigeria, toward the use of disinfectants. The findings gave critical insights into the interplay between farmers' awareness of use of disinfectants and associated biological risks, decision-making patterns in the choice of disinfectants, and disinfection practices as they relate to biosecurity. A cross-sectional survey design was employed, targeting 150 purposively selected poultry farms across Nsukka LGA. Data were collected through a structured, close-ended questionnaire validated by the *Department of Veterinary Public Health, University of Nigeria, Nsukka, Enugu state of Nigeria*. Copies of the questionnaire were thereafter distributed to farmers. The questionnaire covered six key areas: socio-demographic information, poultry management, health concerns, knowledge of disinfectants, attitudes towards their use, and practical application. Descriptive statistics, such as frequencies and percentages were used to analyze the data. Inferential statistics, Chi-square test, was employed to assess the statistical associations between the categorical variables. The p-value, $p < 0.05$ was considered statistically significant.. Summary of findings are as follows: **Demographic information** (Majority of farmers (54.7%) are aged 35-50, 38.7% are less than 35years, while 6.7% are above 50years. Most farmers (48%) have secondary education, followed by tertiary education (36.7%) and primary education (15.3%). **Knowledge of Disinfectants:** Generally, the farmers do not know the different classes of disinfectants that they use. They only gave names. From their responses, we were able to classify the various disinfectants they use. Phenolic compounds are the most widely used (19.0%). Acids is lower, with 5.4%. Quaternary ammonium compounds 2.7%, iodine compound is 2.0%. Aldehydes, alcohols, and per-oxygen compounds, each have limited use (1.4%), and chlorine compounds and bases are the least used, with only 0.7%. About 47.6% of respondents use more than one disinfectant. **Awareness of biological risks:** Only 19.5% are fully aware of these risks, while 63.1% have moderate awareness and 17.4% lack awareness entirely. The most commonly recognized disinfectant types are bactericidal (38%) and bactericidal + virucidal (36.7%), while knowledge of fungicidal and sporicidal disinfectants is very low (1.4% each). **Choice determinants:** Cost and availability are the major determinants influencing disinfectant choice, with 34% of farmers considering both factors together. **Practice of Disinfectant Use**: The primary reasons for disinfectant use are disease prevention (22.7%) and cleaning & sanitation (50.7%), most farmers use disinfectants as needed (56.7%), with only 29.3% practicing daily disinfection. Only 6.7% and 7.3% of farmers disinfect their farms weekly and monthly respectively. Significant associations exist between KAP and factors like age ($p = 0.001$ for purpose), education ($p = 0.049$ for expiry checks), and training ($p = 0.003$ for frequency of use) and this underscores the influence of experience and education on biosecurity. **Source of disinfectant recommendation**: Veterinary doctors (61.1%), are the most influential source of disinfectant recommendations, followed by fellow farmers (36.2%). In conclusion, the findings provide critical insights into the gaps in knowledge

and improper disinfectant use, emphasizing the need for targeted education and improved biosecurity measures to enhance poultry health and productivity in the region.

Keywords: Poultry farmers, Disinfectants, Knowledge, Attitudes, Practices, Nsukka.

CREDIT ACCESSIBILITY AMONG MAIZE FARMERS IN IDO LOCAL GOVERNMENT AREA OF OYO STATE, NIGERIA

Adepoju O.A[1], Agude T[1]
Department of Agricultural Extension and Management, Federal College of Agriculture Ibadan, Oyo State, Nigeria, Email address: oladoyinadepoju62@gmail.com

ABSTRACT

This study investigates credit accessibility among maize farmers in Ido Local Government Area of Oyo State, Nigeria. A multi-stage sampling technique was employed to select 100 respondents. Data were collected using structured questionnaires and analyzed with both descriptive statistics (frequency, percentage, mean, and standard deviation) and inferential statistics (Chi-square analysis). Findings revealed that the majority of respondents (53.0%) were male, with 46.0% aged between 41–50 years. Most were married (83.0%) and had 1–6 years of formal education (66.0%). Household sizes ranged mainly from 5–8 members (60.0%), and 44.0% had artisan work as a secondary occupation. A substantial number (84.0%) were members of agricultural cooperative societies, and 43.0% acquired farmland through inheritance. Nearly half (49.0%) cultivated 6–10 hectares, and 47.0% had 1–10 years of farming experience. Most respondents (75.0%) had 1–3 contacts with extension agents annually, while 73.0% sourced capital through bank loans. Annual income for 45.0% of respondents ranged between ₦200,001–₦500,000, and 56.0% borrowed less than ₦200,000. Key sources of credit included the Bank of Industry (mean = 2.19), commercial banks (mean = 2.15), and international grants (mean = 2.12). Credit was primarily utilized for purchasing farm tools (mean = 2.19), acquiring farm inputs (mean = 2.15), and expanding maize farming activities (mean = 2.12). Non-agricultural uses included vehicle acquisition for family use (mean = 1.91) and debt repayment (mean = 1.90). Major constraints to credit access were delays in loan processing (mean = 2.43), inadequate collateral (mean = 2.41), and lack of information on credit facilities (mean = 2.34). The study concludes that maize farmers in the study area face significant barriers to accessing credit. It recommends that financial institutions streamline loan processing, ease collateral requirements, and improve information dissemination to enhance farmers' access to financial resources.

IRON ENRICHED JAM USING NATURAL SWEETENER: A SUSTAINABLE FOOD APPROACH

Ms. Tannu Goswami[1], Prof. (Dr.) Pratibha Singh[1]*
[1]Department of Nutrition and Dietetics, School of Allied Health Sciences, Manav Rachna International Institute of Research and Studies (MRIIRS), India.
*Email: pratibha.fas@mriu.edu.in (Corresponding author's email)

ABSTRACT

Sustainable food systems emphasize nutrient-rich, eco-friendly alternatives to processed foods. Palmyra jaggery (Borassus flabellifer), a minimally processed, iron-rich natural sweetener, serves as a sustainable substitute for refined sugar. Unlike sugarcane, which requires excessive water and depletes soil, palm trees conserve water, improve soil fertility, and grow without deforestation. This study develops an iron-rich jam using Palmyra jaggery and evaluates its sensory properties, total soluble solids (TSS), moisture content, and shelf-life stability over four months. Jams were formulated with varying Palmyra jaggery proportions. A nine-point hedonic scale assessed taste, texture, aroma, and color. TSS and moisture content were analyzed, and shelf life was monitored under refrigerated conditions. Results showed high sensory acceptability, with minimal texture hardening and slight color darkening over time. Stability analyses confirmed a four-month shelf life without preservatives. Palmyra jaggery enhances nutritional value, sustainability, and economic feasibility by reducing dependence on resource-intensive sweeteners. Standardizing processing methods can further improve quality, reduce spoilage, and support farmer livelihoods. This study underscores the potential of Palmyra jaggery in commercial functional food production, supporting sustainable agriculture and providing an iron-rich alternative to conventional jams for health-conscious consumers.

Keywords: Iron-rich jam, Palmyra jaggery, Sensory evaluation, Shelf-life stability, Sustainable food system

INTERRELATION AMONG HALAL MEAT, MEAT PRODUCTS AND TOURISM SECTOR IN ASIAN CONTINENT

MD. Mushfiquer Rahaman RAIHAN
MS Student, Bangladesh Agricultural University, Mymensingh-2202

ABSTRACT

Travelling different places and consuming halal meat, foods, drinks is common practices in Muslim's. The Global Muslim Travel Index (GMTI) projects that over 230 million Muslim travelers will contribute USD 300 billion for the global economy. Muslim's population growth rate is really high. So, Muslim's and non-Muslim's country focus on halal tourism as well as halal food. Dedicated Muslim's views are consuming halal meat as a religious significance, attributing spiritual depth to it. But not all kind of animal meat is halal. Varying different kind production process halal meat can be non halal and also fear of adulteration issue. Facing those problem Muslim tourists are confused with halal meat which also effect on tourism sector. According to Islamic law animal rearing, feeding, management, processing products need to be permissible way. Then the meat and meat products will be halal. Different Muslim's country follows different halal production process and logo for different food items. Non-Muslim's country adapts nearby Muslim's countries system or they follow their own system. Both countries have government or private sector which monitor the whole halal meat and food sector. The marketing system of halal meat of those countries are more or less same. There is a huge possibility to export halal meat to different country. As the growing Muslim population, the halal industry will grow more in future. With government intensive exporting opportunity will rise few times higher than now. As halal foods are mandatory for Muslim's so halal meat, meat products and tourism are related to one another.

GAS CHROMATOGRAPHY IN FOOD ANALYSIS

P.SARANYA, R.VIDHYALAKSHMI, G.PRATHEEBA, DANISH KHAN, C.REJITHA
Faculty of Pharmacy, Bharath Institute of Higher Education and Research, Selaiyur, Tambaram, Chennai-6000073

ABSTRACT

Gas chromatography (GC) is a sophisticated analytical technique that separates and identifies volatile substances in a mixture using a mobile gas phase and a stationary phase, allowing for both qualitative and quantitative analyses. The purpose of this article is to provide a quick overview of the many applications of GC in food analysis in comparison to high-performance liquid chromatography (HPLC), as well as to discuss cutting-edge GC techniques utilized in the most common applications.analysis of food is required for several reasons, including detection of harmful components, monitoring legislation, detecting adulteration, formulation of controlled diets, managing formulation throughout product development and detecting changes in food during storage and processing . Finally, GC's high sensitivity, selectivity, and adaptability make it an invaluable tool for ensuring the safety of food supplies. As food analysis evolves, GC will remain an important tool for protecting consumers and maintaining the highest standards of food quality.One of the primary advantages of GC is its ability to handle complicated mixtures with precision, making it important in quantitative and qualitative analysis. Furthermore, combining GC with mass spectrometry (GC-MS) improves identification capabilities by providing structural information about analytes. However, GC is confined to thermally stable and volatile molecules, making it unsuitable for nonvolatile or strongly polar chemicals. Despite these limitations, gas chromatography is a fundamental component of analytical chemistry, providing unparalleled efficiency in chemical separation and analysis across a wide range of scientific disciplines.

Keywords : Gas chromatography, Food analysis , Qualitative, sensitivity and techniques.

PARENTING STYLE AND NUTRITION: A CROSS-CULTURAL SYNTHESIS OF EVIDENCE ON FEEDING PRACTICES AND DIETARY OUTCOMES

Author: Ms. Bharti Vashisth
Affiliation: Department of Nutrition & Dietetics, School of Allied Health Sciences, Manav Rachna International Institute of Research and Studies (MRIIRS), India

Co- Author: Prof. (Dr.) Pratibha Singh
Affiliation: Department of Nutrition & Dietetics, School of Allied Health Sciences, Manav Rachna International Institute of Research and Studies (MRIIRS), India

ABSTRACT

Background:

Parenting style is an important but neglected determinant of children's dietary behaviors. Despite the fact that authoritative parenting has been found to be the most beneficial to healthy eating in western literature, this paradigm needs to be examined within the culturally diverse environment of Asia.

Objective:

To synthesize current research on how parenting styles (authoritative, authoritarian, permissive and neglectful) influence children's dietary outcomes in different Asian cultural settings.

Methods:

A narrative review was conducted by analyzing 23 peer-reviewed studies published between 2015 and 2025. Studies were selected based on the use of Baumrind's parenting framework and their focus on dietary behaviours of Asian or Asian diaspora populations. PubMed, Scopus and Google scholar were used to draw data of the paper and assessed for the cultural relevance, methodological soundness and nutritional outcomes.

Results:

The findings suggests that authoritative parenting, consistently, is associated with better dietary behaviors like higher fruit and vegetable intake, more structured mealtimes, and lower obesity risk. Nevertheless, there are cultural factors that modify the interpretation of parenting styles: authoritarian attributes can be interpreted as care and responsibility in collectivist societies. Some poor dietary habits were linked with non-responsive styles in particular permissive and neglectful. Disordered eating regardless of style resulted from such feeding practices as coercion or emotional feeding. Outcomes were also significantly influenced by parental education, stress and socio-economic status.

Conclusion:

Although Authoritative parenting has cross-cultural applicability, culturally sensitive adaptations of parenting are needed for effective public health interventions in Asia. Parenting support programs geared specifically toward the context can improve childhood nutrition.

Keywords: Parenting styles, child nutrition, feeding practices, authoritative parenting, Asia, cultural adaptation

THE IMPACT OF NaOH PRETREATMENT, THERMAL PRETREATMENT, AND THEIR COMBINATION (NaOH-thermal) ON BIOMETHANE YIELD DURING THE ANAEROBIC DIGESTION OF WALNUT SHELLS

Zineb El Hamri[1], M. Karaoui[1], M. Alami[1], M. Assouag[1]
[1] Team of Innovative Materials and Mechanical Manufacturing Processes, ENSAM, University Moulay Ismail, B.P. 15290, Al Mansour, Meknes, Morocco.
*Corresponding E-mail: zineb.elhamri@edu.umi.ac.ma

ABSTRACT

Anaerobic digestion (AD) of walnut shells (WS) produces limited biomethane yields due to their high fiber content, classifying them as a largely non-biodegradable lignocellulosic biomass. In this study, thermal pretreatment (50–250 °C), alkaline pretreatment (1–5% w/w NaOH), and a combined alkaline-thermal approach (4% w/w NaOH + 150 °C) were evaluated to enhance the anaerobic biodegradability of WS. The highest biomethane yields, 159.9 ± 6.8 mL CH_4.g VS^{-1} and 169.8 ± 6.8 mL CH_4.g VS^{-1}, were obtained following thermal pretreatment at 250 °C and NaOH pretreatment at 4%, respectively. The combined NaOH-thermal pretreatment resulted in the highest biomethane yield of 192.4 ± 8.2 mL CH_4.g VS^{-1} at the end of the AD process, although it exhibited the longest lag phase (3.90 days) and the highest total VFA concentration (1280.1 mg HAc L^{-1}). This superior yield was supported by the highest SCOD/TCOD ratio (0.37 ± 0.02) and the most effective removal of lignocellulosic fibers, with reductions of 41.1 ± 2.7% in cellulose, 35.6 ± 1.8% in hemicellulose, and 58.7 ± 3.2% in lignin. Cumulative biomethane production was successfully modeled using a modified Gompertz equation. This study highlights that thermal, NaOH, and combined NaOH-thermal pretreatments are effective strategies for significantly improving the biomethane yield of WS, even with their high lignin content.

Keywords: Alkaline pretreatment . Biomethane production . Thermal pretreatment, Lignocellulosic removal . Lignocellulosic biomass . Biogas . Alkaline-thermal pretreatment.

ANTIBIOTIC SUSCEPTIBILITY PATTERN OF BACTERIA ASSOCIATED WITH HAWKED SUYA-MEAT IN ALIERO METROPOLIS

Sani A.M.,*and M.M Shamsuddeen
Department of Microbiology, Faculty of Life Sciences, Kebbi State University of Science and Technology Aliero, Kebbi State, Nigeria,
*Corresponding Author: abubakarsani464@gmail.com

ABSTRACT

Meat is the flesh of animals which serves as food and it is obtained from sheep, cattle, goat and swine. It is that part of animal that provides major source of protein in West African food. The aim of this research is to isolate and identify bacteria associated with hawked Suya meat in Aliero metropolis and to determine antibiotic susceptibility pattern of bacteria. Suya meat were bought from the sellers and was collected in raps of Aluminum foil. It was then taken to the laboratory for analysis. The sample was homogenized and pipetted using 5ml sterile pipette. This was cultured on Mackonkey agar and Nutrient agar incubated at 37^0C for 24 hours. Discrete bacteria colonies were observed and each colony was gram-stained and examined microscopically. Biochemical identification were carried out to confirm the particular bacteria present. The disc diffusion assay was employed to investigate the sensitivity of isolates to the antibiotics. The standardized inocula of the test organisms were emulsified on the surface of Mueller-Hinton agar using sterile cotton swab, the plates was dried at room temperature for 5 min, and incubated at 30^0C for 48 hours. The following antibiotic discs at different concentrations were used: Septrin (SXT) 30µg, Streptomycin (S) 30µg, Chloramphenicol (CH) 30µg, Sparfloxacin (SP) 10µg, Amoxicillin (AM) 30µg, Ciprofloxacin (CPX) 10µg, Tarivid (OFX) 30µg, Gentamycin (GN) 10µg, Pefloxacin (PEF) 10µg and Augumetin (AU) 25µg.Bacteria isolated were *Staphylococcus aureus, Bacillus subtilis* and *Escherichia coli.*The result of this research provides preliminary data on bacteria contamination of Suya meat such as *Staphylococcus aureus, Bacillus spp* and *Escherichia coli.* Awareness as regard to hygiene should be created to the sellers to minimize the rate of contamination through carelessness. If suya meat must be hawked, it should be carried about in protective glass case or ware that does not expose it to microorganisms as to reduce the incidence of food poisoning in the society.

Keywords; Meat, Antibiotic, Bacteria, Sensititivity, Suya.

MITIGATION OF SALINITY INDUCED NEGATIVE EFFECTS ON THE GERMINATION AND GROWTH OF SOYBEAN BY CALCIUM APPLICATION

Anam Hameed and Muhammad Faisal
Institute of Plant Breeding and Biotechnology, MNS-University of Agriculture, Multan, Pakistan, Correspondence: Muhammad Faisal (muhammad.faisal@mnsuam.edu.pk)

ABSTRACT

Soybean is an oil seed leguminous crop and moderately sensitive to salt stress. The response of soybean plant to salt stress depends heavily on the Salt Overly Sensitive (SOS) signaling system. The present study outlines how calcium treatment may help reduce salinity stress and affects soybean seed germination and growth parameters. The seeds of two contrasting varieties (salt tolerant and salt sensitive) were primed with different concentrations of calcium (10 and 20 mM) and stressed with different levels of NaCl (80 and 100 mM). The findings indicate that while germination improved by up to 25% under NaCl stress, it was enhanced by 7% in calcium primed, unstressed seeds under non-stressing conditions. Similarly, in calcium-primed plants, improvements in seedling length (8%), plant height (18%), number of nodes (14%), SOD activity (20%), and Na^+/K^+ concentration (5% reduction) show that the adverse effects of salinity have been reduced. Furthermore, the presence of orthologs of the *Arabidopsis thaliana SOS* genes in soybeans was confirmed and identified *in silico* in this study. The *Glycine max* genome's amino acid sequences of SOS proteins from *Arabidopsis thaliana* (AtSOSs) showed up to 80% protein identity; as a result, these homologs were known as *GmSOS*. Additional phylogenetic and in silico analyses revealed that GmSOSs are members of the SOS family and may have similar functions because they share many characteristics with orthologs from other species. This is the first study to describe how SOSs help soybeans cope with salt stress.

HEMATOLOGICAL AND BIOCHEMICAL ALTERATIONS INDUCED BY DELTAMETHRIN EXPOSURE IN MALE

ABSTRACT

Deltamethrin has been reported to induce toxic effects in various organs of both mammalian and non-mammalian species. In this study, rats were divided into two groups: a control group (n=3) that received no treatment, and a treated group (n=6) that was administered deltamethrin. Hematological and biochemical parameters were analyzed to assess the toxicological impact. The results showed a highly significant increase in white blood cell (WBC) count (p=0.001) and a significant change in red cell distribution width-standard deviation (RDW-SD) (p=0.026) in the treated group compared to the control. No significant differences were observed in hemoglobin (Hb), red blood cells (RBCs), hematocrit (Hct), mean corpuscular volume (MCV), mean corpuscular hemoglobin (MCH), mean corpuscular hemoglobin concentration (MCHC), RDW-CV, platelet count (Plt), mean platelet volume (MPV), platelet distribution width (PDW), or plateletcrit (PCT). Biochemical analysis revealed highly significant elevations in Gamma-Glutamyl Transferase (GGT) (p=0.001) and aspartate aminotransferase (AST) (p=0.003), along with significant increases in urea (p=0.024) and uric acid (UA) (p=0.037). No significant changes were detected in total, direct, or indirect bilirubin, alkaline phosphatase (ALP), alanine aminotransferase (ALT), or creatinine (CREA) levels. These findings suggest that deltamethrin induces selective hematological and biochemical alterations, indicating its potential toxic effects.

LI-FI BASED INDOOR NAVIGATION SYSTEM

TEAM MEMBERS: SADHANA K, SAMREEN F, THEJASWINIE A P
MENTOR: Mrs. PRIYADHARSHINI S **COUNSELLOR:** Dr. SUBHASHINI
Department of Electronics and Communication Engineering
R.M.K. Engineering College, Kavaraipettai, Thiruvallur District, Tamil Nadu

ABSTRACT

Localization and navigation systems are practically viable and can easily be used but are not commonly used in real-time. In this presentation, an indoor navigation and information system that is easy to implement and use has been proposed, that uses visible light communication (VLC), which is an ideal technology for an application like this. The proposed system focuses on designing a device for visually impaired people that is comfortable, user-friendly, and also helps them travel independently.

This system aims to provide location information in the absence of explicit instructions and can be a supporting method for users who travel in buildings. The LiFi technology enhances indoor navigation by providing precise location updates via a Li-Fi transmitter, receiver, and Arduino microcontroller. Tested under varying conditions, it aids visitors in navigating buildings where directions are unclear.

For visually impaired individuals, Li-Fi-based navigation offers real-time positional data and guidance through audio output, addressing challenges in public spaces. The system includes LED lights transmitting positional info and an embedded receiver that calculates optimal paths.

REPRESENTATIONS OF KURDISH WOMEN IN TRADITIONAL MEDIA: THE CASE OF TRT KURDI AND YEREVAN RADIO

ABSTRACT

Kurdish broadcasting activities and traditional radio broadcasting activities began in 1939 with Baghdad Radio. The suitability of the conditions of the period and the difficulty women had in getting involved in occupational health within the patriarchal order, Baghdad Radio became an important milestone in Kurdish women's introduction to radio broadcasting activities. Following Baghdad Radio, Yerevan Radio, which was established in Armenia in 1955, spread to surrounding geographies and was considered an important traditional media representation for Kurds. In this research, the conditions of the period were taken into consideration, the patriarchal order within the specified geography was examined, and the possibility of mobbing that could be applied to women employees was emphasized. Within the scope of the research, the working conditions of women media employees working at Yerevan Radio and the working conditions of women media employees working under TRT Kurdi today are met. As a result of this comparison, the representative power produced by traditional women and the comprehensive working conditions in the past will be examined between the past and the present. Enziva Reşit, who was a presenter at Yerevan Radio, which continued its broadcasting life within the patriarchal order brought by the conditions of this period, is the first Kurdish female presenter, and the first Kurdish radio and television channel established in the state, TRT Kurdi, are generally evaluated.

While making this comparison, the studies conducted on Yerevan Radio, in addition to the negotiations conducted with Temur Muradov, the son of Enziva Reşit; the documents obtained regarding TRT Kurdi radio and television have content analysis technology. The comparisons obtained in the interview conducted with TRT Kurdi presenter … using a part-time interview machine are between for the purpose of comparison.

As a result of these comparisons, it was revealed that, apart from the oppressive policies presented by the Cold War Period in the case of Yerevan Radio, Enziva Reşit was accepted in society almost equally with today's TRT Kurdi female media people.

KÜRT KADINLARIN GELENEKSEL MEDYADAKİ TEMSİLLERİ: TRT KURDİ VE ERİVAN RADYOSU ÖRNEĞİ

ÖZET

Kürt dilinde yayın faaliyetleri ve geleneksel radyoculuk çalışmaları 1939 yılında Bağdat Radyosu ile başlamıştır. Dönemin şartları gereği ataerkil düzen içerisinde, kadınlar iş hayatına atılmada zorluk yaşasa da, Bağdat Radyosu Kürt kadınlarının radyoculuk faaliyetleriyle tanışmasında önemli bir mihenk taşı olmuştur. Bağdat Radyosunu takiben 1955 yılında Ermenistan'da kurulan Erivan Radyosu çevre coğrafyalara yayılmış Kürtler için, önemli bir geleneksel medya temsili olarak kabul edilmekteydi.

Bu araştırmada, dönem şartları göz önüne alındığında, belirtilen coğrafyanın içerisinde bulunduğu ataerkil düzen bağlamında, kadın çalışanlara karşı uygulanabilecek mobbing ihtimali üzerinde durulmuştur. Araştırma kapsamında, Erivan Radyosu'nda görev alan kadın medya çalışanlarının çalışma şartları ile günümüzde TRT Kurdi bünyesinde görev alan kadın medya çalışanlarının çalışma şartları karşılaştırılmaktadır. Bu karşılaştırma neticesinde geçmiş ile günümüz arasında, geleneksel medyada kadının değişen temsil gücü ve geçmişten günümüze çalışma koşulları incelenecektir. Bu çerçevede dönem şartlarının getirdiği ataerkil düzen içerisinde yayın hayatına devam eden Erivan Radyosu'unda spikerlik yapan Enziva Reşit, ilk Kürt kadın spikeri, ve devlet eliyle kurulan ilk Kürt radyo ve televizyon kanalı olan TRT Kurdi çalışmanın örneklemi olarak seçilmiştir.

Bu karşılaştırma yapılırken Erivan Radyosu ile ilgili yapılmış çalışmalara ek olarak Enziva Reşit'in oğlu Temur Muradov ile yapılan mülakat; TRT Kurdi radyo ve televizyonu ile ilgili edinilmiş dokümanlar içerik analizi tekniği kullanılarak incelenmiştir. TRT Kurdi sunucusu … ile yarı yapılandırılmış görüşme tekniği kullanılarak yapılan mülakatta edinilen bulgular karşılaştırma amacı ile incelenmiştir.

Bu karşılaştırmalar neticesinde, Erivan Radyosu örneğinde Soğuk Savaş Dönemi'nin getirdiği baskıcı politikalar haricinde, Enziva Reşit'in ilk Kürt Kadın spiker olarak, günümüz TRT Kurdi kadın medyacıları ile neredeyse eşit şekilde toplumda kabul gördüğü ortaya çıkmıştır.

Anahtar kelimeler: TRT, ERİVAN, SUNUCU, KADIN

OTOMAN POLITICS AND MILITARY DEVELOPMENTS FROM SULTAN OSMAN III TO SULTAN SELIM III: AN EVALUATION FROM THE PERSPECTIVE OF THE 18TH CENTURY

Barış KAYA
Graduate Student (M.A. with Thesis), Ankara Yıldırım Beyazıt University, Institute of Social Sciences, Department of History, Ankara-Türkiye bariskaya2809@gmail.com

ABSTRACT

This study analyzes the transformation in the domestic and foreign policies of the Ottoman Empire during the second half of the 18th century, specifically focusing on the period from Sultan Osman III to Sultan Selim III. This era was marked by significant internal and external upheavals, which forced the empire into a process of change. Domestically, the frequent changes in grand viziers reflected growing political instability and weakened administrative control. These changes were not merely the result of palace intrigues but were symptomatic of broader structural issues within the Ottoman governance system.

Externally, the empire engaged in prolonged conflicts and diplomatic relations with major powers such as Russia, Austria, and Iran. These interactions, through wars and treaties, deeply influenced the formulation and adaptation of Ottoman foreign policy. The military setbacks and territorial losses emphasized the need for urgent reform in both military and administrative institutions.

This paper particularly emphasizes the reform efforts initiated under Sultan Selim III, who, unlike his predecessors, actively pursued structural modernization through initiatives such as the Nizam-ı Cedid (New Order). However, these reforms were also met with resistance, highlighting the tension between innovation and tradition within the Ottoman elite.

By offering a comparative evaluation of the political and military developments under the reigns of Sultan Osman III and Sultan Selim III, this study seeks to contribute to a deeper understanding of the Ottoman Empire's gradual transformation during a critical phase in its history. The findings also provide insight into how reform efforts were shaped by both internal dynamics and external pressures.

THE COMPREHENSIVE HORIZON OF ARTIFICIAL INTELLIGENCE IN VETERINARY MEDICINE

Dr Sagaya Aurelia
Associate Professor, Department of Computer Science, CHRIST University, Bangalore
sagaya.aurelia@christuniversity.in

ABSTRACT

AI's influence on veterinary medicine goes beyond documentation, bringing with it a new era of technology integration that affects all facets of veterinary practice. AI's adaptability is demonstrated by its use in numerous crucial fields, which is revolutionising not just the way data is captured but also the methods used for diagnosis, treatment, and training in those fields.

AI systems are able to scan through large databases of research findings and clinical records to provide recommendations for a diagnosis based on past data and symptoms. This capacity helps veterinarians create differential diagnoses and anticipate possible consequences, which helps them develop the best treatment strategies. In a field where a wide range of species and conditions are encountered, such diagnostic assistance is crucial.

One of the many uses for AI is as a tool for SOAP notes. A brief summary of many software businesses that are doing intriguing things is also included in this article: Shepherd, Instinct, Vetsoap, and PetDesk.

Keywords: Artificial Intelligence, Software, Veterinary medicine, diagnostic medicine

DIGITAL TRANSFORMATION IN THE INSURANCE INDUSTRY: INSURTECH

Pınar AKALAN
Postgraduate, Karamanoğlu Mehmetbey University, Institute of Social Sciences, Department of Banking and Finance, Karaman-Türkiye ORCID: 0009-0005-8185-2356

Arzu ÖZMERDİVANLI

ABSTRACT

With the developments in internet usage and information technologies, technology-focused innovations have started to increase in the finance sector. In particular, applications such as the internet of things, artificial intelligence, robotic technologies, machine learning, data analytics, autonomous vehicles, 3D printers, and blockchain have accelerated digital transformation in the finance sector. Digital transformation is a concept that refers to the integration of business processes with newly developed digital technologies. Digital transformation has paved the way for financial technology (fintech) companies to provide more services in the sector. In addition, Insurtech, which develops technologies for the insurance sector among fintech companies and includes them in various aspects of the sector, has become an important concept that has come to the fore in recent years. Insurtech is a concept created by abbreviating the words “Insurance” and “Technology” and includes technologies applied in the field of insurance. The concept of Insurtech refers to an innovative information system that emerges through the process of intensively integrating technology into insurance-related activities. Insurtech digitizes and automates insurance processes such as policy purchase, risk management, premium determination and damage-compensation payments, making transactions faster and more efficient. In addition, Insurtech uses technology to facilitate product comparison, simplify the purchasing process, and better adapt insurance coverage, as well as to increase efficiency, developing innovative business models that can provide policyholders with greater insurability. In emerging markets with less developed distribution networks, insurtech has the potential to improve financial inclusion and increase insurance penetration. Although Insurtech has the potential to provide great benefits for both insurers and end users, it also includes risks such as cybersecurity and technology risk management. Insurtech investments, which started to develop in the global insurance sector in 2011, are increasing day by day. This study aims to examine in detail the Insurtech investments that will transform the insurance sector. In this context, the development process, advantages, disadvantages of Insurtech, its status in the world and in Turkey are examined in the study, and some suggestions are presented for the future development of Insurtech.

ABSTRACT

In this study, the relationships between the life orientation of young adults working in rehabilitation centers and their socio-demographic characteristics were examined. The research is a descriptive study designed using the relational screening model, with the participation of young adults working in rehabilitation centers. The sample of the study consists of 300 young adults employed at rehabilitation centers. In order to collect data, a Socio-Demographic Information Form and the Life Orientation Test-Revised (LOT-R) were used. The data collected for the study were analyzed using the SPSS program. For data analysis, t-test, Pearson correlation analysis, Analysis of Variance (ANOVA), and Regression Analysis methods were employed. According to the findings obtained from the study, a moderate, positive, and significant relationship was found between life orientation and educational level among young adults working in rehabilitation centers. This result indicates that as the level of education increases, the level of life orientation (optimism) also increases. A low-level, negative, and significant relationship was also found between life orientation and years of work experience. This finding shows that as the number of years worked increases, the level of life orientation (optimism) decreases. It was found that there is no significant difference in life orientation between young adult women and men working in rehabilitation centers. No significant difference in life orientation was found between age groups (19–24 years and 25–34 years). However, when comparing single and married young adults working in rehabilitation centers, a significant difference in life orientation was found between the groups. The average life orientation of single individuals was found to be significantly higher than that of married individuals. Additionally, the average life orientation of young adults without children was found to be significantly higher than that of those with children.

Keywords: Life Orientation, Optimism, Rehabilitation Centers, Young Adults.

ÖZEL GEREKSİNİMLİ BİREYLERLE ÇALIŞAN YETİŞKİNLERDE YAŞAM YÖNELİMİNİN İNCELENMESİ

ÖZET

Bu çalışmada; rehabilitasyon merkezlerinde çalışan genç yetişkinlerin yaşam yönelimleri ile sosyo-demografik özellikleri arasındaki ilişkiler incelenmiştir. Araştırma rehabilitasyon merkezlerinde çalışan genç yetişkinlerin katıldığı ilişkisel tarama modelinin kullanıldığı betimleyici nitelikte bir çalışma tasarımındadır. Araştırmanın örneklemini rehabilitasyon merkezlerinde çalışan 300 genç yetişkin oluşturmaktadır. Araştırmada veri toplamak amacıyla; Sosyo-Demografik Bilgi Formu ve Yaşam Yönelimi Testi (YYT-R) kullanılmıştır. Araştırma için toplanan veriler SPSS programıyla analiz edilmiştir. Verilerin analizi için t Testi, Pearson korelasyon çözümlemesi, Varyans Analizi (ANOVA) Testi ve Regresyon Analizi yöntemleri kullanılmıştır. Araştırmadan elde edilen bulgulara göre; Rehabilitasyon merkezlerinde çalışan genç yetişkinlerde yaşam yönelimi ve eğitim düzeyi arasında da orta düzeyde, pozitif ve anlamlı bir ilişki bulunmuştur. Bu sonuçlar, eğitim düzeyi arttıkça yaşam yönelimi (iyimserlik) düzeyinin de arttığı anlamına gelmektedir. Yaşam yönelimi ve çalışma yılı arasında da düşük düzeyde, negatif ve anlamlı bir ilişki bulunmuştur. Bu bulgu, çalışma yılı arttıkça yaşam yönelimi (iyimserlik) düzeyinin azaldığını göstermektedir. Rehabilitasyon merkezlerinde çalışan genç yetişkin kadınlarla, rehabilitasyon merkezlerinde çalışan genç yetişkin erkeklerin yaşam yönelimi bakımından anlamlı olarak farklılaşmadığı bulunmuştur. Yaş grupları (19-24 yaş ve 25-34 yaş) arasında yaşam yönelimi bakımından anlamlı fark olmadığı bulunmuştur.Rehabilitasyon merkezlerinde çalışan bekar genç yetişkinlerle, evli genç yetişkinler karşılaştırıldığında yaşam yönelimi bakımından gruplar arasında anlamlı fark elde edilmiştir.Yaşam yönelimi bakımından bekarların ortalaması evlilerden anlamlı olarak daha yüksek olduğu tespit edilmiştir.Rehabilitasyon merkezlerinde çalışan genç yetişkinlerden çocuğu olmayanların yaşam yönelimi ortalaması ise çocuğu olanların yaşam yönelimi ortalamasından anlamlı olarak daha yüksek olduğu belirlenmiştir.

Anahtar Kelimeler: Yaşam Yönelimi,İyimserlik,Rehabilitasyon Merkezleri,Genç Yetişkinler.

THE RELATIONSHIP BETWEEN FINANCIAL WELL-BEING AND PSYCHOLOGICAL BURNOUT: AN EMPIRICAL RESEARCH

ABSTRACT

There are many factors that can disrupt human psychology today. These factors can be listed as internal and external factors. One of the external factors and the ones that are thought to have the greatest impact is the financial situation. Living conditions and socioeconomic opportunities resulting from developments in the world are decreasing day by day and making life difficult. Insufficient income and financial opportunities in the face of increasing needs and expenses cause people to have difficulty balancing their income and expenses, and in this case, they do not feel good psychologically.

The purpose of this research is to reveal the relationship between the financial well-being of households and their psychological burnout. The universe of the research is the financial consumer 461 of households in Bingöl province. First of all, the Cronbach Alpha coefficient of the Financial Well-Being and Burnout scale was calculated in the research. The alpha coefficient was found to be 0.83. When it is considered in terms of research conducted in the field of social sciences, it can be said that the relevant values are highly reliable. The data obtained from the survey were evaluated using the SPSS 22.0 package program and the test tests were conducted by taking into account the 5% significance level.

When the distribution of households according to demographic characteristics is examined, it is determined that women, those in the 18-22 age group and singles are in the majority. When the household is examined in terms of education, occupational status and income level, it is determined that university students, students and those in the income group of less than 10,000 TL are in the majority.

The normal distribution status of the scale scores was tested with the skewness test. It was determined that the Financial Well-being and Burnout scales showed a normal distribution. Pearson correlation was used in the relationship between the scales. A positive relationship was found between financial well-being and psychological burnout.

Keywords: Financial well-being, psychological burnout, household

FİNANSAL İYİLİK HALİ İLE PSİKOLOJİK TÜKENMİŞLİK ARASINDAKİ İLİŞKİ: AMPİRİK BİR ARAŞTIRMA[1]

ÖZET

Günümüzde insan psikolojisini bozacak çok fazla faktör mevcuttur. Bu faktörler iç ve dış etkenli faktörler olarak sıralanabilir. Dış faktörlerden ve en büyük etkisinin olduğu düşünülenlerden biri de finansal durumdur. Dünyadaki gelişmelerden kaynaklanan yaşam koşulları ve sosyoekonomik imkanlar her geçen gün azalarak yaşamı zorlaştırmaktadır. Artan ihtiyaçlar ve harcamalar karşısında yetersiz kalan gelir ve finansal imkanlar insanların gelir giderlerini dengelemekte zorluklar yaşamalarına neden olmakta ve bu durumda psikolojik olarak kendilerini iyi hissetmemelerine sebebiyet vermektedir.

Bu araştırmanın amacı, hanehalkının finansal iyilik hali ile psikolojik tükenmişlikleri arasındaki ilişkiyi ortaya koymaktır. Araştırmanın evrenini Bingöl ili hanehalkının 461 finansal tüketici oluşturmaktadır. Araştırmada öncelikle Finansal İyilik Hali ve Tükenmişlik ölçeğinin geneline ait Cronbach Alpha katsayısı hesaplanmıştır. Alpha katsayısı 0,83 olarak bulunmuştur. Sosyal bilimler alanında yürütülen araştırmalar açısından bakıldığında ilgili değerin yüksek seviyede güvenilir olduğu söylenebilir. Anketten elde edilen veriler, SPSS 22.0 paket programı kullanılarak değerlendirilmiş ve test sınamaları %5 anlamlılık düzeyi dikkate alınarak yapılmıştır.

Hanehalkının demografik özelliklerine göre dağılımına bakıldığında; kadınların, 18-22 yaş aralığı grubunda olanların ve bekarların ağırlıkta olduğu tespit edilmiştir. Eğitim, mesleki durum ve gelir düzeyi açısından hanehalkı incelendiğinde ise üniversite öğrencilerinin, öğrencilerin ve 10.000 TL'den az gelir grubunda yer alanların çoğunlukta olduğu saptanmıştır.

Ölçek puanlarının normal dağılım durumu çarpıklık (Skewness) testi ile sınanmıştır. Finansal İyilik Hali ve Tükenmişlik ölçeklerinin normal dağılım gösterdiği tespit edilmiştir. Ölçekler arası ilişkide Pearson korelasyonundan yararlanılmıştır. Finansal iyilik hali ile psikolojik tükenmişlik arasında pozitif ilişki tespit edilmiştir.

Anahtar Kelimeler: Finansal iyilik, psikolojik tükenmişlik, hanehalkı

[1] Bu özet bildiri hazırlanmakta olan "Finansal İyilik Hali ile Psikolojik Tükenmişlik Arasındaki İlişki: Hanehalkı Üzerinde Ampirik Bir Uygulama" başlıklı kitap bölümünden türetilmiştir.

CAN FALSE SELF BE FUNCTIONAL?

Merve ÇELİK
Lecturer. Res., Bingöl University, Vocational School of Health Services, Child Protection and Care Services Program, Bingöl-Türkiye, mervecelik@bingol.edu.tr,
ORCID: 0000-0003-4808-4269

ABSTRACT

Self; It expresses awareness regarding the changes that occur in time in terms of personality and is mostly encountered in the literature in two different forms as real self and false self. Real self; It includes reflecting the awareness in question to people as it is. In false self, on the other hand, it is about changing the elements related to this awareness and using these elements by making them loved and accepted by people.

When the literature is examined, in almost all sources; false self appears as an undesirable situation. The aim of this study is to draw attention to the fact that the concept of false self, which is largely considered as an undesirable situation and whose negative aspects are emphasized, can have a positive side and serve a functional purpose.

The literature on the subject has been examined in depth and a compilation study has been presented in this direction. The definition of self, the functions of real and false self have been mentioned. By examining and synthesizing the information obtained from the academic literature, the idea that the concept of false self can be functional has gained weight.

False self; It is formed by feeding on the creativity of the individual and can again serve a function such as supporting that creativity. In addition, when used in moderation, it can serve to protect the integrity of the self, as in defense mechanisms that appear as a protective element of the self. It can increase the person's adaptation to social life in individuals with low self-esteem or psychopathology and provide functionality in daily routines. In order to further clarify this situation; it is useful to look at the correlation of the false self concept with the situations that are thought to have a functional effect.

Keywords: Self, ego, false self.

SAHTE KENDİLİK İŞLEVSEL OLABİLİR Mİ?[1]

ÖZET

Kendilik; kişilik açısından zamanla meydana gelen değişimlere ilişkin farkındalığı ifade etmektedir ve literatürde çoğunlukla; gerçek kendilik-sahte kendilik şeklinde iki farklı biçimde karşımıza çıkmaktadır. Gerçek kendilik; bahsi geçen farkındalığının insanlara olduğu gibi yansıtılmasını içerir. Sahte kendilikte ise bu farkındalığa ilişkin unsurların değiştirilmesi ve bu unsurların insanlar tarafından sevilip-kabul görmeyi sağlayıcı hale getirilerek kullanılması söz konusu olmaktadır.

Literatür incelendiğinde neredeyse tüm kaynaklarda; sahte kendilik pek de istendik olmayan bir durum olarak karşımıza çıkmaktadır. Bu çalışmanın amacı ise; büyük oranda istenmedik bir durum olarak ele alınan ve olumsuz taraflarına dikkat çekilen sahte kendilik kavramının, olumlu bir tarafı olabileceğine, işlevsel bir amaca hizmet edebileceğine dikkat çekmektir.

Konu ile ilgili literatür derinlemesine ele alınmış ve bu doğrultuda bir derleme çalışma ortaya konulmuştur. Kendiliğin tanımı, gerçek ve sahte kendiliğin işlevlerine değinilmiştir. Ulaşılan akademik yazından elde edilen bilgilerin incelenip sentezlenmesi ile sahte kendilik kavramının işlevsel olabileceği fikri ağırlık kazanmıştır.

Sahte kendilik; bireyin yaratıcılığından beslenip oluşturulmakta ve yine o yaratıcılığı destekleme gibi bir işlev görebilmektedir. Ayrıca dozunda kullanıldığında benlik bütünlüğünü koruyucu bir unsur olarak karşımıza çıkan savunma mekanizmalarındaki gibi kişinin benlik bütünlüğünü koruma işlevi görebilmektedir. Özgüveni düşük veya psikopatoloji barındıran bireylerde kişinin sosyal hayat adaptasyonunu artırıp günlük rutinler konusunda işlevselliğini sağlayabilmektedir. Bu durumu daha da netleştirebilmek adına; sahte kendilik kavramının işlevsel olarak etki ettiği düşünülen durumlarla korelasyonuna bakılmasında yarar vardır.

Anahtar Kelimeler: Kendilik, benlik, sahte kendilik.

[1] Bu özet bildiri, hazırlanmakta olan "**Sahte Kendilik İşlevsel Olabilir Mi?**" başlıklı kitap bölümünden türetilmiştir.

RELATIONSHIP BETWEEN ANXIETY LEVEL ON ADULTS AND CHILDHOOD TRAUMA AND PARENTAL ATTITUDE

EZGİ EMEL ŞAHİN
Master's Student, Istanbul Nisantasi University, Institute of Graduate Education
Department of Clinical Psychology, Istanbul-Turkey
20221527032@std.nisantasi.edu.tr (Ezgi Emel Şahin) ORCID: 0009-0007-9434-5104

ABSTRACT

The objective of this research is to examine the relationship between anxiety level on individuals and childhood traumas and parental attitudes. It was also evaluated whether childhood traumas and parental attitudes differ according to demographic variables. Parental Attitude Inventory, Childhood Traumas Questionnaire, Beck Anxiety Inventory were employed on the porpuse of evaluating the relationship between adults' anxiety level and childhood traumas and parental attitudes, Personal Information Questionnaire was applied to gather personal informations of participants.

The study was conducted applying correlation survey model among quantitative methods. It was conducted in 2025 with a sample of 402 adult individuals living in Türkiye, aged between 18-65. Data used in this study was collected online by forms delivered to participant via Google Forms. Collected data on this study was analyzed using SPSS 25 packaged software. Normality assessment, applied on the porpuse of assigning statistical test employing, was conducted considering skewness and kurtosis. Fallowing determination of normal distribution of the data, unpaired t-test, one way Anova, Pearson Correlation, simple and multiple linear regression were employed among parametric test methods. According to obtained information, statistically significant and positive relationship was observed between individual's anxiety level and cildhood traumas ($p<.05$). Negative and significant relationship was observed between adult individuals' anxiety level and democratic parental attitude ($p<0.01$). On the other hand, positive and significant relationship was observed between anxiety level and authoritative parental attitude and protective parental attitude. According to this result, parent's too protective or strict attitude can increase individual's anxiety.

Keywords: Parental attitude, anxiety level, childhood trauma

ANTIMICROBIAL POTENTIAL OF LIVID PIGWEED (*Amaranthus lividus* L.)

Emil Shukurlu[1]
[1]Institute of Botany, Ministry of Science and Education of the Republic of Azerbaijan, A. Abbaszade st., 1128th crossing, Baku, AZ1004, Azerbaijan. **(**Responsible Author) [1]ORCID: 0000-0002-2805-6298

ABSTRACT

Amaranthus L. is a broadly distributed herbaceous genus encompassing around 70 species called pigweeds or amaranths. Because of the synonyms applied to the misidentified names and misapplication of names the species number is still unsettled [1]. A. lividus is an annual, glabrous species reaching heights of 17–40 cm. Fruits are oval shaped and indehiscent. The seeds are 1-1.2 mm in diameter. In Azerbaijani flora it is distributed in Absheron, Kur-Araz lowland, Lankaran and found in riverbanks and roadsides [2]. For the antimicrobial assay the aerial parts and roots of A. lividus were collected during summer of 2024 from the Sabirabad district of Azerbaijan. After being air dried the aerial and underground parts were extracted separately using benzene, chloroform, ethanol, acetone, and distilled water. The antimicrobial activity of all these extracts were evaluated by disc-disffusion test against *Staphylococcus aureus*, MRSA (Methicillin-resistant *Staphylococcus aureus*), *Escherichia coli*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Bacillus anthracoides* and *Candida albicans*. The acetonic extract of aerial parts demonstrated antibacterial activity against *B. anthracoides* with 10 mm diameter zone of inhibition. Benzene and ethanolic extracts of roots and aerial parts have showed a slightly weak antibacterial activity against *P. aeruginosa* producing a 7 mm zone of inhibition. All investigated extracts have inhibited the growth of *E. coli.* With regards to the *C. albicans* all analyzed extracts have showed an antifungal activity, except those obtained with distilled water. Amongst the tested extracts, the acetonic extract of the roots showed the largenst inhibition zone against MRSA, measuring 10 mm in diameter and 7 mm of it was attributable to the control solution, which was dimethyl sulfoxide. *A. lividus* is used in the treatment of lung disorders, and its use in Ayurvedic medicine has also been reported. Moreover, the presence of phenolics, flavonoid, alkaloids and saponins has been shown in its leaves [3]. The evaluated antibacterial and antifungal activities in this study provide a basis for future research on its phytochemical components and potential use in medicinal and public health fields.

Keywords: disk-diffusion method, microbial growth inhibition, livid pigweed.

ISLATION AND IDENFICATION OF FUNGAL SPECIES ASSOCIATED WITH THE TIGER NUT DRINK IN SOME TERTIARY INSTITUTION WITHIN KATSINA METROPOLIS.

USMAN SAMA'ILA
Umaru Musa Yaradua Unıversıty, Faculty Of Natural And Applıed Scıence, Department Of Mıcrobıology, Katsına, Nıgerıa, ORCID ID: https://orcid.org/40009-0005-3683-0625, mcb180078@students.umyu.edu.ng

ABSTRACT

Tigernut milk drink is a traditional non-alcoholic beverage with a spicy nutty taste. It is widely consume for its nutritional and medicinal benefits to its consumers and for its non-alcoholic properties. A range of microbes can be associated with drink manufactured, though only a few are able to cause spoilage. Microbiological spoilage leads to deterioration of the sensory quality and typically appears as off-flavors, odours and visual changes in the product, The aim of this research is the isolation and identification of common fungi associated with Tigernut milk drink within some tertiary institutions at katsina metropolis. These institutions are located in katsina state.The research followed a laboratory based experimental design were Samples of locally produced tiger nut drinks from these institutions were collected and analyzed for microbial content through the use of PDA media for isolation and identification, the results shows the present of fungal isolated which were dominantly candida spp from the whole samples, it was concluded that presence of fungal isolates can leads to spoilage of tiger nut drink, also the reseach acknowledge the more scientific research to investigate on other microoganism apart from fungal species that can leads to tiger nut spoilage.

Keywords; Fungal,Isolation, identification and Tiger nut

GREEN SYNTHESIS OF ZINC-OXIDE NANOPARTICLES USING *Achyranthes aspera* LEAF EXTRACT AND THEIR POTENT ACTION AGAINST THE POULTRY PATHOGENS

Shagufta Saeed[1*] | Aneesa Nisar[1] |
[1]Institute of Biochemistry and Biotechnology, University of Veterinary and Animal Sciences-UVAS, Lahore-54100, Pakistan, Corresponding author's emails: shagufta.saeed@uvas.edu.pk

ABSTRACT

Nanotechnology is an emerging field worldwide because of its tremendous properties linked to the high surface area to volume ratio, improved pharmacokinetic profile, and targeted drug delivery. In the current study, zinc oxide nanoparticles (ZnO NPs) were synthesized from *Achyranthes aspera* leaf extract, characterized by UV/Visible spectroscopy, XRD, SEM, FTIR, AFM and evaluated for antibacterial efficacy against poultry pathogenic bacterial strains. UV-visible absorption peak was found at 370 nm. XRD showed hexagonal wurtzite structure of ZnONPs while SEM results indicated an average size less than 100 nm with a minimum and maximum size of 28.63 and 61.42 nm, respectively. Further analysis of synthesized nanoparticles by FTIR showed stretching frequency at 3393.14 cm^{-1}, 2830.99 cm^{-1}, 2285.23 cm^{-1}, and 2108.78 cm^{-1}. The antibacterial activity of newly developed nanoparticles was investigated against common poultry pathogens *Salmonella gallinarum* and *Salmonella enteritidis* by the disk diffusion method. It showed zones of inhibition with a diameter of 27.6 and 28.8 mm. The minimum inhibitory concentration was 0.39 and 0.195 mg/mL, respectively, which was quite interesting compared to extract zero activity at this concentration. Characterization with different techniques showed a uniform and stable synthesis of ZnO NPs. Furthermore, the findings confirm the higher activity of nanoconjugate in comparison to leaf extract and pure drug against pathogenic bacteria.

Keywords: poultry pathogens, green synthesis, *Achyranthes aspera*, surface characterization, zinc oxide nanoparticles

.

PHYTOCHEMICAL SCREENING AND ANTIMICROBIAL ACTIVITIES OF LEAVES EXTRACT OF **Dodonaea viscosa* Linn.

Umar Rabiu Bello
Department of Pure and Industrial Chemistry, Umaru Musa Yar'adua University, Katsina, Nigeria

ABSTRACT

The increasing prevalence of antibiotic resistance necessitates the exploration of alternative antimicrobial agents, particularly from medicinal plants. This study investigated the phytochemical composition and antimicrobial efficacy of *Dodonaea viscosa* Linn. leaf extracts against pathogenic microorganisms, including *Salmonella typhi*, *Bacillus subtilis*, and *Candida albicans*. The leaves were extracted using ethanol, n-hexane, ethyl acetate, methanol, and aqueous solvents, with ethanol yielding the highest extract quantity. Phytochemical screening revealed the presence of flavonoids, saponins, tannins, terpenoids, phenols, and steroids, while alkaloids were absent. Antimicrobial activity was assessed using the agar well diffusion method, with results demonstrating concentration-dependent inhibition zones. Ethanol extracts exhibited the highest inhibitory activity, particularly against *Salmonella typhi* (20 mm zone at 100% concentration), followed by *Bacillus subtilis* and *Candida albicans*. The findings suggest that *Dodonaea viscosa* Linn. possesses significant antimicrobial properties, potentially due to its rich phytochemical profile. This study underscores the plant's potential as a source of novel antimicrobial agents and highlights the need for further research to isolate and characterize its active compounds.

Keywords: Dodonaea viscosa*, antimicrobial activity, phytochemicals, solvent extraction, medicinal plants.

THE VALORIZATION OF *Coriandrum sativum*

Benlahrache Nour El Houda1 , Boufercha Oumeima 2, Boubendir Abdelhafid1, Benhizia yacine2 , Goudjil Hayet 2

benlahrache@centre-univ-mila.dz

ABSTRACT

Coriandrum sativum, commonly known as coriander, is an aromatic plant with multiple uses in both cooking and traditional medicine. Its valorization is based on its extracts, which contain various bioactive compounds offering health benefits and applications in the agri-food sector. Coriander seeds are widely used to add flavor to various dishes in different cuisines around the world. It is a key ingredient in curries, salads, and other culinary preparations.

Coriander extracts are rich in polyphenols and flavonoids, which are responsible for many therapeutic properties. These compounds are recognized for their antioxidant and antimicrobial effects. Studies have shown that coriander extracts possess significant antimicrobial effects against various pathogens, making it useful in combating foodborne infections. This property can serve as a natural additive in food products to improve their microbiological quality while meeting the growing demand for alternatives to synthetic preservatives.

Coriander also plays an important role in sustainable agriculture. Due to its insecticidal properties, coriander extracts can be integrated into integrated pest management programs against crop pests such as Tribolium castaneum, a harmful insect to stored goods. Furthermore, coriander cultivation requires fewer chemical inputs compared to other crops, making it a more sustainable option for farmers. By incorporating it into diversified agricultural systems, biodiversity can be promoted, and the resilience of agricultural ecosystems can be enhanced.

The valorization of Coriandrum sativum can contribute to the local economy by increasing farmers' incomes and creating opportunities in the agri-food industry. International markets for spices and aromatic herbs continue to grow, offering export opportunities for coriander.

In conclusion, the valorization of coriander extends well beyond its culinary use. Its antimicrobial and antioxidant properties, along with its applications in sustainable agriculture, make it a valuable plant both economically and for public health. By integrating these aspects into agricultural and industrial practices, it is possible to optimize its use while contributing to sustainable development.

UPCYCLING GRAPEFRUIT PEEL WASTE FOR MUFFIN FORTIFICATION: CHARACTERIZATION OF PHYSICAL, BIOACTIVE, AND MICROSTRUCTURAL PROPERTIES

Sahil Chaudhary, Barinderjit Singh
Department of Food Science and Technology, I. K. Gujral Punjab Technical University, Kapurthala, Punjab 144603, India

ABSTRACT

Upcycling food processing byproducts is a growing trend. Utilizing grapefruit (Citrus x paradisi) peel powder to formulate muffins offers an opportunity to improve nutritional and bioactive composition; however, it also demands evaluation of other food properties. Grapefruit peels (GP) were lyophilized at − 70 °C and 0.0500 mbar using a CHRIST-Alpha 2–4 LSC-basic lyophilizer and then vacuum-stored in polyethylene bags after grinding. GP powder was used at 3-12% concentration levels for the muffin fortification by replacing the base flour. Tested for antioxidant and bioactive potential, results divulged increased DPPH, FRAP, TPC, and TFC values with an increase in GP level. GP incorporation also affected the physical attributes of the developed muffins, and results indicated a decrease in muffin height but an increase in weight. Microstructural evaluation through scanning electron microscopy revealed a complex microstructure with higher porosity, irregularity at surfaces, and escalated moisture retention, causing muffins to harden and chewiness, but the compromised springiness, as scrutinized through texture profile analysis. Appearance is an important aspect to consider, as it affects the consumer appeal. Since peel powder itself is dark in color, it induced darkness to muffins, causing a decrease in lightness, i.e., L*, but an increment in a* and b* values was recorded for the developed muffins. Talking about sensory cues, panelists preferred 9% incorporation appealing for color and texture; however, due to the inherent bitterness in peel powder, a 6% incorporation level was recommended considering the taste aspect, henceforth 6% emerged finest considering the overall acceptability. Thus, grapefruit peel flour has great potential to be used for muffin enrichment with enhanced nutritional and quality attributes, illustrating an economic and eco-friendly way to create value-added products with multiple nutritional benefits.

REPURPOSING N-ACETYLCYSTEINE: UNVEILING ITS POTENTIAL FOR MEMORY ENHANCEMENT IN ANIMAL MODEL

Huma Ikram*, Sania Ajaz, Darakhshan J. Haleem
Neurochemistry and Biochemical Neuropharmacology Research Unit, Department of Biochemistry, University of Karachi, Karachi-75270, Pakistan.
*E-mail: huma_biochemist@yahoo.com

ABSTRACT

N-acetylcysteine (NAC) is a well-known antioxidant and mucolytic agent with emerging evidence suggesting its neuroprotective properties. This study investigates the potential of NAC to enhance memory in an animal model, exploring its repurposing for cognitive enhancement. Adult male Albino Wistar rats weighing 200±20g were orally administered NAC at the dose of 25, 50 and 100mg/kg. On day 0, rats underwent training in the Morris Water Maze (MWM) and familiarization in the Novel Object Recognition (NOR) test. Following administration of water or respective NAC doses, memory performance was assessed using the MWM test, measuring acquisition, retention and consolidation. The NOR test was also conducted to evaluate recognition memory. Additional behavioral assessments included the open field, Skinner's box, light-dark activity box, elevated plus maze, and forced swim test were also performed. Rats were then decapitated; brain samples were isolated and stored at -70°C

to analysis by HPLC-EC. Results: NAC administration showed a dose-dependent improvement in memory performance in both the MWM and NOR tests. Behavioral activities indicate enhanced cognitive function and reduced anxiety-like behaviors post-NAC administration. Neurochemical analysis of brain samples revealed changes in dopamine and serotonin metabolism. Conclusion: NAC demonstrates capacity for memory enhancement and cognitive improvement, with effects measured via several behavioral assessments. Findings may help in extending therapeutics in cognitive disorders.

INTEGRATING AI TOOLS INTO HIGHER EDUCATION CURRICULA: A MULTIDISCIPLINARY APPROACH

Dr. Aderinsola E. Kayode
Faculty of Management Sciences, Durban University of Technology,
South Africa Trinity University, Lagos, Nigeria**,** https://orcid.org/0000-0002-5674-299X

ABSTRACT

As Artificial Intelligence (AI) continues to transform educational landscapes, there is a growing imperative to understand how AI tools can be effectively integrated into higher education curricula through a multidisciplinary lens. This study presents a systematic review of peer-reviewed literature published between 2021 and 2025, focusing on the application of AI tools, such as intelligent tutoring systems, generative AI, predictive analytics, and adaptive learning platforms, across diverse academic disciplines. Using the PRISMA framework, a total of 67 studies were selected from databases including Scopus, Web of Science, and IEEE Xplore. The review reveals that while STEM fields lead in practical AI adoption, emerging humanities, business, and education efforts highlight increasing interest in interdisciplinary approaches. Key themes identified include pedagogical transformation, faculty readiness, ethical considerations, and student engagement with AI. The results underscore the importance of cross-sector collaboration, institutional policy alignment, and digital and ethical AI literacy development. Furthermore, the study identifies gaps in empirical evidence regarding long-term learning outcomes and the inclusion of underrepresented disciplines. The discussion advocates for intentional curriculum design that aligns AI integration with broader educational goals, ensuring equitable access and critical engagement with AI tools. This review contributes a structured knowledge base to guide educators, policymakers, and curriculum developers in embedding AI meaningfully and ethically into higher education across all fields of study.

RESEARCH OF FASHION TRENDS IN WEDDING FASHION

Vasileva Elizaveta Vasilevna[1], Kiseleva Marianna Vladimirovna[2]
[1] Russian State University. A.N. Kosygin (Technologies. Design. Art), Design and digital modeling of clothes, Russia, Moscow, student, e-mail: ms.nm03@mail.ru, ORCID 0009-0000-7666-5859
[2] Russian State University. A.N. Kosygin (Technologies. Design. Art), Russia, Moscow, candidate of Technical Sciences, e-mail: marianna.kiseleva@gmail.com, ORCID 0000-0001-6160-8288

ABSTRACT

Strict limits and rules have lost their relevance. Today, women do not hesitate to combine elements of clothing from different eras and trends, creating unexpected combinations.

Every woman preparing for a wedding strives to look perfect. Therefore, choosing a wedding outfit is an important and exciting event.

The trends of 2025 surprise with their originality and unusual details: feathers, fringes, rhinestones and embroidery. Brides can now safely choose short dresses for their second outing. Long models remain classics, from minimalistic to romantic.

Mini dresses are no longer just for parties. Modern brides can choose a stylish mini wedding dress, whether it's a modest Chanel-style tweed model, an elegant bustier or a luxurious fringed dress.

Long wedding dresses are timeless classics. They can be made in a minimalist, romantic or boho style. Special attention should be paid to elegant floor-length dresses. If you like retro, take a closer look. for models with lantern sleeves and fringes.

Corset dresses are another popular silhouette–shaping trend. Simple models easily fit into a casual style, and dresses with a plunging neckline are suitable for bold brides.

An off-the-shoulder wedding dress always looks elegant. Sometimes the back can also be open. Large earrings and a high ponytail will help complement the look.

Minimalist wedding dresses are versatile and easily fit into a casual style. It can be a loose satin dress or a combination.

The tradition of white dresses is a thing of the past. Saturated colors and pastel shades are in fashion. Brides choosing alternative outfits emphasize their uniqueness.

In conclusion, modern wedding fashion is multifaceted and has no limitations. Every bride creates her own unique dream image. This is an important choice, because a wedding is a special event, and every girl wants to be irresistible.

SCIENTIST'S INTELLECTUAL ASSISTANT: THE ROLE OF CHATGPT IN INNOVATION

Lotoreva Yuliana Igorevna[1], Kiseleva Marianna Vladimirovna[2]
[1] Russian State University. A.N. Kosygin (Technologies. Design. Art), Russia, Moscow, student, e-mail: marbler72@gmail.com, ORCID 0009-0003-6284-9181
[2] Russian State University. A.N. Kosygin (Technologies. Design. Art), Russia, Moscow, candidate of Technical Sciences, e-mail: marianna.kiseleva@gmail.com, ORCID 0000-0001-6160-8288

ABSTRACT

In recent years, artificial intelligence (AI) has ceased to be an element of science fiction and has become an integral part of the modern scientific process. One of the most striking examples of AI is the use of neural networks - in particular, the ChatGPT model developed by Openai.

One of the key methods of using Chatgpt in science is the automation of routine intellectual tasks. The model performs many tasks. It generates and edits texts of scientific articles, helping in the formulation of annotations, hypotheses, literature reviews, analyzes large data arrays, extracting key ideas from scientific publications and structuring information. Translates and adapts content into different languages, contributing to international cooperation. Offers hypotheses, interprets the results of experiments and even helps in the development of research methodologies. Although the model does not replace a scientific examination, it becomes an intellectual assistant that can significantly reduce time for the preparatory stage of the study.

The use of ChatGPT in scientific and innovative activities is accompanied by a number of restrictions. One of which is the lack of primary thinking: the model does not generate truly new ideas, but only combines existing knowledge. Also, the conclusions obtained from the neural network require mandatory verification by a person-expert. It is important to maintain transparency in the use of AI and not to replace genuine author's work by generating texts.The scientific community is already conducting an active discussion about the standards and rules of the use of neural networks, including a mandatory indication of their participation in the creation of publications. Every year, the border between human intelligence and machine algorithms is becoming more and more blurry. ChatGPT and other AI systems do not replace the scientist, but enhance its capabilities. In the future, one can expect the appearance of hybrid research teams, where AI will be a full -fledged participant in the scientific process - from setting tasks to analysis and distribution of results.

ABSTRACT

Background: Among children, cognitive performance is influenced by dietary habits, health status, and socioeconomic factors. Poor diets, especially high intakes of ultra-processed foods, together with psychological stress and learning difficulties, can impair attention and concentration in school-age children. Understanding the interactions between these variables is essential for promoting better educational outcomes and long-term health.

Methods: A cross-sectional survey was conducted among primary school students in the region of Khemisset, Morocco. Socio-economic parameters, dietary habits, health status, visual problems, psychological stress and learning difficulties were assessed by questionnaires completed with parental consent. Cognitive performance was assessed using the d2R test, which measures processing speed, concentration and accuracy.

Results: Of the 330 students (53.9% girls, 46.1% boys), the majority had a BMI of less than 18.5 (59.7%). Most reported no health problems (91.2%) or vision problems (89.4%), while 32.7% experienced psychological stress and 43% had learning difficulties. Dietary habits showed that 66.9% ate three or more meals a day, but 60% skipped breakfast. The d2R test results showed that higher meal regularity and breakfast consumption were associated with better processing speed, concentration and accuracy.

Conclusion: This study highlights the significant influence of dietary habits and lifestyle factors on cognitive performance among primary school students. Regular meal consumption, particularly breakfast, was positively associated with enhanced attention, concentration, and processing accuracy. In contrast, high intake of ultra-processed foods and the presence of psychological stress and learning difficulties were linked to poorer cognitive outcomes. These findings reinforce the importance of promoting balanced nutrition and healthy routines early in life to support optimal cognitive development

HINDRANCES TO COMMERCIAL BANKS INVOLVEMENT IN REAL ESTATE DEVELOPMENT MINNA, NIGERIA

Dr. Sekinat Abdulkareem
Department of Estate Management and Valuation, Federal University of Technology, Minna Nigeria

Mrs. Foluke Olanike Fabunmi
Department of Estate Management and Valuation, Federal University of Technology, Minna Nigeria

ABSTRACT

The study examines hindrances to commercial banks involvement in real estate development in Minna, Nigeria. The study focuses on banks that are most reliable for financing real estate development in Nigeria namely; Fidelity Bank Plc, United Bank of Africa (UBA), Guarantee Trust Bank (GTB), and Union Bank of Nigeria (UBN). Data were collected from the head of units who are top officers from the selected banks in the study area. Information were gotten on financial products offer by commercial banks for real estate financing and challenges hindering their effectiveness. Data were analyzed using frequency distribution tables and relative importance index. The study shows that the selected commercial banks offer a range of financing products specifically for real estate development. Mortgage loan, bridge loan, and construction loan are the most effective products used by the commercial banks in facilitating real estate financing. The study further revealed that economic uncertainty ranked first with RII of 0.79, regulatory constraint is also seen as one of the challenges facing commercial banks which ranked second with RII of 0.66. High risks of default with RII of 0.60 as well as borrower creditworthiness having RII of 0.56 which ranked 4th and 5th respectively are also among the challenges associated with financing real estate development. Market volatility and limited capital available were ranked 5th and 6th with RII of 0.55 and 0.48 respectively. Addressing these challenges is crucial for enhancing the capacity of commercial banks to support real estate development and, by extension, contribute to the economic development of Nigeria. The study suggests that commercial banks should adopt innovative financing models such as Public-Private Partnerships (PPPs) and Real Estate Investment Trusts (REITs) to spread risks and increase the flow of funds into the real estate sector.

(ORCİD № 0009-0008-7657-6176)

ABSTRACT

The purpose of this article is to examine and analyze creative tourism itineraries and the process of planning creative tours. It outlines the key stages involved in developing creative tours, with a focus on their role in supporting the growth of creative tourism. To contextualize the concept, the article provides an overview of the general definition and types of tours, their significance, the planning process, and the evolution of tour demand alongside relevant marketing strategies. It also discusses essential components to consider when designing package tours and addresses broader issues related to tour planning. Drawing on these foundations, the article explores the design and structuring of creative tour programs. Creative tourism is positioned as a sustainable model that enhances the quality of tourism activities and contributes to regional economic development. Within this framework, the development of creative tourism routes and strategic tour planning are presented as critical components.

Keywords: tour planning, individual and package tours, creative tourism, gastronomy city – Lankaran.

CREATIVE TOUR PLANNING

ÖZET

Bu makalenin amacı yaratıcı turizm ve yaratıcı tur planlamasının kurallarını açıklamak ve tartışmaktır. Yaratıcı turlar öngörülmekte ve yaratıcı turizmi geliştirmek amacıyla tarihleri not edilmektedir. Yaratıcı tur kavramını anlamak için makalede turun genel tanımı ve türleri, önemi, planlama süreci, turlara olan talebin gelişimi ve pazarlama rotaları hakkında kısa bir açıklama sunulmaktadır. Paket tur hazırlanırken dikkat edilmesi gereken temel unsurlar dikkate alınarak tur planlaması ve turlarla ilgili genel konular hakkında bilgi verilmektedir. Bunlara dayanarak yaratıcı turların tasarımı tartışılmaktadır. Bölgesel ekonomik kalkınmayı sağlamak için turizm bölgelerinde kaliteli turizm faaliyetlerinin sürdürülebilirliği temelinde yaratıcı turizm geliştirilmektedir. Bu bağlamda yaratıcı turizm rehberlerinin ve yaratıcı tur planlarının hazırlanması büyük önem taşımaktadır.

Anahtar Kelimeler: tur planlama, bireysel ve paket turlar, yaratıcı turizm, gastronomi şehri – Lenkeran.

FINANCIAL SYSTEM STRUCTURE AND BUSINESS FINANCING IN MOROCCO

Dr MSATFA ZOUHEIR
University Hassan First Morocco

ABSTRACT

This study examines how the structure of Morocco's financial system affects corporate financing methods. In a banking-dominated context, companies—especially SMEs—rely heavily on bank loans, with limited access to capital markets. The underdevelopment of the stock market, the lack of diversified financial instruments, and conservative lending practices hinder access to appropriate funding for business growth. Ongoing reforms aim to improve the situation by promoting participatory finance, private equity, and public support mechanisms. A more diversified financial system is crucial to better meet the needs of the national entrepreneurial landscape.

yallese.mohamedathmane@univ-guelma.dz ORCID: 0000-0003-1686-7269

ABSTRACT

Carbon fiber reinforced polymers such as PEEK CF30% are widely used in aerospace and biomedical sectors due to their high strength and thermal resistance. These polymers exhibit various machining challenges mainly represented by irregular surface finish and low productivity. It is therefore crucial to optimize the cutting conditions in order to address these two issues. In the present study that involves the turning of PEEK CF30% using PCD tools, both productivity and surface quality were assessed. To this end, an experimental plan based on the Taguchi L_{18} design was applied in order to structure the experiments. The influence of the cutting parameters represented by the cutting speed (*Vc*), the feed rate (*f*), the depth of cut (*ap*) and the tool nose radius (*r*) on the surface roughness (*Ra*) and material removal rate (MRR) was investigated. A statistical approach based on the Analysis of Variance (ANOVA) procedure was employed to identify the most significant factors affecting (*Ra*). It was found that the feed rate (*f*) had the highest impact on (*Ra*). Moreover, the Response Surface Methodology (RSM) method was utilized for the modelling of (*Ra*) as a function of the input parameters (*Vc*, *f*, *ap*, and *r*). Finally, multi-objective optimization was performed using the Desirability Function (*DF*) approach to identify the optimal cutting conditions that simultaneously minimize (*Ra*) and maximize (*MRR*). The results obtained led to a selection of the parameters that would lead to a high surface quality and efficient turning of PEEK CF30%, supporting improved machining strategies in industrial applications.

Keywords: PEEK CF30%, RSM, Turning, multi-objective optimization, Taguchi, Machining.

FEATURE EXTRACTION AND ANALYSIS TECHNIQUES FOR HUMAN MOTION UNDERSTANDING IN IMAGES AND VIDEOS

ABSTRACT

The analysis of human motion from images and videos has emerged as a crucial area of research, with applications spanning biomechanics, surveillance, human-computer interaction, and sports science. This paper focuses on the extraction and analysis of relevant features to interpret and quantify human motion. By leveraging state-of-the-art techniques in computer vision, such as deep learning-based pose estimation, spatiotemporal feature extraction, and optical flow analysis, we aim to establish robust methodologies for motion analysis. Our approach integrates key feature detection and motion trajectory modeling to enhance accuracy and efficiency in recognizing complex human activities. Experimental results demonstrate the effectiveness of the proposed methods in real-world scenarios, paving the way for advancements in motion analysis technologies and their practical applications in diverse fields.

ABSTRACT

ordered microporous Y zeolite was synthesized through hydrothermal treatment using Algerian metakaolin and Ludox (40% SiO2) as the aluminum and silica sources, respectively. The metakaolin was derived from thermal activation of na tural kaolin. The resulting Y zeolite was ion-exchanged with various cations, including Cu^{2+}, Ni^{2+}, Ca^{2+}, and Na^{+}, to investigate their impact on CO2 adsorption at 0 °C. The materials were thoroughly characterized using advanced techniques such as X-ray diffraction (XRD), nitrogen adsorption at 77 K, Fouriertransform infrared spectroscopy (FTIR),and scanning electron microscopy (SEM). CO2 adsorption isotherms at 0°C were obtained using a volumetric method, revealing nonlinear concave curves indicative of strong adsorption interactions. Notably, Na-exchanged Y zeolite (Na-Y) exhibited the highest CO2 adsorption capacity, with an equilibrium capacity trend of Cu^{2+} < Ni^{2+} < Ca^{2+} < Na^{+}. The experimental adsorption data were best fitted to the Langmuir isotherm model, yielding a maximum CO2 uptake of 77.57 $cm^3 \cdot g^{-1}$ STP for Na-Y zeolite. These results highlight the potential of ion-exchanged zeolites for enhanced CO2 capture applications.

ABSTRACT

Dye-sensitised solar cells (DSSCs) are of significant interest to researchers in the field of solar cell research due to their affordability and enhanced energy efficiency. In this study a theoretical analysis was performed on five phenylazonaphthalene-based azo dyes, utilising quantum methods, including density functional theory (DFT/B3LYP/SDD/6-311+G(d,p)) and its time-dependent derivative (TD-DFT/CAM-B3LYP/SDD/6-31+G(d,p)). The structural, electronic and optical properties of the dyes under study (C_1, C_2, C_3, C_4 and C_5) were examined and discussed, including FMO energy gap (E_g), chemical hardness (η), electronegativity (χ), chemical potential (μ), open circuit voltage (V_{oc}), softness (S), molecular electrostatic potential (MEP), light harvesting efficiency (LHE), injection driving force ΔG_{inject}, NBO analysis and maximum electronic absorption (λ_{max}). The following properties were calculated in order to evaluate their potential applications in dye-sensitised solar cells (DSSCs).

Keywords: Azo-dye; Phenylazonaphthalene; DSSCs; optoelectronic properties; DFT and TD-DFT.

SYNTHESIS OF NEW DECAVANADATE MATERIAL $Na_2[H_4V_{10}O_{28}]14H_2O$: CHARACTERIZATION AND BIOLOGICAL ACTIVITY

ABSTRACT

A new decavanadate has been prepared by slow evaporation at room temperature. The molecular structure was investigated by single-crystal X-ray diffraction. Decavanadate compound crystallizes in triclinic system, space group P-1 (No. 2). The crystal structure of the decavanadate can be described by the decavanadate groups, the dimers $Na_2(H_2O)_{10}^{2+}$ and water molecules which are stack in layers parallel to the (010) plane. The crystal structure of the title compound is stabilized by hydrogen bonds and van der Waals interactions. The cohesion of the structure is ensured by O-H. . .O and N-H. . .O hydrogen bonds. The compound was tested against gram-negative bacteria pseudomonas aeruginosa. After 24 hours of incubation, the results show that the decavanadate compound was effective hours and he had a recovery after 24 h.

Keywords: Decavanadate, structure, Synthesis, biological activity.

CRANK-NICOLSON METHOD FOR SINGULARLY PERTURBED UNSTEADY PARABOLIC PROBLEM WITH MULTIPLE BOUNDARY TURNING POINTS

[1*]Yimesgen Mehari Kebede, [1]Prof. Awoke Andargie Tiruneh, [1]Dr. Endalew Getnet Tsega

[*] yimesgen2004@gmail.com , [1*]ORCID ID https://orcid.org/0000-0003-3307-9555

ABSTRACT

In this paper, a numerical scheme for a time-dependent singularly perturbed parabolic convection-diffusion problem with boundary turning points is presented. The problem exhibits a left boundary layer in the spatial domain. We use the Crank-Nicolson method for temporal discretization and a non-standard finite difference approach for spatial discretization on uniform meshes. Through rigorous error analysis, it has been shown that the scheme is stable and parameter uniform convergence with second-order accuracy in time and first- order in space. Three model examples are provided to show the applicability of the scheme. It is shown that, the numerical results are in agreement with the theoretical findings.

ABSTRACT

The scale build-up phenomenon is generally defined as the accumulation of poorly soluble mineral deposits on water-contact surfaces, which frequently causes both technical and environmental problems, in addition to significant economic damage. One of the best techniques for preventing these undesired problems is the use of chemical inhibitors. Nevertheless, the use of environment-unfriendly chemicals can prove hazardous. Recently, food waste has attracted the interest of many researchers in the field of the circular economy. In this context, the aim of this study is to evaluate the scaling inhibiting potential of extracts obtained from a food waste product. This study was carried out using the non-electrochemical method LCGE under the following conditions: a temperature of 25°C, a water hardness of 40° F, degassing by atmospheric air, duration 2 hours. Results showed that the formation of scale was completely inhibited by the addition of a small quantity of the inhibitor to the water studied. In addition, the morphology and phase structure of the scale formed in the presence of the inhibitor were significantly modified. Consequently, we recommend the use of food waste extract as a new, environmentally friendly anti-scale compound.

Keywords: *Food waste, scale, circular economy, green inhibitor*

SUSTAINABLE RURAL DEVELOPMENT THROUGH ADVANCED AGRICULTURAL PRACTICES AND FOOD SECURITY IN THE WESTERN BALKANS

MSc. Diellorita Abazi
Institution: International University of Struga, Kosovo
E-mail: dielloritaabazi.afsd@hotmail.com

ABSTRACT

Sustainable rural development remains one of the key challenges for the Western Balkan countries, particularly in the agriculture and food security sectors. This paper aims to analyze the impact of advanced agrotechnical practices and technological innovations in improving agricultural productivity, preserving food quality, and ensuring a secure supply chain in the region. Based on a comparative analysis methodology and secondary data sources from international organizations and local institutes, major challenges such as land fragmentation, lack of modern mechanization, and inadequate natural resource management have been identified. Special focus is given to the role of agricultural policies and subsidies in promoting sustainable practices, as well as the impact of vocational education in raising awareness about food safety. Findings suggest that the integration of smart technologies, such as moisture sensors and precision irrigation systems, significantly contributes to production efficiency and environmental preservation. In conclusion, the paper provides concrete recommendations for policymakers and local farmers toward building a sustainable, competitive, and EU-compliant agricultural model.

ABSTRACT

Nanobiotechnology, an interdisciplinary field merging nanotechnology and biotechnology, is redefining the landscape of food, agriculture, and medical microbiology by harnessing the unique properties of nanoscale materials to address complex biological challenges. This study explores the evolution and application of nanobiotechnology, highlighting how its integration into food and agricultural systems enables the development of advanced diagnostic tools, targeted therapeutics, and innovative delivery mechanisms. Tracing the historical trajectory from early microbiological discoveries-such as the invention of the microscope and the establishment of germ theory-to the modern era where nanoscale interventions are commonplace, it is evident that the synergy between nanotechnology and biology has unlocked new possibilities for precision and specificity in addressing microbial threats. Recent literature and case studies reveal that nanoscale biosensors and imaging agents, such as quantum dots and magnetic nanoparticles, have significantly improved the sensitivity, speed, and accuracy of pathogen detection, facilitating early diagnosis and timely intervention in both food safety and crop protection. Nanoparticle-based delivery systems are enhancing the precision of agrochemical and therapeutic applications, reducing environmental impact, and improving crop yield and quality. Furthermore, bio-inspired nanomaterials are being utilized for soil health monitoring and smart packaging, expanding the potential of nanobiotechnology to promote sustainable agricultural practices. While these advancements offer clear advantages over traditional methods-including higher specificity, reduced side effects, and rapid response-there remain challenges related to scalability, regulatory oversight, and environmental safety. In conclusion, nanobiotechnology stands as a transformative force in food and agriculture, offering innovative solutions for diagnostics, therapeutics, and sustainability that can enhance global food security and public health. It is recommended that future efforts prioritize interdisciplinary research, robust regulatory frameworks, and the promotion of public-private partnerships to facilitate the safe and effective adoption of nanobiotechnological innovations in real-world agricultural and food systems.

MANAGERIAL INSIGHTS INTO CIRCULAR ECONOMY STRATEGIES IN THE FOOD INDUSTRY

Dr. Bhabajyoti Saikia
Associate Professor, Faculty of Commerce and Management
Assam down town University, Email id: saikia.bhabajyoti@gmail.com
Orcid id: https://orcid.org/0000-0002-5173-8393

ABSTRACT

The transition toward sustainable practices in the food industry is increasingly being shaped by the principles of the circular economy (CE), which emphasize resource efficiency, waste minimization, and value retention across the production-consumption cycle. This study explores the managerial insights and strategic approaches adopted by food industry stakeholders to integrate circular economy principles into their business models and operations. Drawing on qualitative interviews and secondary case analyses of food processing firms, agribusinesses, and food retail enterprises, the research identifies key drivers, enablers, and barriers influencing circular strategies such as food waste valorisation, by-product reuse, sustainable packaging, and closed-loop supply chains. The findings reveal that managerial leadership, innovation culture, stakeholder collaboration, and regulatory support are critical to the successful adoption of CE practices. Moreover, the study highlights how digital technologies such as IoT, blockchain, and data analytics are enabling transparency and efficiency in circular supply chains.

The paper contributes to both academic and practical understanding by offering a strategic framework for managers to evaluate and implement circular initiatives, balancing economic performance with environmental and social goals. The insights also suggest that small and medium enterprises (SMEs) in the food sector can achieve competitive advantage through adaptive and scalable CE practices, especially when supported by ecosystem partnerships. This research underscores the pivotal role of managerial decision-making in steering the food industry toward a more regenerative, resilient, and sustainable future.

ECONOMIC ANALYSIS OF SUGARCANE PRODUCTION IN NUMAN LOCAL GOVERNMENT, ADAMAWA STATE-NIGERIA

Titus Wuyah Yunana, PhD
Department of Economics, Nigeria Police Academy, Wudil-Kano-Nigeria
(Inzehty01@gmail.com)

ABSTRACT

This study provides a comprehensive economic analysis of sugarcane production in the Numan Local Government Area of Adamawa State, Nigeria. It examines the current state of sugarcane farming, including production practices, input costs, and yield outcomes. The study adopt the Multi-stage sampling procedure in selecting 120 registered sugarcane farmers in the study area. Data were collected through the administration of a structured questionnaire to the farmers. The study retrieved only 83 questionnaires and analyzed using simple descriptive statistics, and logistics regression analysis. The study explores the socio-economic implications for local farmers and the potential for sugarcane as a viable cash crop to enhance economic development in the region. The results indicates that, majority of the farmers are between 35-40 of age and are married. The results also revealed that majority of the sugarcane farmers in the area are secondary school graduate with an average farming experience of 11 years. The logistic regression result shows that all the variables included in the model are jointly significant in predicting the factors influencing sugarcane production in the study area. Based on the findings, the study recommends that both the government and the private sectors should provide access to resources, infrastructural facilities, address environmental factors, and also identifying opportunities for improving production efficiency and profitability. These will support sustainable sugarcane farming and contribute to the agricultural development of Adamawa State.

ABSTRACT

Pomegranate syrup, or pomegranate molasses, is a traditional product rich in bioactive compounds such as polyphenols (punicalagin, ellagic acid), flavonoids, and anthocyanins, recognized for their antioxidant, anti-inflammatory, and cardiovascular protective effects. While scientific research has confirmed, through clinical trials, the benefits of pomegranate juice or extracts on memory, heart health, metabolism, and immunity, few studies have yet specifically targeted artisanal molasses. However, the prolonged cooking used in its production can alter certain sensitive molecules, while preserving or activating other, more stable compounds. Promoting local pomegranate varieties, adapted to Mediterranean terroirs and rich in tannins, offers promising potential for combining ancestral knowledge, sustainable production, and innovation in preventive health, from an epistemological perspective linking tradition and science.

MODELING OF SEMICONDUCTING POLYMER–GAS INTERACTIONS USING DFT: THE CASE OF 2-PANI"

Hayrettin GÜRBÜZ[1] Yavuz EKİNCİOĞLU [2*]
[1]Graduate School of Natural and Applied Sciences, Department of Physics, Bayburt University, Bayburt 69000, Türkiye, hygurbuz1990@gmail.com
[2*] Corresponding Author. Vocational School of Health Services, Department ofMedical Services and Techniques, Bayburt University, Bayburt 69000, Türkiye, yekincioglu@bayburt.edu.tr

ABSTRACT

In this study, the interaction between the conductive polymer polyaniline (PANI) and the highly toxic hydrogen cyanide (HCN) gas was theoretically investigated. The efficiency of gas sensors greatly depends on the chemical stability, selectivity, and electrical conductivity of the sensing material. Therefore, the behavior of PANI toward HCN gas was explored in detail using quantum chemical methods. All calculations were performed using Density Functional Theory (DFT) with the B3LYP functional and the 6-311++G(d,p) basis set. Initially, the geometry of the isolated PANI molecule was optimized, and then its interaction with the HCN molecule was modeled to form adsorption complexes. After structural optimization, key electronic parameters including the energies of the Highest Occupied Molecular Orbital (HOMO) and the Lowest Unoccupied Molecular Orbital (LUMO) were calculated. The change in the HOMO–LUMO energy gap before and after adsorption provided insight into the variation in electronic properties. Additionally, global reactivity descriptors such as chemical hardness, softness, electronegativity, and electrophilicity index were evaluated to further interpret the reactivity changes of the system. Adsorption energy values were calculated to assess the strength and nature of the interaction between PANI and HCN. The recovery time (time required for desorption) was also estimated to determine the reusability and responsiveness of the sensor material. The variation in electrical conductivity, as inferred from the HOMO–LUMO gap, further supported the sensing potential.

ABSTRACT

Hydrogen has recently become very important as a clean energy carrier as an alternative to the increasing use of fossil fuels. Sodium borohydride ($NaBH_4$) is one of the most effective hydrogen sources as a storage material. Various metal-containing catalysts are also used in hydrogen production by $NaBH_4$ methanolysis. In this study, the hydrogen production performances of cobalt- and copper-complex-supported catalysts on SiO_2 and Al_2O_3 were systematically investigated through the methanolysis of sodium borohydride ($NaBH_4$). Catalysts were prepared by adsorbing different amounts (1–5 mg) of metal complexes onto the support materials and tested under constant conditions (30 °C, 0.25 g $NaBH_4$, 0.1 g catalyst, and 10 mL solvent). For SiO_2-supported catalysts, the highest hydrogen generation rate (HGR) was obtained with pure SiO_2 at 3614 $mL \cdot min^{-1} \cdot g^{-1}$. Among the cobalt-complex-supported SiO_2 catalysts, the maximum HGR was 2080.3 $mL \cdot min^{-1} \cdot g^{-1}$ with 1 mg Co, although pure SiO_2 again demonstrated the highest performance in this series. For Al_2O_3-supported systems, the most efficient catalyst was found to be the one with 4 mg Co, yielding an HGR of 2446.4 $mL \cdot min^{-1} \cdot g^{-1}$. In the copper-complex-supported systems, Cu-SiO_2-4 mg showed the highest performance with an HGR of 3300 $mL \cdot min^{-1} \cdot g^{-1}$, while the Cu-$Al_2O_3$ catalyst with 1 mg Cu achieved a maximum of 1716.8 $mL \cdot min^{-1} \cdot g^{-1}$. In hydrolysis conditions, only the $CoAl_2O_3$-4 mg catalyst was able to produce hydrogen, with an HGR of 1142 $mL \cdot min^{-1} \cdot g^{-1}$. Additionally, the activation energies for the reactions were calculated. The results indicate that methanol is a more suitable medium than water for both cobalt and copper complex-supported catalysts. This study highlights the significant impact of metal complex concentration and support type on hydrogen production and provides valuable insight for future catalyst design.

Keywords: $NaBH_4$, Hydrogen, Catalyst, SiO_2, Al_2O_3.

DEVELOPMENT OF ILLUMINATED FEEDBACK IN HOB CONTROL

Serdar ÇAKIR

ABSTRACT

In conventional gas hobs, the main information provided to the user about the hob status is provided by silkscreened symbols and markings on the control knobs. Although these systems basically show the user which burner is switched on and which direction the gas flow is switched to, they are limited in terms of visual feedback. It may cause user errors, especially in low-light environments or in emergency situations.

New generation hobs with light indicators offer a more advanced and dynamic information transfer to the user. LED-based indicators on each burner light up when the hob is on, alerting the user and visually indicating that the burner is active. These systems not only show the on or off status of the hobs, but also visualise functions such as the presence of gas flow, heat levels and, in some models, hazard warnings, thereby increasing user safety.

Another important advantage of this technology is that the control knob and the associated combustible eye can be illuminated in the same colour. This allows the user to easily recognise which button belongs to which burner and minimises the risk of confusion. This feature provides a significant ergonomic advantage, especially for older users or individuals with visual sensitivity.

Dynamic warning systems such as colour change and flashing provide instant and understandable information to the user. In this context, illuminated indicators; Reduces user errors by strengthening visual perception, button-eye mapping makes it easy to control, increases the level of security, provides ease of use in dark environments, it increases the perceived quality of the product with its modern design language.

As a result, the classic silkscreen-based displays are increasingly being replaced by more functional and user-friendly illuminated display systems. This transformation should be considered an important innovation not only in terms of aesthetics and technology, but also in terms of user safety, control precision and ergonomics.

OCAK KONTROLÜNDE IŞIKLI GERİ BİLDİRİM GELİŞTİRİLMESİ

ÖZET

Geleneksel gazlı ocaklarda kullanıcıya ocak durumu hakkında bilgi veren başlıca unsur, serigrafiyle belirtilmiş semboller ve kontrol düğmeleri üzerindeki işaretlerdir. Bu sistemler temel düzeyde kullanıcıya hangi brülörün açık olduğunu ve gaz akışının hangi yöne çevrilerek sağlandığını gösterse de, görsel geri bildirim konusunda sınırlı kalır. Özellikle düşük ışıklı ortamlarda veya acil durumlarda kullanıcı hatalarına sebebiyet verebilir.

Yeni nesil ışıklı göstergeli ocaklar ise kullanıcıya daha gelişmiş ve dinamik bir bilgi aktarımı sunmaktadır. Her brülör üzerinde yer alan LED tabanlı göstergeler, ocak açık olduğunda yanarak kullanıcıyı uyarır ve görsel olarak brülörün aktif olduğunu belirtir. Bu sistemler, yalnızca ocakların açık veya kapalı durumunu göstermekle kalmayıp, aynı zamanda gaz akışının varlığı, ısı seviyeleri ve bazı modellerde tehlike uyarıları gibi fonksiyonları da görselleştirerek kullanıcı güvenliğini artırır.

Bu teknolojinin bir diğer önemli avantajı, kontrol düğmesiyle ilişkili yanıcı gözün aynı renkte aydınlatılabilmesidir. Böylece kullanıcı, hangi düğmenin hangi brülöre ait olduğunu kolayca algılayabilir ve karışıklık riski minimuma indirilir. Bu özellik, özellikle yaşlı kullanıcılar veya görsel hassasiyeti olan bireyler için ciddi bir ergonomi avantajı sağlar.

Renk değiştirme ve yanıp sönme gibi dinamik uyarı sistemleri sayesinde kullanıcıya anlık ve anlaşılır bilgi aktarımı yapılır. Bu bağlamda, ışıklı göstergeler; görsel algıyı güçlendirerek kullanıcı hatalarını azaltır, düğme-göz eşleştirmesiyle kontrolü kolaylaştırır, güvenlik seviyesini artırır, karanlık ortamlarda kullanım kolaylığı sağlar, modern tasarım diliyle ürünün algılanan kalitesini yükseltir.

Sonuç olarak, serigrafi tabanlı klasik göstergeler yerini giderek daha fazla fonksiyonel ve kullanıcı dostu olan ışıklı gösterge sistemlerine bırakmaktadır. Bu dönüşüm, yalnızca estetik ve teknoloji anlamında değil, aynı zamanda kullanıcı güvenliği, kontrol hassasiyeti ve ergonomi açısından da önemli bir yenilik olarak değerlendirilmelidir.

ABSTRACT

In this study, hydrophobic sol-gel coatings were developed for application on glass surfaces used in the home appliance industry, with a focus on stovetop glasses that must endure high thermal resistance. Two types of formulations were prepared using the sol-gel technique: one based on polydimethylsiloxane (PDMS), a widely used silicone polymer known for its hydrophobic properties, and another referred to as FSilan, a hybrid silane system composed of tetraethyl orthosilicate (TEOS), methyltrimethoxysilane (MTMS), HCTMO (a group of organic silane derivatives such as hydrochlorothiazide or trimethylolethane/ trimethylolpropane /trimethyloxirane), and glycidyloxypropyltrimethoxysilane (GLYMO). Each coating was applied to soda-lime glass substrates and cured at different temperatures (150 °C, 200 °C, 250 °C 300 °C and 350 °C) to investigate the influence of curing conditions on surface hydrophobicity and thermal stability. Surface characterization was conducted through water contact angle measurements to assess wettability, while surface morphology and elemental composition were analyzed using SEM and EDS. Following thermal exposure, changes in hydrophobic performance and surface structure were evaluated based on post-heating contact angle measurements and SEM imaging. The findings revealed a strong correlation between curing temperature and coating performance. While both formulations showed hydrophobic characteristics post-curing, FSilan-based coatings maintained their structural integrity and water repellency at higher temperatures, outperforming PDMS-based systems in thermal durability. These results provide insights into optimizing sol-gel-derived hydrophobic coatings for functional glass surfaces in domestic appliances, contributing to the development of thermally stable, long-lasting, and efficient surface treatments in industrial applications.

ABSTRACT

The adhesive bonding of materials has been the focus of numerous recent studies worldwide due to its advantages, including reduced component requirements, the ability to form joints free from residual stresses, ease of application, provision of sealing and insulation, lower weight compared to bolting, nut-and-bolt assemblies, and riveting, as well as lower processing temperatures compared to welding. Furthermore, owing to these advantages, adhesive bonding is widely employed in the aerospace, aviation, automotive, and defence industries.

In this study, the effects of plasma surface treatment parameters and adhesive type on the bonding performance of aluminum and basalt fiber reinforced polyamide matrix composite (BFRP) plates were investigated. The effectiveness of plasma surface treatment varies depending on parameters such as frequency (Hz), power (W), and treatment duration (s). In this research, the frequency (1250 Hz) and power (200 W) values were kept constant, and the influence of different treatment durations (30, 60, 90, and 120 seconds) on adhesion performance was examined. Additionally, two commercial adhesives (cyanoacrylate-based Loctite 401 and epoxy-based Loctite 3430) were used as variables to evaluate the interaction of different adhesive chemistries with aluminum and composite (BFRP) materials. For each parameter set, five tensile specimens were prepared, and the shear strength of the adhesively bonded materials was measured. Specimens without any surface treatment withstood a shear force of 0.65 kN, whereas those exposed to plasma surface treatment for 60 seconds demonstrated a significantly enhanced shear strength of 3.31 kN, corresponding to an increase of approximately 409%. Fracture surface analysis was conducted to calculate the adhesive-to-cohesive failure ratio for each parameter. In the future scope of this study, FT-IR analysis, microstructural imaging via SEM, contact angle measurements, and XPS analysis will be carried out to further expand the investigation.

Keywords: Adhesive bonding, plasma treatment, aluminum, composite.

ABSTRACT

This study aimed to investigate the synthesis, characterization, and postharvest application of calcium-based nanoparticles derived frım *Sideritis pisidica* Boiss. & Heldr. (SPNPs) for maintaining the quality of 'Ağın Beyazı' grapes over 20 days of cold storage. *S. pisidica*, a natural medicinal plant of the southwestern region of Türkiye, is rich in phytochemicals with antioxidant and antimicrobial activities and hence an ideal choice for green nanoparticle synthesis. SPNPs were prepared with the assistance of a precursor $CaCl_2$ and were characterized by UV-visible and FTIR spectroscopy to ascertain confirmation of the synthesis and stabilization of the nanoparticles because of the functionality of the plant source.

Grapes were subjected to SPNP treatment at 25, 50, and 100 mg/L levels and also compared with the control maintained at 4°C. These physicochemical parameters were measured such as firmness, respiration rate, total soluble solids (TSS), titratable acidity, pH, and color coordinates (L*, a*, b*). The outcomes showed that SPNP treatment did not significantly impact fruit firmness, pH, titratable acidity, or TSS relative to the control but significantly affected respiration rate and color retention. There was an elevated respiration rate in the later stages of storage in 100 mg/L SPNP-treated grapes. In addition, the values of b* (blue-yellow axis) showed smaller increments in SPNP-treated grapes.

The findings show that SPNPs are not highly effective as an environmentally friendly approach to extending the shelf life and quality of the grapes. While the SPNP treatments did not significantly impact compositional and structural aspects, their impact on respiration and color retention warrants further research, particularly on optimal concentration and treatment procedures.

ABSTRACT

Plants have been the hub of human life since the start of civilization, serving as basic sources of food, medicine, clothing, and shelter. Of their many contributions, the most critical is that they provide human nutrition. With experience spanning thousands of years, humans have acquired knowledge to consume various plant part which are fruits, leaves, seeds, roots, flowers, and tubers. Even today, especially in the countryside, wild plants are heavily harvested and eaten as part of traditional cuisine. With the rising awareness of natural nutrition and health, there is a growing popularity of herbal and wild edible plants globally.

Türkiye is one of the richest countries in terms of wild and domesticated plants due to its diverse climates, ecological zones, and its historical position as a bridge between continents and civilisations. This natural richness enables many wild edible plants to naturally grow. The province of Bingöl, located in eastern Anatolia, has a very rich vegetation that has not yet been thoroughly explored. It is essential for both the ecological balance and the cultural heritage that this natural wealth is properly conserved and utilised.

This study examines some of the wild edible plant species that occur naturally in Bingöl, including *Anchusa azurea, Urtica membranacea, Ferula meifolia, Gundelia Tourneforti, Crocus spp., Rheum ribes, Arum maculatum, Nasturtium officinale, Chenopodium album, Asparagus officinalis, Capsella rubella, Portulaca oleracea, Mentha pulegium, Allium ampeloprasum, Rumex tuberosus, Satureja hortensis, Raphanus raphanistrum, Eremurus spectabilis*. Of these species, *Eremurus spectabilis, Anchusa azurea, Urtica membranacea, Arum maculatum, Nasturtium officinale, Chenopodium album, Rumex tuberosus*, and *Portulaca oleracea* are the most widely known and consumed.

The research covers their taxonomy, lifespan, ecological requirements, edible parts, nutritional content, traditional use, as well as field activities including interviews with plant taxonomy experts from Bingöl University and residents of 12 villages.

Keywords: Wild edible plants, biodiversity, genetic resources, sustainability

THE ROLE OF PHARMACIES IN COLD CHAIN MEDICINES MANAGEMENT AND NANOTECHNOLOGICAL APPROACHES

Fethiye SAĞKAN
Dr., Zonguldak Bülent Ecevit University, Çaycuma Vocational School of Food and Agriculture, Department of Chemistry and Chemical Processing Technologies, Zonguldak-Türkiye, fethiyesagkan@beun.edu.tr **(**Responsible Author) ORCID: 0000-0002-4922-0448

ABSTRACT

Today, accurate, safe and effective delivery of therapeutic drugs to patients is of great importance in the effectiveness of health services. Especially for medicines with high temperature sensitivity, such as biotechnological products, vaccines, insulins and some special formulations, this process is carried out within a special logistics system called "cold chain". The cold chain is an integrated system that ensures the transfer of medicines from the production stage to the end user, protected at specific temperature ranges, and any disruption in any link of the chain can completely eliminate the effectiveness of the medicine. The most fragile link in this chain is pharmacies, which often lack adequate technical infrastructure. This study aims to examine the challenges pharmacies face in managing medicines in the cold chain and the contribution of nanotechnology to this process. Using literature review and analysis methods for current practices, the processes of pharmacies to store, track and deliver temperature-controlled products to patients were evaluated. In addition, the effects of nanotechnological drug formulations and nano-sensor technologies on cold chain processes were discussed. Pharmacies are the last distribution point that is highly vulnerable to temperature deviations. Inadequate infrastructure, lack of calibration and uninterrupted power supplies increase the risk of cold chain breakage. Nanotechnology-based formulations (e.g. lipid nanoparticle carrier systems) have significant potential to reduce this risk. In addition, nano-sensor labeling systems provide pharmacies with a great advantage in monitoring the reliability of the product. The safe management of cold chain medicines requires not only logistics but also knowledge, infrastructure and regulatory compliance. It is of great importance that pharmacies are not left alone in this process, supported and especially integrated into nanotechnological developments.

Keywords: Pharmacy, cold chain, nanotechnology, drug safety, temperature monitoring.

OXIDATIVE STRESS IMPACT OF TOXIC HEAVY METALS ON GIANT AFRICAN LAND SNAILS (*Achatina achatina* and *Achatina fulica*)

AJAYI Andrew Ayodeji *, FAMOSAYA Catherine Adesoye, SAMBO Complete Emem

*Corresponding Author, ajayiaa@oauife.edu.ng

ABSTRACT

The bioaccumulation of heavy metals in snails has implications for ecosystem health and food web dynamics as snails serve as a pathway for transferring metals to predators, scavengers including humans that consume them. This study analysed the levels of heavy metals (Manganese (Mn), Iron (Fe), Cadmium (Cd), Arsenic (As), Lead (Pb), Chromium (Cr), Copper (Cu) and Zinc (Zn) in land snails and investigated the use of antioxidant defence system as biomarkers. Enzyme activities of Catalase (CAT), Superoxide dismutase (SOD), Glutathione-S-transferase (GST) and Malondialdehyde (MDA) were used to evaluate the oxidative stress impact of toxic heavy metals on the snails. Forty-nine matured giant land snails were purchased from OAU Incinerator and Ikire Town. The snails were analysed for bioaccumulation of heavy metals using an Atomic Absorption Spectrophotometer. The results showed that in *A. fulica* from OAU Incinerator, Cu and Cr were highest in the foot (4.011 ± 0.000) mg/Kg and (2.111 ± 0.000) mg/Kg respectively, Fe and Cd were predominant in the digestive gland (2.116 ± 0.000) mg/Kg and (1.112 ± 0.000) mg/Kg respectively whereas *A. achatina* from Ikire accumulated the highest concentration of As (1.116 ± 0.000) mg/Kg, and Zn (2.117 ± 0.000) mg/Kg in the digestive gland, while the gonad accumulated more Fe (1.903 ± 0.001) mg/Kg, Cd (2.009 ± 0.000) mg/Kg and Cr (1.503 ± 0.000) mg/Kg than other tissues. The results recorded in this study were above the permissible limit of FAO/WHO expect for Cd in *A. fulica* and Zn in *A. achatina*. The enzymatic activity of MDA, SOD and GST are higher in *A. fulica* from OAU Incinerator than in *A. achatina* in Ikire except CAT. The input of these heavy metals into the environment occurs through anthropogenic activities such as municipal wastewater, antifouling measures, indiscriminate use of manure and fertilizers, disposal of household and manufacturing industrial wastes. This study would recommend very close monitoring of agrochemical applications, proper waste disposal and other anthropogenic activity in the two sites.

OPTIMIZING PERFORMANCE AND USER EXPERIENCE IN ONLINE FOOD DELIVERY PLATFORMS USING DATABRICKS AND DELTA LAKE

S. MUNEESWARI

ABSTRACT

The exponential growth of online food delivery platforms has resulted in a surge of high-volume, diverse, and real-time data generated from user interactions, order logistics, vendor performance, and delivery tracking. **Understanding and optimizing this complex data ecosystem is critical to enhancing user experience and operational efficiency.**

This study presents a **scalable analytical framework** built on the **Databricks Unified Analytics Platform**, leveraging **Apache Spark**, **Delta Lake**, **Structured Streaming**, and **MLflow**. The aim is to enable comprehensive data-driven insights and real-time decision-making for food delivery platforms.

The proposed approach is motivated by the need for **reliable, maintainable, and real-time data pipelines** that support predictive modeling, anomaly detection, and behavioral analytics in a high-velocity data environment. The framework addresses these needs by integrating a modern data lakehouse architecture with advanced machine learning and streaming capabilities.

Methodologically, the study involves ingesting and transforming large-scale structured and semi-structured datasets—including clickstream logs, order metadata, and customer feedback—via Spark-based data pipelines. We applied **predictive analytics**, **clustering**, and **real-time anomaly detection** to uncover insights into customer engagement, order fulfillment bottlenecks, churn risk, and demand variability.

The system design includes **Delta Lake** for ACID-compliant data storage and version control, **feature engineering pipelines** for delivery delay forecasting and dynamic pricing, and **Delta Live Tables** for automated, real-time data orchestration. **Databricks Notebooks** were employed for collaborative development and experiment tracking via MLflow.

Implementation results show improved data quality, reduced delivery prediction error, and timely identification of anomalies affecting customer satisfaction and delivery logistics. The integration of real-time and historical data streams significantly enhanced model accuracy and operational responsiveness.

In conclusion, this work demonstrates the effectiveness of a unified, scalable analytics architecture in transforming raw operational data into actionable insights, thereby driving intelligent decision-making, improved user experiences, and competitive differentiation in the online food delivery sector.

Keywords: *Online Food Delivery, Databricks, Delta Lake, Structured Streaming, Predictive Analytics, Real-time Data Processing, Anomaly Detection, User Behavior Analytics*

IMPACT OF AVIAN COCCIDIOSIS ON INTESTINAL INTEGRITY : DAMAGE QUANTIFICATION THROUGH HISTOMORPHOMETRIC ANALYSIS

Amira Chahrazad BENABDELHAK, Hanane DERBAK, Hanane TITOUAH, Sofiane AISSANOU, Abdelhanine AYAD

ABSTRACT

Avian coccidiosis is a widespread intestinal parasitic disease that significantly affects poultry health and productivity. The infection compromises intestinal structure and function, leading to poor nutrient absorption and growth retardation. Evaluating intestinal damage is crucial for monitoring disease severity and improving management strategies. A one-year prevalence study was conducted in a poultry slaughterhouse. Intestinal samples (duodenum, jejunum, ileum, cecum) were collected and analyzed using flotation techniques to distinguish between infested and non-infested groups. Histological sections were prepared using standard protocols and examined under a light microscope (magnification ×3.2) equipped with a digital camera (Future WinJoe). Morphometric measurements of villus height (VH) and crypt depth (CD) were performed using ImageJ software (version 1.52, NIH, USA). Histomorphometric analysis revealed a significant reduction in villus height ($p < 0.001$) in infected chickens, especially in the jejunum (from 1047.94 ± 20.91 to 681.85 ± 16.50) and cecum (from 520.02 ± 14.45 to 218.54 ± 6.44). Crypt depth was significantly increased ($p < 0.05$) in the infested group. The VH/CD ratio was markedly lower in infested chickens, indicating compromised intestinal absorptive function. This study highlights the detrimental impact of coccidiosis on intestinal architecture and function. Histomorphometric analysis provides a valuable quantitative tool for assessing gut health in poultry and contributes to the development of targeted strategies for disease monitoring and control in livestock farming.

ABSTRACT

In natural aquatic environments, water temperature is a critical abiotic factor influencing fish reproduction, particularly spermatogenesis. Seasonal thermal fluctuations play a pivotal role in regulating testicular development and gamete production, thereby shaping the reproductive cycle. This study investigates the influence of natural water temperature variations on the quantitative dynamics of spermatogenesis in Mugil cephalus, a species of both ecological and economic importance. Over a 9-month period, from July 2014 to December 2015, male specimens were collected from commercial catches in the Gulf of Bejaia (northeastern Algeria), under uncontrolled natural thermal conditions. To assess spermatogenic activity, two histological parameters were measured: the absolute number of seminiferous lobules (SN) per microscopic field and their surface area (SA). These metrics served as indicators of the progression and intensity of spermatogenesis. The results revealed that spermatogenesis in M. cephalus is highly sensitive to thermal variation, with significant correlations observed particularly at lower water temperatures. An inverse relationship between seminiferous lobules (SN) and surface area (SA) was consistently found, highlighting distinct phases of reproductive activity. This suggests that thermal cues play a regulatory role in testicular function and gametogenic output. These findings underscore the critical importance of understanding the interplay between environmental factors and reproductive biology in wild fish populations. Such insights can significantly contribute to the optimization of aquaculture protocols and the sustainable management of M. cephalus, especially in the context of ongoing climate variability and its potential impact on marine ecosystems.

Keywords: Mugil cephalus, surface area of seminiferous lobules, number of seminiferous lobules , Water Temperature, wild condition.

DETERMINATION OF NITRATE IONS (NO_3^-), IN RED MEAT OF ANIMALS, IN THE CITY OF PRISTINE, THROUGH THE INSTRUMENT "GREEN TEST ECO 5 F –ANMEZ"

Prof. Assoc. Dr. SKENDER DEMAKU
SHEGA ELSHANI
MSc. ARBNORË ALIU
MSc. DONIKA SYLEJMANI

ABSTRACT

The advancement of meat preparing innovation in Kosovo over the final decade has essentially affected the nourishment industry, particularly in guaranteeing nourishment security and open wellbeing within the nearby advertise. This ponder analyzes the usage of meat handling strategies and compliance with guidelines set by wellbeing and nourishment security organizations in different slaughterhouses and megamarkets. We gotten Ten ruddy meat tests (new and handled) and subjected them to comprehensive research facility tests, counting physicochemical, microbiological and nitrate examinations. The comes about affirmed that all tried tests complied with national and worldwide quality benchmarks, appearing secure levels of fat, protein, salt, water and nitrate, and were free of destructive pathogens such as Salmonella, Staphylococcus aureus and E. coli. The ponder too highlights the dietary significance of proteins in meat and looks at the potential wellbeing impacts of nitrate bioaccumulation. The watched mechanical strategies - from crude fabric determination to bundling - illustrated a tall level of operational security and cleanliness. In spite of these progresses, assist change in normal usage and open mindfulness is suggested to guarantee proceeded advance in nourishment security.

CYTOKININ HORMOPRIMING AND THE GERMINATION OF SOME *Solanaceae* CROP VARIETIES FROM BULGARIA

Andrey Popatanasov
Bulgarian Academy of Sciences, Institute of Neurobiology, Sofia, Bulgaria
email for correspondence: and_atanasov@abv.bg

ABSTRACT

Although Bulgarian farmers have been cultivating the New World crops from the *Solanaceae* family for a few centuries, it took more than a century to get widespread acceptance and rise to the top of the Bulgarian population's vegetable consumption list. So it is no wonder that in the 20th century, Bulgaria became one of the world's leading producers of these crops. Due to their significance, such crops as pepper, tomatoes and etc. got in the focus of breeding initiatives aimed at enhancing local adaptability and nutritional characteristics. One of the outcomes of such endeavors were development of many local cultivars with improved adaptation to the local conditions and consumers demands. Also many of these cultivar have exceptional blend of traits as high production, high nutritional content, and distinctive fruit flavor and scent all of which garnered respect and fame to Bulgaria and Bulgarian agro-scientists and farmers and gave nutritional delight to the renownly picky local consumers.

Due to such factors these cultivars are cultivated locally in a variety of environmental settings, some of which aren't ideal for the plants. Priming with certain plant growth regulators has been shown to have beneficial impacts on plant development in both normal and stressed conditions in many plant species. Since the early stages of plant ontogenesis are among the most critical for the crop's long-term survival, growth, and yield, then research on the effects of certain cytokinin-acting plant growth regulators on the early stages of development can be beneficiary for the growers and farmers.

In this work is presented some of the research and results in this area done in Bulgaria with some of the cultivars of the New World *Solanaceae* crops.

Keywords: cytokinin, hormopriming, plant hormone, Solanaceae, *Solanum lycopersicum, Capsicum annuum*.

EFFECT OF INSURGENCY ON INCOME OF MARKETERS IN CHIKUN LOCAL GOVERNMENT AREA OF KADUNA STATE, NIGERIA

ABSTRACT

The study analyzed the effect of insurgency on income of grain marketers in Kaduna State, Nigeria. The specific objectives were to: describe the socio-economic characteristics of the respondent in the study area; identify the type of insurgence activities; determine the effect of insurgency on income of the respondents and identify the constraint faced by marketers in the study area. A multi-stage sampling technique was employed to select one hundred thirty two (132) marketers in Chikun Local Government Area of Kaduna State due to the prevalence of insurgence activities in the area. Data were collected through structured questionnaire and were analyzed using descriptive statistics and Ordinary Least Square (OLS) regression model. The result showed that majority (85.6%) of the marketers were married with a mean age of 44 years and majority (79.5%) had secondary education as their highest level of qualification. The result shows that almost all the respondent (96.2%) have experienced insurgency activity with more than half of the respondents indicated kidnaping (59.8%) and sporadic shooting (20.5%) as the highest forms of insurgency experience in the study area. However, the OLS result shows that, age positively affected income at 10% level of probability, while household size, frequency of occurrence of insurgent activity and severity of the insurgency negatively affected the income of the marketers at 10%, 1% and 5% level of probability respectively in the study area. The most pressing constraints faced by the marketers includes; high cost of crop (X=2.41), lack of access to market (X=2.27), high cost transportation (X=2.23) and low patronage (X=2.03) ranked among the top four (4) major constraints in the study area, the study area. The study recommends improve security checks in the study area.

Keywords: *Insurgency, Income and Grain Marketers*

ENGINEERING AN AUTOMATED MODEL FOR FOOD CLASSIFICATION (CNNAFCM) BASED ON PICTURES OF NIGERIAN INDIGENOUS LUNCHES WITH THE PURPOSE OF AI IN AGRICULTURE

Olasina J R [1,2], Aliu O H[2]
[1,2] Department of Computer Engineering, Federal Polytechnic Ilaro, Ogun State, Nigeria.
[2] ASPMIRE Lab, Covenant University, Ota, Ogun State, Nigeria
Email: [1]jamiu.olasina@federalpolyilaro.edu.ng

ABSTRACT

As a result of this study, a powerful model called the Convolutional Neural Network-Based Automatic Food Classification Model (CNNAFCM) was created, using images of Nigerian swallow foods unique to the region. It is well known that food AI models are mostly trained on datasets that represent Western cultures, so the team creates and prepares over 4,000 images with proper annotations for four major Nigerian dish categories and five kinds of image degradation. To make sure the models being studied could identify both types of CP foods, the CNNAFCM was designed to test both the fresh and stale options. Instead of focusing only on one type of data, CNNAFCM uses data from traditional local foods, and is created for use in agricultural monitoring, recognizing foods, and analyzing diets in under-developed regions. By applying benchmarking to MobileNet, and LeNet-5, along with local data, we are showing that it is a robust convolutional neural network. Early findings suggest the model does a good job distinguishing between types of food and is able to generalize well when presented with unfamiliar foods. Thanks to this technology, agriculture now has better options for AI that honor differences in eating habits and allows for easier monitoring of food origins. This also makes it possible to connect Internet of Things systems to agriculture, create mobile health apps, and make aids for those with vision problems. The CNNAFCM framework acts as a flexible and aware model to help in classifying foods from various degradation. The project continues, and we are working on improvements like deploying and testing the system live on important data from different parts of the world. Being part of the congress will lead to new and valuable partnerships in global food AI research.

ASSESSING THE ENVIRONMENTAL CONSEQUENCES OF PLANT PROTECTION MEASURES IN ALGERIAN ARID-ZONE CEREAL FARMING

Hassina Hafida BOUKHALFA[1], Naoual GUEHILIZ[1]
[1] PIARA Laboratory, Mohamed Khider University of Biskra, ESNLS Faculty, Agricultural Sciences Department, Biskra, Algeria.
Corresponding author e-mail: h.boukhalfa@univ-biskra.dz

ABSTRACT

This study investigates phytosanitary practices in cereal cultivation within the Biskra region, located in the southeast of Algeria. Through field surveys involving 259 farmers, we calculated phytosanitary pressure indices (FTI and PPI). The survey results reveal that a majority of cereal farmers take measures to protect their crops, primarily against weeds. However, a diverse range of active ingredients, including Cloquintocet-Mexyl, Clodinafop-Propargyl, and 2,4-D, were identified. Fourteen active ingredients were classified as moderately dangerous (Class II) according to the WHO.

Despite efforts to combat pests, the study highlights an uncontrolled use of pesticides, evidenced by non-compliance with recommended application rates, ignorance of recommended application intervals, and improper dosage of pesticides. Limited supervision further exacerbates this issue, particularly among cereal producers with low levels of education. To assess the consequences of these practices, we calculated the Treatment Frequency Indicator (TFI) and the Phytosanitary Pressure Index (PPI). These indices categorized study sites based on the risk levels associated with pesticide use by cereal farmers.

Our findings indicate higher total Plot TFI (combining herbicide and non-herbicide TFI) for durum wheat and soft wheat compared to barley. Notably, Ain Naga exhibits very strong phytosanitary pressure (IPP=2.60), while El Feidh, El Outaya, Mlili, Oumeche, and Ourllal experience strong pressures. Doucen, on the other hand, presents a moderate pressure. Such practices may contribute to reduced cereal yields and environmental pollution, impacting human and animal health through bioaccumulation and biomagnification. Addressing these challenges necessitates comprehensive training, awareness programs, and continuous monitoring of cereal farmers to ensure sustainable agriculture, safeguarding human and animal health, and protecting the environment.

Keywords: cereals, phytosanitary practices, survey, PPI, FTI, arid region.

INFLUENCE OF LOCAL–IMPORTED WHEAT MIXTURES ON COUSCOUS QUALITY

Hassina Hafida BOUKHALFA[1], Fatima Zohra BENSALEM[2]
[1] PIARA Laboratory, Mohamed Khider University of Biskra, ESNLS Faculty, Agricultural Sciences Department, Biskra, Algeria.
[2] Mohamed Khider University of Biskra, ESNLS Faculty, Agricultural Sciences Department, Biskra, Algeria.
Corresponding author e-mail: h.boukhalfa@univ-biskra.dz

ABSTRACT

An experimental study was carried out on El-Baraka brand couscous, to determine the extent of the effect of the blending technique (combination) between two types of wheat (local and imported) on the quality characteristics of the finished product.

The results of physicochemical analyses of local and imported durum wheat (dockage, specific weight, thousand kernel weight, moisture content, etc.), as well as those of the semolina obtained from their millings (particle size, moisture content, ash content, color index, gluten, etc.), showed that they complied with Algerian standards, with a quality superiority in favor of imported wheat. Physicochemical analyses (particle size, color indices, water content, ash content, etc.), culinary analyses (swelling index, post-cooking weight, etc.) and sensory tests on the couscous produced from the blending proved that it complied with Algerian standards, with superiority over the control couscous made from local wheat, and that it largely retained the quality characteristics of the control couscous made from imported wheat.

Keywords: couscous, blending, quality, physicochemical analysis, culinary analysis, sensory testing.

ASSESSMENT OF WATER QUALITY FOR LIVESTOCK CONSUMPTION

ABSTRACT

This study aimed to evaluate the sanitary quality of drinking water for livestock in the municipality of Ain Naga by identifying biological, chemical, and physical hazards to assess the level of risk. A field survey was conducted across several farms to analyze water sources and watering systems, focusing on the origin of the drinking water, the number and hygiene of drinking troughs, and their usage capacity.

Bacteriological analyses performed on water samples collected from boreholes, water sources, and drinking troughs indicated the complete absence of total coliforms, fecal coliforms, total germs, and fecal streptococci or enterococci. These findings confirm that the drinking water in Ain Naga has good bacteriological quality.

Physicochemical analyses showed that while boreholes and water sources had normal levels of physical parameters and chemical substances, watering troughs contained minerals such as chlorides, sulfates, ammonium, and nitrates at levels exceeding regulatory and international standards. This suggests that the physicochemical quality of drinking water in this municipality is only moderate.

The survey linked these results to several contributing factors, including inadequate hygiene practices, traditional watering system installations, lack of maintenance of water pipelines, and excessive use of pesticides and fertilizers in farming areas. These conditions contribute to the contamination of drinking water, affecting livestock health and production.

Based on these findings, the study recommends improving maintenance of watering installations to ensure the hygiene of materials in direct contact with drinking water and conducting annual water quality analyses. These measures are essential for protecting animal health, ensuring good farming practices, and enhancing livestock production in Ain Naga.

Keywords: drinking water quality, livestock health, bacteriological analysis, physicochemical contaminants, farm management.

FEEDING THE FUTURE METROPOLIS: VERTICAL FARMING AS URBAN INFRASTRUCTURE

Melik Sami[1], Khelil Sara[2], Tallal Abdel Karim Bouzir[3].
[1,2] Departement of architecture, Mohamed Khider Biskra University, Biskra, Algeria.

[3] Institute of Architecture and Urban Planning, Blida University, Blida, Algeria.
sami.melik@univ-biskra.dz ; sara.khelil@univ-biskra.dz ; bouzirtallal@gmail.com

ABSTRACT

The aim of this research is to understand if vertical farming could be key to urban infrastructure in large cities by increasing food supply, decreasing environmental issues, and helping to sustain the city. Research and findings show that vertical farming produces the same types and amounts of food as traditional farming, however, it requires significantly less water and land. It has been found that using vertical farming can raise local food production by up to 30%, improving the stability of the food chain in cities. In addition, looking at the social and economic effects, vertical farming may open up new jobs and strengthen nearby business communities. These discoveries are important when it comes to healthcare, since easier access to fresh produce for those in cities often contributes to a better diet and lowers the risk of diseases related to nutrition. This study suggests that making vertical farming a part of urban planning can boost community well-being, make cities more attractive, and set a sustainable pathway for city development. The study suggests that having policies that help startups invest in vertical farming can help solve food security and health challenges in urbanized areas.

Keywords: Vertical Farming; Urban Agriculture; Sustainable Food Systems; Urban Infrastructure.

[3] Institute of Architecture and Urban Planning, Blida University, Blida, Algeria.
sami.melik@univ-biskra.dz ; sara.khelil@univ-biskra.dz ; bouzirtallal@gmail.com

ABSTRACT

The study explores ways that architectural logistics can improve the food grid in urban areas by improving cold chain systems and storage. The key research issue to consider is that existing transport and infrastructure supporting temperature-sensitive food are poor, putting at risk food quality and safety. An analysis of the cold chain, warehousing, and urban deliveries brings out flaws in the existing ways they are managed. Current systems do not handle the task of food distribution well, which results in a lot of wasted food and possible risks to the public. It is proven in the research that implementing new designs for storing and handling food can create more chances for food access and higher food quality, which helps protect people's health. It shows that making sure urban infrastructure works with local food distribution can play a role in improving public health outcomes. The findings can greatly affect healthcare by providing a way to keep food safe as part of urban planning, leading to improved health for urban communities. Through the relation between healthy urban planning and improved distribution of food, the research encourages stronger public health policies for urban planning.

Keywords: Urban Food Logistics; Cold Chain Infrastructure; Architectural Design for Food Systems; Perishable Food Storage; Food Distribution Networks.

ZERO-KILOMETER ARCHITECTURE: DESIGN STRATEGIES FOR HYPERLOCAL FOOD SYSTEMS

Melik Sami[1], Khelil Sara[2], Tallal Abdel Karim Bouzir[3].
[1,2] Departement of architecture, Mohamed Khider Biskra University, Biskra, Algeria.
/LACOMOFA Biskra laboratory
[3] Institute of Architecture and Urban Planning, Blida University, Blida, Algeria.
sami.melik@univ-biskra.dz ; sara.khelil@univ-biskra.dz ; bouzirtallal@gmail.com

ABSTRACT

This study focuses on finding effective ways of designing zero-kilometer architecture in urban areas to foster both local food supply and demand, serving the dual purpose of lowering carbon emissions and improving ecological sustainability. By using a mixed methods approach, the study combines information from community polls and architect's recommendations with analyzing the food supply routes and their effects on the environment. The main takeaway is that engaging communities in urban food farming and buying foods locally helps people collaborate and ensures less CO2 is emitted during transport of goods. As a result, these research findings highlight that urban local food production could ensure more food security, promote good nutrition, and thus support the overall health of city dwellers. It shows how architectural design, food sustainability, and health are all linked, so this study can guide and assist those working for healthier communities. All in all, the study calls for designing cities with both architecture and sustainable food systems, saying that doing so forms a base for creating healthy urban areas and sturdy networks of food supply.

Keywords: Zero-Kilometer Architecture; Hyperlocal Food Systems; Sustainable Urban Design; Local Food Production; Food-Energy-Water Nexus.

PUBLIC SPACE AS FOOD INFRASTRUCTURE: ACTIVATING PARKS AND PLAZAS FOR EDIBLE URBANISM

Melik Sami[1], Khelil Sara[2], Tallal Abdel Karim Bouzir[3].
[1,2] Departement of architecture, Mohamed Khider Biskra University, Biskra, Algeria.
/LACOMOFA Biskra laboratory
[3] Institute of Architecture and Urban Planning, Blida University, Blida, Algeria.
sami.melik@univ-biskra.dz ; sara.khelil@univ-biskra.dz ; bouzirtallal@gmail.com

ABSTRACT

Its purpose is to look at the role of parks and plazas in changing the urban environment by turning them into food infrastructures that increase edible urbanism and deal with problems related to food access and maintaining sustainable cities. The study has shown that public areas in those communities are not well-used for urban agriculture, though their sizes and qualities could be suitable for this purpose. The study looks at case studies of successful urban farms to find out which methods encourage farming in cities and share examples where people are involved. According to the study, urban agriculture helps improve health results for communities by making fresh foods available, encouraging unity, and supporting better care of the environment. The findings add to the field of public health in urban design by suggesting that having food systems in public spaces can improve food security and support better health for residents. As a result of this study, new guidelines and strategies in healthcare are now being created, based on the strong connection between the environment and health. It encourages different groups to join forces to support the development of communities that benefit us and the planet.

VALUE ADDED PRODUCT DEVELOPMENT INCORPORATED WITH HEMP SEED

Prof (Dr) Pratibha Singh
Professor Department of Nutrition and Dietetics
Manav Rachna International Institute of Research and Studies , Faridabad , Haryana, India

ABSTRACT

In the recent years increasing interest in vegetarian diets has been observed, a major problem in this type of diet is to provide the appropriate amount of protein [1] . Value addition of food is current most talked topic because of increasing nutritional awareness among consumers today [1] . An investigation will be conducted to develop protein rich multi-millet khakhra incorporated with hemp seed. The seeds of hemp (cannabis sativa L.) have been a significant source of food for thousands of years. In recent years, hemp has not been thoroughly explored for its nutritional potential due to the mistaken belief regarding the cannabis plants. Two variations Will be prepared referencing standard recipe. Variation 1 will be prepared using whole wheat flour-40g, sorghum-20, fingermillet-10g, kasuri methi-5g, hemp seed powder 20g, oil-5g, variation 2 will be prepared using whole wheat flour-40g, sorghum-15g, fingermillet-10g, kasuri methi-5g, hemp seed powder-25g, oil-5g. The product will be subjected to sensory evolution by semi trained panel members using 9 point hedonic on 100 panelists. According to the secondary data product having 25g of hemp seed powder will be most preferred one [2] . khakhras can be eaten as a snack at any time of the day. hemp seed powder incorporated in it enhances its nutritive value and makes it more nutritious. It is suitable for consumption of all the age group.

Keywords: cannabis sativa, hemp, protein, seed.

ABSTRACT

Assessing the quality of surface water in reservoirs is essential for the sustainable management of water resources, especially in regions where such water is used for multiple purposes, including irrigation, drinking supply, and recreation. This study presents a detailed physicochemical and microbiological evaluation of the surface waters of the Bin El Ouidane reservoir, located in the Tadla-Azilal region of Morocco - an area where agriculture is highly dependent on water availability and quality.

Water samples were collected from multiple locations and depths during two contrasting seasons to capture both spatial and temporal variability. Physicochemical parameters analyzed included temperature, pH, electrical conductivity, turbidity, dissolved oxygen, nitrates, phosphates, and selected heavy metals. Microbiological quality was assessed by quantifying fecal indicator bacteria, namely Escherichia coli and total coliforms.

The findings revealed significant seasonal variations. Elevated levels of nitrates and phosphates point to a potential risk of eutrophication, which could affect downstream agricultural productivity and soil health. While heavy metal concentrations remained below critical thresholds, their presence suggests possible localized contamination. Microbiological results indicated episodic fecal pollution, which could pose health risks if the water is used for irrigating crops consumed raw.

These results highlight the need for improved water quality monitoring and protection strategies to safeguard both public health and agricultural sustainability in the region.

Keywords: Water quality, Bin El Ouidane reservoir, irrigation, agricultural water use, physicochemical analysis, microbiological contamination, Morocco

LACTIC ACID BACTERIA: FUNCTIONAL DIVERSITY AND EMERGING APPLICATIONS

Bouchemal Amina, Inouri Ahlem, Ladouali Zeyneb, Mechiah Fahima , Benhoula Mohamed

ABSTRACT

Lactic acid bacteria are a group of ubiquitous, heterogeneous, and ecologically diverse bacteria.They are mainly responsible for the production of lactic acid as a by-product. These microorganisms are of significance due to the multifaceted roles they play in the agricultural, food, and clinical sectors. Advancements in the domains of genetics, molecular biology, physiology and biochemistry have provided new insights and applications for these bacteria. The objective of this study is to underscore the multifaceted applications of LAB and their pivotal role in confronting contemporary challenges.

Keywors : Fermentation, Food Biotechnology, lactic acid bacteria, functional diversity

CONTRIBUTION OF SEED MORPHOMETRIC CHARACTERIZATION TO THE IDENTIFICATION OF INDIGENOUS MOROCCAN GRAPEVINE CULTIVARS

ABSTRACT

The study of grapevine seed morphology provides valuable insights into the domestication level of cultivars and the extent of their selection. In this context, a morphometric characterization was carried out on eleven of the most widespread indigenous grapevine cultivars from the northwestern region of Morocco. These cultivars were identified during field surveys conducted in the Ouezzane region, with three biological replicates per cultivar. For morphometric analysis, twenty seeds per cultivar were cleaned, air-dried at ambient temperature, and photographed. The images were processed using SuperAmpelo measurement software. Following calibration, three morphometric parameters were measured for each seed: total length, total width, and beak length. Additionally, the Stummer index—defined as the ratio of seed width to total length—was calculated for each seed.

Our results showed that beak length and the Stummer index were the most discriminating parameters among the studied cultivars. Furthermore, the Stummer index enabled the classification of all cultivars into three distinct groups. The cultivar Zbarjel exhibited the lowest ratio (0.55), closely aligning with the cultivated compartment of Vitis vinifera, which suggests a more advanced evolutionary stage and, therefore, earlier domestication. In contrast, the cultivar Fekass Khal showed the highest ratio (0.66), indicating a relatively recent domestication process. The remaining cultivars fell into an intermediate category, with ratios that were not sufficiently distinctive for clear classification.This study contributes valuable data to the identification and characterization of Morocco's indigenous viticultural heritage, offering new perspectives on the domestication history of local grapevine cultivars.

Keywords: Grapevine (*Vitis vinifera*); Seed Morphometry; Indigenous Cultivars; Morocco; Morphological Characterization.

FIRST-GENERATION SCREENING OF GAMMA-IRRADIATED STRAWBERRY PLANTS FOR AGRONOMIC AND QUALITY TRAITS IN MOROCCO

ABSTRACT

Strawberries are among the most widely consumed seasonal fruits globally and hold considerable economic importance. This study aims to improve the yield and quality of Moroccan strawberries by selecting high-performing plants. A total of 3 000 plants plants were subjected to gamma irradiation and cultivated under controlled environmental conditions. In this first generation, 1425 plants were selected based on superior pomological and biochemical characteristics, including high fruit sugar content (°Brix), acceptable acidity levels, natural pH, attractive fruit colour, and overall plant vigour. Comprehensive data on plant growth parameters, fruit size and weight, °Brix, acidity, pH, and colour reflectance values (L*, a*, b*) were collected and analysed using SASS software. The findings of this study provide valuable insights for Moroccan strawberry growers and breeders, supporting the identification and development of varieties well-adapted to local conditions and market requirements, and contributing to the goal of national self-sufficiency.

COLOADED THERMOSENSITIVE SYSTEM OF IRINOTECAN AND CURCUMIN NANO-VESICLE FOR COLORECTAL CANCER TARGETING, *in vitro* and *in vivo* INVESTIGATION

Aleena Maryiam, Hamid Saeed
Punjab University College of Pharmacy, Allama Iqbal Campus, University of the Punjab, Lahore 54000, Punjab, Pakistan

ABSTRACT

The aim of study was to develop the thermoresponsive nanovesicles loaded drug delivery system for colorectal cancer targeting. Irinotecan and curcumin loaded nanoparticles (IRT-CUR-NTs) were incorporated into poloxamer (P407, P188) based system (IRT-CUR-NTG) that was administered by rectal route. IRT-CUR-NTs was optimized in terms of particle size, zeta potential and polydispersity index. Irinotecan and curcumin entrapment efficiency was also calculated. IRT-CUR-NTs were characterized by performing fourier transform infrared spectroscopy, differential scanning calorimetry, transmission electron microscopy. IRT-CUR-NTG was prepared and pH, gelation time, gelation temperature was noted. Moreover, *in vitro* drug release study and pharmacokinetic study was performed to check the drug release patterns. Additionally *in vitro* anticancer analysis was performed on HT29 cell lines. *In vivo* anticancer analysis demonstrated the significant reduction in tumor size and tumor volume after treatment with IRT-CUR-NTG. Results obtained from analysis indicate that prepared thermosensitive could be promising system in treatment of colorectal cancer but further analysis are required to prove its further efficacy.

Keywords: Colorectal, Curcumin, Irinotecan, Nanoparticles, Thermosensitive, Poloxamer

ABSTRACT

The convergence of the Internet of Things (IoT) and Artificial Intelligence (AI) is transforming traditional agricultural practices into smart, data-driven systems. This research presents a comprehensive framework that integrates IoT sensor networks with advanced machine learning algorithms to enhance crop monitoring and farm productivity[1,2].

In the proposed system, a network of IoT sensors—including soil moisture probes, temperature and humidity sensors, and multispectral imaging devices—is deployed across agricultural fields to continuously monitor critical environmental and crop parameters[2,4]. The collected data is transmitted to a cloud-based platform where AI models process the information in real-time to detect anomalies, predict pest or disease outbreaks, and recommend timely interventions such as irrigation, fertilization, or pesticide application.

Machine learning techniques play a pivotal role in analyzing the vast amount of data generated. In the proposed system, Random Forest is utilized for disease and pest prediction, while regression models forecast crop yields and soil nutrient levels[1,3]. Random Forest demonstrates an R^2 score of 0.92. Regression models are employed to forecast crop yields and soil nutrient levels, with Linear Regression achieving a mean absolute error (MAE) of 6.7%. These models effectively support real-time decision-making in precision agriculture[1,3].

Infuture, K-means clustering, an unsupervised learning method, can be utilized to segment agricultural zones based on soil and crop conditions, enabling targeted interventions. Additionally, time-series forecasting models such as Long Short-Term Memory (LSTM) networks may be used to predict weather trends and optimize irrigation schedules. The implementation of this IoT-AI synergy demonstrates significant improvements in early disease detection, resource optimization, and overall farm management[2,3].

THE ROLE OF AGRICULTURAL TECHNOLOGY USE IN ENHANCING SUSTAINABLE FOOD SYSTEMS OF SMALLHOLDER SOYBEAN FARMING IN NORTHERN GHANA

Selorm Omega [1]
[1]University of Cape Coast, Department of Agricultural Economics and Extension, Cape Coast, Ghana
[1]ORCID ID: https://orcid.org/0000-0001-9159-9351
selorm.omega@stu.ucc.edu.gh

ABSTRACT

Agriculture remains the backbone of livelihoods for millions of smallholder farmers, especially in Northern Ghana, where poverty is widespread. However, these farmers face climate variability, limited resources, and fluctuating market conditions. Despite the potential of agricultural technology use to improve productivity, many smallholder farmers have yet to fully utilize them. This research explores how the use of agricultural technology impacts sustainable soybean food systems, focusing on social, economic, and environmental dimensions. Drawing on data collected through structured interviews with 280 soybean farmers, the study employs a three-stage least squares regression to understand these relationships in depth. The findings reveal that using agricultural technology is strongly linked to better social (2.464, $p<0.05$), economic (1.694, $p<0.05$) and environmental (2.713, $p<0.05$) sustainability. Interestingly, the study also highlights some complexities. Larger scale operations (0.281, $p<0.05$) and higher education levels (0.014, $p<0.05$) were associated with lower social outcomes, suggesting that expanding farm operations or education alone may not guarantee improved social conditions. Conversely, farmers who kept records (4.996, $p<0.05$) and those with secure landholding status (3.210, $p<0.05$) experienced better social sustainability, indicating that management practices and tenure security matter significantly. A surprising result was the consistently negative association between participation in agricultural development programmes (ADP) and all sustainability outcomes (Social- -3.634, Economic- -3.043 and Environmental- -3.377, $p<0.05$), which raises questions about the relevance or implementation effectiveness of these programmes in the local context. For policymakers and stakeholders, such Ministry of Food and Agriculture, the Environmental Protection Agency and Agriculture-based NGOs, efforts should focus on removing barriers to effective technology use, improving the design and delivery of development programmes, and supporting farmers with tools that balance productivity with wellbeing. Such strategies are crucial for building a resilient, sustainable soybean food system that can thrive despite the challenges faced by smallholder farmers in Northern Ghana.

ABSTRACT

Sumithion, a synthetic organophosphate, is extensively used in agricultural land as an insecticide. It is also used in larval-rearing ponds to control tiger bugs (*Cicindela* spp.). The indiscriminate use poses a potential threat to many non-target organisms, including fish. Sumithion toxicity alters numerous physiological, biochemical, and hematological parameters which eventually affect growth, reproduction, immunity, etc. An experiment was performed to observe the role of Spirulina in reducing the detrimental effects and damage in Nile tilapia (*Oreochromis niloticus*) due to sumithion exposure. Four treatments namely Treatment-1 (Control), Treatment-2 (Sumithion; 0.3 mg/L), Treatment-3 (Spirulina; 50gm/kg), and Treatment-4 (Sumithion + Spirulina) were administered. The findings indicated that fish exposed to sumithion showed the least weight gain (WG), lowest specific growth rate (SGR), and the highest feed conversion ratio (FCR) among all treatments. Moreover, the intestinal parameters exhibited significant negative alterations. Whereas Spirulina-supplemented diet played a crucial role in counteracting the changes caused by sumithion toxicity. Nevertheless, Spirulina-supplemented diet exhibited significant enhancements in growth parameters (WG, SGR, FCR) and improved intestinal functions. The present study unveiled the implementation of dietary Spirulina to be an effective approach to mitigate sumithion-induced growth inhibition in Nile tilapia by improving intestinal morphology.

ABSTRACT

This study reports the phytochemicals contained in aqueous extract prepared from avocado leaves and turmeric powder procured from Nsukka environment. The aim of the study was to investigate the qualitative phytochemicals present and to determine the total phenolic and flavonoids contents of avocado leaves and turmeric. Results showed reducing sugar strongly present, flavonoids, tannins, steroids, glycoside and saponins were mildly present. Result for turmeric extract showed flavonoids, phenols, alkaloids were moderately present, tannins, steroids, glycoside, reducing sugar were mildly present while saponin was absent. Extracts of avocado leaves and turmeric contains important medicinal bioactive compounds and it justifies their use in the traditional medicine for treatment of diseases. In conclusion, extracts of avocado leaves and turmeric studied were rich in phytochemicals with remarkable pharmacological and medicinal relevance.

Crop Production Department, Olabisi Onabanjo University, College of Agricultural Sciences Ayetoro, Ogun State.
kanyinsolaadesola@gmail.com

ABSTRACT

Urban planners play a crucial role in supporting sustainable urban agriculture practices. This study assessed the role of urban planners in promoting energy-efficient screen house tomato production in urban areas, with a case study of Yewa North Local Government Area of Ogun State. An experimental design was employed at the screen house of the Crop Production department, College of Agricultural Sciences, Olabisi Onabanjo University, Ayetoro, Ogun State. Three tomato varieties (Kerewa, Royal, and UC.82) were evaluated in a randomised complete block design with three replicates. Energy-related data, including manual, biological and chemical energy inputs and tomato yield as output, were collected and analysed using Analysis of Variance (ANOVA). The results showed significant variations in energy inputs across operations and varieties, with manual labor and chemical inputs being the most substantial contributors. Royal emerged as the most energy-efficient and economically profitable variety. This study highlights the importance of urban planners in promoting energy-efficient practices in screen house tomato production, contributing to sustainable urban food systems and economic development. The findings can inform urban planning policies and practices that support sustainable urban agriculture and energy-efficient food production.

Keywords: Urban Planners, Energy-efficient, Sustainable Urban Food System, Screen house.

NUTRITIONAL COMPOSITION AND HEALTH BENEFITS OF BITTER MELON

Dr. Muhammad Imran
Associate Professor, Department of Food Science, Faculty of Life Sciences, Government College University, Faisalabad, Pakistan
imran@gcuf.edu.pk

ABSTRACT

Bitter melon which is typically known as bitter gourd with scientific name *Momordica charantia* belongs to the gourd family and has much resemblance with cucumber, pumpkin and zucchini. It is cultivated as edible fruit around the world and considered a staple in many types of Asian cuisine. It possessed distinct appearance, bitter taste and sharp flavor. Bitter melon is a great source of energy and several key nutrients including carbohydrates, vitamins, fiber and minerals. It has been associated with several health benefits due to presence of several phyto-nutrients. It has cancer-fighting properties, helps to reduce blood sugar and cholesterol levels. The phyto-nutrients extracted from bitter melon are supplemented into functional foods and functional beverages. Modern technologies like novel green ultrasound are adopted to extract phyto-nutrients from bitter melon and these phyto-nutrients are preserved using nanoencapsulation. Overall, bitter melons are good source of nutrient for supplementation in plant-based diets cand have wide applications against different metabolic syndrome diseases.

HOSPITAL WASTEWATER AS A SILENT VECTOR: MICROBIAL CONTAMINATION AND ANTIBIOTIC RESISTANCE AT THE HUMAN HEALTH-ENVIRONMENT INTERFACE

Presenting author name: SAYERH FatimaZahra.
Laboratory of Process Engineering and Environment, Faculty of Science and Technology of Mohammedia, Hassan II University, Casablanca, Morocco.

Co-authors' details: Mouhir Latifa, Saafadi Laila.
Laboratory of Process Engineering and Environment, Faculty of Science and Technology of Mohammedia, Hassan II University, Casablanca, Morocco.

ABSTRACT

Hospital wastewater represents a complex matrix containing pathogenic microorganisms, antibiotic residues and chemical pollutants, posing serious risks to public health, food safety and ecosystems. This study, carried out in two hospitals in south-west Morocco, assessed the microbiological quality of the effluents and analyzed the antibiotic resistance profiles of the bacteria isolated. Results revealed high loads of fecal indicators (E. coli, enterococci, total and fecal coliforms) and pathogens such as Pseudomonas aeruginosa, Staphylococcus aureus and Klebsiella pneumoniae. Of the 75 strains isolated, 68% were multi-resistant, with high resistance to beta-lactams and quinolones. In particular, 47% of E. coli strains were producers of extended-spectrum beta-lactamases.

Statistical analyses (ANOVA, PCA, Chi² test) showed significant differences between the two hospitals in terms of bacterial loads and resistance profiles. The direct discharge of these untreated effluents into urban sewage systems increases the risk of contamination of water used for irrigation, thus exposing agricultural soils, crops and consumers. Faced with this problem, the study proposes the integration of advanced treatment techniques (such as electrocoagulation, bioactive filters or combined physico-chemical and biological processes) to reduce the microbial and chemical load of HWW, with a view to their safe reuse for agriculture, in particular irrigation, thus contributing to circular water management and food safety.

RESUME

Anacyclus pyrethrum, plante médicinale endémique du Maroc, est depuis longtemps valorisée pour ses propriétés thérapeutiques, notamment en tant qu'analgésique, insecticide naturel et tonique du système nerveux. Cette espèce, riche en composés bioactifs, suscite un intérêt croissant en pharmacologie et en agronomie, mais fait face à une surexploitation préoccupante. Cette synthèse bibliographique examine les connaissances actuelles sur ses propriétés phytochimiques et pharmacologiques, ses usages traditionnels, sa biologie reproductive, ainsi que son statut de conservation. L'objectif est de contribuer à une meilleure compréhension scientifique de cette espèce et de proposer des pistes de valorisation durable intégrant la protection de la biodiversité et la régulation de sa filière d'exploitation au Maroc.

Mots clés : *Anacyclus pyrethrum ; Plante Médicinale ; biodiversité ; conservation*

VALORIZATION OF AGRICULTURAL WASTE IN SUSTAINABLE BIOCOMPOSITES: ENHANCING MECHANICAL PROPERTIES WITH NATURAL FIBER REINFORCEMENTS

ABSTRACT

In response to the rising demand for sustainable materials and the depletion of non-renewable resources, this study focuses on developing high-performance bio-composites reinforced with agricultural residues, specifically utilizing coconut fibers as a low-cost, thermally stable natural filler in polypropylene matrices to create eco-friendly materials with enhanced mechanical properties. Bio-composites, consisting of a matrix that binds the structure and transfers loads, and natural fibers that provide strength and stiffness, face a key challenge in the poor interfacial adhesion between the hydrophilic fibers and hydrophobic thermoplastic matrices. To improve fiber-matrix compatibility and overall performance, chemical treatments such as alkaline processing were employed.

This study investigates the effect of fiber length on the mechanical behavior of polypropylene reinforced with coconut fibers, using extrusion and injection molding processes. A detailed experimental analysis encompassing structural, morphological, thermo-mechanical, and moisture absorption tests was conducted to determine the optimal fiber configuration. The use of agricultural biomass as functional fillers, combined with tailored coupling agents and processing methods, resulted in composites with significantly enhanced properties, including a more than 70% increase in Young's modulus, improved thermal stability, and reduced water absorption. These results underscore the potential of valorizing agricultural waste to develop high-performance, bio-based materials, positioning such bio-composites as sustainable alternatives to petroleum-based plastics for applications in agriculture, packaging, and the processing industry.

Keywords: Biocomposites, natural fibers, agricultural residues, polypropylene, thermomechanical properties, sustainability, biomass valorization,

UNIVERSITY STUDENTS' MINDFULNESS LEVELS AND DEPRESSION LEVELS AND THEIR RELATIONSHIP WITH THEIR TENDENCY TO RECEIVE PSYCHOLOGICAL SUPPORT

Istanbul Nisantasi University, Faculty of Economıcs, Administrative and Social Sciences, Department of Psychology

ABSTRACT

In recent years, growing attention has been directed toward understanding the psychological factors that influence young adults' willingness to seek mental health support, particularly in the context of increasing mental health challenges among university populations. This study aims to explore the relationship between university students' levels of mindfulness and depression, and how these psychological factors influence their tendencies to seek professional psychological help. The research is grounded in the increasing recognition of mindfulness and depression as critical determinants of psychological well-being among young adults, particularly within the university population. A total of 202 undergraduate students aged 18 and above participated in the study. Data were collected using the Demographic Information Form, the Five Facet Mindfulness Questionnaire (FFMQ), the Beck Depression Inventory (BDI), and the Attitudes Toward Seeking Professional Psychological Help Scale–Short Form (ATSPPH-SF). In addition to descriptive statistics, Pearson correlation analyses were conducted to examine the relationships among the key variables. The findings revealed a statistically significant and positive correlation between mindfulness and the tendency to seek psychological help ($r = 0.273$; $p < 0.01$), indicating that higher levels of mindfulness are associated with greater openness to seeking professional support. However, the relationship between depression levels and help-seeking tendencies was found to be non-significant ($r = 0.015$; $p = 0.835$). These results suggest that individuals with higher mindfulness may possess greater self-awareness and acceptance, which may facilitate adaptive help-seeking behaviors. The study highlights the potential value of mindfulness-based interventions in promoting early psychological support and enhancing mental health outcomes among university students.

Keywords: Mindfulness, depression, psychological support

EXAMINING THE EMOTIONAL REFLECTIONS OF VOICE BEHAVIORS IN ORGANIZATIONS: AN EMPLOYEE PERSPECTIVE

Bahar ARABACI
PhD Student, Marmara University, Institute of Social Sciences , Labor Economics and Industrial Relations, İstanbul-Türkiye, bahararabaci@klu.edu.tr
ORCID: 0000-0001-5219-9160

Sibel GÖK
Prof. Dr., Marmara University, Faculty of Economics, Labor Economics and Industrial Relations, İstanbul-Türkiye, sgok@marmara.edu.tr, ORCID: 0000-0003-2755-6941

ABSTRACT

This study aims to examine the impact of voice behaviors (employee voice and employee silence) appearing in the organizational context on employees' emotional states. Voice behaviors are categorized into two main groups: employee voice (voice behavior) and employee silence (silence behavior). Employee voice refers to proactive communication behaviors where individuals participate in organizational processes, express opinions, and share suggestions. In contrast, employee silence reflects the withholding of knowledge, thoughts, or concerns for various reasons.

A review of the existing literature shows that voice behaviors are often examined in terms of their antecedents or organizational outcomes, while their emotional reflections on employees have been relatively underexplored. This study aims to fill this gap by comprehensively analyzing the positive (feeling good, feeling comfortable, excitement) and negative (feeling bad, disappointment, feeling worthless) emotional impacts of voice behaviors on employees.

The study was conducted using a qualitative research method, adopting a phenomenological approach. In-depth semi-structured interviews were carried out with 43 academicians working at public universities in the Marmara Region with at least one year of work experience. The findings reveal that voice behaviors directly affect employees' emotional states. Employee voice contributes to participants feeling valued and motivated, whereas employee silence leads to feelings of disappointment, exclusion, and worthlessness.

The findings of the study indicate that a supportive communication climate in organizations enhances employees' emotional well-being and strengthens organizational commitment. In this context, promoting employee voice, valuing their emotions and thoughts, and evaluating their contributions are considered strategic necessities for sustainable success and satisfaction.

ÖRGÜTLERDE SES DAVRANIŞLARININ DUYGUSAL YANSIMALARI: ÇALIŞANLARIN PERSPEKTİFİNDEN BİR İNCELEME

ÖZET

Bu çalışma, örgütsel bağlamda ortaya çıkan ses davranışlarının (çalışan sesi ve çalışan sessizliği), çalışanların duygu durumları üzerindeki etkilerini incelemeyi amaçlamaktadır. Ses davranışları, çalışan sesi (voice behavior) ve çalışan sessizliği (silence behavior) olmak üzere iki temel kategoriye ayrılmaktadır. Çalışan sesi, bireylerin örgütsel süreçlere katılım sağlamak, görüş ve önerilerini dile getirmek amacıyla sergiledikleri aktif iletişim davranışlarını tanımlarken; çalışan sessizliği, sahip olunan bilgi, düşünce veya endişelerin çeşitli sebeplerle dile getirilmemesi durumunu yansıtmaktadır.

Mevcut literatür incelendiğinde, ses davranışlarının genellikle öncülleri veya örgütsel sonuçları üzerinde durulduğu; çalışanların duygusal yansımalarına yeterince odaklanılmadığı görülmektedir. Bu çalışma, literatürdeki bu boşluğu doldurmak amacıyla ses davranışlarının çalışanların duygu durumları üzerindeki olumlu (iyi hissetme, rahat hissetme, heyecan) ve olumsuz (kötü hissetme, hayal kırıklığı, değersiz hissetme) etkilerini kapsamlı bir şekilde incelemeyi hedeflemektedir.

Nitel araştırma yöntemiyle yürütülen bu çalışmada, fenomenolojik yaklaşım benimsenmiş olup, Marmara Bölgesi'ndeki devlet üniversitelerinde görev yapan, en az bir yıllık iş deneyimine sahip 43 akademisyenle yarı yapılandırılmış görüşmeler gerçekleştirilmiştir. Elde edilen bulgular, ses davranışlarının çalışanların duygusal durumları üzerinde doğrudan etkili olduğunu göstermektedir. Çalışan sesi, katılımcıların kendilerini değerli hissetmelerine ve motive olmalarına katkı sağlarken; çalışan sessizliği ise hayal kırıklığı, dışlanmışlık ve değersizlik hissiyatına yol açmaktadır.

Araştırma bulguları, örgütlerde destekleyici bir iletişim ikliminin, çalışanların duygusal iyilik hallerini artırarak örgütsel bağlılığı güçlendireceğini ortaya koymaktadır. Bu doğrultuda, çalışanların sesliliğini teşvik eden, duygu ve düşüncelerini önemseyen ve değerlendiren bir örgüt iklimi, sürdürülebilir başarı ve memnuniyet için stratejik bir gereklilik olarak değerlendirilmektedir.

ABSTRACT

This study aims to examine the concept of work values, which is widely discussed in the literature, in the context of Generation Z. Within the scope of the study, work values are defined as the set of attitudes and behaviors that individuals develop in line with the value systems of the society they belong to and adopt in order to achieve the goals they set in their work life.

There are many studies conducted on Generation Z at national and international levels, and these studies are generally aimed at describing the general characteristics, tendencies and expectations of this generation. However, the number of studies on the values and expectations of this generation regarding work life is quite limited. When the existing literature is examined, it is seen that the studies mainly focus on Generation Z students; however, the research on Generation Z individuals who are actively involved in the labor market is limited. This situation can be associated with the fact that Generation Z is just starting to enter the work life.

Understanding the work values and priorities of Generation Z, who are expected to assume more active roles in work life in the coming years, is important in terms of both increasing the satisfaction and loyalty of employees at the individual level and structuring human resources policies more effectively at the institutional level. In this context, this study, which is expected to make an original contribution, aims to examine the work values of Generation Z employees in a comprehensive manner.

The main purpose of the study is to reveal the factors that shape the work values of Generation Z employees based on their experiences in work life; to deeply analyze how these values are interpreted, in which contexts they are addressed, and what kind of expectations they have from work life. In this context, the phenomenological approach, which is one of the qualitative research methods, was adopted and semi-structured in-depth interviews were conducted with 25 Generation Z employees who have at least two years of work experience.

In line with the findings obtained, the work values of Generation Z, the factors that shape these values, their expectations about work life, and the possible transformations they may bring about in work life in the future were analyzed. This report includes the findings and results reached within the scope of the research conducted.

Keywords: Value, Generation Z, work values.

A STUDY ON THE REASONS FOR NOT IMPLEMENTING IN-CLASS SCIENCE EXPERIMENTS

ABSTRACT

Experimental activities in science teaching have an important place in developing students' scientific process skills and concretizing abstract concepts. However, studies have shown that teachers do not implement science experiments in the classroom sufficiently. The aim of this report is to determine why science teachers avoid conducting science experiments and to discuss the factors behind this situation. In this study conducted with a qualitative research design, semi-structured interviews were conducted with 20 science teachers working in different schools. The obtained data were analyzed using the content analysis method. The findings show that the reasons why teachers avoid conducting experiments are multidimensional. The most frequently mentioned reasons include inadequate laboratory infrastructure, time constraints, student discipline problems, security concerns, and the intensity of the curriculum. In addition, factors such as teachers not receiving sufficient in-service training on experimental methods, difficulties in obtaining experimental materials, and failure to integrate experiments into the measurement-evaluation process were also determined. In addition, some teachers think that the contribution of experiments to the teaching process is limited and that conducting experiments uses teaching time inefficiently. These findings reveal that in order to increase experimental applications in science teaching, teachers should be supported, school infrastructure should be strengthened and experiments should be given more place in teaching programs. The study aims to present solution suggestions for increasing the quality of science education by making the obstacles faced by teachers visible.

* ORCİD:0009000011374380, sumeyyeaydogan55@gmail.com

ABSTRACT

Aim

The rate of sexual abuse cases in Turkey has been increasing over the years. Studies conducted on sexual abuse are of great importance in terms of prevention and intervention. In this context, the aim of this research is to examine the theses conducted between 2014-2024 on individuals who were victims of sexual abuse, and the types of prevention and intervention studies conducted in the National Thesis Center database of the Council of Higher Education.

Methods

Document analysis, one of the qualitative research methods, was used in this study. The findings were analyzed through content analysis methods. The theses were retrospectively examined in terms of their fields of study, types, research models, and gender distribution.

Findings

According to the research results, 55 theses were reached. The distribution of the theses by field of study was as follows: Psychiatry (16), Forensic Medicine (15), Psychology (12), Social Work (6), Sociology (4), Physiotherapy and Rehabilitation (1), and Nursing (1). Twenty of the theses reached were conducted as qualitative, 19 retrospective, 13 quantitative and 2 mixed methods (qualitative and quantitative). Twenty-five of the theses were conducted as descriptive, 28 relational, 1 descriptive and relational, and 1 intervention program. The gender distribution of the group studied in the theses was 78.03% female and 21.97% male

Conclusion

Research conducted in recent years has revealed that with the increasing visibility of sexual abuse cases, its multidimensional effects and the need for interdisciplinary intervention have become evident.

Keywords: Sexual abuse, thesis analysis, abuse victims, retrospective research

TÜRKİYE'DE 2014-2024 YILLARI ARASINDA CİNSEL İSTİSMARA UĞRAYAN BİREYLER İLE İLGİLİ YÜRÜTÜLEN TEZLERİN DOKÜMAN ANALİZİ YÖNTEMİ İLE İNCELENMESİ

ÖZET

Amaç

Türkiye'de cinsel istismar vaka oranları yıllar içerisinde artmaktadır. Cinsel istismara yönelik yürütülen çalışmalar istismarın önlenmesi ve istismara müdahale bağlamında önem arz etmektedir. Bu doğrultuda bu araştırmanın amacı cinsel istismar mağduru bireyler ile ilgili 2014-2024 yılları arasında yürütülen ve Yüksek Öğretim Kurumu Ulusal Tez Merkezi veri tabanında yer alan tezlerin ve ne gibi önleme ve müdahale çalışmalarının yürütüldüğünün incelenmesidir.

Gereç ve Yöntem

Araştırmada nitel araştırma yöntemlerinden doküman analizi kullanılmıştır. Elde edilen bulgular ise içerik analizi yöntemi ile incelenmiştir. Çalışmada, yayınlanan tezlerin hangi ana bilim dallarında yer aldıkları, türleri, araştırma modelleri ve cinsiyete göre dağılımı retrospektif olarak incelenmiştir.

Bulgular

Araştırma sonuçlarına göre, 55 tez çalışmasına ulaşılmıştır. İncelenen tezlerin ana bilim dalları sırasıyla Psikiyatri(16), Adli Tıp(15), Psikoloji(12), Sosyal Hizmet(6), Sosyoloji(4), Fizyoterapi ve Rehabilitasyon(1), Hemşirelik(1) olarak saptanmıştır. Ulaşılan tezlerin 20'si nitel, 19'u retrospektif, 13'ü nicel ve 2'si karma yöntem (nitel ve nicel) olarak yürütülmüştür. Tezlerin 25'i betimsel, 28'i ilişkisel, 1'i betimsel ve ilişkisel, 1 'i müdahale programı şeklinde yürütülmüştür. Tezlerde çalışılan grubun cinsiyet dağılımı %78,03'ü kadın; %21,97'si erkek şeklindedir.

Sonuç

Son yıllarda yapılan araştırmalar, cinsel istismar olgularının artan görünürlüğüyle birlikte, çok boyutlu etkilerinin ve disiplinlerarası müdahale gereksiniminin belirginleştiğini ortaya koymaktadır.

Anahtar Kelimeler: Cinsel istismar, tez analizleri, istismar mağdurları, retrospektif araştırma

THE EFFECT OF CONCEPT CAFES ON SPATİAL PERCEPTİON: THE CASE OF DUDU FİRİN-KAHVE

ABSTRACT

This research aims to evaluate the effects of coffee spaces on user preferences in the context of spatial and visual perception components. Today, coffee spaces have become public interior spaces that stand out with their multidimensional functions such as socialization, rest, experience and aesthetic satisfaction, beyond being just a consumption area. In this context, the relationship between users' perception of a space and the physical elements used in interior design constitutes an important research area in terms of the discipline of interior architecture. This study aims to examine the effects of physical design parameters that affect users' visual-spatial perceptions on user preferences.

The coffee shop named “Dudu Fırın-Kahve” located in Karatay district of Konya province was chosen as the application area of the research. The place attracts attention in terms of offering a nostalgic and aesthetic experience to the user with its location that establishes integrity with its surroundings at an important point in the historical environment of Konya. This structure, located around Bedesten, one of the historical centers of Konya, brings together traditional architectural elements and contemporary interior arrangements, both keeping the cultural heritage alive and serving as a current social meeting point. In this context, Dudu Fırın place constitutes an original example in terms of evaluating the relationship between spatial perception and user preference.

The study analyzed how the physical characteristics of the space – parameters such as shape, proportion, texture, color, light – are reflected in the user perception. Dudu Fırın was chosen as a sample due to both the richness offered by its historical context and its high popularity among users. In this respect, the study offers the opportunity to evaluate the integration of traditional spatial textures into contemporary use and the effect of interior design on user perception.

Qualitative research method was used within the scope of the research. Spatial Analysis was carried out with on-site observation, detection, photography and drawing techniques as data collection tools. Spatial analysis was structured from general to specific within the framework of the exterior-interior relationship of the coffee space; the space was evaluated based on spatial perception parameters (shape/form, proportion/size, material/texture, color, light/illumination, heat, sound and smell).

The findings revealed that users' spatial perceptions are directly related to the physical design components of the space. It was determined that interior design decisions, especially in concept spaces, play a decisive role on user satisfaction and preferences. The study draws attention to

the importance of structuring design decisions with a user-centered approach and provides data that can contribute to the field of interior design.

KONSEPT KAFELERİN MEKÂNSAL ALGIYA ETKİSİ: DUDU FIRIN-KAHVE ÖRNEĞİ

ÖZET

Bu araştırma, kahve mekânlarının kullanıcı tercihleri üzerindeki etkilerini, mekânsal ve görsel algı bileşenleri bağlamında değerlendirmeyi amaçlamaktadır. Günümüzde kahve mekânları yalnızca bir tüketim alanı olmanın ötesinde; sosyalleşme, dinlenme, deneyim yaşama ve estetik tatmin gibi çok boyutlu işlevleriyle öne çıkan kamusal iç mekânlar hâline gelmiştir. Bu bağlamda, kullanıcıların bir mekâna ilişkin algısıyla iç mekân tasarımında kullanılan fiziksel unsurlar arasındaki ilişki, iç mimarlık disiplini açısından önemli bir araştırma alanı oluşturmaktadır. Bu çalışma, kullanıcıların görsel-mekânsal algılarını etkileyen fiziksel tasarım parametrelerinin, kullanıcı tercihleri üzerindeki etkisini incelemeye yöneliktir.

Araştırmanın uygulama alanı olarak, Konya ili Karatay ilçesinde yer alan "Dudu Fırın-Kahve" adlı kahve mekânı seçilmiştir. Mekân; Konya'nın tarihi çevresinde önemli bir noktada çevresiyle bütünlük kuran konumuyla kullanıcıya nostaljik ve estetik bir deneyim sunması açısından dikkat çekmektedir. Konya'nın tarihi merkezlerinden biri olan Bedesten çevresinde konumlanan bu yapı, geleneksel mimari unsurlarla çağdaş iç mekân düzenlemelerini bir araya getirerek hem kültürel mirası yaşatmakta hem de güncel bir sosyal buluşma noktası işlevi görmektedir. Bu bağlamda, Dudu Fırın mekânı; mekânsal algı ve kullanıcı tercihi ilişkisini değerlendirmek açısından özgün bir örnek teşkil etmektedir.

Çalışmada, mekânın fiziksel özelliklerinin –biçim, oran, doku, renk, ışık gibi parametrelerin– kullanıcı algısına nasıl yansıdığı analiz edilmiştir. Dudu Fırın'ın örneklem olarak seçilmesinde hem tarihi bağlamının sunduğu zenginlik hem de kullanıcılar arasındaki popülerliğinin yüksek olması etkili olmuştur. Bu yönüyle çalışma, geleneksel mekânsal dokuların çağdaş kullanıma entegrasyonu ile iç mekân tasarımının kullanıcı algısına etkisini birlikte değerlendirme fırsatı sunmaktadır.

Araştırma kapsamında nitel araştırma yöntemi kullanılmıştır. Veri toplama aracı olarak yerinde gözlem, tespit, fotoğraflama ve çizim teknikleriyle mekânsal Analiz gerçekleştirilmiştir. Mekânsal analiz, kahve mekânının dış-iç mekân ilişkisi çerçevesinde genelden özele doğru kurgulanmış; mekân, mekânsal algı parametreleri (biçim/form, oran/ölçü, malzeme/doku, renk, ışık/aydınlatma, ısı, ses ve koku) üzerinden değerlendirilmiştir.

Elde edilen bulgular, kullanıcıların mekânsal algılarının, mekânın fiziksel tasarım bileşenleriyle doğrudan ilişkili olduğunu ortaya koymuştur. Özellikle konsept mekânlarda iç mekân tasarım kararlarının, kullanıcı memnuniyeti ve tercihleri üzerinde belirleyici bir rol oynadığı saptanmıştır. Çalışma, tasarım kararlarının kullanıcı odaklı bir yaklaşımla yapılandırılmasının önemine dikkat çekmekte ve iç mekân tasarımı alanına katkı sunabilecek nitelikte veriler sağlamaktadır.

Anahtar Kelimeler: Konsept kafe Mekanları, iç mekan tasarımı, algı, mekânsal algı parametreleri, Konya.

ZAKAT AND WEALTH MEASURES IN ISLAMIC LAW

ABSTRACT

Although the Quran provides definitive provisions on the obligation of zakat, it does not provide detailed information on who is obliged to pay zakat. Detailed information on the measure of wealth (nisab) is clarified through the hadiths and practices of the Prophet Muhammad. In the conditions of that day, who would be considered rich was determined in a way based on gold, silver and some other goods used as money. In the classical jurisprudence literature, the nisab of zakat is explained based on the practices of the Prophet Muhammad, based on gold, silver, animals and some land products. In the contemporary period, different ideas are expressed among Islamic jurists on how to determine the nisab of zakat, in addition to the classical understanding. This study focuses on the principles that should be valid in determining the measure of wealth in today's conditions. The criteria for wealth may vary in different economic and social conditions in Islamic societies and around the world. Within modern financial systems and global economic structures, the calculation and implementation of zakat may pose practical difficulties. However, the fundamental purpose of zakat remains the same: it should be used as a tool to strengthen the principles of social justice and solidarity in Islam and to maintain balance within society. Consequently, the importance of zakat and the criteria for wealth are among the fundamental elements that shape the social and economic order of Islam. Who is/should be considered rich may also change locally due to the social positions of the communities. From this point of view, it is not understood that the studies on who should be considered rich are important.

Keywords: Zakat, Nisab, Wealth.

İSLAM HUKUKUNDA ZEKÂT VE ZENGİNLİK ÖLÇÜLERİ

ÖZET

Kur'an zekâtı farziyyeti konusunda kesin hükümler ortaya koymakla birlikte, kimlerin zekât yükümlüsü olacağı hakkında ayrıntılı bilgi vermemektedir. Zenginliğin ölçüsü (nisab) ile ilgili ayrıntılı bilgi Hz. Peygamber'in hadisleri ve uygulamaları ile açıklık kazanmaktadır. O günün şartlarında para olarak kullanılan altın, gümüş ve diğer bir kısım mallar üzerinden kimlerin zengin sayılacağı bir şekilde belirlenmiştir. Klasik fıkıh literatüründe de Hz. Peygamber'in uygulamaları esas alınarak altın, gümüş, hayvanlar ve bir kısım toprak mahsulleri üzerinden zekâtın nisabı açıklanmaktadır. Çağdaş dönemde İslam hukukçuları arasında zekâtın nisabının nasıl belirleneceği konusunda klasik anlayışın yanında farklı düşünceler de dile getirilmektedir. Bu çalışma günümüz şartlarında zenginliğin ölçüsünü belirlenme konusunda hangi esasların geçerli olması gerektiği konusu üzerinde durmaktadır. Zenginlik kriterleri, İslam toplumlarında ve dünya genelinde farklı ekonomik ve sosyal koşullar altında değişiklik gösterebilir. Modern finansal sistemler ve küresel ekonomik yapılar içinde, zekâtın hesaplanması ve uygulanması pratik zorluklar doğurabilir. Ancak zekâtın temel amacı, İslam'ın sosyal adalet ve dayanışma ilkelerini güçlendirmek ve toplum içindeki dengeleri korumak için bir araç olarak kullanılması gerektiği gerçeği değişmez. Sonuç olarak, zekâtın önemi ve zenginlik kriterleri, İslam'ın sosyal ve ekonomik düzenini şekillendiren temel unsurlardan biridir. Kimlerin zengin olarak kabul edileceği/edilmesi gerektiği toplumluların sahip oldukları sosyal konumları gereği mahallî olarak ta değişebilmektedir. Bu noktadan hareketle kimlerin zengin olarak kabul edilmesi gerektiği konusundaki çalışmaların önemli olduğu anlaşılmamaktadır.

Anahtar Kelimeler: Zekât, Nisab, Zenginlik.

SUPPRESSIVE POTENTIAL OF ENTOMOPATHOGENIC NEMATODES (EPN) IN BIOLOGICAL CONTROL OF PEST SPECIES

ABSTRACT

Nematodes from the families Steinernematidae and Heterorhabditidae have shown to be successful biocontrol agents against several insect pests. These little nematodes, in symbiotic relationship with bacteria (*Xenorhabdus* spp. in Steinernema, *Photorhabdus* spp. in Heterorhabditis), may rapidly infect and kill insects, hence offering an environmentally sustainable substitute for traditional pesticides. Emphasizing their biology, methods of action, and integration into integrated pest management (IPM) plans, this paper provides a thorough synthesis of entomopathogenic nematode (EPN) applications across several crops and pests. Key accomplishments—from the management of soil-dwelling larvae in orchards and field crops to the control of cryptic borers and greenhouse pests—are examined together with concerns including environmental sensitivity, formulation challenges, and inconsistent field performance. Particular focus is paid to studies and applications in Türkiye, where interest in EPNs for pest control is growing. Case studies from Turkish agricultural and international contexts show the value of EPN in both laboratory and field environments, stressing success factors and practical concerns for farmers and practitioners. Present results are summarized in the paper's conclusion along with future directions include increasing EPN heat/desiccation resistance, attaining affordable mass production, and strengthening their contribution to sustainable agriculture.

ABSTRACT

Plant-parasitic nematodes (PPNs) can cause a significant concealed threat in agriculture, especially in vegetable production, where their pervasive infestation results in annual global crop losses surpassing $157 billion, inflicting substantial economic strain on agricultural systems and food security. Therefore, the application of efficient nematode management strategies—such as cultural, chemical, biological, and integrated methods—is crucial to reduce yield losses. Among these control strategies, antagonistic fungi have emerged as a viable biological control option due to their capacity to parasitize nematode eggs, degrade cuticles, and interrupt worm life cycles, providing an eco-friendly alternative to synthetic nematicides. Both, fungi and nematodes are among the most abundant and ubiquitous organisms inhabit the same soil environment, it is inevitable that they will engage in various forms of interaction. It is widely known that fungi synthesize antibiotic metabolites and produce certain compounds that have antagonistic effects on nematodes and other organisms. Furthermore, plant-parasitic nematodes (PPN) are estimated to cause over $157 billion in crop losses annually, resulting in significant economic losses in agriculture. This situation suggests that fungi with antagonistic relationships against nematodes could be used as biological control agents. Because due to chemical nematicides elevate potential health risks and environmental concerns they may generate they have been subjected to restrictions by authorities in recent times. This study provides an in-depth analysis of the diversity of nematophagous fungi and their efficacy in applied contexts, emphasizing the following four groups: nematode-trapping fungi, endoparasitic fungi, egg-parasitic fungi, and toxin-producing fungi. Thus, it highlights the significance of antagonistic fungi such as *Pochonia chlamydosporia*, *Purpureocillium lilacinum*, *Trichoderma* spp., *Arthrobotrys oligospora*, and *Muscodor albus*. In application, the evaluation of technologies, solid substrate and liquid fermentation product formulations, seed treatment, and converter distribution systems are utilized.Various cultivation systems, regional studies, fungal strain selection, formulation selection, soil conditions, cultivation types, and other integrated management practices have demonstrated control efficiency rates ranging from 30% to 85%.

Keywords: antagonistic fungus, *P. Chlamydosporia*, biological control, nematophagous fungus, formulation technology

TECHNICAL SPECIFICATIONS OF PRISMATIC BALERS

ABSTRACT

The use of bales and the mechanization of the production chain are important issues in the agricultural sector. Processing and transporting bales is a tiring and difficult task for farmers. Storing bales is a time-consuming process due to low manpower requirements. In the past, agricultural crops such as wheat were turned into straw in sizes that animals could eat with a more primitive machine called a thresher. Straw is animal food that takes up a lot of space like fluffy dust. Therefore, more storage space was needed. In order to store more straw in smaller areas, it is important to pack straw produced from crops such as wheat, barley, clover, and vetch. Balers have an important place in agriculture for more efficient use of closed areas. Balers are machines used to compress straw and other materials in different ways. Of these compression types, prismatic balers are the most commonly used baler. Prismatic balers transfer the crop to the collection unit-feeding unit-pressing room-tying unit and discharge unit in order and complete the baling process. In this study, the stages of the crop until baling and the technical features of the prismatic balers are discussed. These machines are usually pulled from the side of the tractor and driven by the tractor's power transmission box (PTO). These balers are machines that cover a large area in the field. These balers cut the stem part of the harvested and spread crop into smaller pieces so that animals can consume it more easily. In this way, it increases the compressibility rate of the crop and allows more stock to be made in a smaller area. In addition, bales of the desired size and dimensions can be produced from these small crops and used in different animal husbandry. Savings in time and labor costs can be achieved when preparing feed with the produced bales. It is thought that the bales will increase the storage capacity of processed agricultural crop waste and provide farmers with more long-term flexibility in animal nutrition.

Keywords: Prismatic baler machines, baling, agricultural machinery

PRİZMATİK BALYA MAKİNELERİNİN TEKNİK ÖZELLİKLERİ

ÖZET

Balyaların kullanımı, üretim zincirinin makineleşmesi tarım sektöründe önemli bir konudur. Balyaların işlenmesi ve taşınması çiftçiler açısından yorucu ve zor bir güç gerektiren bir iştir. Balyalar depolanmaları düşük insan gücü gereksinimleri nedeniyle vakit alan işlemlerdir. Eski zamanlarda daha ilkel bir makine olan Patoz ile buğday gibi tarımsal mahsuller hayvanların yiyebileceği büyüklüklerdeki saman haline getirilmekteydi. Saman kabarık toz gibi çok yer kaplayan hayvan yiyeceğidir. Dolayısı ile daha fazla depolama alanına gereksinim duyulmaktaydı. Daha küçük alanlara daha fazla samanın depolanabilmesi için buğday, arpa, yonca, fiğ gibi mahsullerden üretilen samanın paketlenmesi önem arz etmektedir. Kapalı alanların daha verimli kullanılabilmesi için tarımda balya makineleri önemli yere sahiptir. Balya makineleri, saman ve diğer malzemeleri değişik şekillerde sıkıştırmak için kullanılan makinalardır. Bu sıkıştırma şekillerinden prizmatik balya makineleri en yaygın kullanılan balya makinesidir. Prizmatik balya makineleri mahsulü sırasıyla toplama ünitesi-besleme ünitesi-pres odası-bağlama ünitesi ve boşaltma ünitesine sıralamasıyla aktararak balyalama işlemini tamamlar. Bu çalışmada mahsulün balyalama olana kadar ki aşamaları ve prizmatik balya makinelerinin teknik özellikleri ele alınmıştır. Bu makinalar genellikle traktörün yan tarafından çekilir ve traktörün güç aktarma kutusundan (PTO) tahrik edilir. Bu balya makinaları tarlada geniş bir alanı kaplayan makinalardır. Bu balye makineleri hasat edilen ve tarlaya yayılan mahsulün sap kısmını daha küçük parçalara keserek hayvanların daha kolay tüketmesini sağlamaktadır. Bu sayede mahsulün sıkıştırılabilirlik oranını artırarak daha küçük alana daha fazla stok yapılabilmesini sağlamaktadır. Bunun yanısıra üretilen bu küçük parça mahsüllerden istenilen boyut ve büyüklükte balyalar üretilerek değişik hayvan besiciliğinde kullanılması sağlanabilmektedir. Üretilen balyalar ile yem hazırlanırken zamandan ve işçilik maliyetlerinden tasarruf sağlanabilmektedir. Balyalar işlenmiş tarımsal mahsül atıklarının depolama kapasitesini artırarak çiftçilere hayvan beslenmesinde daha fazla uzun vadeli esneklik sağlayacağını düşünülmektedir.

Anahtar Kelimeler: Prizmatik balya makineleri, balyalama, tarım makineleri

THE IMPORTANCE OF UTILIZATION OF BLACKTHORN (*Prunus spinosa* L.) WASTE SEEDS BY DIFFERENT EXTRACTION METHODS

Merve MACİT
Asst. Prof. Dr., Bingöl University, Food Agriculture and Livestock Vocational School, Department of Crop and Animal Production, Bingöl-Türkiye
mmacit@bingol.edu.tr **(**Responsible Author) ORCID: 0000-0001-9648-4799

ABSTRACT

Prunus spinosa L., usually known as Jackal or Blackthorn plum, is widely distributed in Europe, Western Asia and Northwest Africa at altitudes of 0-1700 m. The fruit is commonly consumed raw and processed into jelly, marmalade, jam and compote. Blackthorn fruits extracts are available in various areas including food industry as colorants and preservatives due to antioxidant and antibacterial properties of polyphenols. For example, the color, adhesive structure, appearance and general acceptability of fruits improves the symptoms of freezing. Berries are considered an excellent source of vitamin C. Blackthorn fruit is mostly used for its health benefits such as laxative, hemostatic, de-worming and constipating. Blackthorn fruits are also rich in bioactive compounds, including minerals, amino acids, vitamins, triterpenes, phytosterols, phenolic and organic acids. Phytochemicals, especially those with high antioxidant activity, appear to reduce the risk of chronic diseases such as cardiovascular disorders and cancer. In Blackthorn seed oil obtained by cold pressing method in Blackthorn, where different extraction methods were applied, vanillin was determined as the most important phenolic component, while oleic acid was found at the highest rate. β-sitosterols are found at high levels. Oleic acid constitutes the main fatty acid in hexane-formed seed extracts. Blackthorn seeds, which are traditionally discarded, are seen to have various bioactive images in the extract obtained by supercritical CO_2 extraction method. These result show that *P. spinosa* seed extracts have potential pharmaceutical and nutraceutical applications. The fruit parts of the Blackthorn plum, which are generally, are used. The seed parts remain as waste. Therefore, in this study, there are studies in which the recovery of the remaining seeds is provided by different extraction methods and the bioactive compounds in the obtained extracts are determined.

Keywords: *Prunus spinosa L.*, Extraction methods, Waste seeds, Bioactive compounds.

SUSTAINABLE MARINE TOURISM: THE CASE OF BURHANİYE

Meziyet NARIN
Lecturer, Balıkesir University Burhaniye Vocational School, Tourism and Hotel Management ProgramBalıkesir-Turkey (Responsible Author), ORCID: 0000-0001-8077-1507

ABSTRACT

The United Nations World Tourism Organization (UNWTO) defines sustainable tourism as "tourism that fully considers current and future economic, social and environmental impacts and meets the needs of the industry, the environment, visitors and host communities". The concept of sustainable is of vital importance as it protects long-term economic, environmental and social life. Marine tourism includes activities such as water sports, yacht and boat trips, etc. and related hospitality services. It is envisaged to create stable local development by promoting resource efficiency and environmental sustainability in this type of tourism, which is highly integrated with other types of tourism.

With its 8333 km. long coastline with a rich history and favorable climatic conditions, Turkey has a significant potential for sea tourism on both the Mediterranean and Aegean coasts. With its seas that can experience four seasons at the same time and maintain their warmth even in winter, it is a geologically very suitable country for sea tourism. The importance of the subject emerges with this potential. It is aimed evaluate the sea tourism potential of Burhaniye District of Balıkesir, located in the Edremit Gulf of our country, which has a sea tourism potential, in terms of alternative tourism and to extend the short season to the whole year. It is also important to direct young people to marine tourism activities. In addition, it will be emphasized on what needs to be done in terms of ensuring sustainability by revealing the problems, especially the pollution factor, which is one of the factors that pose a threat to the tourism in question. In this research, qualitative research method will be used, and document analysis will be made from secondary data. Document analysis will be created by scanning written sources such as newspapers, magazines, books, reports, articles and theses.

Keywords: Sustainable Tourism, Sea Tourism, Balıkesir, Burhaniye.

SÜRDÜRÜLEBİLİR DENİZ TURİZMİ: BURHANİYE ÖRNEĞİ

ÖZET

Birleşmiş Milletler Dünya Turizm Örgütü (UNWTO) sürdürülebilir turizmi "mevcut ve gelecekteki ekonomik, sosyal, çevresel etkileri tam olarak göz önüne alan; endüstrinin, çevrenin, ziyaret edenlerin ve ev sahibi toplumların ihtiyaçlarını karşılayan turizm çeşidi" olarak tanımlamıştır. Sürdürülebilir kavramı uzun vadeli ekonomik, çevresel, sosyal hayatı koruma altına aldığı için hayati öneme sahiptir. Deniz turizmi ise, su sporları,yat ve tekne gezileri vb. gibi faaliyetleri ve bunlara bağlı ağırlama hizmetlerini içermektedir. Diğer turizm çeşitleriyle entekrasyonu yüksek olan sözkonusu turizm çeşidinde kaynak verimliliğinin ve çevrenin sürdürülebilirliğinin teşvik edilerek istikrarlı yerel kalkınmanın oluşturulması öngörülmektedir.

Türkiye 8333 km. uzunluğunda zengin tarihi barındıran kıyıları ve kuygun iklim koşulları ile hem Akdeniz hem de Ege sahillerinde deniz turizmi açısından önemli potansiyele sahiptir. Aynı anda dört mevsimi yaşayabilen ve kışın dahi sıcaklığını koruyan denizleri ile, jeolojik açıdan deniz turizmine çok uygun bir ülkedir. Konunun önemi de bu potansiyel ile ortaya çıkmaktadır. Deniz turizm potansiyeline sahip ülkemizin Edremit Körfezinde yer alan Balıkesir'in Burhaniye İlçesi'nin alternatif turizm açısından deniz turizm potansiyelinin değerlendirilerek kısa sezonun bütün yıla yayılmasının sağlanması amaçlanmaktadır. Ayrıca deniz turizm etkinliklerine gençlerin yönlendirilmesi de önem arz etmektedir. Bunun yanında sözkonusu turizm açısından tehdit unsuru oluşturan faktörlerden kirlilik unsuru başta olmak üzere sorunların ortaya konularak sürüdürlebilirliğin sağlanması açısından yapılması gerekenler üzerinde durulacaktır. Bu araştırmada nitel araştırma yöntemi kullanılarak ikincil verilerden doküman analizi yapılacaktır. Doküman analizi geçmişe dönük gazete, dergi, kitap, rapor, makale ve tez gibi yazılı kaynaklar taranmasıyla oluşturulacaktır.

Anahtar Kelimeler: Sürdürülebilir Turizm, Deniz Turizmi, Balıkesir, Burhaniye.

CULTURAL TOURISM POTENTIAL OF SAVAŞTEPE SARIBEYLER

Meziyet NARIN
Lecturer, Balıkesir University Burhaniye Vocational School, Tourism and Hotel Management ProgramBalıkesir-Turkey (Responsible Author), ORCID: 0000-0001-8077-1507

ABSTRACT

Culture is a set of tangible and intangible values that distinguishes a society from other societies, continues to change from past to present, gives an identity with its unique art, beliefs, customs, traditions, understanding and behaviors, and provides order by giving a sense of solidarity and unity. Cultural tourism is a type of tourism in which foreigners travel to experience cultural places, activities and artifacts in a region by seeing them on site. This tourism is also important as a type of tourism that develops conservation awareness and provides national and local economic gain

Located in the North Aegean, Balıkesir province is one of the prominent provinces in cultural tourism with its cultural heritage, historical artifacts, museums and ruins. The ancient cities of Antandros (Edremit-Altınoluk), Daskyleion (Bandırma-Ergili), Kyzikos (Erdek) have important historical heritage in terms of cultural tourism. However, despite its potential, Balıkesir cannot create economic, social and cultural value by highlighting its cultural heritage in tourism except for certain settlements. The aim of this study is to draw attention to the issue by revealing the tourism potential of Sarıbeyler Neighborhood in Savaştepe District of Balıkesir Province. Thus, it is envisaged to encourage the initiation of studies to contribute to the national economy with sustainable, four-season tourism income by bringing new tourism routes to the province and the region. The settlement in question is located in the North Aegean, which has hosted the oldest civilizations and has rich traditional values in terms of food culture and handicrafts. The subject is important in terms of evaluating the cultural richness of Sarıbeyler Neighborhood as tourism application areas, revealing new touristic products and transforming them into income-generating elements. In the study, archive/document scanning, one of the qualitative research methods, will be carried out and awareness will be raised by photographing the values on site, transforming them into visuals and writing these values down.

Keywords: Cultural Tourism, , Balıkesir, Savaştepe, Sarıbeyler.

SAVAŞTEPE SARIBEYLER'İN KÜLTÜR TURİZM POTANSİYELİ

ÖZET

Kültür, bir toplumu diğer toplumlardan ayıran, geçmişten günümüze değişerek devam eden, kendine özgü, sanatı, inançları, örf ve adetleri, anlayış ve davranışları ile bir kimlik kazandıran, dayanışma ve birlik duygusu vererek düzeni de sağlayan maddi ve manevi değerlerin bütünüdür. Kültür turizmi, yer yabancılarının bir yöredeki kültürel mekanları,etkinlikleri ve eserleri yerinde görerek deneyimlemek için seyahat ettiği bir turizm türüdür. Bu turizm aynı zamanda koruma bilincini geliştiren, ülkesel ve yerel ekonomik kazanç sağlayan bir turizm çeşidi olarak önem arz etmektedir.

Kuzey Ege'de bulunan Balıkesir ili sahip olduğu kültürel mirası, tarihi eserleri, müzeleri, Ören yerleri ile kültür turizminde öne çıkan illerden biridir. Antandros (Edremit-Altınoluk), Daskyleion (Bandırma-Ergili), Kyzikos (Erdek) antik kentleri bölgenin kültür turizmi açısından önemli tarihi mirasa sahiptir. Ancak sahip olduğu potansiyeline rağmen Balıkesir kültürel mirasını turizmde belli yerleşim yerleri dışında öne çıkararak, ekonomik, sosyal ve kültürel değer yaratamamaktadır. Bu çalışmanın amacı Balıkesir İli Savaştepe İlçesi, Sarıbeyler Mahallesi'nin kültür turizm potansiyelini ortaya koyarak konuya dikkat çekmektir. Böylece yeni turizm rotalarının il ve bölgeye kazandırılmasıyla sürdürülebilir, dört mevsim turizm geliri ile ülke ekonomisine katkı sağlamak için çalışmaların başlatılmasını teşvik etmek öngörülmektedir. Sözkonusu yerleşim yeri en eski medeniyetlere ev sahipliği yapmış, beslenme kültürü ve el sanatları açısından zengin geleneksel değerlere sahip Kuzey Ege'de yer almaktadır. Sarıbeyler Mahallesi'nin sahip olduğu kültürel zenginliklerin turizm uygulama alanları olarak değerlendirilmesi, yeni turistik ürünlerin ortaya çıkarılması ve gelir getirici unsurlara dönüştürülmesi açısından konu önem arz etmektedir. Çalışmada nitel araştırma yöntemlerinden arşiv/doküman taraması yapılacak ve yerinde değerlerin fotoğraflanması görsele dönüştürülmesi ve bu değerlerin yazılı hale getirilmesi yöntemiyle farkındalık artırılacaktır.

Anahtar Kelimeler: Kültür Turizmi, , Balıkesir Savaştepe, Sarıbeyler.

EXPLORING GENDER DIFFERENCES IN RISK BEHAVIOUR AND PROFIT MARGINS OF ORANGE FLESH SWEET POTATO PRODUCERS IN OSUN STATE, NIGERIA

Adebisi Luke O[b] * and Oludare Tomisona O. [b]
[b]Agricultural and Rural Management Training Institute (ARMTI), PMB 1343, Ilorin, Kwara State, E-mail: tobadebisi@gmail.com

ABSTRACT

Orange Flesh Sweet Potato (OFSP) has emerged as a vital biofortified crop contributing to food and nutrition security in Nigeria, yet its production faces significant risks that threaten farmer profitability. Despite Nigeria being among the top producers of sweet potatoes in Africa, smallholder farmers, particularly in Osun State, continue to grapple with production and market uncertainties. This study explored the gender dimensions of risk behaviour and profitability among OFSP farmers in Osun State, Nigeria. A total of 100 farmers were randomly selected, and data were collected using structured questionnaires. Analytical tools applied included descriptive statistics, the Safety-First Model, gross margin analysis, and independent t-test.

Findings revealed that key sources of production risk included pest and disease infestation (95.0%), limited access to quality planting materials (87.0%), high cost of inputs (84.0%), and price volatility (75.0%). Gender analysis of risk attitudes indicated that 68% of male farmers and 78% of female farmers were risk-averse. Profitability assessment showed that male farmers earned an average gross margin of ₦218,195.80 per hectare, which was significantly higher ($p<0.01$) than the ₦192,916.40 recorded by female farmers.

The study recommends that relevant agricultural agencies and research institutions ensure timely access to improved OFSP vines while enhancing extension services to build farmers' capacity in risk management and productivity improvement. These interventions are crucial for narrowing gender gaps in profitability and strengthening the resilience of OFSP farming systems.

ABSTRACT

The sheep gastrointestinal tract is a complex ecosystem that hosts a huge diversity of microorganisms that play a critical role in digestion, immune defense, and overall health of the animal. The distribution of these microorganisms is heterogeneous and shows a pronounced cranio-caudal gradient. Using metabarcoding techniques, the features of the cranio-caudal gradient of microorganism distribution along the gastrointestinal tract of Romanov lambs were determined. The rumen of sheep, where the main fermentation of plant fibers occurs, is usually dominated by anaerobic bacteria such as *Fibrobacter succinogenes*, *Ruminococcus albus*, and *Ruminococcus flavefaciens*, as well as methanogenic archaea such as *Methanobrevibacter*. They break down cellulose, hemicellulose, and starch into volatile fatty acids (VFA), which serve as the main source of energy for sheep. Bacteria of the genus *Ruminococcus* were also one of the dominant genera in the rumen (upper part), their share was 19%. But the most abundant genus was bacteria of the genus *SFMI01* (25%). Also among the dominant OTUs were bacteria of the family *Lachnospiraceae* (11%), genera *Limivicinus* (6%) and *Nanosyncoccus* (5%). As they move into the abomasum, the acidic environment suppresses the growth of many rumen bacteria, and acid-resistant species such as *Lactobacillus* and *Streptococcus* begin to dominate. Also, in Romanov lambs, the microbiocenosis of the lower part of the rumen turned out to be the most isolated in terms of the composition of microbes, where bacteria of the genus *Latilactobacillus* dominated (75%). The microbiota of the upper, middle and lower part of the cecum differed insignificantly. The dominant genera were Nanosyncoccus (its share was 18, 17 and 14%). *Faecousia* (10, 9 and 11%), *Lachnospiraceae* families (7, 7 and 6%), *Ruminococcus* (2% each). In the large intestine, where water absorption and feces formation occur, the microbiota undergoes changes again. The proportion of bacteria capable of fermenting undigested carbohydrates and proteins increases, including *Bacteroides* and *Prevotella*. The cranio-caudal gradient reflects the adaptation of the microbiota to different environmental conditions and functions of each section of the gastrointestinal tract, ensuring optimal digestion and assimilation of nutrients by the sheep.

ABSTRACT

The ornamental fish industry presents significant economic potential, especially in the international market, where demand for high-quality fish seed continues to grow. This study explores the breeding and seed production techniques of two widely cultivated ornamental fish species—Koi carp (Cyprinus rubrofuscus) and goldfish (Carassius auratus). Both species follow a similar induced breeding protocol, wherein synthetic hormones are administered at doses of 0.3 ml/kg body weight for males and 0.6 ml/kg for females. Post hormone administration, the brooders are released into controlled breeding tanks with regulated temperature and water flow conditions. Following successful spawning, a 2–3 day period without feeding is maintained to optimize hatchling survival. Subsequently, formulated feeds are introduced. This paper also includes an economic analysis of the breeding process, demonstrating the viability and profitability of ornamental fish seed production. The findings support scalable breeding practices to meet global market demand.

ISOLATION OF POLYPHENOLS FROM JACKFRUIT PULP AND THEIR INCORPORATION INTO CHITOSAN-BASED EDIBLE FILMS WITH ANTIOXIDANT PROPERTIES

Simran Dhingra
IK Gujral Punjab Technical University, PG Student, Department of Food Science and technology, Kapurthala, India, ORCID ID: 0009-0006-8176-1566
Simrandhingra2301@gmail.com

ABSTRACT

The present study investigates the extraction of polyphenolic compounds from Artocarpus heterophyllus (jackfruit) pulp and explores their potential as bioactive agents in the development of functional edible films. Polyphenols are known for their antioxidant activity and potential applications in enhancing food preservation and extending shelf life when incorporated into biodegradable packaging materials. Jackfruit pulp, a rich yet underutilized source of natural antioxidants, was selected for polyphenol extraction using an ethanol-based solvent system. The extracted compounds were subjected to a range of antioxidant assays, including Total Antioxidant Activity (TAA), Total Phenolic Content (TPC), Total Flavonoid Content (TFC), 2,2-diphenyl-1-picrylhydrazyl (DPPH) radical scavenging activity, and Ferric Reducing Antioxidant Power (FRAP). Additionally, a proximate analysis of the jackfruit pulp was performed to determine its nutritional composition including moisture, ash, protein, fat, and carbohydrate content.Following biochemical characterization, the extracted polyphenols were incorporated into chitosan-based edible films at varying concentrations (2.5%, 5%, and 7.5%) to assess their impact on the functional and antioxidant properties of the films. The resulting films were evaluated using the same antioxidant assays to determine the stability and effectiveness of polyphenol integration within the film matrix. Results indicated a concentration-dependent enhancement in antioxidant activity across all tests, confirming the successful retention of bioactivity in the film formulations. Notably, films with higher polyphenol concentrations demonstrated significantly greater radical scavenging capacity and reducing power.This study highlights the dual benefit of utilizing a fruit waste byproduct and enhancing the functional quality of biodegradable films, presenting a sustainable and natural alternative for food packaging applications. The findings provide promising insights into the use of jackfruit-derived bioactives in the formulation of active packaging materials aimed at improving food safety and shelf life.

DEVELOPMENT OF BROCCOLI-INFUSED BARNYARD MILLET PASTA

Shreya
I.K Gujral Punjab Technical University, PG Student, Department of Food Science and Technology, Kapurthala, India, 0009-0008-8442-317X, shreyamehandiratta6@gmail.com

ABSTRACT

The increasing demand for functional and health-oriented foods has driven innovation in pasta development using alternative grains and nutrient-rich vegetables. In this study, pasta was formulated using a 1:1 blend of barnyard millet flour and refined wheat flour, enriched with broccoli powder at four levels: 0%, 2.5%, 5%, and 10%. Barnyard millet, a gluten-free pseudocereal, is known for its high fiber, low glycemic index, and micronutrient richness, while refined wheat flour contributes to dough structure and texture. Broccoli powder, rich in antioxidants, dietary fiber, and phytochemicals, was incorporated to enhance the nutritional and functional properties of the pasta.

Proximate analysis showed a steady increase in protein content with broccoli addition, from 10.24 g in the control to 12.37 g at 10% incorporation. Ash content, indicative of mineral enrichment, also rose progressively with higher broccoli levels. Colorimetric measurements revealed a decline in lightness (L*) values from 78.99 to 75.61 and a shift in a* values from 2.49 to 0.39, indicating a greener hue. The b* values increased from 13.86 to 18.15, reflecting enhanced yellowness, particularly at higher broccoli concentrations.

Farinograph analysis of the base flour (barnyard millet and refined wheat) showed a water absorption of 53.7 mL, which increased to 58.5 mL with 5% broccoli incorporation, suggesting improved water-holding capacity due to fiber and protein interactions. Sensory evaluation revealed that pasta with 2.5% and 5% broccoli powder achieved the highest consumer acceptance, particularly in terms of flavor, texture, and appearance. Although the 10% sample exhibited superior nutritional qualities, it was less favored due to stronger vegetal flavor and darker coloration.

Overall, the 5% broccoli-enriched pasta offered an optimal balance between enhanced nutrition and sensory appeal, making it a promising functional product for health-conscious consumers seeking nutrient-dense, plant-based pasta alternatives.

GENETIC ANALYSIS OF COMPLEMENT COMPONENT 5 GENE IN MASTITIC COWS

Dr. Sehrish Firyal, Hira Anwar, Shagufta Saeed
[1] Institute of Biochemistry and Biotechnology, University of Veterinary and Animal Sciences

ABSTRACT

Pakistan is ranked fourth in milk production worldwide, after India, China, and the United States. Indigenous cattle breeds are well-known breeds for milk production globally. These breeds experiences a number of diseases such as mastitis, theileriosis, anaplasmosis, babesiosis, foot and mouth disease and lumpy skin disease. Mastitis, or inflammation of the mammary gland, is one of the most prevalent diseases that is classified by the mammary gland's inflammatory reaction. Clinical and subclinical mastitis not only lowers milk production but also lowers the nutritional content of milk, which leads to significant financial losses. Worldwide, the dairy industry suffers large and regular financial losses as a result of mastitis. This financial stress is brought on by the increased costs of treating mastitis as well as losses from a variety of problems, such as decreased milk production, rejected milk, and culling. *S. aureus* is the most significant pathogens, responsible for clinical and subclinical mastitis in all over the world. The current study was designed to sequence and analysis of the partial C5 gene in to identify single nucleotide polymorphism and to find out the association analysis of C5 gene as an indicator of mastitis in dairy animals. Sequence analysis of C5 gene aid as a molecular marker for mastitis resistance and subsequently to be used in a selection of dairy animals.

ABSTRACT

Phytochemical is a collective term for plant chemicals with varied structure and function. Solanum lycopersicum (Tomato) and Capsicum annum (Pepper) are the world's most highly consumed vegetables due to their status as basic ingredients in many raw, cooked or processed foods. The extracts for fresh and processed tomato and pepper were prepared using ethanol as solvent they were analyzed for various phytochemicals (alkaloids, flavonoids, saponins, steroids, phenolics, and tannins). The result revealed that the processing method slightly affects the presence of the phytochemical in both tomatoes and peppers. Alkaloids were absent in the processed tomato and pepper but flavonoids, saponins, steroids, phenolics, and tannins were all present in both the extracts. Based on this study both fresh and processed tomatoes and peppers can still provide essential phytochemicals associated with health benefits. However, the potential loss of alkaloids in processed form may be attributed to the use of high temperatures during the drying method. This signifies that fresh vegetables have more nutritional health benefits than processed ones but all can be consumed because most of these compounds contribute to the desired nutritional or therapeutic properties of food products.

EXPLORING THE DIGITAL LITERACY PROFICIENCY OF RURAL YOUTHS IN ONA-ARA LOCAL GOVERNMENT AREA, OYO STATE

Adelakun Olufolake E. and Bashiru Kerimot. O
Department of Agricultural Extension and Rural Development,
University of Ibadan, Ibadan, Nigeria
*Correspondence: flakyonline@yahoo.com

ABSTRACT

Digital literacy has become an essential competency in the modern world and it has the potential to equip youths' with necessary skills to navigate the digital world effectively, give access to better information and improve rural development. This study examined the level of digital literacy among rural youths in Ona-Ara Local Government Area, Oyo State, Nigeria. A multistage sampling technique was used in selecting the 120 respondents from Akanran, Gbedun and Araromi. A structured questionnaire was used to collect primary data on respondents' personal characteristics; ownership of digital devices; perception towards digital literacy; factors influencing digital literacy and level of digital literacy skills. For the analysis of the data collected, descriptive statistics (frequency, percentage and mean) and inferential (Chi-square and PPMC) were used. The result of the study revealed that majority of the respondents were female (50.8%), christians (49.2%), artisans (61.7%), had secondary education (65.0%). About (40.8%) of the respondents belonged to the age group of 18 to 22 years with a mean age of 25.48 ±5.60 years and majority (78.3%) owned smartphone. A significant proportion of them possess basic digital literacy skills and their proficiency in advanced digital tasks such as content creation, online research, and coding remains limited. The key factors influencing digital literacy were cost of devices maintenance (0.97), financial limitations (0.95) and ability to purchase a digital device (0.94). Additionally, challenges such as the high cost of digital devices (1.58), inability to afford internet subscription (1.40) and limited access to stable internet (1.10) significantly hinder digital literacy development. Despite these constraints, 56.7% had favorable perception towards digital literacy and the level of digital literacy (53.3%) among respondents was high. There was a significant relationship between respondents' age ($r = -0.361$, $p < 0.001$), years of formal education ($r = 0.471$, $p < 0.001$) and their level of digital literacy. Also, there is significant relationship between digital device ownership and digital literacy levels among the respondents. Based on these findings, the study concludes that level of literacy is slightly high. It is recommended that targeted interventions, including improved digital infrastructure, affordable digital device programs, and collaboration between the government, private sector, and non-governmental organizations (NGOs) to fund digital initiatives in rural areas for rural youths

EVALUATION OF GROWTH PARAMETERS AND ANTIOXIDANT DEFENSE MECHANISMS ON MUNG BEAN (*Vigna radiata* (L.) Wilczek) UNDER ARSENIC STRESS

Mehzabin Rehman
University of Science & Technology Meghalaya, Meghalaya, India

ABSTRACT

The present study investigated the effect of arsenic stress on mung bean (Vigna radiate (L.) R. Wilczek) through various morpho-physiological and antioxidant defense mechanisms. In mung beans, arsenic leads to a reduction in seed germination and growth, resulting in decreased productivity. Mung bean plants were exposed to different concentrations of arsenic (10, 25, and 50µM) for various durations followed by a recovery period. Various parameters such as root and shoot lengths, fresh and dry weight, chlorophyll content, membrane stability index, relative electrical conductivity, relative water content, and chlorophyll levels were evaluated. Additionally, biochemical parameters including malondialdehyde (MDA) and superoxide dismutase (SOD) activity were assessed. The experiments were conducted in a randomized block design with three replicates each. The results showed an increase in superoxide dismutase (SOD) activity in the plants with higher concentrations of arsenic, indicating their response to arsenic stress. Conversely, lipid peroxidation, a measure of cellular damage, decreased as arsenic concentration increased. This suggests that mung bean plants exhibited higher SOD enzyme activity at higher arsenic concentrations (50µM) and lower activity at lower concentrations (10µM). Membranes were found to be protected and stable at lower arsenic concentrations, but became increasingly unstable and damaged at higher concentrations. The total stress response index (TSRI), calculated based on combined morpho-physiological and biochemical parameters, revealed that mung bean plants were most affected by the highest arsenic concentration (50µM), while they were able to tolerate the lower concentration of 10µM. These findings provide valuable insights into the tolerance mechanisms employed by mung bean plants in response to arsenic stress and can contribute to the development of strategies for improving crop resilience under arsenic stress conditions.

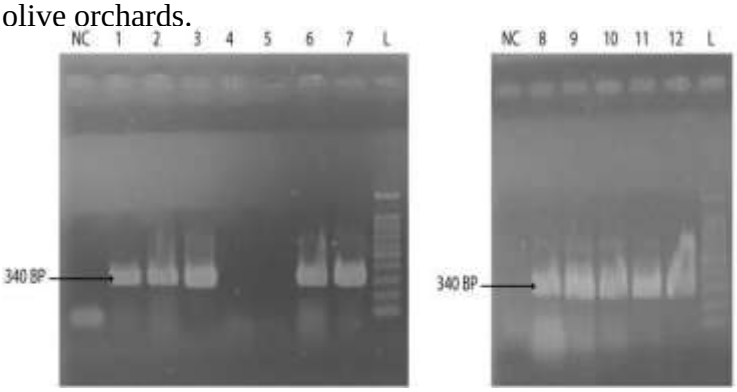
ABSTRACT

In the eastern region of Morocco, symptoms of decline and necrosis were observed on olive trees (*Olea europaea*) in several farms. Fungal isolates were obtained from infected leaves and shoots. Pathogen identification was conducted through a dual approach: morphological examination of conidia under a microscope and molecular detection via PCR amplification using specific primers AAF2 and AAR3, which confirmed the presence of *Alternaria alternata.* Pathogenicity tests were performed on healthy olive plants, and the observed symptoms were successfully reproduced, fulfilling Koch's postulates. This study represents the first report of *A. alternata* as the causal agent of olive tree decline in the eastern region of Morocco, highlighting the importance of early diagnosis and management of this emerging pathogen in olive orchards.



PROTEINS LINKED TO COLON CANCER: SYSTEMATIC REVIEW

ABSTRACT

Colorectal cancer (CRC) is a leading global health threat, with approximately 2 million new cases and 1 million deaths reported. In 2018, making it the 3rd leading cause of cancer deaths among men and 2nd among women. Beta-caryophyllene (BCP) is a naturally occurring bicyclic sesquiterpene found in various plants, including black pepper and cannabis. It has acquired attention for its potential therapeutic effects, particularly its anti-inflammatory and anticancer properties. Recent studies suggest that BCP may play a significant role in the prevention and treatment of colon cancer, a leading cause of cancer-related deaths worldwide. BCP utilize its effects through its interaction with the cannabinoid receptor type 2 (CB2), triggering anti-inflammatory pathways and promoting apoptosis in cancer cells. Furthermore, BCP has been shown to inhibit cancer cell proliferation, metastasis, and angiogenesis, all key factors in the progression of colon cancer. This review explores the molecular mechanisms underlying BCP's potential antitumor activity in colon cancer, highlighting its ability to modulate signaling pathways such as NF-κB, VEGF, Caspases, BCL-2 and MAPK. Additionally, the safety profile and pharmacokinetics of BCP are discussed, emphasizing its potential as a promising therapeutic agent in colon cancer management. Further clinical studies are ongoing to fully establish the clinical efficacy and therapeutic benefits of BCP in colon cancer treatment.

ABSTRACT

Traditional Internet of Things (IoT)-based soil health monitoring systems face several critical challenges, including poor Internet connectivity, high response time, lack of data diversity, and privacy issues, etc., because of the entire data transmission, storage, and analysis on cloud servers. To overcome these limitations, this paper proposes an intelligent framework by combining Federated Learning (FL) and dew-edge-cloud computing. In the proposed framework, the soil data collected using IoT devices are stored inside the microcontrollers for temporary storage during network unavailability through cache-based dew computing. The collected data is then transmitted to the user devices working as the edge nodes when network is available. The edge devices pre-process the data and then use it to train respective local models. In the centralized FL, the edge devices communicate with the cloud server for creating the global model. In decentralized FL, the edge devices communicate among themselves to build the global model. We have experimentally implemented both the centralized and decentralized FL frameworks. As FL is used for creating the model through collaborative learning without sharing raw data, the data privacy is protected. For precise time-series analysis, the Long Short-Term Memory (LSTM) is used to serve as the primary classifier, achieving a good effect on identifying the temporal soil parameter patterns, such as soil moisture, temperature, and nutrient content. Experimental results shows that the proposed framework ensures high prediction accuracy of 95%, and reduces the response time and energy consumption ~85%, compared to cloud-based traditional systems. The experimental results also present that the proposed LSTM-based FL framework outperforms other deep learning classifiers, and existing soil health monitoring approaches. The use of FL for privacy-preserving learning, in combination with LSTM for temporal modelling in the multi-layered network provides a scalable and secure solution for real-time, data-driven soil health monitoring. This whole framework is especially suited for connectivity-limited agricultural settings and represents a sustainable precision farming practices.

ABSTRACT

Human-wildlife conflict is a critical issue in forested and hilly regions worldwide, posing significant threats to both human safety and wildlife conservation. In the absence of effective surveillance infrastructure, farmers, forest workers, and tourists are highly vulnerable to unexpected encounters with wild animals, leading to injuries, fatalities, and property damage. The lack of scalable, real-time monitoring systems exacerbates this challenge, particularly in remote or low-connectivity areas.

To address this issue, we have developed an IoT-enabled wildlife detection system that leverages sensor fusion and artificial intelligence. Our solution integrates an ESP32 microcontroller, a camera module, infrared and ultrasonic sensors, and the YOLOv5 deep learning algorithm to achieve up to 98% animal detection accuracy. The system autonomously identifies animal intrusions and delivers real-time visual or audio alerts to nearby human activity zones.

Optimized for energy efficiency and autonomous operation, this system is ideal for deployment in rural or forest-adjacent environments with limited infrastructure. It is cost-effective, scalable, and capable of supporting broader smart surveillance applications. By combining IoT, AI, and cloud computing, the proposed solution contributes to reducing human-animal conflict, enhancing public safety, and promoting sustainable human-wildlife coexistence on a global scale.

ABSTRACT

Agriculture faces economic and environmental challenges, particularly in water management, especially in arid and semi-arid regions. In these areas, where shallow water tables are accessible and sunshine is abundant, photovoltaic solar energy is an ideal solution for pumping water. It reduces dependence on fossil fuels while being more cost-effective and environmentally friendly.

The adoption of photovoltaic pumping systems can thus improve crop productivity and boost the profitability of irrigated agriculture. This study compares three types of pumping systems—solar photovoltaic, diesel, and butane—in three different regions to assess their cost and their economic and environmental impact.

The results are clear: photovoltaic pumping is the most reliable and sustainable solution. It generates just 2.1 tonnes of CO_2 per year, compared with 29.3 tonnes for thermal pumping. What's more, the cost of pumping water is around 0.5 MAD/m³ for solar power, compared with 2 MAD/m³ for thermal systems, as illustrated in one of the regions studied (1 MAD = 0.1 USD).

Keywords: Photovoltaic Water Pumping, Fossil Fuel Pumping Systems, Spatio-Temporal Analysis, Economic Assessment, Carbon Footprint Reduction

NUTRITIONAL INFLUENCE ON MILK COMPOSITION AND OUTPUT IN DAIRY CATTLE FROM THE MITIDJA PLAIN

ABSTRACT

Algeria faces a persistent shortage of milk and dairy products, largely due to inadequate livestock nutrition, both in terms of quantity and quality. This study aimed to assess the impact of feeding dairy cows with green alfalfa and alfalfa hay on milk yield and its physico-chemical composition. Twelve Pie Noire dairy cows were selected for the experiment, which was conducted over two periods of four weeks each. During the first period, green alfalfa at the budding stage was compared with two control forages: green barley and green sorghum. In the second period, alfalfa hay was compared to a control diet also based on alfalfa hay but from a different phenological stage.The results revealed that incorporating green alfalfa at the budding stage, as well as alfalfa hay, into the cows' diet significantly improved milk yield, protein content, non-fat dry matter, and milk density compared to the control diets. However, no significant differences were observed in other physico-chemical parameters such as fat content, lactose content, acidity, and freezing point. At the flowering stage, the introduction of alfalfa did not lead to significant improvements in milk production or composition.

Keywords: Alfalfa, milk production, cows, Algeria.

ABSTRACT

The present study aimed to develop a probiotic fresh cheese, considered a functional food, using goat's milk and probiotic lactic acid bacteria belonging to the genera *Lactobacillus* and *Lactococcus*. The selected bacterial strains were first subjected to a comprehensive evaluation of their probiotic properties and technological potential. The probiotic characterization revealed that the strains exhibited strong antibacterial activity, notable resistance to acidic pH and bile salts, and good adhesion capacity to polystyrene microplates an indicator of their ability to colonize the gastrointestinal tract.

The acidifying activity of the strains was also assessed and showed that they possess excellent acidification power, an essential parameter in cheese production for ensuring microbial safety and desirable texture. Microbiological analyses of both the raw goat's milk and the six types of fresh cheese produced confirmed their good microbiological quality, indicating that the production process was hygienically controlled and safe.

Physicochemical evaluations demonstrated that both the milk used and the resulting cheeses met established quality standards in terms of composition, pH, moisture content, and acidity. These parameters remained within the acceptable range, ensuring product stability and consumer safety.

Finally, sensory evaluation revealed high scores across all tested attributes, including taste, texture, appearance, and overall acceptability, suggesting that the incorporation of probiotic

strains did not negatively affect the sensory quality of the cheese. On the contrary, the presence of these beneficial bacteria may have enhanced the product's organoleptic profile.

In conclusion, the study successfully demonstrated the feasibility of producing high-quality probiotic fresh cheese from goat's milk, integrating health benefits with desirable technological and sensory characteristics. Such a product could meet the growing consumer demand for functional dairy foods that promote gut health while maintaining traditional artisanal qualities.

Keywords: functional food, probiotic lactic acid bacteria, goat's milk, fresh cheese.

CRAFTING NUTRIENT RICH BISCUITS WITH BUCKWHEAT AMARANTH AND WHEAT FLOUR

Ruhani
[1]I. K. Gujral Punjab Technical University (Main Campus), PG Student, Department of Food Science and Technology, Kapurthala, Ruhani11901212@gmail.com

ABSTRACT

In recent years, the food industry has experienced a significant shift toward the development of nutrient-enriched, functional foods, driven by growing public awareness of health and the need for sustainable dietary practices. Biscuits, a widely consumed snack across all demographics, are commonly made using refined wheat flour, which lacks several key nutrients such as essential amino acids, dietary fiber, and antioxidants. This study investigates the potential to enhance the nutritional composition of biscuits by blending wheat flour with flours derived from pseudocereals such as **amaranth (Amaranthus spp.)** and **buckwheat (Fagopyrum esculentum)**. These grains are noted for their excellent protein quality, complete amino acid profiles, and the presence of health-promoting bioactive compounds with benefits like blood sugar regulation, cardiovascular protection, anti-cancer properties, and blood pressure control.

The experimental framework includes **proximate analysis**, **evaluation of functional properties**, and **assessment of antioxidant activity** of each flour type. These were followed by the development of biscuit formulations with different concentration enriched with the pseudocereal flours. Sensory evaluations were conducted to ensure consumer acceptability in terms of taste, texture, and appearance. The findings indicate that incorporating amaranth and buckwheat significantly improves the biscuits' nutritional value by boosting fiber content, antioxidant levels, and essential micronutrients—without negatively impacting sensory quality. This research supports the use of locally accessible and cost-effective pseudocereals to produce nutritious, functional biscuits that cater to health-conscious consumers, including those adhering to gluten-free or plant-based diets.

OPTIMIZATION OF HYDROLYSIS PARAMETERS FOR MAXIMUM TOTAL SUGAR EXTRACTION FROM VEGETABLE PEEL WASTE USING THERMO-CHEMICAL HYDROLYSIS

ABSTRACT

This study aimed to optimize the hydrolysis conditions for maximizing total sugar extraction from vegetable peel waste, a byproduct obtained after oil extraction. The pre-treatment process included washing, drying, grinding, and sieving to ensure particle uniformity. Thermo-chemical hydrolysis was employed using hydrochloric acid (HCl) as the catalyst. Eight experimental runs were conducted by varying key parameters: HCl concentration (0.5–3 M), solid/liquid ratio (2–20), temperature (40–80°C), and hydrolysis duration (45–180 min).

The optimal conditions for achieving the highest total sugar yield (206 g/L) were identified as : HCl concentration = 0.5 M, solid/liquid ratio = 10, temperature = 60°C, and duration = 120 min. These parameters ensured efficient breakdown of cellulose and hemicellulose into fermentable sugars while minimizing acid consumption and energy usage. The results demonstrate the potential of vegetable peel waste as a low-cost, renewable feedstock for biofuel and biochemical production, contributing to sustainable waste valorization.

Keywords: *Sugar extraction optimization, Vegetable peel waste valorization, Thermo-chemical hydrolysis, Acid concentration effect, Renewable bioresource*

ABSTRACT

Opuntia cactus is a horticultural crop, which is extensively used as food for humans and feed for animals in many countries of the world. This crop has widely adapted to different parts of Tunisia and is an integral part of the culture and economy of arid and semi-arid zones of the country. Recently, to fulfil the demand for large-scale cultivation in a short period by rapid mass multiplication, *in vitro* organogenesis and embryogenesis experiments were conducted with the aim of developing a protocol for *in vitro* propagation of local cactus from areole explants and *in vitro* selection of local cactus for salinity tolerance and resistance. For the first experiment, a reliable strategy was followed for micropropagation of *Opuntia ficus-indica* (L.) and *Opuntia robusta* L. cactus in the presence of the growth regulators, 6-benzylaminopurine (BAP) and metatopolin (mT), at four different concentrations (0.5, 1, 2 and 3 mg/l) and via callogenesis with 2,4-D and picloram at 2, 4, 6 and 8 mg/l. Results of the first experiment revealed that best values of shoot evolution for the 2 cactus species was recorded on media supplemented with 1 and 3 mg/l BAP, mainly. Media with mT lead to vitroplants with less quality. *Opuntia robusta* vitroplantlets show better evolution results than *Opuntia ficus-indica* vitroplantlets. In the second experiment, large and compact calli were initiated on MS medium enriched with 2 and 4 mg/l picloram. For salinity stress tolerance, a decreasing pattern in number and quality of cactus shoots and calli were observed with increasing salinity levels and widely affected at 8 and 10 g/l NaCl. On media with 2, 4 and 6 g/l of NaCl, plantlets show a normal morphologic evolution indicating that cactus can tolerate relatively high salinity levels.

Keywords: Opuntia cactus, mT, *in vitro* propagation, NaCl, salinity stress.

GOVERNANCE, DIGITALIZATION AND MEDICAL RECORD PRIVACY: A LEGAL AND ETHICAL INQUIRY

ABSTRACT

The rapid digitalization of healthcare systems has transformed the management and accessibility of medical records, offering significant benefits in terms of efficiency, data sharing and patient care. However, this transformation also presents complex legal and ethical challenges concerning the confidentiality and protection of sensitive health information.

This paper explores the intersection of governance structures, technological advancements and privacy rights within the context of electronic health records (EHRs) and broader e-governance frameworks. Through a critical examination of national and international legal instruments, including data protection laws such as the General Data Protection Regulation (GDPR) and health-specific regulations like HIPAA, this study evaluates the adequacy of existing legal safeguards in ensuring patient privacy. In addition, it investigates ethical considerations surrounding informed consent, data ownership and the balance between individual rights and public interest in healthcare innovation.

The paper also highlights governance mechanisms and institutional responsibilities that are essential for upholding privacy standards in digital health infrastructures. Case studies from various countries are used to illustrate the practical implications of differing legal approaches and governance models.

Ultimately, this inquiry argues that effective protection of medical record confidentiality in the digital age requires a multi-layered strategy combining robust legal frameworks, ethical guidelines and accountable governance. Such an approach is vital for building public trust and promoting responsible digital transformation in healthcare.

ABSTRACT

With increasing consumer awareness regarding health and nutrition, there is a growing demand for innovative bakery products made with functional ingredients. This study aimed to develop, standardize, and evaluate a nutrient-enriched healthier brownie using alternative flours and natural ingredients, while also assessing consumer acceptance through a structured survey. Two types of brownies—cakey and fudgy—were formulated using finger millet, dates, and apple pomace, replacing refined flour and sugar to improve nutritional quality. The formulations were optimized based on texture, moisture, and palatability through iterative trials. Nutritional profiling was performed to analyse parameters such as moisture, ash, fat, protein, crude fibre, and antioxidant activity. Textural properties were measured instrumentally. A consumer acceptance study was conducted in two phases: (1) a sensory evaluation using a 9-point hedonic scale involving semi-trained panelists to assess appearance, flavour, texture, aroma, and overall acceptability, and (2) a consumer perception survey to evaluate awareness, preferences, and willingness to purchase healthier bakery alternatives. The results revealed that the millet-based cakey brownie and the date-apple fudgy brownie exhibited significantly enhanced fibre and antioxidant levels compared to conventional brownies. Sensory scores indicated high acceptability across most parameters. The consumer survey showed that over 80% of respondents were willing to shift to healthier bakery options if taste and texture were satisfactory, highlighting strong market potential. This study demonstrates the successful integration of underutilized natural ingredients and by-products in bakery innovation, aligning with both health-focused trends and sustainable food development.

Keywords: Brownie, Health benefits, Consumer behaviour, Food industry, Millets, functional ingredients dates, apple pomace, sensory evaluation, health-oriented bakery, clean label, food innovation.

URBAN AGRICULTURE AND FOOD SECURITY IN CITIES

Michael, Sheila Ojei
Admiralty University of Nigeria
Department of Biology and Forensic Science
Email: ojeisheila@gmail.com, ojei-forensic@adun.edu.ng

ABSTRACT

Rapid urbanization and the increasing vulnerability of global food systems highlight the need for innovative solutions to ensure food security in cities. Urban agriculture, defined as the cultivation, processing, and distribution of food within urban areas, offers a sustainable approach to address these challenges. This paper explores the potential of urban agriculture to enhance food security while contributing to economic, social, and environmental sustainability. The study examines how urban agriculture can mitigate food deserts, reduce food miles, and improve access to fresh, nutritious produce for urban populations. Key technological innovations, such as vertical farming, hydroponics, and aquaponics, are analyzed for their scalability and applicability in dense urban settings. Furthermore, the paper investigates the role of policy frameworks, community engagement, and private-public partnerships in overcoming barriers such as land scarcity, resource management, and economic constraints. Case studies that illustrate successful integration of urban agriculture into urban planning, emphasizing the positive impacts on local economies, community well-being, and environmental resilience is elucidated. The paper concludes by proposing a roadmap for scaling urban agriculture initiatives globally, with recommendations for stakeholders to address policy gaps, foster innovation, and promote sustainable urban food systems. Research underscores urban agriculture as a vital strategy for achieving food security in cities while advancing the United Nations Sustainable Development Goals (SDGs), particularly SDG 2 (Zero Hunger) and SDG 11 (Sustainable Cities and Communities).

Keywords: Urban agriculture, food security, sustainable cities, vertical farming, urban planning, food systems.

GROWTH PERFORMANCE AND HAEMATOLOGY EFFECTS OF DIETARY MIXTURE OF GINGER (*Zingiber officinale* L.) AND GARLIC (*Allium sativum* R.) ON CATFISH (*Clarias gariepinus* Bruchell 1822) JUVENILES

ABSTRACT

The present study aimed at determining the effects of medicinal herbs on growth, and hematological parameters on juvenile catfish. This study was conducted to investigate the effects of ginger and garlic as dietary supplements on the growth performance and haematological parameters of *Clarias gariepinus* juveniles using standard methods and procedures for a period of 8 weeks at the University of Abuja research farm, Abuja. In this study, a total of 540 catfish juveniles were used, the fish were randomly allocated into six dietary groups with 30 birds per replicates in a completely randomized design. The control group T6 was fed a basal diet only, while the experimental groups received diets in which ginger and garlic was amended with at different proportions. The treatments were T1 100 % ginger and 0 % Garlic, T2 (75%Ginger and 25% Garlic), T3 (50% Ginger and 50% Garlic), T4 (25% Ginger and 75% Garlic), T5 (0% Ginger and 100% Garlic), the experiment was carried out over a period of 8 weeks. The result shows that the inclusion of T5 (100%garlic) have significantly($p>0.05$) higher growth performance followed by T6 (Control), while T1 (100% ginger) has the lowest growth performance among the treated groups. There were significant differences changes in the heamatology of Clarias gariepinus fed different levels of garlic and ginger, but the highest values for red blood cells (2.68±0.29), heamoglobin (7.17±0.13), packed cell volume (33.4±2.15), mean corpuscular haemoglobin concentration (24.94±1.12) and in lymphocytes (3.09±1.17) were observed in T2 (75% Ginger and 25%Garlic). Highest mean corpuscular volume (146.8±1.59) mean corpuscular haemoglobin(31.21±1.07), and esinophil (0.20±0.01)were seen in T3(50%Ginger and 50%Garlic), while control (T6) has the highest white blood cell (5.85±1.05)and lymphocytes (3.16±1.00)were observed in T6 (Control).This results shows that fish fed withT5 (100% garlic) had better growth and haematology parameters and its therefore recommended for use in fish diet.

GROWTH, YIELD AND QUALITY RESPONSE OF SWEET CORN (*Zea mays* L. *Saccharata Sturt*) ON THE APPLICATION OF *BIOFERTILIZER* DAN TRICHO-COMPOST

Darwin H. Pangaribuan[1)], Koes Hendarto[1)], Anggun Anggraini[2)]
1) Lecturer of Agrotechnoloy Department, Agriculture Faculty, Universitas Lampung, INDONESIA
2) Alumni Agrotechnoloy Department, Agriculture Faculty, Universitas Lampung, INDONESIA
Jln. Soemantri Brodjonegoro 1, Bandar Lampung 35145,

ABSTRACT

Sweet corn production can be improved by organic cultivation by utilizing biofertilizer and compost rich in Trichoderma. This research used Randomized Block Design (RBD) with 6 treatment, single fertilizer recommendation (Urea 300 kg ha^{-1}, TSP 150 kg ha^{-1} and KCL 100 kg / ha (P0), bio fertilizer + tricho-compost dose 20 ton ha^{-1} + half fertilizer (P1), biological fertilizer and trichocompos dose 15 ton ha^{-1} + half of inorganic fertilizer (P2), biological fertilizer and tricho-compost dose 10 ton / ha (P3) + half of inorganic fertilizer, bio fertilizer and tricho-compost dose 5 ton / ha (P4) + half of inorganic fertilizer, biological fertilizer (P5), and each treatment was repeated three times. The results showed that the application of tricho-compost fertilizer with doses of 15 tons ha^{-1} combined with biological fertilizer is a treatment that can reduce the use of fertilizer recommendations by half, resulting in the highest production of sweetcorn and increased respiration and the population of bacteria and fungi in the soil. The technology of biological fertilizer can reduce the recommended dosage of the use of compost so that it can be adopted by farmers.

Keywords: Organic Farming, Plant Nutrition, Trichocompost, Sweet corn

INFLUENCE OF HEAVY METAL CONCENTRATION ON THE DISTRIBUTION BETWEEN MACRONUTRIENTS IN GOAT MILK

Chira Maria-Natalia[1]
[1]"Ștefan cel Mare" University of Suceava, Faculty of Food Engineering, Suceava, Romania
[1]ORCID ID: https://orcid.org/0009-0008-3571-7905
[1]Email: natalia.cotos@student.usv.ro

ABSTRACT

The study aims to investigate the distribution of some toxic heavy metals—lead (Pb) , cadmium (Cd) and of an essential trace element, copper (Cu), between the macronutrients of goat milk (casein, whey, and fat) during the acid coagulation process. The goat milk used was sourced from a micro-farm in Suceava County. Three contamination levels were assessed based on the maximum admissible limits established by Regulation (EU) 2023/915 for lead (Pb), Regulation (EC) 396/2005 for copper (Cu), and Codex Alimentarius for cadmium (Cd). Fractional separation of milk components was achieved via a sequential protocol: centrifugation for lipid extraction, followed by acid precipitation controlled via pH monitoring for casein-whey differentiation. Quantification of metal concentrations was performed using flame atomic absorption spectrophotometry (FAAS) for Cu and graphite furnace atomic absorption spectrophotometry (GFAAS) for Pb and Cd.

At contamination levels corresponding to the regulatory maximums (0.020 mg/kg for Pb, 0.010 mg/kg for Cd, and 2 mg/kg for Cu), metal ions showed a predominant affinity for casein (>85%), with limited partitioning into whey (<15%). At medium concentrations of 10 times the maximum permissible limit and high concentrations of 50 times the maximum permissible limit for lead (Pb) and cadmium (Cd) and 25 times for copper (Cu), respectively, a significant copper migration to the lipid phase was observed in a proportion of 30%, while for lead and cadmium an increase in migration to whey was observed in a proportion of 25% for lead and 40% for cadmium, due to saturation of the binding sites in casein. The results highlight the influence of heavy metal concentration on the macronutrients structure in goat milk. Heavy metal (Pb, Cd, Cu) contamination of raw materials significantly influences dairy manufacturing processes, affecting the quality, safety and yield of finished products through their effects on macronutrients.

Keywords: goat milk; heavy metal; metal distribution; food contamination;

ABSTRACT

The paper aims to identify the role of agricultural entrepreneurship for the economy in the digital age, by analyzing the impact of technological innovation and circular economy approaches on the development of agri-food small and medium-sized enterprises (SMEs) as a very important factor in the economic development of a country. The agricultural sector is experiencing a fundamental transformation as a result of two major global trends: the digitalization of the economy and the need for environmental sustainability. Through a theoretical-empirical approach, the study explores the ways in which digital technologies – including precision agriculture, smart sensors, agricultural drones, artificial intelligence and supply chain management platforms – are affecting the improvement of productivity, transparency and sustainability of agricultural SMEs. At the same time, the adoption of circular economy models in agriculture, such as the recycling of organic waste, water reuse, and the circulation of resources in production and processing, is addressed. The study draws on case studies from rural regions of South-East Europe, highlighting good practices, common challenges and the gap between technological potential and actual implementation capacities. Particular attention is also paid to the role of public policies, access to rural finance and the need for digital capacity building among farmers and rural entrepreneurs. The findings highlight that in order to achieve a sustainable transformation of agriculture, it is essential to build a rural innovation ecosystem that connects agricultural entrepreneurship with technology, the circular economy and institutional support. The paper contributes to the academic debate and policy development by providing an integrated framework for increasing the competitiveness, sustainability and resilience of SMEs in the agricultural sector.

OPTIMIZING GOAT SEMEN CRYOPRESERVATION: IMPACT OF EXTENDER TYPE ON POST-THAW SPERM QUALITY

Asmaa Sayah[a*], Karim Benhenia[b]
[a] High National Veterinary School, 16270, Street Isaad Abbes, Oued Smar, Algiers, Algeria. (a.sayah.vet@gmail.com)
[b] Animal Biotechnology Laboratory, Division of Biotechnology and Health, Biotechnology Research Center (CRBt), Constantine, Algeria.
Email: a.sayah@etud.ensv.dz

ABSTRACT

Semen cryopreservation is an important biotechnology for genetic improvement, biodiversity conservation, and the dissemination of superior traits in goat breeding. Despite significant advancements, the cryopreservation process imposes considerable stress on spermatozoa, leading to structural and functional impairments that compromise post-thaw fertility.

The aim of this study was to evaluate the impact of egg yolk-based and liposome-based extenders on the post-thaw quality of goat sperm, with the objective of identifying optimized cryopreservation protocols that enhance sperm viability, motility, and overall fertility potential.

Recent research has focused on refining cryopreservation protocols specific to caprine semen, emphasizing extender composition, cryoprotectant selection, and antioxidant supplementation. Particular attention is given to the physiological characteristics of goat sperm that influence cryotolerance, including membrane lipid composition and seminal plasma sensitivity. Experimental results demonstrate that extender formulation significantly affects post-thaw motility, membrane integrity, and DNA stability. These findings highlight the necessity of species-specific approaches and the development of standardized evaluation methods to improve reproducibility and fertility outcomes. Enhancing semen cryopreservation techniques in goats will contribute to more effective breeding strategies and sustainable livestock production systems.

Keywords: goat, semen cryopreservation, sperm quality, extender, fertility, biotechnology

DEVELOPMENT OF WHOLE WHEAT BISCUITS FORTIFIED WITH MUSA SPECIES (PARADISICA) INFLORESCENCE

Kanika Sharma[1]
[1]I. K. Gujral Punjab Technical University (Main Campus), PG Student, Department of Food Science and Technology, Kapurthala, India.

ABSTRACT

The present study investigates the development and comprehensive characterization of whole wheat biscuits fortified with banana (Musa paradisiaca) inflorescence, a nutritionally rich yet underutilized part of the banana plant. With rising consumer interest in functional and fibre-enriched foods, this research aims to utilize banana inflorescence to enhance the nutritional quality of baked products while promoting sustainable food processing practices. The core objective was to develop a value-added bakery product by incorporating different concentrations of banana inflorescence powder into whole wheat flour and to evaluate the resultant biscuits for sensory, nutritional, physicochemical, and functional attributes. The formulation involved blending whole wheat flour with banana inflorescence powder at varying levels, along with traditional ingredients such as cow ghee, milk, and powdered sugar. The incorporation of banana inflorescence was carefully optimized to maintain product palatability while delivering health benefits. The prepared biscuits underwent sensory evaluation by a semi-trained panel to assess parameters such as appearance, taste, texture, flavour, and overall acceptability. The sensory data revealed that biscuits with moderate levels of banana inflorescence had high consumer acceptability, indicating that the inclusion of this ingredient does not negatively affect sensory attributes and can, in fact, enhance the product's appeal. Proximate analysis was conducted to determine the moisture, fat, ash, protein, fibre, and carbohydrate content of the fortified biscuits. The results showed a significant increase in dietary fibre and ash content with increasing levels of banana inflorescence, reflecting its nutritional contribution. Physicochemical properties such as spread ratio, hardness, and colour values (L\, a\, b*) were also analysed. The addition of banana inflorescence influenced the texture and colour characteristics of the biscuits, with darker hues and slightly firmer textures noted at higher fortification levels. Special emphasis was placed on dietary fibre content due to its known physiological benefits, including promotion of gastrointestinal health. The fibre in banana inflorescence has the potential to undergo fermentation in the colon, leading to the production of short-chain fatty acids (SCFAs) like acetate, propionate, and butyrate, which are known to contribute to gut health, regulate metabolic activity, and exert anti-inflammatory effects. This study demonstrates the viability of using Musa paradisiaca inflorescence as a functional ingredient in baked products.

ABSTRACT

To begin with, the development of artificial intelligence in Türkiye shows that the country took crucial steps in the last years in the development, implementation, promotion, and dissemination of artificial intelligence technologies. What is more, reputed specialists worldwide believe that Türkiye's adaptation to artificial intelligence represents a successful model. Furthermore, recent international reports highlight the pivotal position held by Türkiye these days in terms of the strategic advantage for cross-continental artificial intelligence collaboration. The current study addresses the benefits derived from the fact that the country has a strategic location between Europe and Asia which offers a unique advantage in supporting the United Nations' Sustainable Development Goals by leveraging development through research and innovation. In continuation, the research paper centers on the advantages and the challenges faced by Türkiye as a worldwide acknowledged center of artificial intelligence innovation and research, constantly driven by the rapid advancements in the field. The complex analysis tackles the findings displayed in major documents published on Türkiye and artificial intelligence, starting with the country's reports on the National Artificial Intelligence Strategy and continuing with the Türkiye's government steps taken to recognize and promote the importance of artificial intelligence innovation as well as the artificial intelligence adoption across various sectors. In addition, the manuscript delves into outlining the way in which Türkiye focuses on establishing robust governance frameworks with the help of the existing detailed strategy for the artificial intelligence implementation.

ABSTRACT

Consumers are paying more and more attention to food safety. Meat, being a perishable product, is prone to spoilage under the influence of microbiological, chemical and physical factors, and its quality is assessed by sensory, physical, chemical and microbiological analysis. The degradation process involves changes in color, texture, pH, and unpleasant odor resulting from the formation of volatile compounds NH_3 and H_2S.

Industrial methods for monitoring the degree of meat spoilage have been developed, such as pH sensors, gas sensors, biosensors, electronic noses, but these methods are expensive, require digital applications, and the packaging contains electronic components that are not reused.

In order to maintain quality standards, the food industry needs a fast and sustainable method to monitor animal products. In this context the use of intelligent packaging offers an innovative solution for the industry. At the beginning of their development, these systems were based on synthetic colorants (bromothymol blue) but their toxicity has led to a switch to safe and biodegradable plant compounds such as anthocyanins, natural water-soluble pigments of the flavonoid family. These compounds can be extracted from fruits, vegetables, flowers, or food waste (peelings), which account for about 30-50% of the weight of food.

Anthocyanins have a remarkable ability to change their color depending on the pH of the environment, from red in acidic conditions to blue or yellow in alkaline environments. They are also compatible with a wide range of bipolymers (starch, alginate) enabling the development of pH-sensitive films. These characteristics have allowed the realization of a wide range of packaging for different types of meat. The anthocyanin-based film can record the pH variation during the meat alteration process by changing color. So consumers can easily identify spoiled products without opening the packaging. Smart packaging is becoming a necessity to combat food waste and reduce illness.

ABSTRACT

The Traveling Salesman Problem (TSP), one of the oldest and most extensively studied combinatorial optimization problems, has roots tracing back nearly 300 years. Its practical extension into real-world logistics came in 1959 when George Dantzig and John Ramser introduced the Vehicle Routing Problem (VRP), modelling the efficient distribution of goods using a fleet of vehicles. In 1987, Marius Solomon and Antoon Kolen independently laid the groundwork for the Vehicle Routing Problem with Time Windows (VRPTW) and its capacitated version (CVRPTW), proposing heuristics and benchmark datasets that have since become industry standards. Since then, the academic focus has largely remained on minimizing total travel distance or total cost within feasible time windows, especially as exact solution methods (e.g., brute-force algorithms) are only effective for problem sets with fewer than 100 delivery points. For larger-scale problems, heuristic and metaheuristic approaches are widely adopted. However, beyond shortest distance or cost minimization, several other critical performance indicators remain underexplored—particularly route balance, vehicle load distribution, and system responsiveness to dynamic demand shifts. This study seeks to address this gap by presenting a comparative analysis of CVRPTW solution sets that vary in the number of delivery points, all mapped within a fixed geographical plane. The aim is to highlight how increasing the number of delivery points influences not only total travel distance, but also less commonly discussed efficiency metrics that reflect the operational quality and adaptability of the routing system. Such an analysis contributes to a more comprehensive understanding of CVRPTW performance in practical, real-world scenarios.

ABSTRACT

Metal–matrix composites (MMCs) combine the ductility and toughness of metallic matrices with the high hardness and wear resistance of ceramic reinforcements, making them ideal for demanding applications in aerospace, automotive, and tooling industries. Powder metallurgy (PM) techniques enable near-net-shape fabrication, uniform reinforcement distribution, and minimal material waste, offering precise control over composite microstructures. Among available ceramic additives, boron carbide (B_4C) stands out due to its exceptional hardness, low density, and chemical stability. The complex interplay of PM parameters and reinforcement levels necessitates systematic evaluation; design of experiments (DOE) methods, especially response-surface methodology (RSM), provide efficient mapping of process–property relationships with fewer experimental trials.

In this study, Ni–Mo alloyed steel powder was reinforced with 1.0 and 1.5 wt.% B_4C via PM processing. The resulting composites were subjected to dry adhesive wear testing using a point-contact pin-on-disc configuration. A DOE based on RSM was employed to evaluate the effects of sliding distance, normal load, and B_4C content on wear performance. Results showed that increasing B_4C reinforcement led to a significant reduction in wear rate, while longer sliding distances and higher loads increased material loss. An empirical model was developed from the RSM analysis to describe the wear behaviour of B_4C-reinforced Ni–Mo steel MMCs.

ABSTRACT

An accident is a specific, unexpected, unusual, and unintended external action that occurs in a particular time and place with no apparent and deliberate cause but with marked effects. Carelessness of the driver is the major factor in such accidents. The traffic authorities give a lot of instructions to the vehicle operators. But many of them do not obey the rules. Nowadays most countries are forcing motorcyclists to wear the helmets and not to use vehicles when the are in a drunken condition. Every day around the world, a large percentage of people die from road accidents. An effective approach is made to solve the problem by using smart helmets. A smart helmet is a special idea that makes motorcycle driving safer than before. To build a safety system that is integrated with the smart helmet and intelligent bike to reduce the probability of two-wheeler accidents and drunk driver cases. A smart helmet provides help in case of an accident by using GSM and GPS technology. The system consists of two modules: a bike module and a headgear module. The headgear module consists of a capacitive touch sensor, a strap switch, and an alcohol sensor. The bike module consists of an accelerometer, a GPS-GSM module, and an abort switch. The two modules have been designed in such a way to work in sync with each other using wireless communication. A capacitive sensor is placed inside the helmet where the actual human touch can be sensed. This sensor works on the principle of capacitance and has an excellent ability to monitor the change in capacitance. If a biker attempts to start the bike without wearing the helmet, it sends a signal to the bike module, which prevents the ignition. The output capacitance increases if a conductive object touches or approaches the sensor electrode. The strap switch to ensure the fastening of the strap belt of the helmet has been used here. This also ensures that the helmet will not fall off during the ride or sudden impact. Also, the ignition of the bike engine cannot be affected without locking the strap belt; it will not start. Alcohol sensor MQ3 is used here for detecting the alcohol concentration present in the driver's breath. The emergency SOS is inbuilt in the helmet that sends emergency signal to the registered contacts and to the nearest hospital with the exact location of the accident zone. A special feature is also implemented that the helmet have the QR code on the backside which has the details of the rider and also the medical history of the raider that can be accessed only by the hospital. The alcohol sensor is connected to the MCU through an interfacing circuit, and the helmet-sensing switch is directly connected to the MCU. The sensor provides an analog resistive output based on the alcohol concentration. MCU is the microcontroller unit, which controls all the functions of other blocks in this system. The MCU takes or reads data from the sensors and controls all the functions of the whole system by manipulating these data. MCU receives data from these sensors, and it gives digital data corresponding to the output of sensors to the encoder only if the two conditions are satisfied.

THE INFLUENCE OF GENDER ON UNIVERSITY STUDENTS' ACADEMIC SPENDING IN THE DIGITAL ERA: A CASE STUDY OF STUDENTS IN PADANG

Yerida Yenti
Universitas Metamedia

ABSTRACT

This study investigated the influence of gender on university students' academic spending in the digital era, focusing on students in Padang. Data was collected from 111 students across three universities in Padang: Universitas Negeri Padang, Universitas Metamedia, and Universitas Islam Negeri Imam Bonjol Padang. Student expenditures were categorized into low (< Rp190,000), medium (Rp190,000 – Rp315,000), and high (> Rp315,000) using a percentile approach, as the expenditure data was not normally distributed. A Chi-Square test revealed a statistically significant relationship between gender and academic spending ($\chi^2 = 10.428$; df = 2; p = 0.005). The findings indicate that male students tend to have higher academic expenditures, while female students are more frequently in the low spending category. This difference is likely due to varying learning preferences and styles, digital device ownership and investment, time flexibility and additional activities, social habits and technology access, and how gender influences funding sources. These results highlight the importance of considering gender in developing digital-based educational policies to support students' specific needs.

ABSTRACT

This study examined the effects of Brain focus learning strategies for improving high performance among secondary schools students. The study adopted quasi-experimental research design with pre-test and post-test control group approach. The population for this study consisted of 700 students in public secondary schools in Obio Akpor Local Government Area of Rivers State. A total of one hundred and eighty (180) senior secondary students who are actively engaged in learning mathematics were randomly selected from two selected schools. A purposive sampling technique was used to select two schools (one serves as experimental group while the other serves as control group).Three research questions and three null hypotheses guided the study. The simple random sampling technique was drawn from the sample used for the study. An instrument titled: Brain Focus Learning Strategies Questionnaire (BFLSQ) and Mathematics Achievement Test (MAT) were used in collecting data for the study and it was developed by the researcher. The instrument used for this study was subjected to face and content validation. Test –retest was used to establish the reliability of the instrument and it has index of 0.85. Both primary and secondary sources of data were used to gather information for the study. The information obtained was then analyzed using descriptive and inferential statistics (Mean, Standard deviation. t-test and Anova). The analysis indicated that the use of brain focus techniques in learning strategies proved to be effective method in enhancing students mathematics performance. The study also recommended among others that schools should provide training for teachers on how to implement theses strategies effectively.

ABSTRACT

The semiconductor industry is a cornerstone of modern technological advancement, underpinning innovations in computing, communications, automotive systems, and artificial intelligence. Over the past few decades, the industry has witnessed exponential growth, driven by Moore's Law, advances in fabrication technology, and rising global demand for smart and connected devices. This paper provides a comprehensive overview of the semiconductor industry's historical evolution, key growth drivers, current market dynamics, and future prospects. It examines the shift from traditional silicon-based fabrication to emerging materials and heterogeneous integration, as well as the role of geopolitical factors, supply chain constraints, and government policies. Through data-driven analysis and case studies, the paper highlights the challenges and opportunities facing semiconductor manufacturers, foundries, and design firms in an increasingly AI- and data-centric world. The study concludes with strategic insights into sustaining innovation and resilience in a post-Moore's Law era.

ABSTRACT

Sustainable development has influenced all spheres of life, including the banking system. Climate change remains a critical global concern, prompting countries to adopt measures aimed at reducing its negative impact. Banks play a vital role in the economy and make significant contributions to advancing sustainable development goals.

This study aims to analyze the factors that hinder the development of green banking, as well as the advantages associated with its adoption, based on the perceptions of employees in commercial banks in Albania. A total of 200 questionnaires were completed by employees of commercial banks operating in the country. The survey was distributed online and divided into three parts: the first focused on demographic factors, the second on barriers to adoption, and the third on the perceived benefits of green banking.

The results show that key barriers to green banking include the complexity of evaluating green projects, the lack of well-trained staff for green credit assessment, the absence of specific guidelines from the Bank of Albania, the lack of a supportive legal framework from the government, and low demand for green loans. On the other hand, employees identified several advantages of green banking, including higher long-term profits for banks, meeting customer demand, providing environmental benefits, reducing paper usage, and conserving energy.

REPRESENTATION SYSTEMS AND THE MITIGATION OF PROBABILISTIC FALLACIES

Carla Santos

Polytechnic University of Beja and NOVAMath-SST-New University of Lisbon, PORTUGAL

ORCID: 0000-0002-0077-1249, carla.santos@ipbeja.pt

ABSTRACT

Conditional probability is a fundamental concept in probability theory, essential for decision-making under uncertainty and widely applied in fields such as medicine, engineering, finance, and data science. It provides a framework for updating probabilities as new information becomes available, allowing for more informed predictions and analyses. Despite its importance, conditional probability is frequently misunderstood. Its apparent simplicity often leads to misinterpretations and errors, commonly referred to as probabilistic fallacies. These fallacies, such as the fallacy of the transposed conditional, can result in significant mistakes in reasoning and decision-making. To address these misunderstandings, various representation systems may be used to facilitate the correct comprehension and application of conditional probability. Each system offers unique strengths and limitations in visualizing and solving conditional probability problems. The choice of representation often depends on the specific problem and the user's familiarity with each method. By understanding and appropriately utilizing these tools, students and practitioners can enhance their ability to solve conditional probability problems accurately, thereby reducing the occurrence of probabilistic fallacies.

In this work, we examine three such systems: Venn diagrams, tree diagrams, and contingency tables, and analyze the advantages and disadvantages of each representation system, with a particular focus on their potential to eliminate, or at least mitigate, the probabilistic fallacies that frequently arise when solving conditional probability problems.

Keywords: conditional transposed fallacy, contingency table, probabilistic falacies, tree diagram, venn diagram

THE ROLE OF TOURISM MARKETING IN OPTIMIZING CITY TOURISM IN JORDAN-SOUTH LEVANT - AMMAN CASE STUDY

Mr. Faisal Hussein
Researcher in PESS (Pioneers Education, Social Sciences)
Email fh1704597@gmail.com, Amman-Jordan

Prof. Dr. Mohammed Waheeb
Hashemite University, Queen Rania College of Tourism and Heritage, Department of Sustainable Tourism, Email**:** mwaheeb@hu.edu.jo

ABSTRACT

Digital marketing is a highly effective tool in developing urban tourism by creating a strong digital identity through official websites showcasing attractions, activities, and events, as well as using engaging visual content and user-generated stories to promote the city's appeal. Enhancing visibility on search engines by targeting specific keywords helps boost the city's ranking in search results. Social media platforms play a central role in displaying tourism experiences and collaborating with travel influencers to reach broader audiences. Additionally, paid digital ads and email marketing help directly promote offers and events, while virtual and augmented reality technologies offer interactive previews of destinations, increasing travel intent. Also data analysis is essential for understanding audience behavior and continuously improving marketing performance.

The Greater Amman Municipality has launched several tourism initiatives aimed at enhancing the city's status as a local, regional, and international tourist destination. One of the most notable of these is the "Tourist Trails" project, which was introduced on the occasion of City Day. This project includes the development of 13 diverse tourist routes that cover various areas of Amman. These routes feature historical, archaeological, cultural, and religious sites, such as the Quraysh Trade Route (Ilaf Route), the Baptism Trail (Christian pilgrimage route), the Jordan-Hejaz Railway, the Great Arab Revolt Path, Amman Promenade, the Ammonite Towers, the Amman River Trail, the cultural and heritage tourism route in Jabal Al-Luweibdeh and Jabal Amman.

These routes have been documented and integrated into the "Amman Explorer" platform, an interactive online tool that allows users to explore the trails and tourist sites via digital maps. The municipality is also working to improve the infrastructure of these routes—including road enhancements and tourist facilities—in cooperation with the Ministry of Tourism and Antiquities, the Jordan Tourism Board, several universities, and other specialized entities.

Additionally, the municipality has organized workshops to train tour guides and equip its staff with essential tourism skills, aiming to improve the quality of services provided to tourists and familiarize them with the city's archaeological and historical sites.

ABSTRACT

The paper aims to explore lesser-known contributors to mitigating the greenhouse effect by examining how certain everyday elements function as carbon dioxide (CO_2) absorbents. Moss, a simple and resilient plant, plays a significant role in capturing CO_2 through photosynthesis, particularly in urban and shaded environments where traditional vegetation may not thrive. Non-ironing clothes, often made from wrinkle-resistant synthetic fibers, indirectly help reduce CO_2 emissions by lowering the need for energy-intensive ironing, thus conserving electricity often produced by fossil fuels. Similarly, white-painted roofs reflect sunlight instead of absorbing it, which reduces the need for air conditioning and, consequently, the associated CO_2 emissions from power generation. Algae, like moss, absorb CO_2 through photosynthesis and can thrive in both aquatic and urban environments. Green walls and rooftop gardens act as living carbon sinks while also insulating buildings and reducing energy use. Biochar, a stable form of carbon-rich material added to soil, helps sequester CO_2 for long periods. Eco-friendly paving materials and natural fiber insulation, such as hemp or sheep wool, also reduce energy consumption and support carbon storage. Simple lifestyle choices like using reusable containers, composting organic waste, and adopting minimalist or circular economy practices can lower emissions from production and waste. Urban tree planting and the creation of microforests help absorb CO_2 and cool cities, while innovative materials like low-carbon concrete continue to absorb carbon long after construction. Collectively, these small but impactful measures, often overlooked in mainstream discussions, can play a vital role in climate mitigation efforts. The main focus of the paper is on moss as an overlooked agent.

METABOLIC PROFILING OF GUT-BRAIN AXIS: A STRATEGY TO DECIPHER METABOLITES AFFECTING ALZHEIMER'S DISEASES (AD) DISEASES BY USING METABOLOMICS

Bushra Ansari[1], Mahendran Sekar[1*]
[1]School of Pharmacy, Monash University, Malaysia

ABSTRACT

The human gastrointestinal tract harbors numerous microbial communities whose true potential has not yet been explored. Through evidences the bidirectional communication between the central nervous system and the gut micro-biome also know as "microbiota-gut-brain-axis" has been revealed. This gut-brain axis regulates brain health, influencing the pathophysiology of Alzheimer's disease (AD).

The correlation between gut microbiota and Alzheimer's disease has evolved as a novel research area with short chain fatty acids (SCFAs) butyrate, propionate, and acetate being identified as a key microbial metabolites influencing pathophysiology of Alzheimer's disease (AD). These metabolites are produced by bacterial fermentation of dietary fibers, playing neuroprotective role by the regulation of neuroinflammation, oxidative stress, and synaptic plasticity. These SCFAs have the ability to cross the blood-brain barrier and exerts anti-inflammatory effects by the reduction of pro-inflammatory cytokines, modulation of microglial activation, and enhancment of histone acetylation, which improves neuronal survival and decline in cognitive functions.

The study aims to investigate the therapeutic potential of SCFAs on AD by the use of integrated metabolomics. Advanced techniques like gas chromatography-mass spectrometry (GC-MS) and liquid chromatography-mass spectrometry (LC-MS) will be used to study the perturbations associated with AD. The identified metabolites will be analyzed on the basis of their mass to charge (m\z) ratio using these techniques. Correlation of SCFA levels with cognitive markers, oxidative stress parameters, and amyloid-β aggregation will also be done. It is expected that pateints diagnosed with AD will have reduced levels of SCFAs leading to AD pathophysiology. SCFAs will lead to significant reduction in amyloid burden, oxidative stress, and cognitive decline, along with the restoration of gut microbial balance. This approach will provide a novel and non-invasive strategy for AD management. Additionally this study will support the development of microbiome-targeted therapeutics and personalized interventions based on metabolic signatures.

*Email: maroine.flouchi@um5.ac.ma

ABSTRACT

Background and Problem Statement: Diabetes mellitus is a chronic disease that is rapidly increasing in prevalence in Morocco, creating a significant health and economic burden. Due to the limitations of conventional treatments, medicinal plants are widely adopted by the population as alternative therapies. In this context, we selected Myrtus communis L. (myrtle), a plant commonly used in Moroccan traditional medicine. Its essential oil (EO) holds promising therapeutic potential but remains underexplored. Considering the growing problem of antibiotic resistance and the prevalence of diabetes, investigating natural alternatives such as EO is both timely and innovative.

Research Objectives: This study aimed to characterize the chemical composition of M. communis EO and evaluate its antioxidant, antimicrobial, and antidiabetic activities using in vitro and in silico approaches.

Methodology: EO was extracted via hydrodistillation and analyzed using GC-MS. Antioxidant activity was assessed using DPPH and FRAP assays. Antimicrobial efficacy was tested against various pathogens. Antidiabetic potential was evaluated through enzyme inhibition assays. Molecular docking predicted bioactivity at the receptor level.

Key Results: Eucalyptol (54.84%) and p-Cymene (19.42%) were major compounds. EO showed strong antioxidant and antimicrobial activity (MIC values as low as 0.019%). It also inhibited α-amylase and α-glucosidase enzymes with IC50 values of 0.179 mg/mL and 0.086 mg/mL respectively, supported by favorable docking scores.

Discussion and Outlook: M. communis EO presents a potent source of bioactive molecules for pharmaceutical use. Further in vivo studies and clinical trials are needed to confirm its safety and efficacy.

Keywords: Diabetes mellitus, Myrtus Communis, essential oil, antioxidant, antimicrobial, antidiabetic.

THE EFFECT OF GAMIFIED MOBILE LEARNING APPS ON ENHANCING CRITICAL THINKING SKILLS IN PRIMARY SCHOOL STUDENTS FOR ENVIRONMENTAL EDUCATION

Zohaib Hassan Sain
PhD Scholar, Universitas Brawijaya, Faculty of Administrative Sciences, Department of Business Administration, Malang-Indonesia
zohaib3746@gmail.com ORCID: 0000-0001-6567-5963

ABSTRACT

Gamified mobile learning applications are revolutionizing primary education by engaging young learners in the development of critical thinking, particularly in the context of environmental education. With the Single National Curriculum (SNC) in Pakistan emphasizing both critical thinking and environmental awareness, there is an increasing need for innovative educational tools to address these areas from early education stages. This study explores the impact of gamified mobile learning apps focused on environmental science topics in enhancing the critical thinking abilities of elementary school students in Pakistan. Adopting a quasi-experimental design, 120 students were randomly placed into either an experimental group (using gamified environmental education apps) or a control group (receiving traditional teaching). Standardized instruments assessed students' critical thinking on topics like climate change, sustainability, and ecological problem-solving before and after an eight-week intervention. The quantitative results indicated that the experimental group showed a 24% improvement in critical thinking scores (from 58.3 to 72.4), while the control group experienced an 8% improvement (from 59.1 to 63.9). Qualitative interviews with teachers and students revealed that those using the gamified apps demonstrated enhanced problem-solving skills and a more profound understanding of environmental challenges. The findings suggest that integrating gamified mobile learning platforms focused on environmental education into Pakistan's primary curriculum could significantly improve critical thinking and climate literacy. The paper advocates for policy changes and teacher training to encourage the use of gamified mobile learning in promoting environmental awareness and developing 21st-century cognitive skills in early education.

ABSTRACT

The territorial distribution of the population, with its demographic and ethno-religious features, combined with the historical and contemporary economic development of Bulgaria, shapes the regional disparities in incomes and unemployment rates as well as the share of the working poor. The country's socioeconomic progress causes the labour market to become more polarized and changes the structural components of employment.

The paper's objective is to elaborate an integrated typology of districts in the country (NUTS 3 level (small regions) according to the EU statistics) according to the specific indicators for demographic situation and the state of labour markets, applying cluster analysis for the selected years 2019 and 2023 (before and after the COVID-19 pandemic). The study results show serious regional disparities: dynamic changes in the scope of districts of each taxon, mainly due to negative trends in demographic development and relatively positive tendencies in the labour market. Furthermore, Sofia (the capital district) has a very distinguished place in the typology due to population size and economic wealth. In addition, the observed regional differences in Northern and Southern Bulgaria's districts are subject to the impact of various factors.

In conclusion, the detailed analysis of these processes will contribute to the improvement and tailoring of regional development policies to reduce the deepening regional economic and social inequalities and address the needs of all stakeholders.

ABSTRACT

The study assessed odour control measures among poultry farmers in Enugu east senatorial zone, Enugu State, Nigeria. Multistage sampling procedure was used in the selection of sixty poultry farmers. Data was collected using structured interview schedule. Data was analyzed using frequency, percentage, mean and standard deviation. Results revealed that the poultry farmers odour control measure include: regular cleaning of poultry house ($\bar{x}$=2.91), removing carcasses immediately there is mortality ($\bar{x}$=2.73), locating manure storage away from sensitive receptors ($\bar{x}$ =2.67), cleaning up spillages in the poultry farm ($\bar{x}$= 2.63), and proper ventilation of poultry houses ($\bar{x}$=2.58). Also, result show that the environmental impacts of odour from poultry farm include: poultry odour causes nuisance to the neighbour ($\bar{x}$= 2.25), air pollution through emission of dusts, microorganisms and organic compounds ($\bar{x}$= 2.03), and water pollution ($\bar{x}$=2.02). Data show that the perceived effects of odour from poultry farms on the health of farmers include: loss of appetite, stomach discomfort ($\bar{x}$=2.20), and difficulty in breathing ($\bar{x}$=2.03). Result show that the farmers waste management practices were: drying of the poultry manure and bagging for sale (95.0%), use of manure for improving plant growth (86.7%), and land filling techniques (53.3%). The poultry farmers should be trained by government through the organization of workshops where these poultry farmers will be educated on emerging technologies such as addition of bentonite to poultry feed during feed formulation to control odour.

THE FUNCTION AND RESPONSIBILITIES OF JUDICIAL POLICE OFFICERS IN THE COURSE OF PRELIMINARY CRIMINAL INVESTIGATIONS

Dr. Dorina SAJA
Criminal Departament, University of Tirana
dorina.saja@fdut.edu.al, ORCID 0009-0007-3588-3797

ABSTRACT

This paper focuses on the responsibilities and functions of Judicial Police Officers during the preliminary investigation phase of a criminal case. As subjects of the criminal judicial process, they actively participate and engage alongside the prosecuting authority from the initiation of proceedings through to their execution.The paper also aims to analyze the legal framework that governs the activity of Judicial Police Officers in the Republic of Albania, focusing on their organization, legal status, roles, and functions, as well as the provisions regulating their relationship with the Prosecutor's Office and other justice institutions. The justice reform brought significant changes to domestic legal acts, including the Criminal Procedure Code and the enactment of the Law on the Organization and Functioning of the Judicial Police, which introduced substantial organizational improvements to strengthen the investigative role of Judicial Police Officers and reaffirmed the leading role of prosecutors. We have analyzed the importance of the amendments to procedural criminal legislation and the improvements brought by the justice reform. Moreover, we have examined the legal provisions related to the preliminary investigation phase, the active role of Judicial Police Officers, and their initiative-driven actions, particularly in cases of flagrant offenses. We have also highlighted the collaborative role and legal obligations of officers in relation to the Prosecutor's Office, outlining all the competencies and actions they must undertake to ensure a due legal process. Finally, the study presents several conclusions and recommendations aimed at further improving law enforcement and aligning it with European Union directives. The research methodology employed in this paper integrates historical, analytical, descriptive, comparative, and statistical methods, which are interrelated in a manner that ensures a comprehensive and effective examination of the subject under study.

ABSTRACT

This work focuses on the synthesis and electrical characterization of SrF_2-modified lead zirconate titanate ceramics, with the general formula $Pb_{1-x}Sr_x(Zr_{0.43}Ti_{0.52})(Al_{0.5}Sb_{0.5})_{0.05}O_{3-x}F_{2x}$, referred to as PZT-SASF. The ceramics were synthesized via the conventional solid-state route, targeting compositions near the morphotropic phase boundary (MPB) to optimize ferroelectric performance. X-ray diffraction (XRD) analysis confirmed the coexistence of tetragonal and rhombohedral phases, indicative of MPB behavior. Scanning electron microscopy (SEM) revealed a microstructure composed of large, irregular grains with noticeable microporosity.

Electrical properties were investigated using impedance spectroscopy and electric modulus analysis over a frequency range of 0.1 kHz to 1 MHz and a temperature range of 300–700 K. The results demonstrate a strong dependence of dielectric behavior on the grain structure. Nyquist plots showed distinct semicircular arcs attributed to grain contributions, allowing for detailed analysis using an equivalent circuit model. Fitting procedures across all temperatures enabled the extraction of grain resistance and capacitance values. Notably, the co-substitution of Sr^{2+} at Pb^{2+} sites and F^- at O^{2-} sites resulted in an enhancement of the dielectric constant, particularly at elevated temperatures, highlighting the potential of this doping strategy for improved electrical performance.

Keywords: PZT-SASF ceramics; SrF_2 doping; Solid-state synthesis; Impedance analysis; Dielectric enhancement; Grain contribution; MPB.

OPERATIONALIZED MEASUREMENT PROCESS FOR MODEL-QUALITY-EVALUATION IN CASE OF DATA ASSETS BASED ON QUESTIONNAIRES

ABSTRACT

History: The quality of data assets can be massively different: from the randomized data to mechanistic relationships between observed phenomena. In general, questionnaires deliver fewer valuable data than classic measurements. Therefore, it is relevant to be capable of estimating data quality of data assets coming from questionnaires. The previous experiments defined operationalized processes for model-quality-evaluations in order to derive suspicious persons (objects) and/or questions based on the difference between estimation and fact concerning each questionnaire-position.

Background and benchmarks: Here and now, a questionnaire (2011-2022) concerning human beings (20.000+), especially their life-parameters (e.g. sleeping-quality, sport-activity, smoking, etc. – 4 groups as X: 2 binary, 1 unit with three options, 1 unit with 4 options and one attribute as Y – with 5 options: see self-evaluation of the own life quality) are focused in order to construct a model series being capable of highlighting differences between the quality of randomized, real, and ideal data assets, where the randomized and the ideal data assets are the benchmarks and the quality of the real (questionnaire-based) data should be measured on the scale defined by the two extreme alternatives (randomized and ideal data assets).

Highlighted details: The randomized data positions follow the internal relationships of the real data (e.g. binary X-case: ratio of smoking in percent = 100% - ratio of no-smoking / case of 5 Y-options: ration of life quality on level 5 + on level 4 + on level 3 + on level 2 + on level 1 = 100%). The OAM (object attribute matrix) for generation of production functions had 11 objects (years – 2014 is missing) and 11 X-attributes + 5 Y-attributes. A model (Y=f(Xi)) is good, if the Y-values (ratios) in each level of 1-2-3-4-5 can be derived from the constant (ranked) Xi-matrix in a parallel way based on a direction vector for the attributes being defined by experts (by the authors of the questionnaires: e.g. the higher ratio on no-smoking-option leads to higher ration of better life quality levels). The models for each Y-level deliver not only differences between facts and estimations, but also importance of the 11 attributes in each model and/or correlation values between Xi and Yj. Predefined rules for model-evaluation: The ideal data assets should have correlation values exactly as 1.00, the randomized data assets should have lower correlation values as real data assets. The volume of estimation errors should be higher in case of randomized data assets than in case of real data assets. The number of antagonistic objects should be higher in case of randomized data assets than in case of real data assets, etc. Result: the questionnaire-based data asset is better than the randomized one and the real data asset produced no suspicious modelling details – based on a totally algorithmizable/operationalizable process!

Future aspects: The observed data asset through the questionnaires can be seen in this first project layer as a group of relatively good interpretable X-phenomena (c.f. ever smoking yes/no, etc.). It means that these data could have been collected based on classic measurements. On the

other hand, there are existing such attributes, where the answers (X-variables) deliver intuitive feelings (like already in case of the Y-variables). It is to expect, that the less measurable X-data will lead to less qualitative modelling results. Therefore, the own “data-quality-meter” should deliver lower index values based on the trivial anti-discriminative principle: Can each data asset have the same quality index?

THE HIDDEN POWERS OF TERT-BUTANOL IN CATALYSIS

Associate Professor Dr. Rozina Khattak
Department of Chemistry, Shaheed Benazir Bhutto Women University,
Peshawar 25000, Pakistan
Email: rznkhattak@yahoo.com

ABSTRACT

In aqueous dye-sensitized solar cells (DSSCs), dicyanobis(2,2'-dipyridyl)iron(III) acts as an active sensitizer that oxidizes iodide, allowing it to revert to its reduced form and become excited by absorbing light again. Therefore, this key oxidation-reduction process needs to happen rapidly, a goal that can be achieved through homogenous catalysis. Utilizing homogenous catalysis could improve the efficiency, affordability, and environmental sustainability of a DSSC by using a small amount of a non-toxic, eco-friendly solvent mixed with water. This can lead to a faster reaction rate and enhanced stability, as well as reduced costs due to the presence of water. As a result, this study aims to use tert-butanol as a catalyst to speed up the reaction involving dicyanobis(2,2'-dipyridyl)iron(III) and iodide in an aqueous setting. The reaction's operational parameters were optimized in order to suggest a feasible mechanism for the catalytic impact of tert-butanol.

TRANSFORMING TRASH INTO TREASURE FOR WASTEWATER CLEANUP

Assistant Professor Dr. Rozina Khattak
Department of Chemistry, Shaheed Benazir Bhutto Women University,
Peshawar 25000, Pakistan
Email: rznkhattak@yahoo.com

ABSTRACT

In this research, waste materials have been utilized to purify wastewater. Dyes are widely utilized in various industries, and their discharge can adversely affect both aquatic organisms and humans. Malachite Green (MG), one of these synthetic dyes, is commonly employed in the textile, paper, leather, stained glass, and several other sectors due to its strong coloring capability and high stability. It is important to eliminate or reduce its concentration prior to its release into water bodies to prevent or manage the onset of various diseases associated with MG. In this study, the MG dye was removed from water using a 1:1 blend of powdered waste materials, including pomegranate peels, corncobs, almond, peanut, and walnut shells. Under optimal conditions, the dye adsorption reached almost 100%. Hence, a combination of biosorbents can be effectively employed in real-world applications to remove hazardous soluble substances from water sources.

ABSTRACT

Rapidly developing technology enables digital devices to become widespread in every field. As a natural result of this; very different devices have started to be used in many fields such as engineering, social and human sciences, entertainment, finance, health, banking, education. This means that an increasing data mass is formed in every field. As data continues to form at increasing speeds, it has become almost impossible to analyze and make sense of them with manual methods or known analytical methods. This situation has led to software becoming a solution-oriented service in many fields. Especially in fields that require multidisciplinary work, there is a great need for study subjects such as artificial intelligence, artificial learning, machine learning and data mining. Because it has become very difficult to analyze the multidimensional and large amounts of data at hand with classical methods.

Optimization is the name of searching for the optimum, or most ideal, solution for a problem. In optimization problems, strategies for solution can be classified as analytical, numerical and intuitive. Meta-Heuristic methods are a solution methodology used for optimization purposes in computer science. It seeks to solve problems by imitating the events and systems that exist in nature. In this study, the Artificial Afterimage Algorithm, a newly introduced heuristic method, was used to make rainfall predictions. For this purpose, the application of rainfall prediction was performed on the Rainfall Prediction using Machine Learning dataset obtained from the Kaggle database. As a result of the experimental studies, the best Accuracy value was 0.85, the best Precision value was 1, the best Recall value was 1 and the best F1 value was 0.869. These results showed that the Artificial Afterimage Algorithm, a newly introduced algorithm in the literature, can be successfully applied.

Keywords: Artificial Afterimage Algorithm, Clustering, Rainfall Prediction

YAĞIŞ TAHMİNİ İÇİN YAPAY AFTERİMAGE ALGORİTMASININ KULLANILMASI

ÖZET

Hızla gelişen teknoloji, her alanda dijital cihazların yaygınlaşmasını sağlamaktadır. Bunun doğal bir sonucu olarak; mühendislik, sosyal ve beşeri bilimler, eğlence, finans, sağlık, bankacılık, eğitim gibi birçok alanda çok farklı cihazlar kullanılmaya başlanmıştır. Bu durum, her alanda gün geçtikçe artan bir veri yığını oluşması demektir. Veriler artan hızlarla oluşmaya devam ettikçe, bunları manuel yöntemlerle ya da bilinen analitik yöntemlerle analiz etmek ve anlamlı hale getirmek neredeyse imkânsız hale gelmiştir. Bu durum birçok alanda yazılımların gün geçtikçe çözüm odaklı bir hizmet olmasını beraberinde getirmiştir. Özellikle multidisipliner çalışma gerektiren alanlarda, yapay zekâ, yapay öğrenme, makine öğrenmesi ve veri madenciliği gibi çalışma konularına çok fazla ihtiyaç duyulmaktadır. Çünkü eldeki çok boyutlu ve aynı zamanda çok miktarda olan verileri klasik yöntemlerle analiz etmek çok güç hale gelmiştir.

Optimizasyon bir probleme ilişkin optimum yani en ideal olan çözümü aramanın adıdır. Optimizasyon problemlerinde, çözüme yönelik stratejiler; analitik, nümerik ve sezgisel olarak sınıflandırılabilir. Meta-Sezigsel yöntemler, bilgisayar bilimlerinde optimizasyon amacıyla kullanılan bir çözüm metodolojisidir. Doğada var olan olayları ve sistemleri taklit etme yoluyla problemlere çözüm getirme arayışındadır. Bu çalışmada literatüre yeni girmiş olan bir sezgisel yöntem olan Yapay Afterimage Algoritması yağış tahmini yapmak için kullanılmıştır. Bu amaçla Kaggle veri tabanından elde edilen Rainfall Prediction using Machine Learning veri seti üzerinde yağış tahmini uygulaması gerçekleştirilmiştir. Deneysel çalışmalar sonunda elde edilen en iyi Accuracy (Doğruluk) değeri 0.85, en iyi Precision (Kesinlik) değeri 1, en iyi Recall (Duyarlılık) değeri 1 ve en iyi F1 değeri ise 0.869 olarak elde edilmiştir. Bu sonuçlar, literatüre yeni kazandırılmış bir algoritma olan Yapay Afterimage Algoritmasının başarı ile uygulanabildiğini göstermiştir.

Anahtar kelimeler: Yapay Afterimage Algoritması, Kümeleme, Yağış Tahmini

Giriş

Bilgi kavramı insanoğlu için her devirde en önemli kavram olmuştur. Sosyal hayat, sağlık, astronomi, yönetim vb. hayatın her alanını ilgilendiren konularda ve hatta savaşlarda bile bilgi her zaman en önemli yönlendirici enstrüman olmuştur. Teknoloji geliştikçe bilgiye ulaşma ve onu analiz etmenin şekli değişmiştir. Aslında bilginin kaynağı veridir. Veri ise, bilginin ham yani işlenmemiş halidir. Ölçme, sayma, deney yapma, gözlem veya araştırma ile elde edilebilir (Özmen, 2016). Veri işlenerek anlamlı bir hale gelir ve sonuçları çok şey ifade edebilir.

Bir çöp yığını gibi görülen çok büyük veri ambarlarında aslında çok anlamlı bilgilerin barındığı son yıllarda yapılan büyük veri ve veri madenciliği çalışmaları ile ortaya çıkmıştır. Veri madenciliği, çok büyük miktardaki verilerin içerisindeki ilişkileri inceleyerek, veriler arasındaki bağlantıları bulmaya çalışan ve veri içinde gizli kalmış bilgilerin çekilmesini sağlayan veri analizi tekniğine verilen isimdir (Kalikov, 2006).

Bilgisayar ve yazılım teknolojisinin henüz çok ilerlemediği yıllarda bu bilgilerin keşfi manuel yapılmaktaydı. Dolayısıyla bu bilgiyi keşfedebilmek oldukça güç ve hatta bazen imkansızdı. Fakat bu alandaki çok hızlı gelişme, bu süreçlerin artık bilgisayarlar yoluyla yapılmasının önünü açtı. Veriyi işlemek adına yapılan tüm süreçler artık bilişim teknolojileri yardımıyla yapılabilmektedir. Artık klasik donanım ve yazılımlarla depolanması ve analiz edilmesi zor olan büyük verileri yeni bilgi teknolojileri, ve yazılımlar aracılığıyla depolamak, işlemek, ve analiz etmek mümkün hale gelmiştir (Köseoğlu & Demirci, 2017).

1. Yapay Zeka ve Yapay Öğrenme

Yapay zeka ilk , 1956 yılında John McCarthy, Marvin L. Minsky, Nathaniel Rochester ve Claude E. Shannon tarafından tanımlanmıştır (McCarthy et al., 1955). Ancak yapay zekanın mucidi John McCarthy olarak kabul edilmektedir (Alpaydın, 2011). McCarthy yapay zekayı, insan benzeri zeki makineler özellikle de zeki bilgisayar programları yapma bilimi ve mühendisliği" olarak ifade etmiştir (McCarthy, 2004). Şöyle ifade edebilir: Bilgisayarların akıllı davranma, anlam çıkarabilme, problem çözme ve genelleme yapabilme gibi insana özgü davranışlarda bulunabilmesi, yani bilişsel becerileri gösterebilmesi yapay zeka olarak nitelendirilmiştir (Arslan, 2020).

Makine öğrenmesi ise yapay zekanın altında bir bilim alanıdır. Diğer bir ismi ise Yapay Öğrenmedir. Bu kavram ilk defa Arthur Lee Samuel tarafından kullanılmıştır. Makine öğrenmesi için: "Bilgisayarların açık bir şekilde programlamadan öğrenme gerçekleştirmesine olanak tanıyan bir araştırma alanıdır" şeklinde bir ifade kullanmıştır (Mockenhaupt, 2021). Başka bir ifadeyle yapay öğrenme, bilgisayarların bir problemi çözmekte örnek veri ya da deneyimi kullanacak biçimde programlanmasıdır (Alpaydın, 2011).

Veri madenciliği de, yapay öğrenmenin altında bir alandır. Büyük ölçeğe sahip verilerin içerisinden bilgiye erişebilme, bilgiyi ortaya çıkarabilme veya büyük veri yığınlarından ilerisi için tahminde bulunabilme için bağıntıların bilgisayar programları kullanılarak keşfedilmesi olarak tanımlanabilir (Pektaş, 2013).

Veri madenciliği aynı zamanda, büyük miktardaki veriler içerisindeki ilişkileri analiz ederek verilerin arasındaki bağlantıları keşfetmeye yardımcı olan ve veri içindeki keşfedilmemiş bilgilerin alınabilmesine yarayan analiz tekniğidir (Kalikov, 2006). Uygulama alanı oldukça geniştir. Yapay öğrenme, veri tabanı sistemleri, görselleştirme, yapay sinir ağları, istatistik, gibi birçok disiplinle ilişkilidir. (Savaş, S. et al., 2012).

2. Sezgisel Yöntemler

Sezgisel yöntemler, yapay öğrenme (makine öğrenmesi) alanının içerisinde yer alan ve özellikle lineer olmayan gerçek dünya problemlerinin çözümünde çok işe yarayan bir metodolojidir. Doğadaki var olan sistemler ve olayları taklit ederek problemlere çözüm getirmeye çalışır.

Genel olarak yaklaşım metodolojisi en iyi olan çözüme benzemeye çalışmaktır. En iyi çözümün etrafında çözümler üreterek elde edilmeye çalışılan optimum çözümü elde etmenin peşindedir. Bu amaçla en iyi çözümün etrafında matematiksel olarak gezmeye çalışır. Bunun için her sezgisel yöntemin kendine ait matematiksel bir alt yapısı vardır.

Sezgisel yöntemler insan beyni (McCulloch & Pitts, 1946), balinalar (Mirjalili and Lewis, 2016), arılar (Karaboğa, 2005), insan bağışıklık sistemi (Alataş & Akın, 2004), gri kurtlar (Mirjalili, S. et al., 2014), kuş ve balık sürüleri (Kennedy et al., 1995), ateş böcekleri (Yang, 2008), yarasalar (Yang, 2010), yer çekimi (Rashedi et al., 2009) vb. birçok canlıyı ve olayı taklit etmeye çalışmaktadır. Her yöntemin matematiksel alt yapısı farklı olmakla beraber temel yaklaşımı aynıdır. Asıl olan en iyi çözüme benzeyerek ideal olan çözüme kavuşmaktır.

2.1. Yapay Afterimage Algoritması

Yapay afterimage algoritması (Demir, 2025), görme olayındaki kavramları taklit ederek problemlere çözüm getirmeye çalışan bir sezgisel algoritmadır. Görme olayındaki pozitif ve negatif afterimage, görsel açı ve algısal boyut kavramlarını temel alarak bir çözüm sunar.

Işık saçan bir cisme belirli bir süre boyunca bakmaya devam ettiğimiz takdirde, gözlerimizi kapatmamız halinde bile bir süre cismin görüntüsünü görmeye devam ederiz. Beynimiz belirli bir süre görüntüyü oluşturmaya devam edecektir. Bu olaya afterimage denilir. Görüntü bazen cismin renkleriyle ayın ama daha belirsiz bir şekilde olacaktır. Bu pozitif afterimage; gözlerimizi kapatmadan fakat cisme bakmadan nötr bir zemine bakmaya devam edecek olursak da cismi tamamlayıcı renkleriyle görmeye devam ederiz ki buna da negatif afterimage deriz.

Cismin gözümüzdeki görüntüsünün oluşmasında cismin boyutu ve göze olan uzaklığının etkisi vardır. Bu değerler altında gözün algıladığı değer olan görsel açı kavramı Denklem (1)'de ifade edilmiştir.

$$V = 2 * \arctan\left(\frac{cismin\ boyutu}{2 * göze\ olan\ uzaklığı}\right) \quad (1)$$

Gözün görsel açı altında algıladığı boyut ise, algısal boyut olarak isimlendirilir. Denklem (2) algısal boyutun formülünü göstermektedir. D cismin göze olan uzaklığını ifade eden değerdir.

$$S = V * D \quad (2)$$

Yapay afterimage algoritması, Denklem (1) ve Denklem (2)'yi kullanarak bir sezgisel alt yapı sunmaktadır. Denklem (3), (4) ve (5) bu algoritmanın temel denklemlerini göstermektedir.

$$V = 2 * \text{atan}\left(\frac{pop_{i,j}}{2 * pop_{i,j} - best_{1,j}}\right) \quad (3)$$

$$S_{i,j} = V * (pop_{i,j} - best_{1,j}) \quad (4)$$

$$New\ pop_{i,j} = S_{i,j} + (|S_{i,j-}(best_{1,j} - |(worst_{i,j} - pop_{i,j})|) * rand) \quad (5)$$

Best, hesaplanan en iyi çözümdür ve pozitif afterimage kavramını temsil eder.

Worst, o adımdaki en kötü çözümdür ve negatif afterimage kavramını temsil eder.

$pop_{i,j}$, aday çözümlerin içerisinde en iyiye aday olan her çözüm değeridir.

3. Veri Kümeleme

Veri madenciliğinde kullanılan yöntemler eğiticili ve eğiticisiz öğrenme yöntemleri olarak temel iki guruba ayrılır. Eğiticili öğrenmede, eldeki verilerin sınıf değerleri bilinmektedir ve algoritmanın eğitimi için kullanılır. Eğiticisiz öğrenmede ise, eldeki kümelerin sayısı ve küme bilgisi kullanılmadan sadece niteliklerin birbirlerine olan yakınlıkları kullanılarak sonuca gidilmeye çalışılır. Kümeleme analizinde, grup içinde maksimum benzerlik ve gruplar arası maksimum farklılık mantığına göre hareket edilir (Dudoit & Fridlyand, 2002).

Kümeleme analizinde kullanılan karışıklık matrisi, bir sınıflandırma modelinin doğru veya yanlış tahmin edilen örneklerin sayısını gösterdiği matristir. Tablo 1 karışıklık matrisini göstermektedir (Tan et al., 2014).

Tablo 1. Karışıklık matrisi

	Gerçek pozitif	Gerçek negatif
Tahmin edilen pozitif	True pozitif (TP)	False pozitif (FP)
Tahmin edilen negatif	False negatif (FN)	True negatif (TN)

Tablodaki pozitif ve negatif kavramları genel bir ifadedir. Uygulamada bunlar kümelenecek olan gurupların isimleri olacaktır. Ayrıca gurup sayısı verideki küme sayısı kadar artacaktır. Örneğin hasta-sağlıklı veya düşük-orta-yüksek şeklinde kümeler olması halinde küme sayısı ve sütun sayısı değişecektir.

Kümelemede performansı ölçmek için ise; accuracy, precisioni, recall ve F1 skor değerleri kullanılır. Accuracy ile modelin ne kadar doğru çalıştığı, precision ile sonuçların ne kadar geçerli olduğu, recall sonuçların ne kadar eksiksiz olduğunu gösterir. F1 skor ise precision ve recall değerlerinin harmonik ortalamasıdır ve ikisi arasındaki dengeyi ifade eder. Denklem (6), (7), (8) ve (9) bu değerlere ilişkin formülleri göstermektedir (Tan et al., 2014).

$$Accuracy = \frac{\text{TP+TN}}{\text{TP+TN+FP+FN}} \tag{6}$$

$$Precision = \frac{\text{TP}}{\text{TP+FP}} \tag{7}$$

$$Recall = \frac{\text{TP}}{\text{TP+FN}} \tag{8}$$

$$F1\ skor = 2 * \frac{\text{Precision*Recall}}{\text{Precision+Recall}} \tag{9}$$

4. Deneysel Sonuçlar

Bu çalışmada Kaggle veri tabanından elde edilen Rainfall Prediction using Machine Learning veri seti üzerinde çalışılmıştır. Veri seti 12 tane öznitelikten oluşmaktadır. İlk öznitelik gün numarası olduğundan çıkarılmıştır. Kümelemeye etkisi olmayan bir özniteliktir. Bir

öznitelik ise yağış olup olmadığını gösteren özniteliktir. Tahmin edilmeye çalışılan değerdir. Kümelemede çıkış özniteliği kullanılmayacağından eğitim esnasında bu öz nitelik çıkarılarak çalışılmıştır. Toplamda 366 adet örnek vardır. Yağış olan ve olmayan 2 gurubun her birinden 20 örnek ayrılmış ve test için kullanılmıştır. Algoritma çıktı olarak best, worst değerlerini ve görsel açı değerini vermektedir. Her denemede algoritma 5000 kez çalışacak kadar denenmiştir. Elde edilen değerler Tablo (2), (3) ve (4)'te gösterilmektedir.

Tablo 2. Best matris değerleri

best									
177.949	11.504	20.919	10.560	16.897	31.210	19.753	18.610	8.342	34.885

Tablo 3. Worst matris değerleri

worst									
3.215	4.134	7.940	1.680	2.692	2.153	8.104	4.789	2.853	8.611

Tablo 4. Görsel açı değeri

V
15.121

best, worst ve V değeri kullanılarak, denklem (3),(4) ve (5) yardımıyla elde edilen küme aralıkları Tablo (5)'deki gibidir. Bu aralıklar test için ayrılan 2 gurubun test best matris ile farklarını göstermektedir. Kümelemede asıl olan öz niteliklerin farklarına göre gurupları mümkün olduğunca birbirinden ayırmaktır. Algoritma bu mantıkla yağış olacak y ada olmayacak durumların tahminini birbirinden ayırırken hesaplanan bu fark değerlerine göre sonuç vermektedir. Küme 1 yağış olmadığı durumları, Küme 2 ise yağış olduğu durumları temsil etmektedir. Tabloda koyu renkle işaretlenen kısım, normalde Küme 2'nin aralığındadır. Bu durumda bu kısım hata olarak değerlendirilmiştir.

Tablo 5. Küme aralıklarının fark değerleri

Küme1	Küme2
934.7	1017.2
950.2	1021.3
998.3	1023.7
998.5	1025.1

1055.3	1057.7
1064.6	1058.5
1065.1	1061
1075.7	1063.4
1111.5	1063.9
1187.7	1064.3
1210.3	1065.3
1211.6	1066.4
1213.9	1067.1
1220.8	1069.2
1226	1091.6

Şekil (1) ise, test değerlerinin karışıklık matrisini göstermektedir.

Gerçek değerler

Tahmin edilen değerler	Yağış yok (0)	Yağış var (1)
Yağış yok (0)	14	6
Yağış var (1)	0	20

Şekil 1. Karışıklık matrisi değerleri

Karışıklık matrisindeki değerler, Denklem (6), (7), (8) ve (9) kullanılarak hesaplandığında;

Yağış yok kümesi için:

$$Accuracy = \frac{14+20}{14+20+6+0} = \mathbf{0.85}$$

$$Precision = \frac{14}{14+6} = \mathbf{0.7}$$

$$Recall = \frac{14}{14+0} = \mathbf{1}$$

$$F1\ skor = 2 * \frac{\text{Precision} * \text{Recall}}{\text{Precision} + \text{Recall}} = \mathbf{0.824}$$

Yağış var kümesi için:

$$Accuracy = \frac{20+14}{20+14+0+6} = \mathbf{0.85}$$

$$Precision = \frac{20}{20+0} = \mathbf{1}$$

$$Recall = \frac{20}{20+6} = \mathbf{0.769}$$

$$F1\ skor = 2 * \frac{\text{Precision} * \text{Recall}}{\text{Precision} + \text{Recall}} = \mathbf{0.869}$$

2 küme için en iyi Accuracy= 0.85, Precision =1, Recall=1 ve F1 skor= 0.869 çıkmıştır.

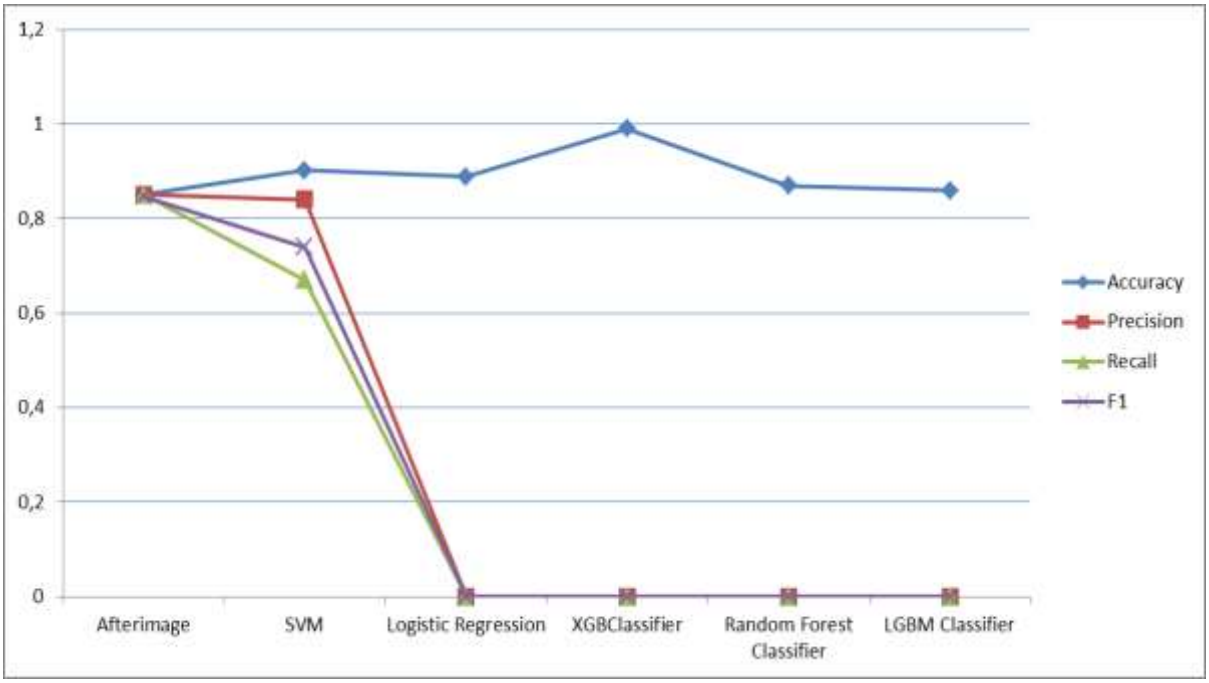
Her iki küme için ortalama değerler ise: Accuracy = 0.85, Precision= 0.85, Recall = 0.85, F1 skor= 0.847 çıkmaktadır. Şekil (2), her iki küme için performans metriklerinin değerlerinin grafiğini temsil etmektedir.

Literatürde bu veri seti ile yapılan çalışmaların sonuçları ve bu çalışma ile karşılaştırması Tablo (6)'da gösterilmiştir. Bu çalışmanın performans metriklerinin ortalama değerleri tabloda verilmiştir.

Tablo 6. Performans metriklerinin literatür karşılaştırması

	Afterimage	**SVM**	**Logistic Regression**	**XGBClassifier**	**Random Forest Classifier**	**LGBM Classifier**
Accuracy	0,85	0,902	0,889	0,99	0,87	0,859
Precision	0,85	0,84	-	-	-	-
Recall	0,85	0,67	-	-	-	-
F1	0,847	0,74	-	-	-	-

Şekil (2), Tablo(6)'da karşılaştırılan durumların grafiksel temsilini göstermektedir.



Şekil 2. Performans metrikleri karşılaştırması grafiksel gösterimi

5. Sonuç ve Tartışma

Özellikle doğrusal olmayan problemlerin çözümünde klasik çözüm yöntemleri çok sorun yaşayabilmektedir. Parametreler arasındaki ilişkinin keşfedilmesi ve bunlar arasında bir bağıntının çıkarılması güç olabilmektedir. Böyle durumlarda sezgisel yöntemler birçok zaman iyi sonuç verebilmektedir. Özellikle parametre sayısının fazla ve doğrusal olmadığı problemlerde sezgisel yöntemler çözüme gitmeyi kolaylaştırabilmektedir.

Yapay afterimage algoritması literatüre yeni kazandırılan bir sezgisel algoritmadır. Bu yönüyle farklı alanlardaki veriler üzerine uygulamaya açık bir yöntemdir. Yapılan çalışmalar göstermiştir ki; performans açısından iyi sonuçlar vermektedir. Özellikle kümeleme uygulamalarında literatürdeki çalışmalara yakın ve bazen literatürden daha iyi sonuçlar verdiği görülmüştür. Bu yönüyle diğer alanlarda da başarılı olma potansiyeli olma ihtimali yüksek bir yöntemdir.

ABSTRACT

This study examines the efficiency of local (offline) open-source large language models (LLMs) in the Basic Proficiency Test (TYT) format, the first stage of Türkiye's Higher Education Institutions Examination (YKS). Experiments were conducted on a modest system equipped with an NVIDIA GTX 1650 GPU (4 GB VRAM) and an Intel Core i7-11370H processor. Models that achieved an inference speed of ≥ 7 tokens per second (Qwen-2.5, Qwen-3, and Gemma-3) were included; those below this threshold (e.g., the local 7 B version of DeepSeek-R1, which yielded only ~2–3 tokens per second) were excluded. As a reference, the cloud-based DeepSeek-R1 model with 671 B parameters displayed top-tier performance with an accuracy of 83.15 %. Among local models, Qwen-3 presented the most balanced results, with an average inference speed of 8.4 tokens per second and an accuracy of 66.31 %. The findings indicate that meaningful success can be achieved on 4 GB VRAM devices through proper quantization and prompt tuning. In light of these results, discussions address equal opportunity and the digital divide in educational technology, emphasizing the potential of local AI solutions for students in rural areas without internet access.

Keywords: local language models; token throughput; accuracy; educational technology; equal opportunity

1 Introduction

1.1. Background

The YKS–TYT is the first step of Türkiye's university entrance examination, taken annually by more than three million candidates. Insufficient internet infrastructure in rural regions restricts access to remote education and deepens educational inequity. Studies conducted during the 2020 pandemic revealed that at least 20 % of Turkish students lacked home internet access. This digital divide hampers the use of online resources and AI-based educational content. Locally deployed LLMs that require no internet connection can therefore offer a low-cost solution. However, balancing output speed and accuracy when running such models on resource-constrained devices is a significant engineering challenge. Although models with large parameter counts may yield better results, hardware limitations often necessitate smaller models. Consequently, it is essential to examine how accurately small models can answer educational questions while producing outputs fast enough to avoid user delay.

1.2 Research Objectives

The primary aim of this study is to comprehensively evaluate the performance of small-scale LLMs operating on a device with 4 GB VRAM on TYT-like questions. Accordingly, our objectives are:

- Measure the inference speed of LLMs within the 4 GB VRAM limit in tokens per second.
- Compare the success rates (accuracy percentages) of the same models on a 95-item TYT-like test.
- Quantitatively analyse performance differences between local models and the 671 B-parameter cloud reference model, DeepSeek-R1.
- Provide educational technology and pedagogical insights into the speed–accuracy trade-off based on the obtained findings.

2 Related Work

In recent years, parameter-efficient methods aimed at improving AI applications in low-resource environments have attracted significant attention. MobileBERT (Sun et al., 2020) compressed the classic BERT model by approximately 4.3× while preserving its information capacity, achieving competitive results on GLUE and SQuAD tasks with only a minor performance drop and running 5.5× faster—enabling real-time inference even on mobile devices. Subsequently, LoRA (Hu et al., 2021) reduced the number of trainable parameters by 10,000× compared with full fine-tuning by adding low-rank adaptation layers to large language models, cutting GPU memory requirements by one-third while attaining accuracy comparable to full-model training.

Quantization is among the most common techniques for increasing inference speed. The 4-bit quantization experiments applied to the LLaMA-2 model by Touvron et al. (2023) reduced memory usage during inference by 75 % and, with optimized GPU kernels, increased inference speed by up to 3×. This speed gain incurred less than a 20 % loss in accuracy (i.e., more than 80 % of the model's accuracy was retained). Recent studies likewise report that 4-bit-quantized LLMs perform near their full-precision counterparts. Notably, the Q4_K_M-based quantized versions of next-generation open models such as Qwen and Gemma demonstrate consistent performance on GPUs with 4 GB VRAM (Qwen Team, 2025; Google AI, 2024).

Although these techniques are promising, no comprehensive study has systematically addressed their impact on the speed–accuracy balance in a multi-disciplinary, high-stakes examination such as TYT. This paper fills that gap by providing a multifaceted analysis of how small-scale local LLMs answer TYT questions on resource-constrained hardware.

3 Materials and Methods

3.1 Hardware Configuration

The experiments were carried out on a standard laptop platform. The system's key hardware specifications are summarized in **Table 1**.

Table 1. Hardware specifications of the experimental environment

Component	Specification
GPU	NVIDIA GTX 1650 - 4 GB
CPU	11th Gen Intel® Core™ i7-11370H @ 3.30 GHz
RAM	16 GB DDR4-3200
Storage	512 GB NVMe SSD
Operating System	Windows 10 Pro (64-bit)
Drivers	CUDA 12.3, cuDNN 9.0

Compared with today's high-end gaming or workstation setups, this configuration is modest. In particular, the 4 GB of VRAM imposes a severe constraint on LLM deployment, making substantial parameter compression (e.g., quantization) essential.

3.2 Software Framework

The software stack and tools employed in the study are listed below:

- **Ollama v0.9.0** – command-line interface for downloading and managing models in INT4/FP16 formats (GitHub, open source).
- **Docker Desktop v4.41** – container infrastructure for running models in an isolated environment (Docker Inc.).
- **OpenAI Web UI v0.6.13** – interface for model interaction and prompt analysis (GitHub, open source).
- **vLLM v0.9.0.1** – high-performance inference library and token-throughput meter (built with NVIDIA CUDA 12.8 and cuDNN 9.10.2; PyPI).

These tools handle low-level optimizations (e.g., deep-learning kernels), enabling us to focus exclusively on model outputs and performance metrics. In particular, **vLLM** proved pivotal for timing inference and managing GPU memory.

3.3 Dataset

For evaluation purposes, a TYT-style mock examination aligned with the Turkish Ministry of National Education (MEB) curriculum was employed to avoid any copyright issues. The original mock test comprised **120 questions**; because the model can process only text-based items, **25 questions containing visual content** (graphs, tables, diagrams) were excluded. The

remaining **95 questions** constituted the evaluation set. Their distribution by subject area is given in **Table 2**.

Table 2. Distribution of original and text-based TYT-like questions

Subject Area	Original (120 items)	Text-based (95 items)
Turkish	40	40
Social	20	20
Mathematics	40	23
Sciences	20	12

Each item is a five-option (A–E) multiple-choice question, balanced across the learning outcomes of the 2024 MEB curriculum and the knowledge–comprehension, analysis, and higher levels of Bloom's taxonomy. This structure ensures a fair assessment of text-based LLMs on both basic knowledge and higher-order reasoning tasks.

3 Materials and Methods

3.4 Model Pool and Pre-Screening

To identify the models for evaluation, a pool of popular open-source LLMs was first compiled. Using Ollama, the most-downloaded models on Hugging Face were scanned, and those expected to perform well on TYT-like tasks were shortlisted. Each model's token-generation speed on the test system was then measured. Preliminary user-experience surveys indicate that fluent interaction requires a minimum speed of 7 tokens per second (based on user polls) (r/LocalLLaMA, 2023). Consequently, models that failed to meet the ≥ 7 tokens per second threshold were eliminated. For example, the local 7 B-parameter version of DeepSeek-R1 achieved only 1.9–3.1 tokens per second and was excluded. Three models advanced to the final stage: Qwen-2.5 (3 B), Qwen-3 (4 B), and Gemma-3 (4 B). These not only provided adequate speed but have also been reported as successful in recent literature. For comparison, the 671 B-parameter cloud model DeepSeek-R1, representing state-of-the-art performance, was included as a reference.

Qwen-2.5 and Qwen-3, developed by Alibaba Cloud, stand out for their multilingual capabilities and an enhanced reasoning feature known as "thinking mode." Gemma-3, derived from Google's Gemini project, is positioned as an efficiency-oriented open-weight model. Both families were released under open licences in 2024–2025. Qwen-3 supports a Mixture-of-Experts (MoE) architecture and performs strongly in over 100 languages, whereas Gemma-3 excels with multimodal support and a long context window (up to 128 K tokens).

3.4.1 Model Quantization and Memory Requirements

To run on limited VRAM, all selected models were loaded in the Q4_K_M quantization format, which stores weights as 4-bit integers while preserving accuracy by separately retaining certain distribution moments. **Table 3** summarizes each model's parameters and memory footprint.

Table 3. Memory usage of quantized models

Model	Parameter Count	Quantization	Memory Requirement
Gemma-3	4.3 B	Q4_K_M	3.3 GB
Qwen-3	4.02 B	Q4_K_M	2.6 GB
Qwen-2.5	3.09 B	Q4_K_M	1.9 GB
DeepSeek-R1 (cloud)	671 B	Q4_K_M	404 GB

These figures represent the size of each model's weight file after quantization. Because a 671 B-parameter model would require roughly 400 GB of GPU memory even in Q4_K_M format, DeepSeek-R1 was accessed via a cloud server, whereas the other three models fit within 4 GB VRAM.

3.5 Evaluation Procedure

The models were assessed on the 95-item test set through the steps below:

1. Token-Throughput Measurement: Using vLLM's timing tools, the average number of tokens each model produced per second while answering the questions was logged. Total tokens generated were divided by total inference time to obtain mean tokens per second.
2. Accuracy Assessment: Models were prompted to output a single letter (A–E) for each question. Outputs were compared with the answer key and coded as correct or incorrect. Where necessary, answer templates (e.g., "Answer: B") were included in the prompts to ensure consistent formatting.
3. Statistical Analysis: A two-way ANOVA was conducted with Model (Qwen-2.5, Qwen-3, Gemma-3, DeepSeek-R1) and Subject Area (Turkish, Social Sciences, Mathematics, Natural Sciences) as factors, at a significance level of $\alpha = 0.05$. The analysis tested for performance differences across subject areas and for Model × Area interactions; significant effects were further examined with post-hoc tests.

4. Findings

4.1 Overall Performance

The general performance metrics of the three screened local models and the reference cloud model are summarized in **Table 4**. For each model, the parameter size, average token-generation speed, number of correct and incorrect answers, and overall accuracy percentage are reported.

Table 4. Overall accuracy and speed performance of the models

Model	Parameters (B)	Tokens/s	Correct	Incorrect	Accuracy (%)
Qwen-3	4	8.4	63	32	66.31
Gemma-3	4	7.9	49	46	51.57
Qwen-2.5	3	11.2	26	69	27.36
DeepSeek-R1 (cloud)	671	–	79	16	83.15

As shown in **Table 4**, the cloud-based DeepSeek-R1 model achieved the best result with 83.15 % accuracy. Among local models, Qwen-3 ranked first with an accuracy of 66.31 %, followed by Gemma-3 with 51.57 %. Qwen-2.5 performed markedly worse, reaching only 27.36 % accuracy. Qwen-3 answered 63 of the 95 questions correctly, while Gemma-3 answered 49 and Qwen-2.5 only 26.

Regarding speed, the smaller-parameter Qwen-2.5 was the fastest (11.2 t/s), followed by Qwen-3 (8.4 t/s) and Gemma-3 (7.9 t/s). Although Qwen-2.5 enjoyed a speed advantage—possibly owing to its lower parameter count and more aggressive optimizations—this did not translate into higher accuracy. On the contrary, it was the least accurate model, clearly illustrating the speed–accuracy trade-off: the fastest model produced the fewest correct answers. Qwen-3, in contrast, reached the highest accuracy while still operating within an acceptable speed range, indicating a more balanced position on this trade-off.

4.2 Sub-Test Analysis

To deepen the overall findings, accuracy was also calculated per subject area (Turkish, Social Sciences, Mathematics, Natural Sciences). Table 5 presents the percentage accuracy of each model for each area.

Table 5. Accuracy percentages of the models by sub-test

Subject Area	Qwen-2.5	Qwen-3	Gemma-3	DeepSeek-R1 (cloud)
Turkish	24 %	71 %	63 %	88 %
Social Sciences	31 %	69 %	48 %	74 %
Mathematics	18 %	34 %	22 %	30 %
Natural Sciences	36 %	61 %	55 %	78 %

The table shows substantial fluctuations across subject areas. For example, in the Turkish section, Qwen-3 achieved a strong 71 % accuracy, whereas Qwen-2.5 reached only 24 %. Likewise, Qwen-3 scored 69 % in Social Sciences, while Gemma-3 achieved 48 %. In Natural Sciences, Qwen-3 (61 %) and Gemma-3 (55 %) clearly outperformed Qwen-2.5 (36 %). A notable observation is the universally low performance in Mathematics: even Qwen-3 achieved only 34 % accuracy, and the cloud-based DeepSeek-R1 reached merely 30 % **(Figure 1)**. This suggests that the numerically intensive reasoning required by these tasks is challenging for both small and large models.

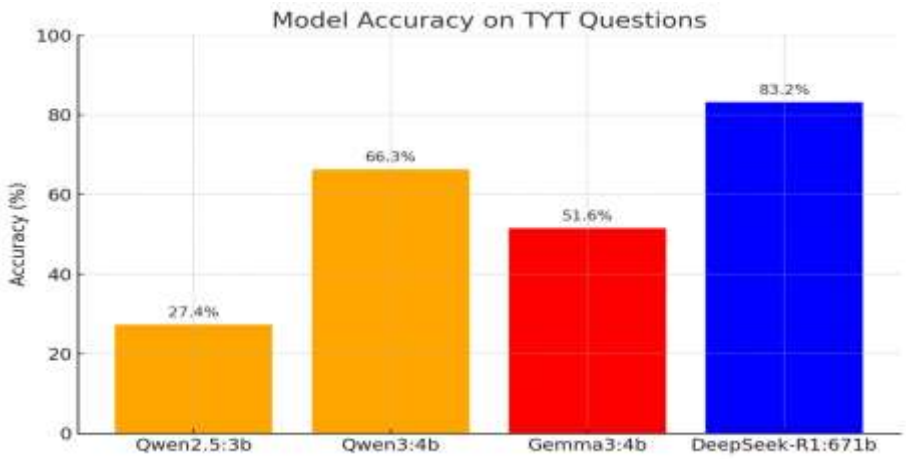

Figure 1. Model Accuracy on TYT Questions

A two-way ANOVA revealed that the main effects of Model and Subject Area, as well as their Model × Area interaction, were statistically significant ($F(3, 12) = 6.12$, $p < 0.01$). This indicates that performance differences between models are not uniform across subject areas; a model's superiority over another depends on the specific section. For instance, while the gap between Qwen-3 and DeepSeek-R1 is narrow in Mathematics (~4 %), DeepSeek-R1 outperforms Qwen-3 by about 17 % in the Turkish section. The significant interaction suggests that future work should target architecture-specific weaknesses within particular subject areas for tailored improvements.

4.3 Evolutionary Trajectory of Model Scale: The Emergence of "Small but Successful" Models

The findings obtained align with a major trend observed in artificial intelligence in recent years: it has become feasible to achieve high performance with "small" models containing comparatively few parameters. This section discusses two main developments in the literature that account for the relative success of such models: (i) breakthroughs in data and training strategies and (ii) architectural and inference-time optimizations.

1- Compute-optimal training approach. Introduced in 2022, the Chinchilla principle demonstrated that there exists a compute-optimal point that balances model size and the amount of training data. In essence, adding parameters does not always translate into higher performance; what matters is training the model with high-quality data in proportion to its parameter count. For example, the 70-billion-parameter Chinchilla model—which was trained on hundreds of billions of tokens—outperformed the 280-billion-parameter Gopher model by more than seven percentage points in average accuracy. This result proved that models trained with roughly twenty tokens per parameter can surpass enormous yet under-trained counterparts, thereby offering more efficient training strategies for researchers limited by hardware constraints.

2- Use of high-quality and synthetic data. Another factor enhancing the success of small models is their training on far higher-quality data. Rather than relying on random internet text, recent models are fine-tuned on textbook-level, human-curated corpora and even synthetic data generated by stronger models. Consequently, even with few

parameters, the knowledge and patterns a model acquires become markedly richer. For instance, the 13-billion-parameter Vicuna model - fine-tuned on ChatGPT dialogues shared by users - has reached 90 % of ChatGPT's response quality (Vicuna Team, 2023). Similarly, Meta's Alpaca and its derivatives, trained on instruction–response pairs produced by GPT-3.5/GPT-4, have attained much higher performance than initially expected. These developments indicate that training a small model under the guidance of a larger one (via distillation or reinforcement) effectively endows it with the "knowledge of the large model," raising the performance ceiling of small models day by day.

In addition to these factors, architectural and inference-time optimizations—such as quantization and LoRA—have been applied to small models, enabling real-time operation. For example, the Q4_K_M quantization format employed in this study reduces model size while minimizing accuracy loss (Brown, 2022). Moreover, infrastructures such as vLLM lower inference latency through techniques like batching and caching. Taken together, these advances make it possible to achieve high performance on specific tasks with "small yet fast" models: when the entire pipeline from training to inference is designed efficiently, even an LLM running on a device with 4 GB of VRAM can correctly answer the majority of high-school-level exam questions.

5. Discussion

The findings of this study indicate that small language models running locally can serve as educational support tools under certain conditions. The Qwen-3 model, which achieved a 66 % accuracy rate, demonstrated performance very close to that of the powerful cloud-based model, particularly in the domains of Turkish language and Social Sciences. This suggests that students could practice exam questions with an AI assistant on their own devices—even without internet access. Conversely, the low performance of all models in Mathematics reveals that questions requiring numerical and logical reasoning remain challenging for AI. This underscores the continued importance of teacher guidance and explicit explanation of solution steps. In other words, although LLMs can produce concise answers effectively, domains such as mathematics may still require larger models or specialized techniques for detailed, step-by-step explanations.

From a speed standpoint, evaluated from a user-experience perspective, the Qwen-3 and Gemma-3 models operate at approximately 8 tokens per second, which falls within an acceptable range. Although Qwen-2.5 offered higher throughput, its practical utility was limited by its lower accuracy. According to user surveys, a minimum speed of 7 tokens per second is required for a fluid conversational interface. Models that fall below this threshold (e.g., the excluded 7 billion-parameter model) introduce significant delays, prolonging students' wait times. Therefore, any locally deployed educational support application should employ a model that delivers both sufficient accuracy and at least this minimum speed; otherwise, students may lose focus or abandon the system while waiting for responses.

The results also carry implications for educational policy and technology integration. Establishing offline AI stations in rural or infrastructure-limited regions is a promising concept. For example, local LLMs hosted on a robust, on-premises server in a school could function as an AI tutor that students access sequentially or simultaneously. This would enable learners in disadvantaged areas to engage in AI-supported education even without internet connectivity. Running large-scale language models locally—rather than on centralized cloud servers—also offers security and privacy benefits by keeping data on-site. Educational content and exam

questions can be answered directly within the classroom, without transmitting data externally. Such an approach could strengthen equity in access to digital learning.

Moreover, local LLM deployment is unlikely to diminish teachers' roles; rather, by relieving them of repetitive tasks (e.g., grading tests, providing basic feedback), it could free up time for pedagogical guidance and motivational support. From a pedagogical perspective, it is essential that students maintain critical thinking skills and consistently verify the accuracy of model outputs. Because models can err, students should be encouraged to identify mistakes and analyse their causes. Doing so can become part of the learning process itself—for instance, discussing "Why might the AI have answered this question incorrectly?" can uncover conceptual misunderstandings. In conclusion, when properly integrated, local LLMs can augment traditional educational approaches and serve as valuable supportive tools.

6. Conclusion and Recommendations

In this study, the success of locally running language models on a device with limited hardware capacity was examined for answering university entrance–level questions. The results show that, with the appropriate choice of model and optimizations, offline models can operate with reasonable accuracy and speed. In light of these findings, the key conclusions and recommendations can be summarized as follows:

- Best Local Model: Under a 4 GB VRAM constraint, the Qwen-3 (4 B, Q4_K_M) model offered the best balance, achieving 66 % accuracy and approximately 8 tokens per second. This model is recommended as the most suitable local model for educational support under the conditions examined.
- Hybrid Deployment: Although powerful cloud-based models (e.g., DeepSeek-R1 or GPT-4) deliver higher performance in verbally oriented subjects (Turkish, Social Sciences), the performance gap between cloud and local models narrows in quantitative subjects (Mathematics, Science). Therefore, a hybrid approach using a cloud model for verbal questions and a local model for numerical questions may be both practical and cost-effective.
- Policy Recommendation: The establishment of offline AI learning centres in disadvantaged regions should be considered; this would enable students without Internet access to benefit from AI-supported educational tools. Such centres could host the necessary hardware and models in advance and serve students over a local network.

In conclusion, open-source local language models can be employed in education to promote equity of opportunity. Nevertheless, it should be kept in mind that large commercial models still offer superior performance. As research continues to enhance the quality of small models, offline AI assistants may become an integral component of future educational practices.

7. Conflict of Interest Statement

The authors declare that there are no institutional or financial conflicts of interest associated with this work.

ABSTRACT

This paper explores how strategic customer engagement can significantly improve vehicle routing efficiency (by influencing the design of the routing set), particularly the demand-to-distance ratio. While existing routing algorithms excel at finding optimal routes for a given set of delivery points, they often overlook the crucial step of customer selection before all orders are finalized. Our study investigates the impact of distance- and demand-based customer selection after an initial set of orders has been placed. We utilized a well-established Hybrid Genetic Search (HGS) algorithm, specifically tailored for the Capacitated Vehicle Routing Problem (CVRP), to determine optimal routes across five distinct scenarios. These scenarios involved an initial random selection of 75 customers, followed by the addition of 50 more customers. The additional 50 were chosen based on different criteria: randomly, by highest demand, by shortest distance, or by the worst demand-over-distance ratio from the remaining pool of potential customers. Through one thousand simulated instances, our results consistently demonstrated that increasing the number of customers improved the demand-to-distance performance. Crucially, selecting customers based on their shortest distance exhibited a significantly steeper performance improvement compared to selection based solely on demand. This compelling evidence underscores that strategic customer addition plays a vital role in substantially enhancing vehicle routing efficiency.

Keywords: Traveling Salesman Problem (TSP), Capacitated Vehicle Routing Problem with Time Windows (CVRPTW), Revenue Management, Demand Responsiveness, Online Grocery, Urban Logistics.

Introduction

As a well and widely known fact reported multiple times through various studies, cities are globally under the pressure of rapidly increasing populations. By 2050, 68% of the world's population is projected to live in urban areas, which means our cities will have an additional 2.5 billion people to accommodate and provide sufficient urban spaces, while also facing the challenge of increasing motorization, according to the United Nations' famous report published in 2019 (Urbanization Statistics, Revision of World Urbanization Prospects., 2019).

Although its share in the total motorized urban trips reached to 40% in some cities already (Herzog, 2010), "urban logistics" has been nevertheless neglected for years while many policies and measures have been proposed and implemented (for public transport, electric vehicles, car-sharing and carpooling, cycling and walking, etc.) in the field of urban passenger mobility. Consequently, this has resulted in increasingly harmful effects (carbon emissions, traffic congestion, noise pollution, energy consumption) of freight vehicles in cities (Sebbane & Dablanc, 2019).

However, there are some fresh initiatives (full and hybrid human-powered vehicles, electric vehicles etc.) to address those passenger mobility problems mentioned above, "urban logistics" will remain as the most intense piece of "urban mobility" consuming the energy most per mile since it requires the use of large vehicles and the demand for the last-mile delivery is continuously increasing which is expected to increase 80% more than its current level today by 2030 (Brady-Phillips & Holmes, 2024, December).

Besides all the points mentioned above, some empirical studies of urban freight deliveries show that the average load factor of urban freight vehicles is only at 30-40% (which means more than half volumes of those vehicles are empty) and more than 20% of vehicles roam on roads of our cities full-empty (Letnik, Mencinger, & Božičnik, 2018), however, it is important to note that not all observable space within a vehicle means usable load capacity due to packaging, handling, stacking and time-slot etc., constraints in logistics operations. Although these studies measure idle space in freight vehicles, they often lack insight into the root causes and operational contexts, limiting their usefulness for developing targeted, domain-specific solutions.

To address the underutilization of load capacity in delivery (freight) vehicles, several land-use and demand management policies—such as time-based or vehicle-type-based access restrictions to streets/roads, and the collaborative/shared use of logistics resources among competitors (with or without shared consolidation centers or depots)—have been developed and implemented by public authorities at various levels (national, regional, or local). However, these efforts often fall short in prioritizing the commercial benefits of logistics service providers and tend to lack meaningful citizen engagement for collaborative solutions (Holguin-Veras, et al., 2021) (Dablanc, 2023). This gap is partly due to limited logistics-related knowledge within public administration institutions (Paddeu, 2025).

On the other hand, since the first introducing of Traveling Salesman Problem (TSP) (Cook, 2012) going back to almost 300 years ago from today and the generation of Vehicle Routing Problem (VRP) with its capacity constrained version (CVRP – Capacitated Vehicle Routing Problem) in 1959 as one of TSP's real-world reflections in the logistics domain (Dantzig & Ramser, 1959), its relatively younger sub-variant, born in the late 1980s (Solomon, 1987) (Kolen, Rinnooy Kan, & Trienekens, 1987), which also takes time windows constraints into account, called VRPTW (Vehicle Routing Problem with Time Windows), has been one of the topics studied less within the general VRP field – [or Traveling Salesman Problem With Profits

(TSPP) more generally] (Feillet, 2005), (Archetti, 2014), (Toth & Vigo, 2014), (Hameed, 2025).

While the majority of studies in this field has been focused on finding the shortest total route distance, beginning with the introducing of "dynamic pricing" approaches in 2007 (Figliozzi, 2007), some studies putted efforts to optimize slot assignments to delivery points (customers/recipients) in order to handle with (manage) uncertain demand observed in attended home delivery (AHD) operations (such as courier, express and parcel –CEP– and/or online grocery deliveries) as one of the real-world applications of CVRP(TW) (Klein, 2017), (Schwamberger, 2023) , (Abdollahi, 2023) , (Waßmuth, 2023).

Building on the previous studies mentioned above, and inspired by the fundamental principle of the Traveling Salesman Problem with Profits (TSPP) (Feillet, 2005) — where it is not necessary to visit all vertices and the operator (salesman) selects the most beneficial ones — this study explores broader strategic engagement opportunities between AHD operators and consumers during the stage of adding delivery points (vertices) to vehicle routes. The aim is to investigate whether there is meaningful potential for implementing engagement strategies to improve the overall efficiency of vehicle routing — CVRP(TW) in this study— operations by influencing the design of routing sets.

Materials and Methods

Material

The dataset used in this study is taken from CVRPLIB , a standard set of benchmark instances for the capacitated vehicle routing problem and publicly accessible at the following URL address http://vrp.galgos.inf.puc-rio.br/index.php/en (accessed on May 4th, 2025) (Uchoa, Pessoa, Poggi, Vidal, & Subramanian, 2017).

Rather than using the direct CVRPTW instances in the mentioned library, which are Solomon(1987) and Homberger & Gehring(1999), one set ('X-n214-k11') in one of the CVRP instances [Uchoa et al. (2014)] is preferred (selected) since only the characteristics of one single time-slot distribution is analyzed in this study by disregarding any hard and/or soft time windows priorities (requirements) of delivery nodes (points) in the problem set.

The CVRP dataset analyzed in this study is classified as "combined distribution" from the route organization aspect of e-commerce last-mile delivery operations (Winkenbach & Janjevic, 2018) and as "one-to-many distribution without transshipment" (Daganzo, 2005) within the Continuous (or Continuum) Approximation (CA) Models for Logistics and Transportation Systems (Ansari, Başdere, Li, Ouyang, & Smilowitz, 2018) and "with single echelon" by the operational chain-hierarchy angle (Clark & Scarf, 1960). The inventory aspect of the operation (inventory routing problem) (Dror, Ball, & Golden, 1985) is disregarded in order to preserve the simplicity of the problem. The problem does not include any reverse logistics transactions, either.

However there are variety of offered algorithms in the academic literature in order to get the shortest total distance within a CVRP problem (Hameed, 2025) , in this study a Hybrid Genetic Search (HGS) algorithm is selected which is introduced by (Vidal T. C., 2012) and (Vidal T. , 2022) based on its already proofed success at a competition organized in 2022 with multi judgment steps under the name of "The EURO meets NeurIPS 2022 Vehicle Routing Competition" (Kool, 2023). Simulations are carried out in a MATLAB environment.

Scenario – Method

In this study, an investigation is carried out to detect the impact of distance and demand-based customer selection after an initial set of orders has been placed. Within this purpose, a well-established Hybrid Genetic Search (HGS) algorithm, specifically tailored for the Capacitated Vehicle Routing Problem (CVRP) (as already mentioned above), is run to determine optimal routes across five distinct scenarios. These scenarios involved an initial random selection of 75 customers, followed by the addition of 50 more customers. The additional 50 were chosen based on different criteria: randomly, by highest demand, by shortest distance, or by the worst demand-over-distance ratio from the remaining pool of potential customers. For each scenario, one thousand simulations were carried out and the results were compared to each other among in total five distinct scenarios.

Findings and Discussion

Data in use

The dataset identified as 'X-n214-k11' comprises 214 coordinates, with the first denoting a depot location and the remaining 213 representing customer locations. Distances from the depot vary significantly, with the closest customer at 24.17 units and the furthest at 601.85 units, while the average distance stands at 291.44 units with a standard deviation of 129.75 units. Each customer has a fixed demand ranging from 2 to 100 units, averaging 48.62 units with a standard deviation of 29 units. This dataset also specifies a single vehicle with a demand fulfillment capacity of 944 units, strongly suggesting its application in a vehicle routing optimization context.

Algorithm in use

The problem was solved using a specialized version of the Hybrid Genetic Search (HGS) algorithm, as described by (Vidal T. C., 2012) and (Vidal T. , 2022), which is specifically tailored for the Capacitated Vehicle Routing Problem (CVRP). The modern implementation incorporates Advanced Diversity Control [https://github.com/vidalt/HGS-CVRP]. The only modification made to the default settings was decreasing the 'maximum number of iterations without improvement' to 1000. All coordinates from the dataset were included in the execution to identify the optimal routes that minimize total distance while using the necessary number of vehicles.

Solution for the data with all locations

The algorithm yielded a solution utilizing 11 vehicles to cover a total distance of 10,956 units. On average, each vehicle visited 19.36 locations with a standard deviation of 3.11, covering an average distance of 996.62 units with a standard deviation of 298.94. The depot, all customer locations, and the optimized vehicle routes are visualized in Fig. 1.

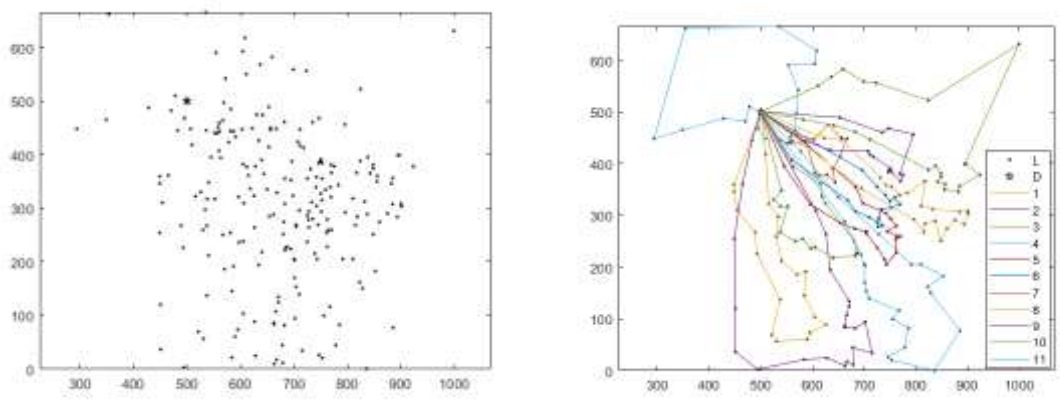

Figure 1. All locations of delivery points in the CVRP dataset used in this study (at the left) and the solution (best) routes gained by the algorithm (at the right).

Simulations

Following the methodology described in the previous section, 75 random customer locations were selected from the total of 213. The algorithm's solution for this scenario involved 4 vehicles traveling a total distance of 5233 units, successfully fulfilling the 3702 units of demand from these 75 customers. Consequently, the performance was calculated as a demand-to-distance ratio of 3702/5233 = 0.7074. The locations and vehicle routes are presented in Fig. 2.

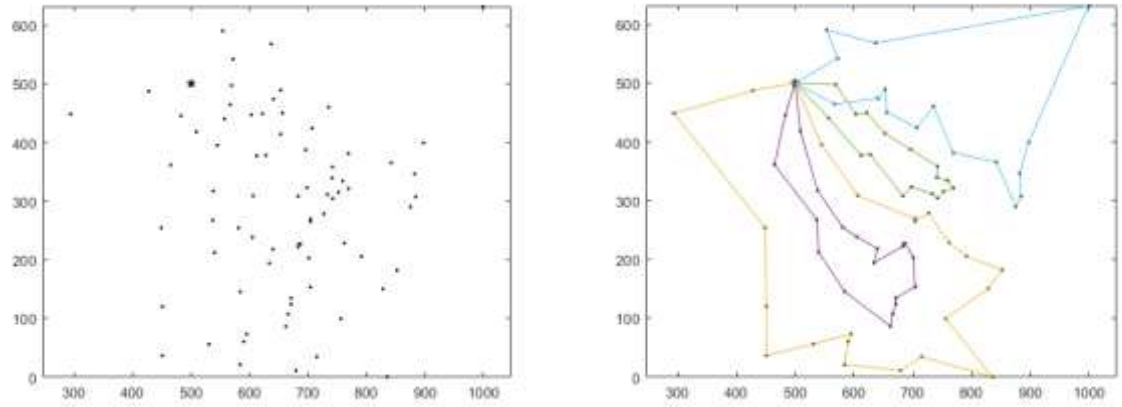

Figure 2. The locations of an instance with randomly selected initial 75 delivery points (at the left) and the solution (best) routes gained by the algorithm (at the right).

Starting with the initial 75 selected locations, an additional 50 random locations from the remaining pool were added as in Fig. 3, and the algorithm was executed. This resulted in a solution using 7 vehicles, covering 7395 units of distance, and satisfying 6375 units of demand. Notably, the performance, measured as the demand-to-distance ratio, increased to 0.8621 (6375/7395). Subsequently, instead of random selection, the 50 locations with the highest demand from the remaining pool were added to the initial 75, and the algorithm was executed again. This scenario required 9 vehicles, covered an increased distance of 8544 units, and fulfilled 7744 units of demand, leading to an improved performance ratio of 0.91 (7744/8544). The locations and vehicle routes are presented in Fig 4.

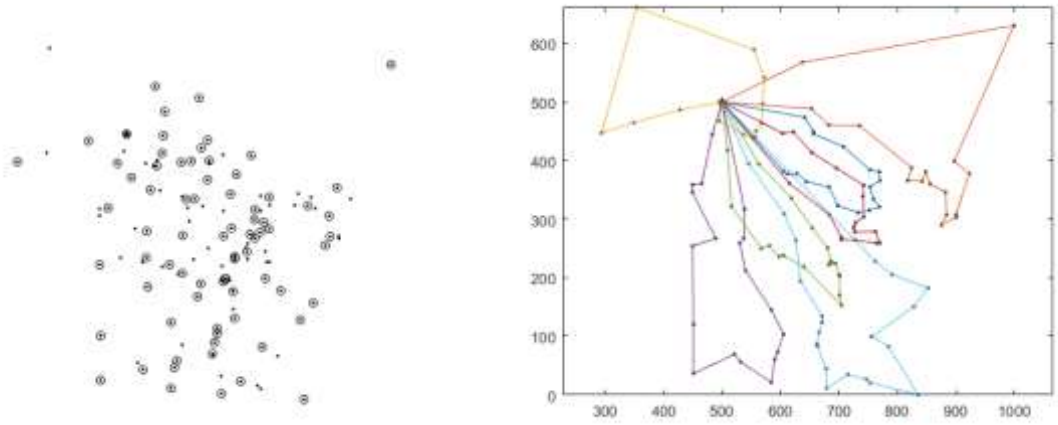

Figure 3. The locations of the same instance together with **randomly selected** additional 50 delivery points (at the left) and the solution (best) routes gained by the algorithm (at the right).

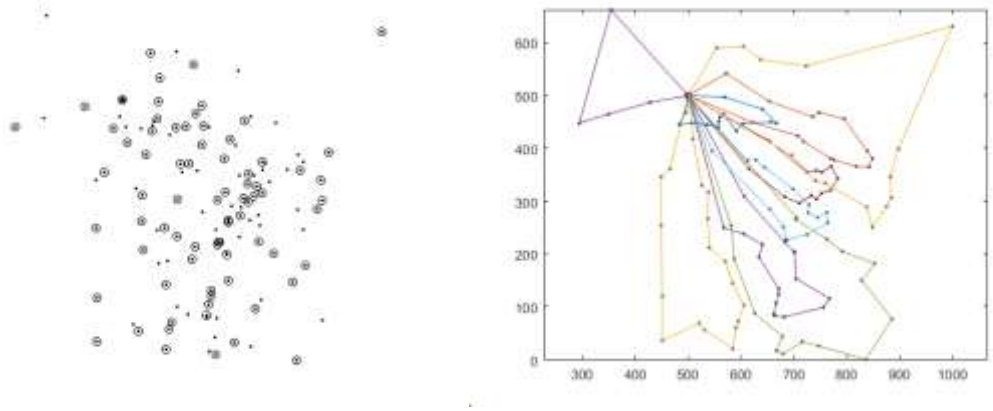

Figure 4. The locations of the same instance together with additional 50 delivery points selected by **highest demands** (at the left) and the solution (best) routes gained by the algorithm (at the right).

In an alternative selection method, another 50 locations were chosen from the remaining pool based on their proximity to the existing 75 locations as shown in Fig. 5. This resulted in 7 vehicles covering a distance of 7128 units and satisfying 6381 units of demand, with a resultant performance ratio of 0.8952 (6381/7128). Across all scenarios—whether the 50 additional customers were selected by demand, proximity, or randomly—an increase in performance was consistently observed.

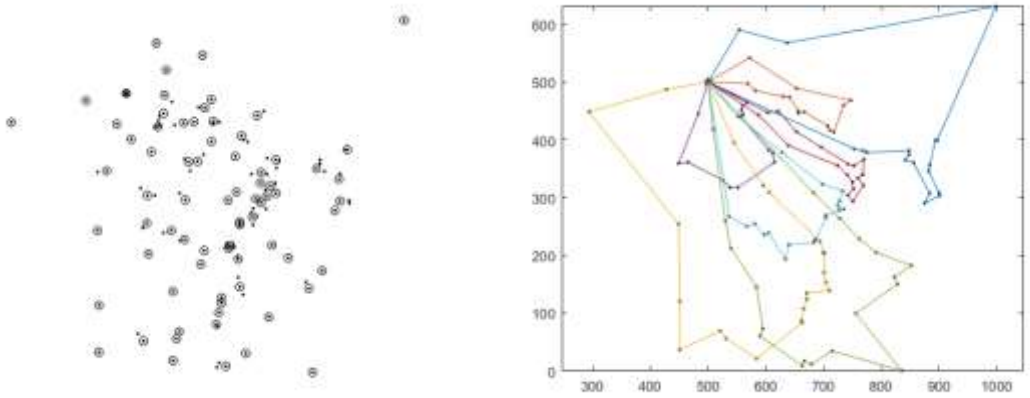

Figure 5. The locations of the same instance together with additional 50 delivery points selected by **shortest distances** (at the left) and the solution (best) routes gained by the algorithm (at the right).

Finally, when the 50 additional customers were selected based on a low demand/distance ratio as in Fig 6., the algorithm's solution resulted in a performance of 0.69. This outcome was falling behind the scenario that included only the initial 75 customers.

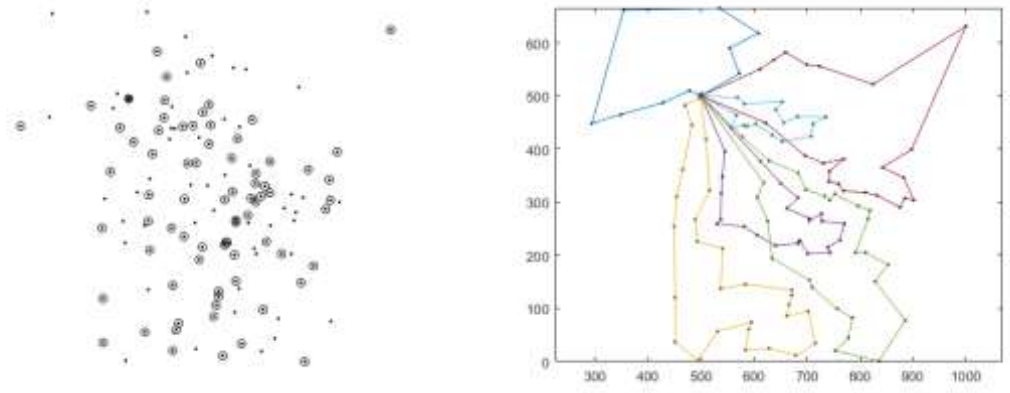

Figure 6. The locations of the same instance together with additional 50 delivery points selected by lowest demand/distance ratios (at the left) and the solution (best) routes gained by the algorithm (at the right).

Looking at the results presented so far, it can be inferred that increasing the number of customers (from 75 to 125) can improve the demand/distance performance. However, these results were derived from single instances. To increase the sample size and observe how adding customers impacts performance, the above simulation was repeated 1000 times. The performance results are presented in Fig. 7.

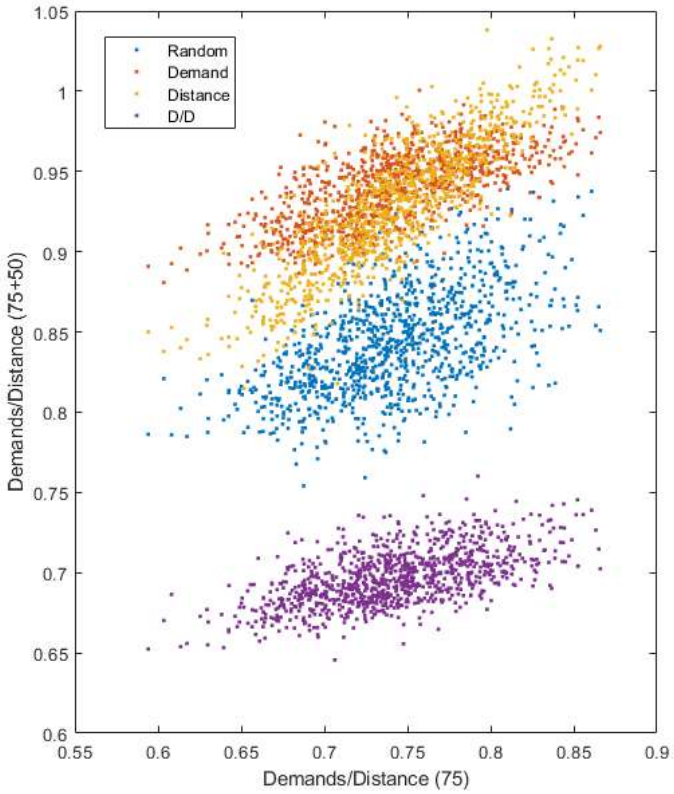

Figure 7. The efficiency change based on additional delivery points (horizontal axis – initial efficiencies, vertical axis – efficiencies after 50 additional costumers inserted).

In Fig. 7, the blue dots indicate that performance increases when an additional 50 customers are randomly selected. For each instance in the simulation, the initial 75 locations were randomly chosen, leading to a performance range distributed between 0.6 and 0.85. When 50 random locations are added to these initial customer sets, the figure shows a linear region where the performance range expands to 0.75-0.9. Adding 50 high-demand locations further boosted performance by 0.1. Similarly, selecting locations based on shortest distance also increased performance, with a noticeably steeper improvement trend compared to demand-based selection. For instance, an initial performance of 0.6 for 75 customers can rise to 0.85 with distance-based selection of 50 locations, while an initial performance of 0.85 can exceed 1.0 with the addition of more customers.

On the other hand, as a possible negative scenario, when customers with low demand-to-distance ratios were added, a decline in efficiency was observed. Initially, the efficiency ranged between 0.6 and 0.7, and after adding these customers, the resulting efficiency settled between 0.65 and 0.7. However, it was noted that experiments with an initial efficiency above 0.7 remained around the 0.7 level after adding additional customers.

Conclusion and Recommendations

In this study, the impact of distance and demand-based customer selection/engagement on the operation efficiency were investigated. The assessment involved an initial random selection of 75 customers, followed by the addition of 50 more customers based on different four criteria: randomly, by highest demand, by shortest distance, or by the worst demand-over-distance ratio from the remaining pool of potential customers. When 50 additional customers were randomly selected, an increase in efficiency was observed, indicating that serving more customers can have a positive impact on overall efficiency. Furthermore, the efficiency improved even more when the additional customers were selected from the pool based on high demand or low distance. However, it can also be concluded that choosing the wrong criterion for customer engagement may negatively affect efficiency.

As clearly indicated by the simulation outputs (particularly in Fig. 7), there is a significant positive difference between the fully random selection of vehicle routing vertices (nodes) and the two strategic approaches prioritizing either high-demand or short-distance vertices. This difference highlights meaningful potential for AHD operators to implement customer engagement strategies through incentivization mechanisms, aiming to enhance the overall profitability and efficiency of CVRP(TW) operations. Further optimization of these customer engagement strategies—addressing key questions such as “Which strategy or combination of strategies should be applied, in what ratio, and when, to influence recipient (delivery point) selection?”—represents a promising direction for future research involving additional simulation studies.

ABSTRACT

AI-Generated Content (AIGC) refers to the creation of content such as text, images, audio, video, or code through artificial intelligence tools. These contents are produced based on prompts provided by users and are utilized in diverse domains including education, art, and healthcare. Among AIGC applications, text-to-image synthesis holds a significant position. Generative models developed for this task can be broadly categorized into three main groups: Generative Adversarial Networks (GANs), Variational Autoencoders (VAEs), and Diffusion Models. The aim of this study is to examine the datasets used in text-to-image synthesis, the generative models employed, their architectural structures, loss functions, and mathematical foundations. In this work, the CUB-200-2011 (birds) dataset was used for training and evaluation. Although larger datasets such as COCO are commonly used in the literature, training text-to-image models requires high computational power and large VRAM capacities. Therefore, the birds' dataset was considered a more suitable choice for this study. The models used in the experiments include Attentional GAN, Deep Fusion GAN, Generative Adversarial Contrastive Language–Image Pretraining (GALIP), and a newly proposed GALIP variant with architectural modifications. These models were trained in a semi-scratch manner, where pretrained text encoders were kept frozen. Model performance was evaluated using metrics such as Frechet Inception Distance (FID) and Contrastive Language–Image Pretraining Score (CLIPScore). Experimental results show that the original GALIP model achieved 11.1302 FID and 0.3247 CLIPScore, whereas the proposed GALIP variant outperformed it with 10.8963 FID and 0.3254 CLIPScore. This study presents a comprehensive analysis of existing models' design principles and mathematical foundations, while also introducing a competitive GALIP-based variant that delivers better synthesis performance under limited computational resources.

Introduction

Humans have always been able to transport objects and travel from one place to another using their bodies. What, then, was the purpose of inventing the wheel? It was, of course, the desire to do what we already could, but faster and more efficiently. In this context, we find a common ground between the invention of the wheel and the Artificial Intelligence Generated Content (AIGC): speed and efficiency.

AIGC refers to the creation of written, visual, or auditory content for creative, educational, and many other applications by artificial intelligence (Zhang et al., 2023). Through generative AI, it is possible to produce text, images, audio, video, and code. With advancements in Natural Language Processing (NLP) and Computer Vision, AIGC has reached a level of proficiency where it can produce high-quality content that is nearly indistinguishable from that created by human writers, designers, and artists (Zhang et al., 2023).

The adage "A picture is worth a thousand words" highlights the power of visual communication. Although written text provides a precise and concise means of conveying information, visual media such as images often deliver a richer, more accurate, and easily interpretable representation, facilitating better understanding and communication (Agnese et al., 2020). Therefore, visual content generation holds a significant place within AIGC applications.

Specifically in the domain of image generation, we observe three primary model architectures for Text-to-Image (TTI) synthesis: Generative Adversarial Networks (GANs), Diffusion Models, and Autoregressive Models. Contemporary models like DALL-E, DALL-E 2, and Stable Diffusion are based on diffusion or autoregressive architectures. However, training these models currently demands large datasets, substantial computational power, and significant hardware resources. Although GAN models may not produce images as realistic as these counterparts, they remain an important image generation model due to their lower computational requirements, ability to be trained on smaller datasets, and high inference speed. Furthermore, in recent years, these models have been combined with large-scale models, making them more competitive in terms of performance (Zhang et al., 2023).

One such model that integrates GANs with large-scale models is Generative Adversarial CLIP (GALIP). In this model, Contrastive Language-Image Pre-Training (CLIP) is utilized as the text and image encoder (Zhang et al., 2023).

A primary challenge in this field is the fusion of textual and visual information to generate a semantically coherent image. Solutions developed to address this problem include label-conditioned GANs (cGANs) or models like Attentional GAN (AttnGAN), which use a word-image attention mechanism (Agnese et al., 2020). The main objective of these and similar TTI models is to appropriately combine text and image data to generate an image that aligns with the given prompt. While the AttnGAN model uses an attention mechanism to achieve this semantic alignment, the GALIP model applies an affine transformation within its DFBlock component to harmonize the two modalities. This establishes a more robust semantic bridge between the textual and visual representation spaces (Tao et al., 2022).

In this study, AttnGAN, Deep Fusion GAN (DF-GAN), GALIP, and representing various GAN-based models were compared in terms of their architectures, loss functions, and performance using Fréchet Inception Distance (FID) and Contrastive Language–Image Pretraining Score (CLIPScore) metrics. Furthermore, to improve semantic alignment in text-to-image generation and enhance image diversity, we propose a modified Deep Fusion Block (DFBlock) variant, which also contributes to better gradient propagation. Details of this variant are presented in the following section.

Materials and Methods

Dataset

The models were trained using the Caltech-UCSD Birds-200-2011 (CUB-200-2011) dataset, introduced by Wah et al. (2011). Created by the Caltech Vision Lab, this dataset comprises a total of 11,788 images across 200 different bird species, with each species being represented by approximately 60 images.

The dataset provides not only class labels but also rich descriptive information with fine-grained details. For each bird, it includes annotations for 15 distinct part locations, such as the eye, beak, wings, and tail. Furthermore, it contains 312 binary attributes (e.g., "does it have long wings?" or "is the bird's nape blue?") and bounding box coordinates that specify the location of the birds in the images.

Due to this rich annotation structure, CUB-200-2011 is widely used as an ideal benchmark dataset for both fine-grained classification tasks and for training generative models that require text-to-image synthesis.

Text to Image Models

To perform text-to-image generation, a variety of GAN-based models, such as AttnGAN, DF-GAN and GALIP, were utilized to explore different architectural approaches.

Vanilla Generative Adversarial Network (GAN): GANs have marked a significant milestone in the field of generative modeling, due to their unique ability to generate realistic and diverse samples (Zhou, 2023).

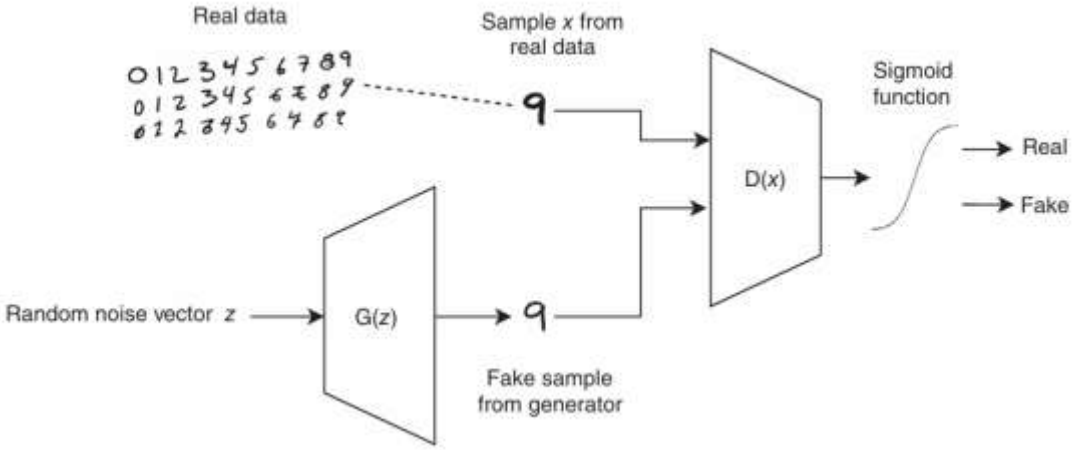

Figure 1. Vanilla GAN architecture (Agnese et al., 2020)

As illustrated in Figure 1, GANs are composed of two deep neural networks: a generator and a discriminator. The generator network takes a random noise vector as input and produces an image. This synthetic image is then fed to the discriminator. The objective of the generator is to create an image that the discriminator classifies as real. The discriminator network, on the other hand, receives both real images from the dataset and the synthetic images produced by the generator. The task of the discriminator is to correctly identify the generated images as fake and the real images as real (Agnese et al., 2020).

This architecture is trained through an optimization process based on game theory. The generator and discriminator have opposing objectives and compete in a zero-sum game. The loss function used in this adversarial process is defined as follows:

$$\min_G \max_D V(D,G) = \mathbb{E}_{x\sim p_{data(x)}}[log\, D(x)] + \mathbb{E}_{z\sim p_z(z)}\left[log\left(1 - D\big(G(z)\big)\right)\right] \quad (1)$$

Equation (1) introduces the key components of the GAN framework: the generator G aims to produce realistic samples, and the discriminator D attempts to distinguish between real data samples x and generated samples. The latent vector z provides the generator with a source of randomness, typically drawn from a standard normal distribution, which enables diverse data generation (Agnese et al., 2020). The discriminator's objective is to maximize the objective function. It aims to output a value of 1 for real images and 0 for synthetic images. In an optimal state for the discriminator, where its classifications are perfect, both terms in the objective function would approach *log(1)*, resulting in a value of 0. The generator, in turn, attempts to minimize its loss against the discriminator.

The vanilla GAN model represents a significant milestone for image generation. However, when considering a multi-class dataset such as the one used in this study, the problem of controlling which of the 200 bird species to generate becomes apparent. This leads to the question of how one can generate an image belonging to a specific class.

Conditional GAN (cGAN): This challenge was addressed by cGAN architecture, proposed by Mirza & Osindero (2014). As presented in Figure 2, in the cGAN model, both the generator and the discriminator are conditioned on extra information, such as class labels, which are provided as input in addition to the noise vector. Consequently, for the bird dataset specifically, the species of the bird in the generated image can be predetermined.

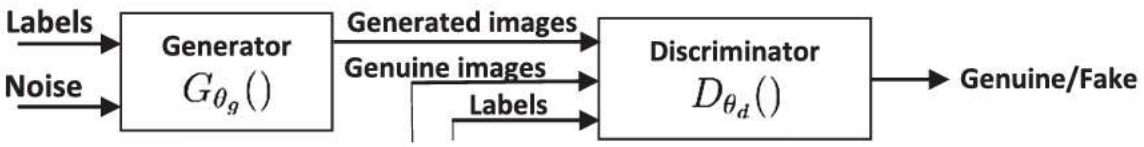

Figure 1. cGAN architecture (Agnese et al., 2020)

The loss function of the cGAN model is analogous to that of the Vanilla GAN. The primary distinction, however, is that the image generation and evaluation processes become conditional. The loss function, which is calculated based on the real/generated images given the corresponding label or condition, is then used to update the model's parameters during training.

$$\min_{\theta_g} \max_{\theta_d} V\left(D_{\theta_d}, E_{\theta_g}\right) = \mathbb{E}_{x\sim p_{data(x)}}\left[log\, D_{\theta_d}((x|y))\right] + \mathbb{E}_{z\sim p_{(z)}}\left[log\left(1 - D_{\theta_d}\left(G_{\theta_g}(z|y)\right)\right)\right] \quad (2)$$

The objective function of the cGAN is defined in Equation (2) which is very similar to the GAN objective function in Equation (1). D_{θ_d} denotes a discriminator function, controlled by parameters θ_d, which aims to classify a sample into a binary space. G_{θ_G} denotes a generator function, controlled by parameters θ_g, which aims to generate a sample from some latent space vector (Agnese et al., 2020).

In cGAN models, image generation is conditioned on class labels. However, generating an image of a specific bird species is often insufficient. For more granular control, more detailed visual attributes—such as the bird's color, the size of its body parts, and the surrounding environment—must also be taken into account.

Attentional Generative Adversarial Network (AttnGAN): In early TTI models, textual data was encoded into sentence vectors to generate images based on the input prompt. Although this method achieved impressive results, conditioning solely on a global sentence vector causes fine-grained, word-level details to be overlooked, thereby hindering the generation of high-quality images (Xu et al., 2018).

Another challenge inherent to GAN models is the risk of collapse in deep architectures. Due to their unstable nature, the backpropagation of gradients becomes more difficult as the network deepens. This can lead to issues such as gradient explosion or vanishing, resulting in mode collapse, which in turn impedes the construction of the deep architecture necessary for high-resolution image generation. To overcome this, the AttnGAN model utilizes 3-stage GAN architecture (Tao et al., 2022).

As illustrated in the figure, a given prompt is first processed by a Text Encoder, which utilizes a bi-directional LSTM, to extract both sentence and word features. The sentence features are concatenated with a random noise vector and fed into an Upsample block to generate initial image features. These features are then used by the generator for image synthesis and are also combined with the word vectors to be passed to the subsequent image generation stage. In the final generation stage, an Image Encoder extracts features from the produced image (Xu et al., 2018).

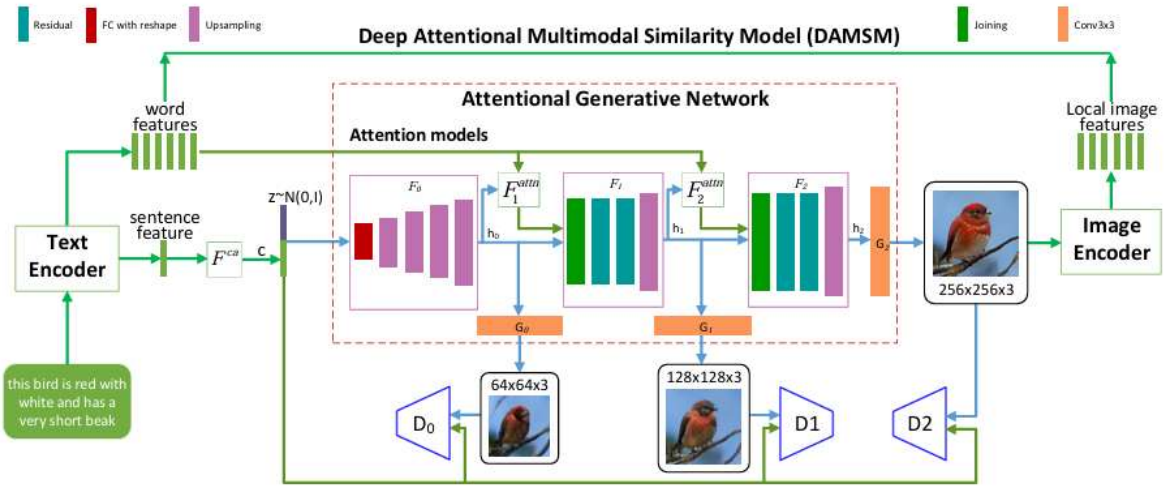

Figure 3. AttnGAN Architecture (Xu et al., 2018)

The semantic alignment is then calculated by comparing the word features from the Text Encoder with the image features using the Deep Attentional Multimodal Similarity (DAMSM) loss.

In Equation (3), the loss function of the AttnGAN architecture is comprised of the adversarial losses from the generator networks and the DAMSM loss, which is weighted by a coefficient, λ (Xu et al., 2018).

$$\mathcal{L} = \mathcal{L}_G + \lambda \mathcal{L}_{DAMSM}, where\ \mathcal{L}_G = \sum_{i=0}^{m-1} \mathcal{L}_{G_i} \quad (3)$$

In Equation (4) and (5), at the i^{th} stage of the AttnGAN the generator G_i paired with a discriminator D_i. Here, x_i samples drawn from the real image distribution p_{data_i} at scale i, while $\hat{x}^i$ denotes samples generated from the model distribution p_{G_i}at the corresponding scale

(Xu et al., 2018). The adversarial loss functions for the discriminator and generator are fundamentally similar to the objective function of the Vanilla GAN model. However, the total loss function in the AttnGAN model is composed of two parts: an unconditional component and a conditional component.

$$\mathcal{L}_{D_i} = \underbrace{-\frac{1}{2}\mathbb{E}_{x_i\sim p_{data_i}}[log\, D_i(x_i)] - \frac{1}{2}\mathbb{E}_{\hat{x}_i\sim p_{G_i}}\left[log\left(1 - D_i(\hat{x}_i)\right)\right]}_{unconditional\ loss}$$
$$\underbrace{-\frac{1}{2}\mathbb{E}_{x_i\sim p_{data_i}}[log\, D_i(x_i, \bar{e})] - \frac{1}{2}\mathbb{E}_{\hat{x}_i\sim p_{G_i}}\left[log\left(1 - D_i(\hat{x}_i, \bar{e})\right)\right]}_{conditional\ loss} \quad (4)$$

$$\mathcal{L}_{G_i} = \underbrace{-\frac{1}{2}\mathbb{E}_{\hat{x}_i\sim p_{G_i}}[log\, D_i(\hat{x}_i)]}_{unconditional\ loss} \underbrace{-\frac{1}{2}\mathbb{E}_{\hat{x}_i\sim p_{G_i}}[log\, D_i(\hat{x}_i, \bar{e})]}_{conditional\ loss} \quad (5)$$

While the unconditional loss focuses on classifying images as real or fake, the conditional loss ensures that the generated image accurately corresponds to the given textual description (Xu et al., 2018). The DAMSM loss, in turn, involves a bidirectional loss calculation at both the word and sentence levels.

$$\mathcal{L}_{DAMSM} = \mathcal{L}_1^{w} + \mathcal{L}_2^{w} + \mathcal{L}_1^{s} + \mathcal{L}_2^{s} \quad (6)$$

In equation (6), $\mathcal{L}_1^{w}$ checks the alignment between the i^{th} word vector and the j^{th} sub-region of the image. $\mathcal{L}_2^{w}$ computes the alignment between the i^{th} sub-region of the image and the j^{th} word vector. $\mathcal{L}_1^{s}$ and $\mathcal{L}_2^{s}$ control the bidirectional semantic consistency between the sentence and the image at the word and region levels (Xu et al., 2018).

Deep Fusion Generative Adversarial Network (DFGAN): Text-to-image synthesis is one of the most significant applications of GAN-based methods. This task aims to generate photorealistic and text-consistent images based on given natural language descriptions. Due to its high application potential, text-to-image synthesis has become an active area of research in recent years (Tao et al., 2022).

The two fundamental challenges in this domain are ensuring the realism of the generated images and maintaining semantic consistency between the given text and the image. Due to the inherent instability of GANs during training, stacked architectures, such as that in AttnGAN, are often preferred for high-resolution image generation. Additionally, attention mechanisms are employed to ensure semantic alignment. However, these solutions introduce a set of their own problems (Tao et al., 2022).

First, the stacked architecture creates entanglement between different generators, which often causes the final generated images to appear as a blurry shape with some crudely combined details. Second, existing methods typically fix the auxiliary networks (e.g., text or image encoders) during the adversarial training process. This allows the generator to easily fool these networks by producing adversarial features, thereby weakening the supervisory power of these networks in ensuring semantic consistency. Third, cross-modal attention mechanisms cannot fully leverage the textual information. Due to high computational costs, they can only be applied twice on image features of sizes 64×64 and 128×128. This limits the text-image fusion and hampers the model's scalability to higher-resolution image generation (Tao et al., 2022).

As a solution to the first problem, as demonstrated by Figure 4, the DF-GAN model introduces single-backbone architecture. Since the generator and discriminator networks are composed of deep models, residual blocks are utilized to facilitate learning by regulating the flow of

gradients. Furthermore, previous GAN models often faced a training problem where learning would stall if either the discriminator or the generator became significantly better than the other. To prevent this, hinge loss is employed (Tao et al., 2022).

$$\mathcal{L}_D = -\mathbb{E}_{x\sim\mathbb{P}_r}[min(0,-1+D(x,e)] - (1/2)\mathbb{E}_{G(z)\sim\mathbb{P}_g}\big[min\big(0,-1-D(G(z),e)\big)\big]$$
$$-(1/2)\mathbb{E}_{x\sim\mathbb{P}_{mis}}\big[min\big(0,-1-D(x,e)\big)\big] + k\mathbb{E}_{x\sim\mathbb{P}_r}[(\|\nabla_x D(x,e)\| + \|\nabla_x D(x,e)\|^p)] \quad (7)$$

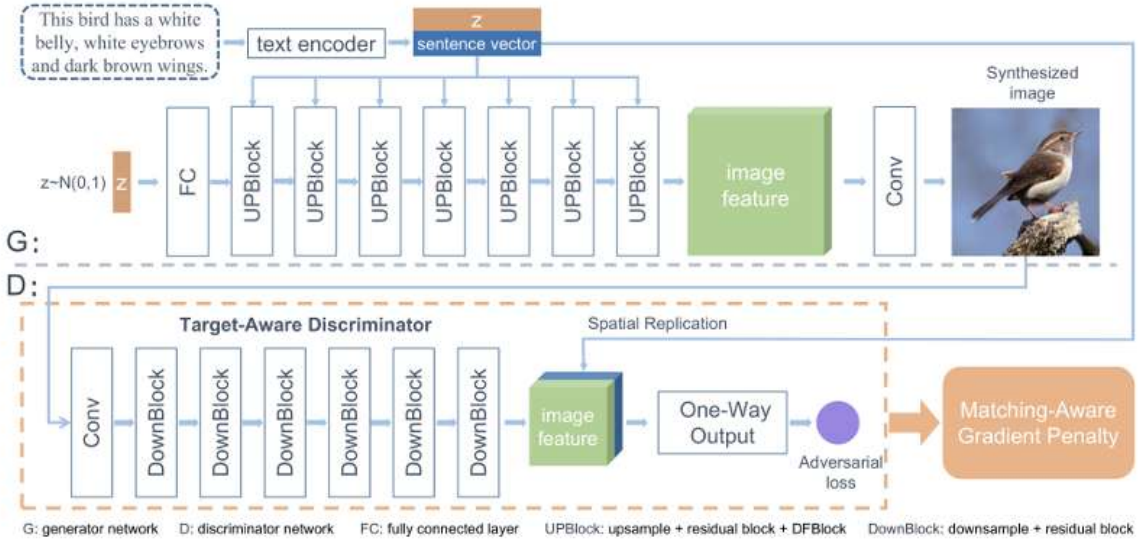

Figure 4. DF-GAN Architecture (Tao et al., 2022)

In equation (7), where z is the noise vector sampled from Gaussian distribution; e is the sentence vector; $\mathbb{P}_g, \mathbb{P}_r, \mathbb{P}_{mis}$ correspond to the distributions of generated data, real data, and mismatched data, respectively (Tao et al., 2022). To address the second problem, a Target-Aware Discriminator was designed to enhance text-image semantic consistency. It consists of two main components: Matching-Aware Gradient Penalty (MA-GP) and a One-Way Output (Tao et al., 2022).

$$\gamma = MLP_1(e), \quad \theta = MLP_2(e) \quad (8)$$

As illustrated in equation (8), the textual information is processed by two separate neural networks to generate scaling (γ) and shifting (β) parameters. In equation (9), these parameters are subsequently used to perform a channel-wise modulation of the visual features (Tao et al., 2022).

$$AFF(x_i|e) = \gamma_i . x_i + \theta_i \quad (9)$$

In conclusion, the DF-GAN model provides a remarkable baseline framework for the task of text-to-image synthesis, notable for both its architectural simplicity and semantic consistency.

Generative Adversarial CLIP (GALIP): Recent advancements in large-scale generative models have presented numerous opportunities for enhancing the performance of GAN-based TTI models (Zhang et al., 2023). One such GAN-based model is the GALIP model.

While impressive results in image generation are being achieved with large-scale datasets, massive model sizes, and pre-trained architectures like diffusion and autoregressive models, they still suffer from three fundamental weaknesses. First, the pre-training process for these models requires vast amounts of data and an enormous number of parameters. This leads to

high computational costs and demanding hardware requirements, making them inaccessible to many researchers and users. Second, the generation process of these large models is considerably slower compared to GANs. Token-based generation and progressive denoising procedures often require hundreds of inference steps, resulting in significant latency. Third, these models lack the intuitive and smooth latent space found in GANs, where meaningful visual attributes correspond to latent vectors. The multi-step generation process fragments the synthesis procedure and disrupts this coherent latent structure. Consequently, controlled image generation with these models necessitates carefully engineered prompts (Tao et al., 2023).

As illustrated in Figure 5, traditional GAN models fundamentally consist of a generator and a discriminator. The GALIP model, in contrast, integrates a pre-trained CLIP model with frozen weights. This integration enhances the model's ability to understand complex scenes and provides it with superior domain-generalization capabilities, owing to CLIP's large-scale pre-training (Tao et al., 2023).

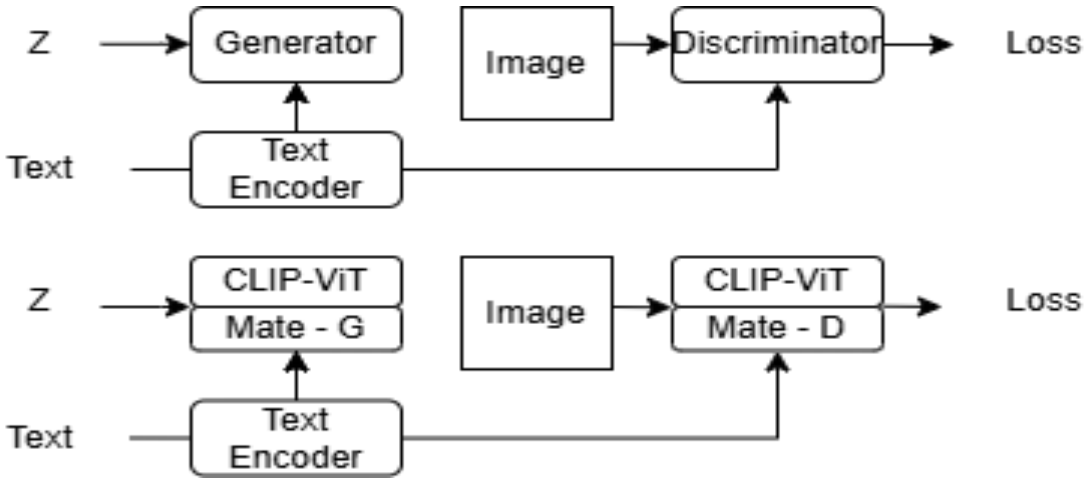

Figure 5. GAN and GALIP architecture (Tao et al., 2023)

As illustrated in Figure 6, the GALIP model is composed of three main components: Mate-G, Mate-D, and CLIP. The sentence vector T, generated by the text encoder, and a random noise vector Z are processed by a Bridge Feature Predictor to extract bridge features, which are then fed into the CLIP model. Subsequently, the output from the CLIP model is combined with Visual Concepts and passed to the Image Generator to synthesize the final image (Tao et al., 2023).

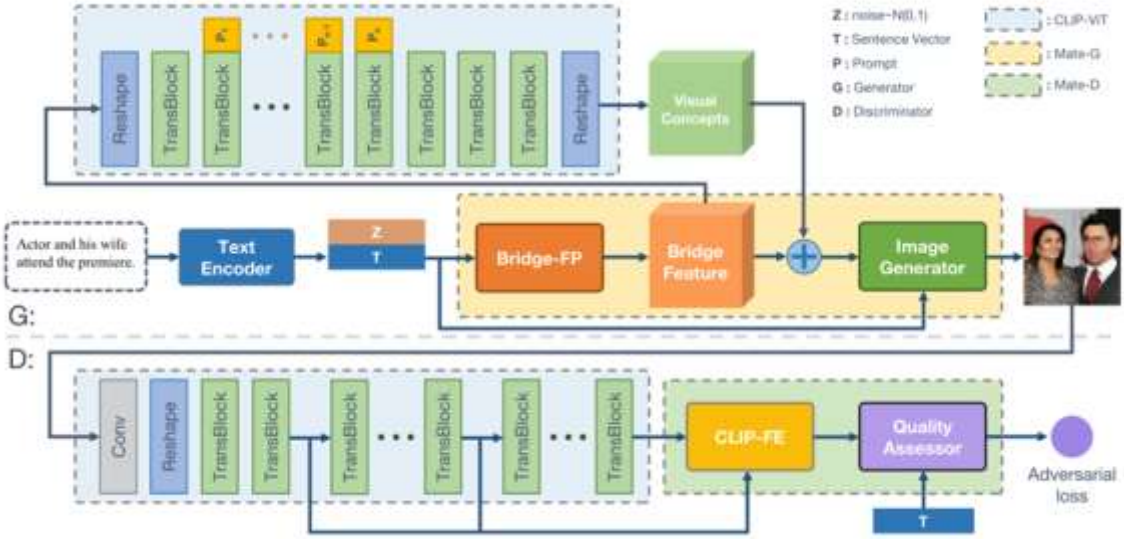

Figure 6. GALIP architecture (Tao et al., 2023)

As shown in Figure 7, From the generated image, features are extracted from different layers of the CLIP image encoder and fed to the CLIP-FE (CLIP Feature Extractor). These image features are then combined with the text data to calculate the adversarial loss (Tao et al., 2023).

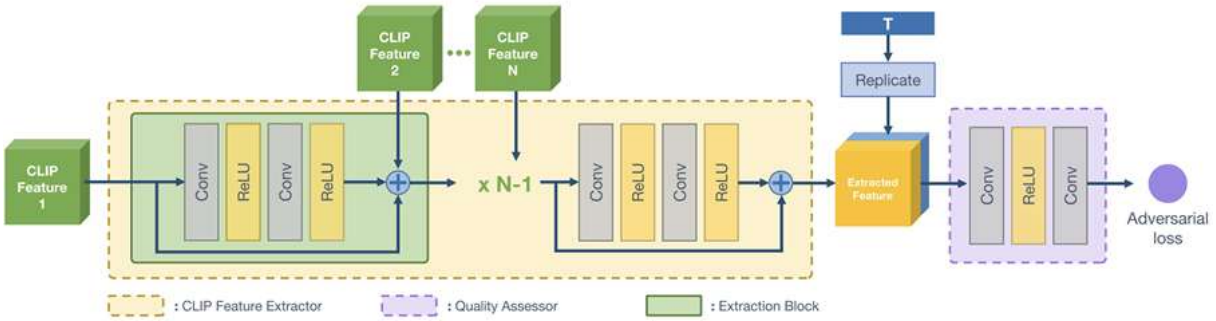

Figure 7. Mate-D (Tao et al., 2023)

As illustrated in Figure 8, we also observe the DF-Block structure in the CLIP Empowered Generator, which is used in the DF-GAN model for text-image semantic alignment, within the GALIP architecture. In this model, DFBlocks are utilized in both the Bridge Feature Predictor and the Image Generator components. In these stages, they work to ensure semantic alignment by fusing the sentence vector with visual features via an Affine transformation (Tao et al., 2023).

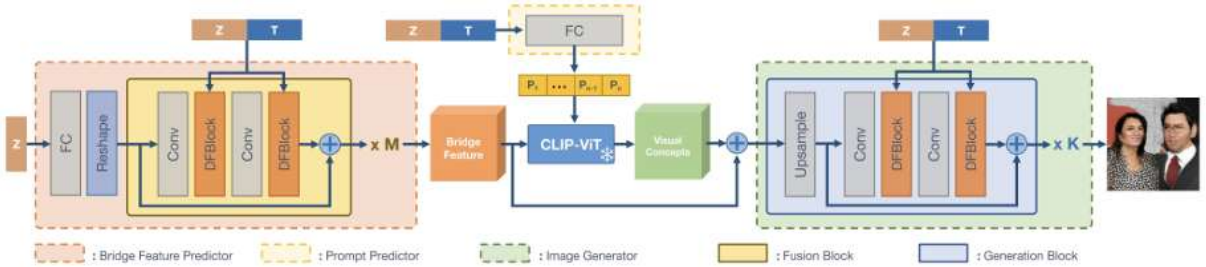

Figure 8. CLIP empowered Generator (Tao et al., 2023)

Proposed DFBlock: As depicted in Figure 9, the DFBlock structure is the key component for achieving text-image semantic alignment in both the DF-GAN and GALIP models. This

approach, noted for its higher efficiency compared to prior attention mechanisms, involves feeding the sentence vector into two distinct multi-layer neural networks. These networks subsequently output the scaling (γ) and shifting (β) parameters, as described in equation (8).

(Tao et al., 2022).

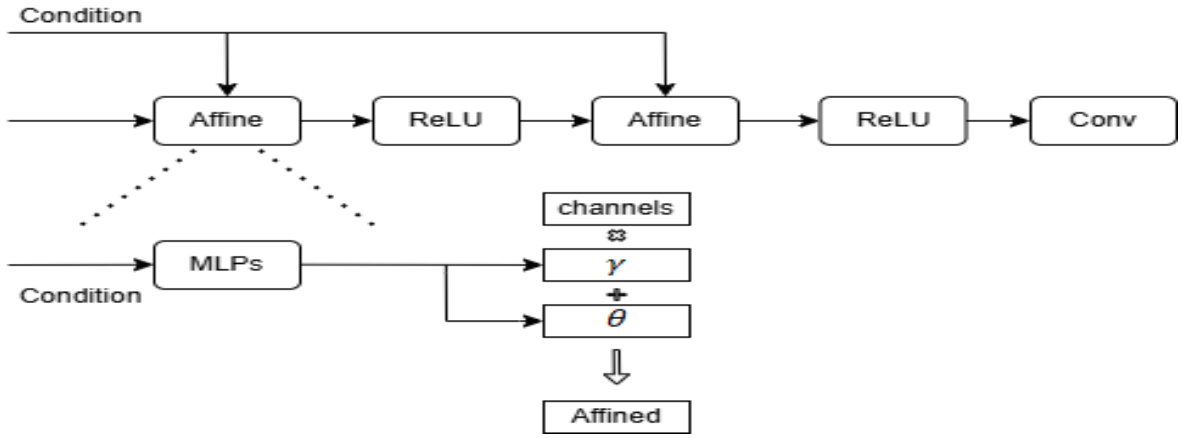

Figure 9. DFBlock (Tao et al., 2022)

These parameters are then applied to each channel of the visual features. In this way, the Affine layer expands the conditional representation space of the generator. However, the Affine transformation is an inherently linear operation for each channel, which limits the effectiveness of the text-image fusion process. Therefore, a ReLU layer is inserted between two Affine layers to introduce non-linearity into the fusion pipeline. This approach further expands the conditional representation space compared to using only a single Affine layer (Tao et al., 2022).

As illustrated in the Figure 10, the proposed new DFBlock structure includes an additional concatenation path alongside the original architecture. The sentence vector, with dimensions 32x512, is first compressed to 32x128. It then undergoes spatial replication before being concatenated with the visual feature vector. A 1x1 convolution is applied to adjust the channel dimension. Subsequently, the output matrices from the Affine path and the concatenation path are summed. The purpose of this concatenation is to increase diversity, supplementing the causal relationships learned between the text and image vectors in the Affine path. Furthermore, by making only slight modifications to the text and image vectors, a structure similar to a Residual Block is established, aiming to improve learning by enhancing the gradient flow.

Evaluation Metrics and Training Parameters: In this study, the FID and CLIPScore metrics were used for model performance evaluation. The FID metric measures how closely the distribution of generated images resembles the distribution of real images, providing insights into the realism and diversity of the generated content. Within this calculation, the covariance matrix quantifies the spread of features, thereby measuring diversity. A lower FID score is better. CLIPScore, on the other hand, indicates how semantically well a generated image matches a given text prompt. A higher CLIPScore signifies a better alignment between the image and the text (Zhang et al., 2023).

To compare the performance of the proposed DFBlock (containing both Affine and Concatenation paths) against the original DFBlock (containing only the Affine path), the models were trained using the hyperparameters shared in the official GitHub repository. The batch size was set to 32, and the training was conducted for 1502 epochs. The model was trained using both NVIDIA RTX 4070 Ti SUPER and NVIDIA A100 GPUs to assess performance across different hardware configurations.

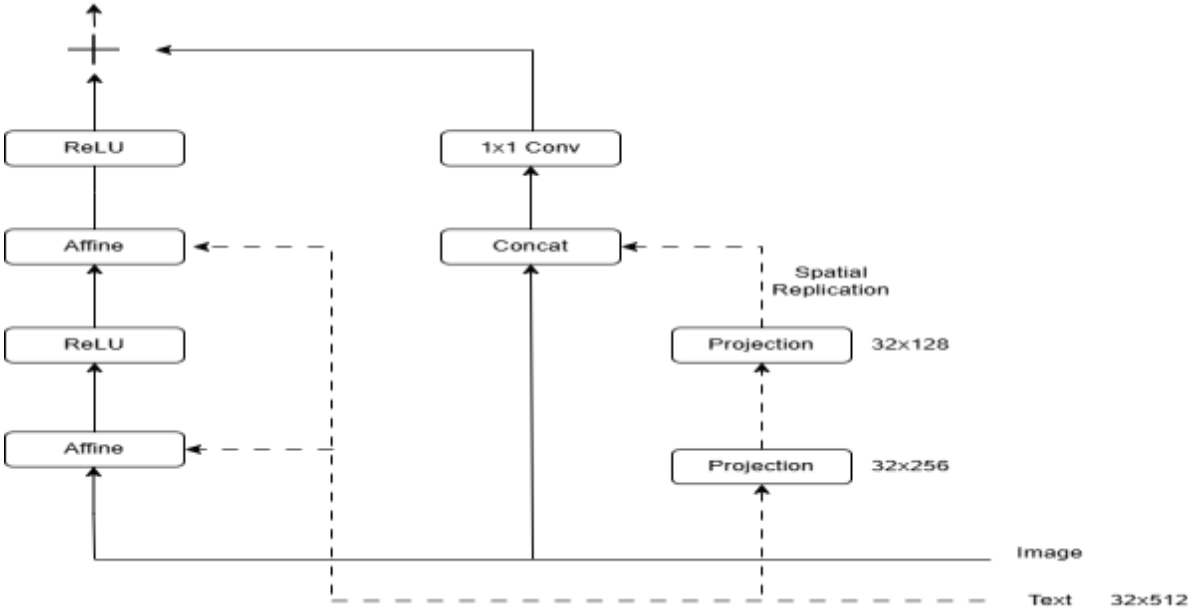

Figure 10. Proposed DFBlock

Results and Discussions

As shown in Table 1 and Figures 12-15, the GALIP models, featuring the original DFBlock and the proposed DFBlock respectively, were trained for 1502 epochs, with performance evaluations conducted every five epochs.

Table 1. Quantitative comparison of text-to-image models on the CUB-200-2011 dataset using FID (lower is better) and CLIPScore (higher is better).

Model	FID	Epoch (FID)	CLIPScore	Epoch (CLIPScore)
AttnGAN	23.98	-	29.4671	-
DF-GAN	11.5996	1150	28.9764	-
GALIP with proposed DFBlock	10.8963	680	0.3254	1435
GALIP with original DFBlock	11.1302	1420	0.3247	1500

Figures 11 through 14 present the best FID and CLIPScore values obtained during the training of the GALIP model with both the original and the proposed DFBlock. As shown in Figure 11, the proposed DFBlock achieved its optimal FID score of 10.8963 at epoch 680, whereas the original DFBlock reached a minimum FID of 11.1302 at epoch 1420 (Figure 12). Regarding semantic alignment, the model incorporating the proposed DFBlock attained the highest CLIPScore of 0.3254 at epoch 1435 (Figure 13), slightly outperforming the original DFBlock, which peaked at 0.3247 at epoch 1500 (Figure 14). These results indicate that the proposed modification not only enhances performance but also accelerates convergence during training.

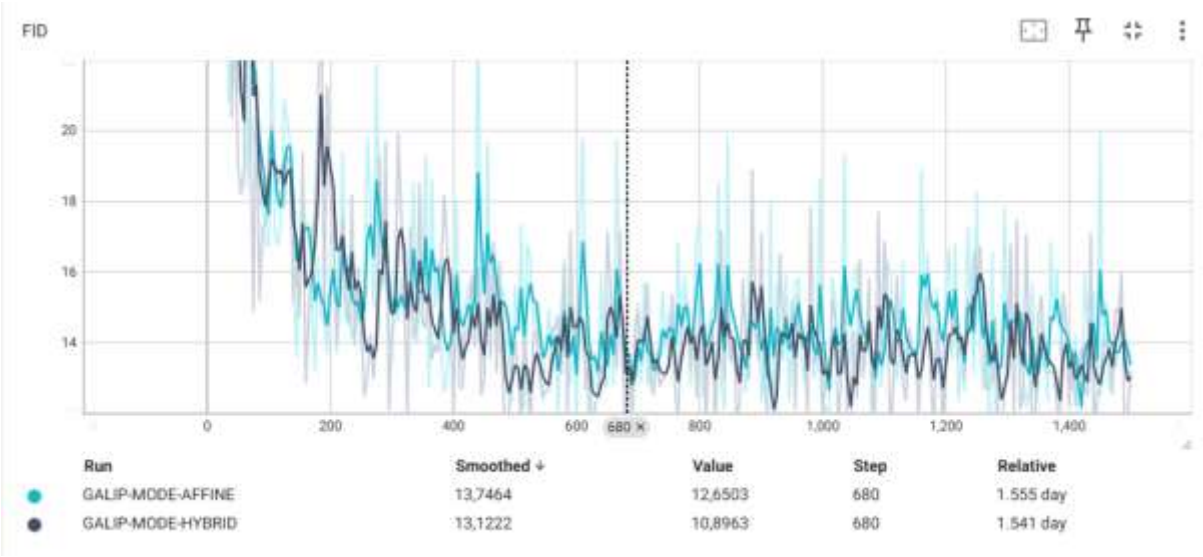

Figure 11. Best FID Score of GALIP with Proposed DFBlock

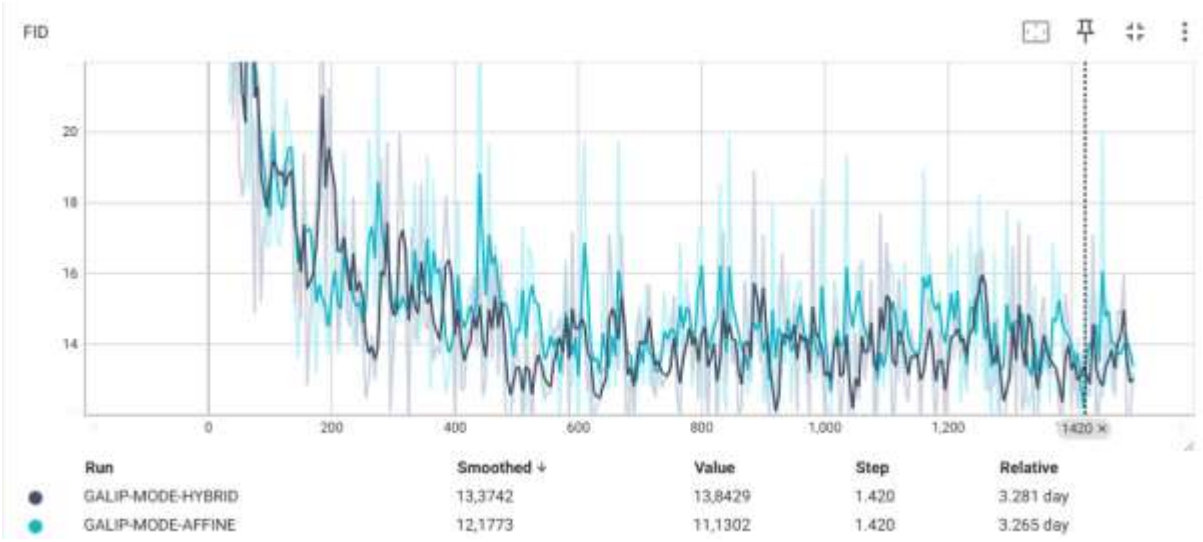

Figure 12. Best FID Score of GALIP with Original DFBlock

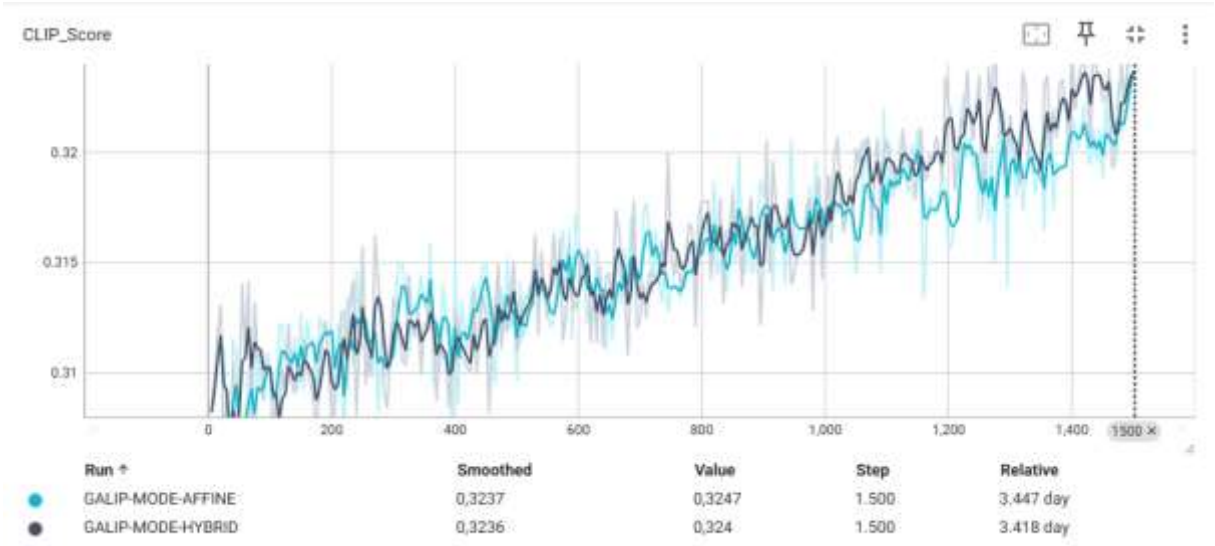

Figure 13. Best CLIPScore of GALIP with Proposed DFBlock

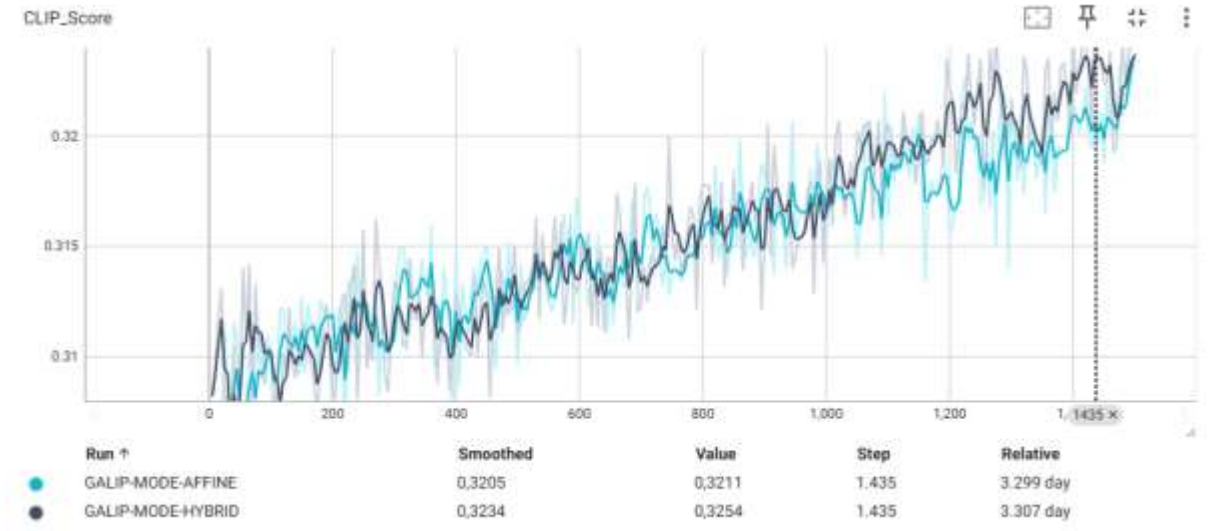

Figure 14. Best CLIPScore of GALIP with Original DFBlock

Conclusion

In this study, a comprehensive comparative analysis was conducted on GAN-based text-to-image synthesis models, including AttnGAN, DF-GAN, and GALIP. Furthermore, a modified version of the DFBlock component within the GALIP architecture was proposed to enhance semantic alignment and image diversity under limited computational resources. Specifically, the DFBlock was extended by introducing a concatenation path in parallel with the Affine branch, which also contributed to improved gradient propagation. Experimental results demonstrated that the proposed DFBlock yielded measurable improvements in both FID and CLIPScore metrics. Additionally, the modified model reached its optimal performance at significantly earlier epochs, indicating a faster convergence rate.

A key limitation of this study was the inability to evaluate the proposed method on the large-scale COCO dataset due to hardware constraints. Given that the baseline GALIP model has been reported to achieve notable FID and CLIPScore values when trained on COCO (Tao et al.,

2023), future research should focus on assessing the proposed DFBlock's performance and generalization capability on this benchmark dataset.

ABSTRACT

Additive manufacturing via laser powder bed fusion (LPBF) has revolutionized the production of complex metal parts by enabling high geometric freedom and near-net-shape fabrication. Cobalt-chromium (Co-Cr) alloys, prized in aerospace for their exceptional high-temperature strength, oxidation and corrosion resistance, are increasingly adopted for LPBF fabrication of jet engine components. Although numerous LPBF parameters—such as laser power, scan speed, hatch speed, and layer thickness—can influence dimensional accuracy, beam compensation (BC) has substantial effect on the dimensions of the produced parts. This parameter defines an offset between the original slice contour and the outermost boundary to ensure the part is built to the correct dimensions. In this study, five identical Co–Cr jet engine components were printed under constant LPBF settings with only the BC value systematically varied (45-105 µm) between builds. Each as-built component was measured using a high-precision coordinate measuring machine (CMM) to quantify deviations from the nominal CAD geometry in critical features. Results show that the optimal BC setting yielded dimensional deviations of less than 1% on the inner diameter and under 0.6 % on the outer diameters, demonstrating high accuracy to the nominal design. These findings underscore the significant role of BC in achieving near-net-shape accuracy of LPBF-fabricated parts and provide practical guidelines for selecting compensation values that minimize post-process work.

Keywords: Additive manufacturing, laser powder bed fusion, Co-Cr alloys, dimensional accuracy

Introduction

In recent years, additive manufacturing (AM) technologies have gained significant attention for their ability to produce complex, lightweight, and high-performance components. Among these techniques, Laser Powder Bed Fusion (LPBF) has emerged as one of the most advanced methods, offering the capability to fabricate intricate metallic structures with excellent precision. In the LPBF process, a high-power laser selectively melts layers of metal powder based on a digital CAD model. After each laser scan, a fresh layer of powder is recoated, and this layer-by-layer approach continues until the entire part is fabricated. The LPBF process provides notable advantages, such as design flexibility, material efficiency, and the potential to reduce component mass—attributes that are critical in advanced engineering applications. (Yildiz & Babacan, 2024) (Aktürk et al., 2025)

Cobalt–Chromium–Molybdenum (Co–Cr–Mo) alloys are widely utilized in LPBF due to their exceptional high-temperature strength, superior wear and corrosion resistance, and excellent biocompatibility. These properties make Co–Cr–Mo alloys highly suitable for demanding applications in sectors such as aerospace, biomedical, and energy. The growing demand for lightweight and complex components has further driven interest in processing Co–Cr–Mo alloys through advanced AM techniques. (Acharya et al., 2021).

To ensure reliable processability in LPBF, Co–Cr–Mo alloy powders are typically produced via Vacuum Inert Gas Atomization (VIGA). This technique enables the production of powders with highly spherical morphology, uniform particle size distribution, and good chemical homogeneity — all of which are critical for maintaining stable powder flow and achieving consistent melting behavior during the LPBF process.

However, the mechanical properties, microstructure, and dimensional accuracy of LPBF-fabricated parts are affected by numerous LPBF process parameters, such as laser power, scanning speed, hatch distance, layer thickness, and scanning strategy. Among these factors, dimensional accuracy is particularly influenced by the offset between the laser scan path and the boundaries of the intended part geometry, which is governed by the melt pool geometry (Fig. 1a). This offset is controlled through the beam compensation (BC) (Fig. 1b), which helps to minimize dimensional deviations and improve the accuracy of the final part.

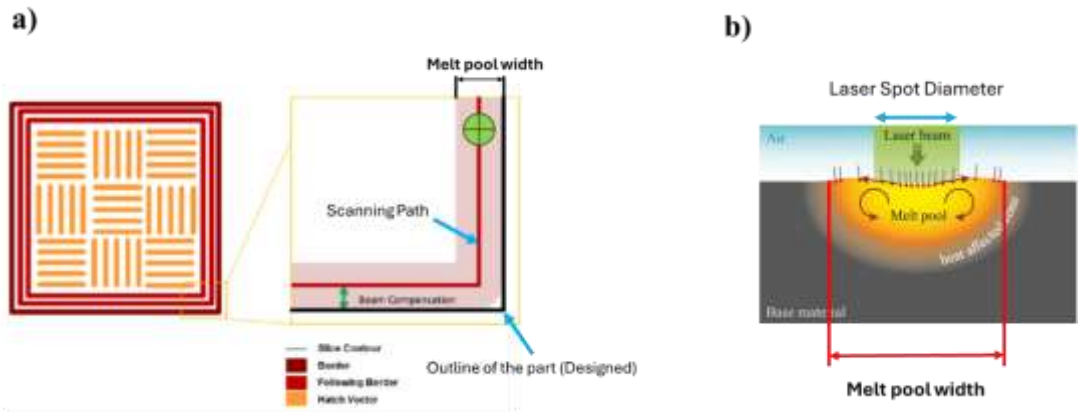

Figure 1. (a) Illustration of the BC; (b) Illustration of the melt pool boundary.

In this study, the effect of different BC settings on the dimensional accuracy of an aerospace jet engine component produced by LPBF from Co–Cr–Mo alloy powder was investigated. The findings aim to support the optimization of LPBF parameters for precision manufacturing of critical components in high-performance applications.

Materials and Methods

Co–Cr–Mo alloy powder with a spherical morphology was produced in-house via VIGA in compliance with the ASTM F75 standard. The powder was subsequently sieved to obtain a particle size range of 10–53 µm.

Five different jet engine components were fabricated using the LPBF (Ermaksan, EnaVision 130) process, employing 5 different BC parameters (45, 60, 75, 90, and 105 µm) under a nitrogen atmosphere. The following optimized process parameters were used during the production: laser power (180 W), scanning speed (581 mm/s), hatch distance (88 µm), layer thickness (30 µm), and laser spot diameter (75 µm). These parameters were chosen based on previous studies (Yıldız et al., 2023; Yıldız et al., 2025). A heat treatment was conducted at 750 °C for 2 hours to relieve internal stress and obtain suitable microstructure within the fabricated parts.

A Coordinate Measuring Machine (CMM) was used to measure five different diameters on each part, as the measurement locations illustrated in Fig. 2. Fig. 3 shows the setup and the CMM during the measurement process. After the measurements, the results were compared with the designed dimensions in terms of percentage deviation.

Figure 2. Measurement locations on the part surfaces (green-colored surfaces).

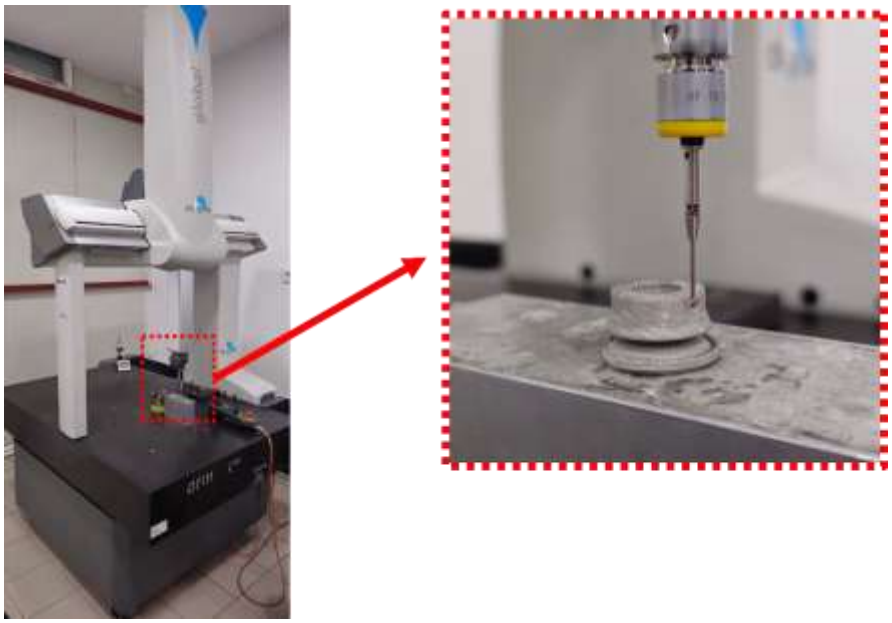

Figure 3. Images of the measurement process using a CMM.

Findings and Discussion

Table 1 presents the relative dimensional deviations between the designed model and the manufactured parts. For practical applications, inner diameters must be produced with negative tolerance, while outer diameters require positive tolerance. Consequently, the fourth and fifth parameter sets are unsuitable for production, as their dimensions fall below the design specifications. In contrast, the first three parameter sets are acceptable for production. In particular, the third parameter set—with a 75 µm BC—produced dimensions very close to the design. This minimizes post-processing effort and reduces overall processing time.

Table 1. Relative dimensional deviation between the designed model and the produced part

Sample	Beam Compensation (BC) (µm)	ID-1 (%)	OD-1 (%)	OD-2 (%)	OD-3 (%)	OD-4 (%)
1	45	-2.34	0.29	0.73	0.45	0.54
2	60	-1.98	0.13	0.43	0.10	0.27
3	75	-0.99	0.33	0.53	0.24	0.28
4	90	0.48	0.01	0.40	0.03	0.34
5	105	0.59	-0.54	-0.01	-0.26	-0.25

*ID: inner diameter, OD: outer diameter

Figure 4 illustrates the influence of BC on part geometry near the borders. When the BC value is low, the laser scan path lies too close to the nominal contour. Due to the outward spread of the melt pool, the effective melting does not fully reach the intended boundary, resulting in undersized dimensions. Conversely, if the BC value is too high, the scan path shifts excessively outward, causing the melt pool to extend beyond the nominal boundary and resulting in oversized dimensions. Thus, dimensional accuracy strongly depends on the alignment between the BC value and the actual melt pool width. In this study, the optimal dimensional accuracy was achieved with a BC value of 75 µm, which closely corresponds to the measured melt pool width. This correlation will be examined in greater detail in future investigations.

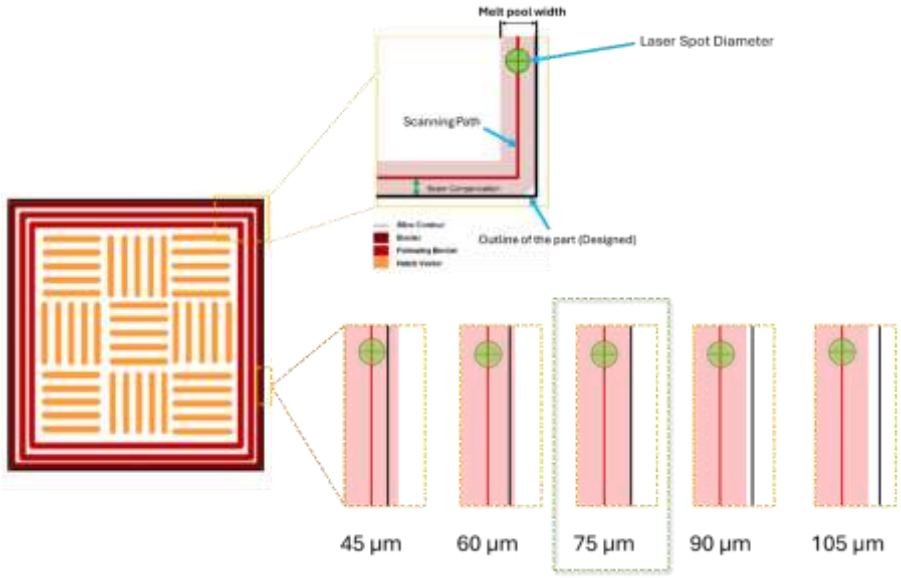

Figure 4. Schematic illustration of the effect of the BC parameter

Conclusion

In this study, the effect of beam compensation (BC) parameters on dimensional accuracy of LPBF-produced part is investigated and following conclusions are obtained:

- BC values significantly influence the dimensional accuracy of LPBF-manufactured components.
- Dimensional accuracy can be optimized solely by adjusting the BC parameter, without requiring any design modifications, provided that the process parameters have already been optimized.S
- Near-net shape parts can be successfully fabricated through LPBF, highlighting the process's potential for precise and efficient production.

Thanks and Information Note

The authors gratefully acknowledge financial support from The Scientific and Technological Research Council of Turkey (TÜBİTAK) under Project No. 121D024. We also extend our sincere appreciation to the members of the AMASMA research group for their invaluable contributions, insightful discussions, and technical assistance. Their dedication and collaboration were essential to the successful completion of this project.

THE ECHO OF ESCAPE FROM REALITY IN DIGITAL CINEMA: INTERPRETING THE SOCIOLOGY OF THE DREAM MOVIE

Yonca ALTINDAL
Assoc. Prof. Dr., Balıkesir University Faculty of Arts and Sciences, Department of Sociology, Department of Applied Sociology, Balıkesir-Turkey
e-mail: yoncaaltindal@balikesir.edu.tr, yoncaaltindal@yahoo.com.tr, yoncaaltindal35@gmail.com, ORCID:0000-0002-1240-127X

ABSTRACT

Communication gains meaning when read on the axis of the reciprocity and intersectionality of the social. Today, the borderlessness and expansion of communication networks have made it necessary to address many phenomena. The variability of the structure and, in fact, the circle of social networks has also begun to find a response in the reality of evaluating the existence of new habituses.

Cinema has also begun to exist and become visible with its own dynamics over time. The subjects, concepts and perspectives addressed have taken cinema far beyond whether it is a pure visual art and have made it necessary to conduct in-depth analyses. In this axis, it has evolved towards evaluation in the context of the discipline of sociology, where many social themes are discussed and examined within cinema. Because cinema needs to include the role of sociology in the process of presenting visuality. It is possible to say that it provides the opportunity to present it in more detail, beyond making analogies at a conceptual level.

This study is based on explaining how the 2016 film “Dream” directed by Derviş Zaim was constructed in the context of digital cinema, how it was conveyed in the context of a mental repertoire, and in fact, discovering the invisible behind the visible. It is important what the photograph of urban life includes with the imagination-friendly metaphors and spatial projections of the introduction of 3-dimensional reflection into cinema. In this context, the class and social context will be presented with a sociological reading will be made around the facts. The main purpose of the study is to establish the umbilical cord between the reflection of the discourses starting from the introduction of the film and sociology. In order to achieve this aim, the basic characters, places, discourses in the film and especially the semantics carried by the title chosen for the film will be examined in the axis of sociological interpretation and critical discourse analysis method.

Keywords: digital cinema, digital angel, imagination-friendly, sociology, dream.

GERÇEKLERDEN KAÇIŞIN DİJİTAL SİNEMADAKİ YANKISI: RÜYA FİLMİNİN SOSYOLOJİSİNİ YORUMLAMAK

ÖZET

İletişim, toplumsalın karşılıklılığı ve kesişimselliği ekseninde okunduğunda anlam kazanmaktadır. Günümüzde iletişim ağlarının sınır tanımazlığı ve yaygınlaştırılması pek çok olgunun da ele alınmasını gerekli hale getirmiştir. Sosyal ilişki ağlarının yapısının ve aslında çemberinin değişkenliği de beraberinde yeni habitusların varlığının değerlendirilmesi gerçekliğinde karşılık bulmaya başlamıştır.

Sinema da zaman içerisinde kendine özgü dinamiklerle var olmaya ve görünür kılınmaya başlamıştır. Ele alınan konular, kavramlar ve perspektifler sinemanın pür bir görsel sanat olup olmaması noktasını çok daha ötesine taşıyarak derinlikli analizlerin yapılmasını da gerekli kılmıştır. Bu eksende sinema içerisinde pek çok toplumsal izleğin tartışıldığı ve irdelendiği sosyoloji disiplini bağlamında değerlendirmeye doğru evrilmiştir. Çünkü sinema, görselliği sunma sürecinde sosyolojinin rolünü dâhil etmeye gereksinim duymaktadır. Kavramsal düzeyde benzetmelerin yapılmasının da ötesinde daha ayrıntılı bir şekilde ortaya koyabilmenin imkânlarını da sağladığını söylemek mümkündür.

Bu çalışma Derviş Zaim tarafından yönetilen 2016 yapımı "Rüya" adlı filmin dijital sinema bağlamında nasıl kurgulandığını, nasıl bir zihinsel repertuar bağlamında aktarıldığını ve aslında görünenin ardındaki görünmeyeni keşfetme noktasında açımlama yapmayı temel almaktadır. 3 boyutlu yansımanın sinemaya girişinin *hayal dostu* metaforlarla ve mekânsal izdüşümleriyle birlikte kentsel yaşamdaki fotoğrafının neyi içerdiği önem taşımaktadır. Bu doğrultuda çalışmada; sınıfsal ve toplumsal bağlam olgular etrafında sosyolojik okuması yapılacaktır. Çalışmanın temel amacı filmin girişinden itibaren yer alan söylemlerin yansıtılış biçimini sosyoloji ile olan göbek bağını kurmaktır. Bu amacı gerçekleştirmek için filmin içerisindeki temel karakterler, mekânlar, söylemler ve de özellikle filme seçilen başlığın taşıdığı anlamsallık ekseninde sosyolojik yorumlama ile eleştirel söylem analizi yöntemi ekseninde irdelenecektir.

Anahtar Kelimeler: dijital Sinema, dijital melek, hayal dostu, sosyoloji, rüya.

Giriş

Sinema, yaşamımızı farklı yönlerden görmeyi sağlayan önemli bir alandır. Toplumun yapısına, kültürüne, hayat tarzına kadar pek çok alanda görünenin ardındaki görünmeyi keşfe yönelik sosyolojik bir yolculuğu temel almaktadır. Bu nedenle de sinemanın pek çok olgu ile birlikte irdelenmesi gerektiğine dair bir okuma yapılması önem taşımaktadır. Sosyoloji disiplinin de etkisi bu noktada ortaya çıkmaktadır. Filmlere dair bilinenlerin farklı yorumları ve analizleri de betimlemeler öte nasıllığına ilişkin geniş bir çerçeveden bakmayı sağlamaktadır.

Rüya filmi kentsel dönüşüm adı altındaki kentsel rantsal alana teslim olunan ve farklı sınıfsallıklardaki mekânsal izdüşümleri üzerinde zihinsel repertuarın değişen ve dönüşen yönleriyle ele alınan yapısıyla sunulmaktadır. Kentsel yenilenmenin yerine piyasanın acımazlığında sınıflar arasındaki eşitsizliğin sosyal adalete yerini bırakmasına ilişkin bir hak temelli okumayı da gerekli kılmaktadır.

Rüya ile gerçek arasındaki zıtlıklarla ya da aynılıklara yansıyan durumsallığın sosyolojisine bakmak çok değerlidir. Bu bağlamda karakterler, mekânlar, kente ilişkin algı, sınıfsallık eksenlerinde filmin yansıtmak istediklerine ilişkin bir değerlendirme yapmak olanaklı hale gelecektir.

Rüya Filminin Toplumsallığının Yöntemi

Bu çalışmanın ayrıksı yönü rüya ile biçimlenen yaşamın istenilen ve arzu edilen ile gerçeklik arasındaki kurulan ya da kurulamayan bağın resmedilişine ilişkindir. Bu resmedilişin sosyolojisini ortaya koyabilmek adına nitel araştırma yöntemin eleştirel söylem analizi ile açımlanışına yer verilecektir. Böylelikle rüya filminin söylemek istedikleri irdelenerek aktarılmaya çalışılacaktır.

Rüya filminin en önemli özelliği geleceğe dair öngörülerde bulunmakta ve bunu da farklı bağlamlarda ve değişen kişilik özellikleriyle aktarmaktadır. Filmin karakterleri ve kullanılan mekânlarda kente, kentleşmeye ve kentlileşmeye dair nüvelerin olduğu ve kapitalist güç ilişkileri temelinde yansıtılması söz konusudur.

Filmin irdelenmesinde nitel araştırma yöntemi (Kuş, 2003) çerçevesinde ele alınmıştır. Bu çalışmada yöntem olarak, araştırma konusuna uygun olmakla birlikte nitel veri analizinin bir türü olan eleştirel söylem analizi kullanılmıştır. Çünkü eleştirel söylem analizi ile sunulanın dışında ve derininde olanın betimleme ve yorumlama yapma alanını da genişletmektedir (Creswell 2013; Van Dijk 2001; 2015; Yıldırım ve Şimşek 2000). Böylelikle yapılacak analizlerde olgusal düzlemde değerlendirmelerin yanı sıra imgelerin ve metaforların resmedilişine özgü açıklamaların da yapılmasını sağlayacaktır. Yaratıcı analizin bir göstergesi olarak eleştirel söylem analizi hem farklılığı bulma hem bunu dile getirme hem de farkındalığı kazandırma gibi pek çok önemli içerimlere de sahiptir.

Rüya: Gerçeklerin Öngörüsüne Dair Bir İpucu

Film, rüya olgusunun içsel yolculuğunun kentsel dönüşüm projelerindeki yaratmış olduğu sınıfsal ve mekânsal eşitsizliğin sosyolojik alt metnini sunmaktadır. Rüya filmi 2016 yapımı Derviş Zaim tarafından yönetilen toplumsal içerikli 3 boyutlu dijital sinemanın görünürlüğüne işaret etmektedir.

Rüya filminin ana karakterleri Sine ve Yâren'dir. Mimar Sine ile Yâren'in karakter analizlerinde kentsel yaşamın sosyal adalet ilkesinden yoksunluğunu, kentsel rantsal alana olan teslimiyetinin gerçekliğini resmetmektedir. Kentsel dönüşüm projeleri genellikle özel sektörün temel aktör olduğu sermaye odaklı projeler olarak görüldükleri için kapitalist ilişkiler çerçevesinde değerlendirilmektedir.

Sine, başarılı bir mimardır ve amcasının inşaat firmasında çalışmaktadır. Sine, cami projesinde yer almaya başlamakta ve film rüyasında gördüğü ve hayal dostu diye metaforlaştırdığı tüm dünyada zamanla meta fetişizmle olan bağlantısı filme konu olmaktadır.

Merkez-periferi, varsıl-yoksul, kadın-erkek dikotomisi bu bağlamda önem taşımaktadır. Bu dikotomilerle birlikte toplumsal gerçekliği bambaşka bir bağlamsallıkta irdeleyen Derviş Zaim kutsal metinlerin insan zihninde uyanışına, farkındalıkla umursamazlık arasındaki med cezirli haline aynı mekânın farklı zamanlarda başka yerlermiş gibi görüntü ile yer verilmesi söz konusudur.

İzleyici 3 d teknolojiyle tanıştıran bir yandan da rüyanın etkisinde kalan Sine ile hayata bakış açısının kentleşme ile olan algılayışına ilişkin nüveler sunmaktadır. Yâren, Sine gibi beyaz yakalı olmayan, sınıfsal olarak kendisini bir bakıma dışlanmış olarak hissetse de sevginin hayal dostu metaforuyla gerçekleşebileceğine inanan bir karakteri resmektedir.

Kentin kapitalist piyasadaki emek akışının yoksulun, periferide yaşayanın aleyhine işleyen eşitsiz yapısını tahakkümcü dil ve davranış pratikleriyle gündelik hayatın sosyolojisindeki nasıl'lığın okuması gözler önüne serilmektedir. Film tamamiyle zıtlıklar üzerine kuruludur. Kentsel dönüşümün kentsel yıkıma yol açtığı, yoksulun varsılın gözünde değersiz görüldüğünü de acımasızlık ilişkisi etrafında aktarılmıştır.

Sine devam eden uykusuzluk rahatsızlığı nedeniyle uyku hastalıkları kliniğine yatar. Yedi uyuyanlar menkıbesini (efsanesini) hatırlatan bir rüya görür. Ertesi sabah klinikte uyandığı zaman fiziksel olarak değişmiş, başka bir kadına dönüşmüştür. Sine fiziki değişime uğramadan önce yapmak isteyip de yapamadığı şeyleri gerçekleştirme özgürlüğünü yaşamaya başlamak istemektedir.

Yedi Uyurlar Efsanesi ile başlayan bir rüya ile Sine karakteri farklı kimliklere bürünmüştür. Yâren'in mahallesi için tasarlanan yeni tarz cami inşaatı başlamıştır. Ancak büyük çaplı bir yer kayması nedeniyle inşaat yarım kalmıştır. Bu cami bilinen geleneksel mimariden çok farklı bir tasarımla inşa edilmiştir. Sine yaratıcılığını özellikle bu cami inşaatında görmek ve göstermek aslında bir yandan da bunu bağlı olduğu ve piyasa odaklı işler yapan ve amcasının patron olduğu mühendislik mimarlık şirketine kanıtlamak istemiştir.

Gelenekselin dışında yapılanın ve kabul edilebilirliğinin öncelikli olmadığı toplumlarda ise yaratıcılığa dair gerek düşünceler ve gerekse bu fikirlerin akabinde oluşturulan üretimler pek hoş karşılanmaz ya da beklentilerin dışında olduğu için direngenlik gösterilir. Direngenliğin bir göstergesi de bu cami inşaatında gerçekleşmiştir. Bir ibadet mekânı bu filmle birlikte gelenekselden kopamayan ve yeniliğe karşı direnç gösteren ile de bir başka dikotomi yaratmıştır.

Dikotomideki tampon kurum ise Yâren karakteridir. Dengeyi sağlayıcı olan Yâren karakteri burada gelişmiş ile az gelişmişliğin arasındaki arafı da betimlemektedir. Yeniliğe açık olmakla birlikte mensubu olduğu sınıftan da kopamayan Yâren karakteri, Sine karakterine olan duygusal anlamdaki hislerini bir anlama bu şekilde ortaya koymaya çalışmaktadır. Ancak yine arada kalmışlığın bir simgesi haline dönüşmektedir. Haliyle insanlar arası kurulan sosyal ilişki ağlarıyla birlikte mekân haline gelen yerlerin konumlanışına ve algılanışına ilişkin farklı gözlerle bakılmasını sağlayan film kareleri sunulmuştur.

Yer kayması dernek üyelerinin bazılarının konutlarının çökmesine de yol açar. Yaren ve arkadaşları mimarlık–müteahhitlik şirketine karşı duruşlarını sertçe olarak ortaya koyduklarında da haklarını aradıklarında da sınıfsal eşitsizliği en derin şekilde yaşamış olurlar.

Cami inşaatında Sine'nin yaratıcılık adı altında bambaşka bir cami inşa etme çabası, dere yatağında inşa edilen konutların insan sağlığına ve canına tehdit oluşturması gerçekleri kapitalist ilişkilerin olağan seyrinde eşitsizlikleri de görünür kılmaktadır. Haliyle karakterlerin yapısının değişime uğramasına, mekânın farklı sosyal statü ve rollere göre değişmesine, davranış örüntülerinin aynı kente ait algılayışın olmayışına dair önemli farkındalıklar sunmaktadır.

Sonuç

İletişimin toplumsal bağlamı kesişimsellikle ilintilidir. İletişimin günümüzde sınır tanımazlığı ilişkiselliğin boyutunu da tanımlamakta yeni olgularla açıklamaya doğru evrilmiştir. Sosyal ilişki ağları da sosyolojik anlamda habitusların gerçekliğini farklılaştırmıştır.

Değişerek durağan olmak gibi bir anlatımla sosyal ilişki ağlarının kentsel hayat yansıyışında yaratıcılıkla üretkenlikten yoksun olmak arasında gidip gelen bir sosyolojik okumaya gebe kalmaktadır. Kentsel hayatın içerisinde merkezde olmak ile öteki olmanın damgalanma halini sınıfsal düzeyde verilmesinin önemi yadsınamaz. Ayrıca mekânsal ayrışmanın heterojenliğinin yerine kendinden olan ve olmayan arasında yaratılan fırsat eşitsizliğine dair bir sosyal kent adaleti ve kent hakkı okumasının (Işık ve Pınarcıoğlu, 2001; Erman, 2010; Kurtuluş, 2010) yapılmasını gerekli kılmaktadır. Filmde de rüya metaforu ekseninde sunulması söz konusudur. Kentin nasıl ele alındığı da burada anlam kazanmaktadır.

Kentler bu anlamda sadece üzerinde nefes alınan mekânlar olmaktan öte kamusal alanların aktif olarak yaşandığı farklı disiplinlerle birlikte algılanması gereken olgudur. Ekonomik, kültürel, politik ve toplumsal bağlamlı olarak kentlerde insanlar yaşamlarını sürdürürken çeşitli faaliyetlerde bulunurlar. Öncelikli olan ise konutların yaşama ne kadar dokunduğu ve nasıl bir

içerimle kurgulanarak inşa edildiğidir. İnsani yaşamdan uzak kırılganlığı arttıran ve sınıfsal olarak farklılıklar ve eşitsizlikler yaratan yapılar ise kentleşmeye ve kentlileşmenin düzeyine ilişkin önemli ipuçları vermektedir.

Film bu anlamda toplumsal gerçekliğin rüyalarla olan bağlantısındaki psikolojik ve sosyolojik yorumunu farklı gözlerden irdelemeye dair geniş bir yelpaze sunmaktadır. Bu yelpazenin boyutu da renkleri de var olanın dışındakine ve gizil olanı aramaya ve bulmaya itmektedir. İşte tam da bu noktada Rüya filmi imgelerin ve simgelerin cami gibi bir ibadet mekânının zaman içerisinde kişiler arasındaki ayrıksılığın ve konutta yaşamanın farklı sınıfsallıklardaki yaşamsallığa yol açışlarının farklı sosyolojik güzergâhlarının vaadini sunmaktadır.

ABSTRACT

In this study, the mechanical properties resulting from the carburizing heat treatment applied to SINT D11 and SINT D32 iron-based materials produced by the powder metallurgy method were comparatively analyzed. These materials, manufactured by Höganäs, were first characterized, then subjected to sintering at 1120 °C, followed by carburizing starting at 925 °C.

As part of the mechanical testing, tensile strength, hardness measurements (Brinell, Vickers, Rockwell), and microstructure analyses were conducted. According to the results, although SINT D32 exhibited a coarser pore structure and lower porosity compared to SINT D11, it achieved higher hardness values after carburizing and successfully met the target minimum of 55 HRC. Microstructural analyses revealed carbide formation and phase transformations on the surface of both materials after the carburizing process.

The study concluded that SINT D32 is more advantageous in terms of longevity and performance in applications such as filtration and wear resistance.

Keywords: SINT D11, SINT D32, sintering, carburizing, powder metallurgy

1. Introduction

With today's advancing industry, the ability to produce high-quality and high-performance parts in a single operation without the need for machining has gained importance. The mechanical, physical, and chemical properties of a part play a crucial role in ensuring feasible and repeatable production continuity under operating conditions**.** Powder metallurgy (PM), a good alternative to conventional machining, serves specific industrial applications in this regard (Roberts, 1984).

Powder metallurgy (PM) is a modern manufacturing method that forms parts by bonding very fine particles together. This process enables mass production of small, complex-shaped components that are difficult to manufacture using other conventional methods, through metal powder technologies (Benjamin, 1974).[1]

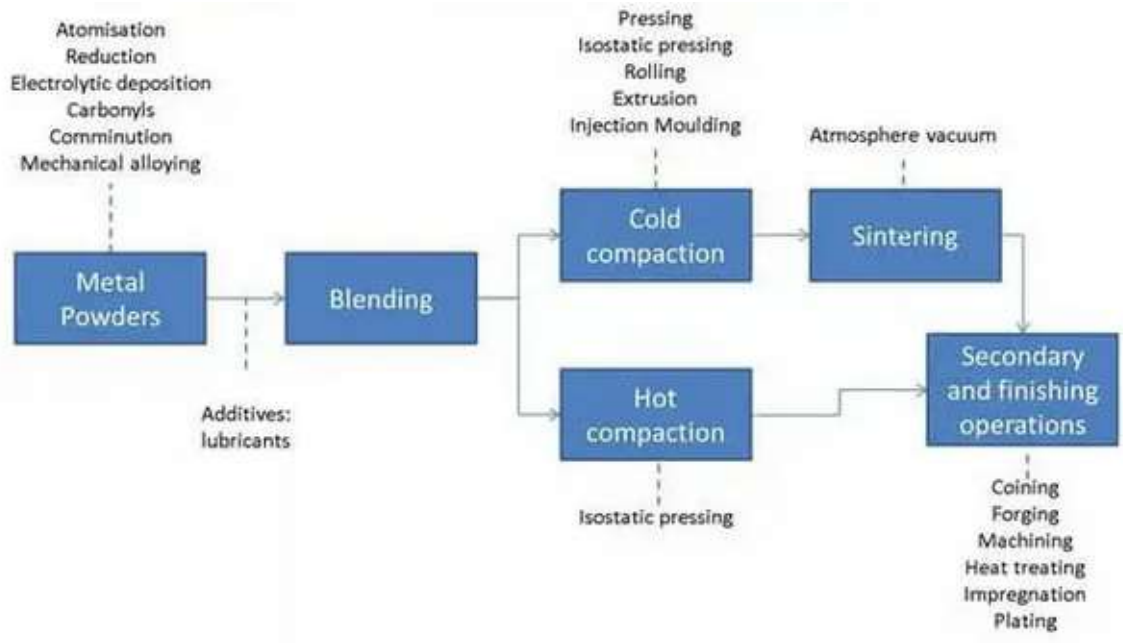

Figure 1. Flow chart of metallic powder processing [2]

2. Materials and Experimental Methods

2.1 Characterization of Powders

In powder metallurgy, powder characterization is the process of determining the physical, chemical, and morphological properties of the metal powders used. These characteristics directly affect the mechanical properties, density, porosity, sintering behavior, and overall performance of the final product.

The characteristics of powders directly influence pressing behavior, shrinkage during sintering, final porosity, mechanical properties, and even surface quality. Especially for high-performance parts (e.g., filters, automotive components, medical implants), powder characterization becomes highly significant [3].

In this study, iron-based powders SINT D11 and SINT D32 produced by the atomization method from Höganäs were used. The chemical and mechanical composition of SINT D11 and SINT D32 powders used in the study is given in Table 1.

Table 1. Composition of SINT D11 and SINT D32 powders

Material	Density Value (g\cm^3)	Chemical and Mechanical Composition											
		Contents (%)								Tensile Strenght MPa	Yield Strenght MPa	Hardness	% Elongation
		C	Cu	Ni	Mo	Sn	P	Fe	Other				
D32	6,8-7,2	0,3-0,9	<3,0	<5,0	0,6-2	-	-	Kalan	<2	520	480	180	1
D11	6,8-7,2	0,4-1,5	1-5	-	-	-	-	Kalan	<2	460	370	130	2

The comparative characterization table of SINT D11 and SINT D32 materials is presented below in Table 2.

Table 2. Material Characterization Table

Property	**SINT D11**	**SINT D32**
Pore Size	~10–12 µm	~25–30 µm
Pore Structure	Fine, dense, small pored	More open, larger pored
Porosity	%30-35	%35-45
Mechanical Strenght	Higher	Lower, but sufficient
Particle Size	~25–40 µm	~60–100 µm
Production Method	Compaction and sintering of fine powders	Compaction and sintering of coarser powders
Filtration Precision	Higher	Lower

2.2 Sintering of Powders

In order to achieve high bond strength between parts joined by sintering, the mechanical interference fit between the components must be properly determined. By narrowing this fit range, an increase in bond strength can be achieved. However, in powder metal green parts assembled with tight mechanical interference, pre-sintering must be applied to prevent the formation of cracks or breakage. In sintering-based joining processes, iron-based powder metal parts are commonly used together with low-alloy carbon steels [4–6].

Since the materials we used SINT D11 and SINT D32 are iron-based, the sintering temperature was set at 1120 °C. Preheating was applied in the range of 550–600 °C. The sintering process was carried out in an endogas protective atmosphere for a duration of 45 minutes. In addition to the sintering operation, a secondary heat treatment process carburizing was also performed.

The parameters of the carburizing process are given in Table 3.

Table 3. Carburizing Process Parameters

HEAT TREATMENT PARAMETERS			
CARBURIZING	**DIFFUSION**	**HARDENING**	**TEMPERING**
925°C %1 C 180 Minutes	850°C %0,70 C 90 Minutes	60° C Oil Quenching 30 Minutes	150°C 120 Minutes

2.3 Mechanical Characterization

The mechanical characterization of materials is critically important for assessing product performance, durability, and operational safety.

2.3.1 Tensile Strength

Due to the brittle nature of porous structures, this test is less frequently preferred; however, it can still be applied for characterization purposes. Tensile testing was conducted in accordance with the ASTM B925 standard. The tensile test results for SINT D11 and SINT D32 are shown below (Tables 4–5).

SINT D11

Table 4. Tensile Test Results of SINT D11 Material

Test Specimen No	***Cross Section Area mm²***	***Lo mm***	***L1 mm***	***Rp%0,1 MPa***	***Rm MPa***	***ELONG %***
1	37.44	30	30.2	362.1	448.7	1.1
2	37.50	30	30.2	358.3	457.9	1.3
3	37.26	30	30.3	364.6	451.9	1.2

SINT D32

Table 5. Tensile Test Results of SINT D32 Material

Test Specimen No	*Cross Section Area* mm^2	*Lo mm*	*L1 mm*	*Rp%0,1 MPa*	*Rm MPa*	*ELONG %*

3	37.26	30	30.3	459.0	481.9	0.8

2.3.1 Brinell Hardness Values (HB)

Hardness is a critical mechanical property in powder metallurgy in terms of both structural integrity and service life. It is particularly related to wear resistance in moving parts or contact surfaces. Hardness is also considered an indicator of the quality of heat treatment and sintering. The hardness values of parts produced with SINT D11 and SINT D32 after the sintering process are presented in Table 6 below.

Table 6. Sintered Hardness Results of SINT D11 and SINT D32

HARDNESS VALUES		
PRODUCT	**AFTER SINTERING PROCESS**	**TARGET HARDNESS VALUE**
03L GEAR ***SINT D11***	167 HB	180 HB
03L GEAR ***SINT D11***	170 HB	180 HB
03L GEAR ***SINT D11***	167 HB	180 HB
03L GEAR ***SINT D11***	167 HB	180 HB

03L GEAR ***SINT D32***	187 HB	180 HB
03L GEAR ***SINT D32***	191 HB	180 HB

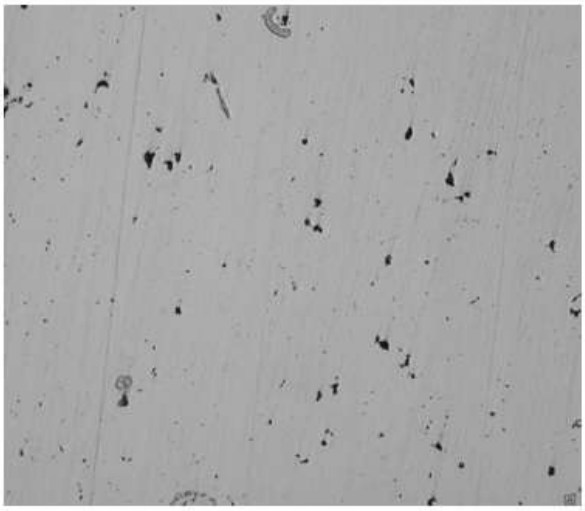
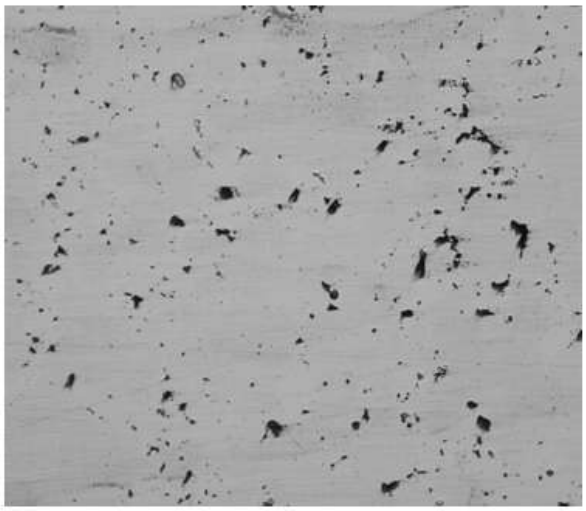
The Brinell hardness testing method was applied to measure the hardness of the products after sintering. Measurements were taken from the surface of the specimens. A ball with a diameter of Ø2.5 mm and an applied force of 187.5 kgf was used.

3. Results and Discussion

Microstructural analysis was performed following the sintering process and subsequently after the combined sintering and carburizing treatment.

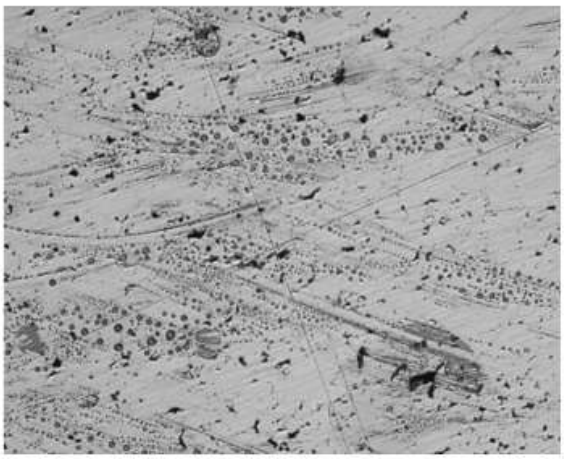


a) Microstructure of Sintered SINT D11

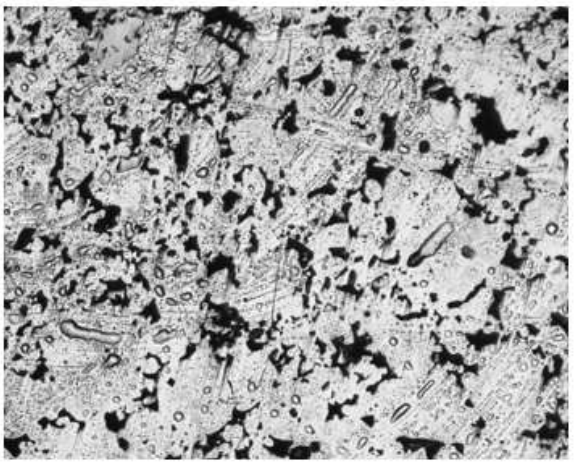


b) Microstructure of Sintered SINT D11

When examining the microstructure shown in Figure a, homogeneously distributed pores can be observed. The structure in the image is typical of a post-sintering microstructure. The presence of pores indicates that the sintering densification process has been completed. The mechanical properties are at a moderate level. In Figure b, the dark areas observed in the image appear to be pores and possibly carbide particles. The matrix phase is light-colored and uniformly distributed, indicating a ferritic structure.



c) Sintered and Carburized SINT D11



d) Sintered and Carburized SINT D32

When examining the microstructure presented in Figure c, it is evident that numerous and densely distributed carbide particles have formed as a result of the carburizing process. A more intense structural change is observed in the subsurface regions, indicating that the carburizing process has diffused inward from the surface. Through carburizing, the surface has been enriched with carbon, forming a harder and more wear-resistant layer.

In the microstructure shown in Figure d, martensitic phase, carbide phases, and precipitates within the pores can be observed. Additionally, linear structures and local patterns are visible, indicating the transformation structure resulting from heat treatment. This structure shows a significant improvement in terms of hardness and wear resistance.

As seen in Table 6, the gear produced with SINT D32 achieved better hardness compared to SINT D11 and reached the target hardness value after carburizing. Considering the wear resistance and long service life in the gear's working environment, it can be concluded that the gear produced with SINT D32 is a more suitable choice.

3.2 Hardness Values of Sintered and Carburized Products

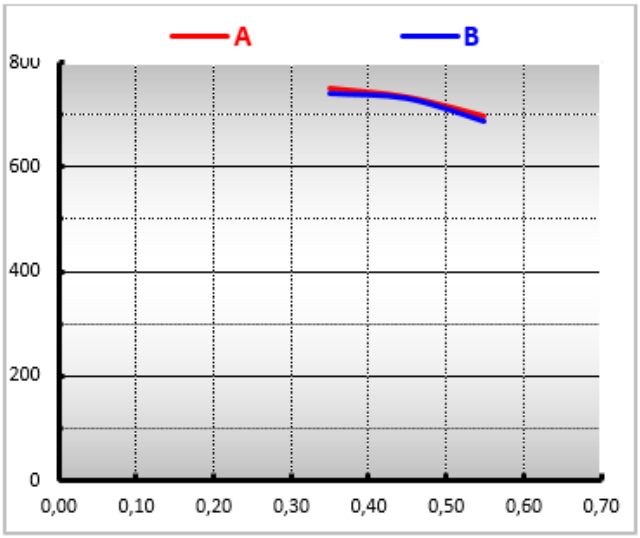
For hardness measurement after carburizing, the Vickers and Rockwell hardness testing methods were applied. Measurements were taken both from the surface and from a depth range of 0.35–0.55 mm of the carburized parts.

Table 7. Carburizing Hardness Results of SINT D11 and SINT D32

PRODUCT	AFTER SINTERING PROCESS	AFTER CARBURIZING PROCESS	TARGET HARDNESS VALUE
03L GEAR ***SINT D11***	167 HB	45,7 HRC	Min. 55 HRC
03L GEAR ***SINT D11***	170 HB	46,4 HRC	Min. 55 HRC
03L GEAR ***SINT D11***	167 HB	48,6 HRC	Min. 55 HRC
03L GEAR ***SINT D11***	167 HB	46,8 HRC	Min. 55 HRC
03L GEAR ***SINT D11***	170 HB	48,2 HRC	Min. 55 HRC
03L GEAR ***SINT D32***	187 HB	57,1 HRC	Min. 55 HRC
03L GEAR ***SINT D32***	187 HB	57,3 HRC	Min. 55 HRC
03L GEAR ***SINT D32***	191 HB	56,4 HRC	Min. 55 HRC
03L GEAR ***SINT D32***	187 HB	55,9 HRC	Min. 55 HRC
03L GEAR ***SINT D32***	191 HB	56,8 HRC	Min. 55 HRC

Table 8. Vickers Hardness Measurement Table and Graph After Carburizing Process

Depth mm	Hardness HV1	
	A	B
0,35	749	740
0,45	733	731
0,55	698	689



In Table 7, we can see the hardness results both before and after carburizing, while Table 8 presents the hardness graph and table of the products measured after the carburizing process. According to the gear's technical drawing specifications, the required minimum hardness value after carburizing is 55 HRC. Gears produced from SINT D11 and SINT D32 materials underwent the carburizing process simultaneously under the same process conditions. It is observed that the gears made with SINT D11 material gained hardness but did not reach the target hardness value. On the other hand, the gears produced with SINT D32 material achieved the desired hardness value.

4. Conclusion

The hardness and structural integrity of parts produced using SINT D32 were found to be superior to those of SINT D11. This indicates that SINT D32 is a more suitable material for applications requiring high wear resistance and durability.

5. Thanks and Information Note

I would like to express my profound gratitude to my advisor, Prof. Dr. Ahmet AVCI, for his invaluable guidance, expertise, and support throughout every stage of this study. I am also deeply grateful to ESTAŞ company for their generous support, the opportunities they offered, and their contributions during both the research and implementation phases.

ABSTRACT

This study explores the detection of Line-of-Sight (LOS) propagation conditions in an indoor office environment using received signal strength (RSS) as the primary observable. A detailed simulation framework was implemented in MATLAB using a ray tracing model to emulate RF signal propagation from a mobile device positioned at 33,046 unique locations within a confined office space to a fixed receiver. The received signal was modelled for each position as the superposition of all propagation paths, and the total received power was computed accordingly. Measurement instances were geometrically labelled as LoS or Non-LoS based on direct visibility. A statistical hypothesis test was applied to distinguish these two categories based on RSS values alone. The simulation was repeated across homogeneous scenarios to account for material-dependent propagation effects. All surfaces (walls, floors, ceilings) were composed of a single material—plasterboard, concrete, wood, and a perfect electric reflector. The results reveal that each material type yields a distinct received power threshold that optimally separates LoS from non-LoS conditions. These thresholds can be used to adapt LoS detection mechanisms accordingly. Furthermore, the results indicate that the environment's material composition significantly influences LoS detection's reliability. Lighter materials such as plasterboard and wood allow for a clearer separation between LoS and Non-LoS cases in terms of received power, whereas denser materials like concrete produce greater overlap, making classification more challenging. This work contributes to developing material-aware indoor positioning systems by providing a simple yet effective approach for LoS classification, which is crucial for enhancing the reliability of RF-based positioning in structurally diverse indoor environments.

Keywords: Indoor, Line-of-Sight Detection, Received Signal Strength, Surface Material

Introduction

Performance of wireless communication systems heavily rely on the propagation characteristics of radio frequency (RF) signals, particularly in indoor environments where structural complexity can significantly affect signal behavior. A critical concept in understanding and optimizing these systems is Line of Sight (LoS), which refers to an unobstructed, direct visual or electromagnetic path between a transmitter and a receiver. In simple terms, if a signal can travel between two points without encountering any physical obstruction, a line-of-sight condition is said to exist. This concept is not only fundamental in human vision but also one of the most important aspects of wireless communication applications.

LoS is essential for numerous technical tasks such as distance measurement, angle estimation, radar and imaging systems, and high-precision indoor positioning. The presence or absence of LoS directly impacts the received signal strength (RSS) and the quality of the communication link. A clear LoS typically ensures stronger signal reception, reduced interference due to minimized reflections and scattering, and enables higher data transmission rates over longer distances. Conversely, Non-Line of Sight (NLoS) conditions often introduce multipath propagation, signal fading, and significant degradation in communication quality.

The literature provides a robust foundation for understanding LoS-related phenomena in wireless systems. For example, Zhou et al. (2015) and Li et al. (2017) emphasize the significance of distinguishing between LoS and NLoS for accurate indoor positioning using Wi-Fi signals [5][6]. Lv et al. (2022) proposed an artificial neural network (ALNN)-based approach to LoS/NLoS classification in millimeter-wave channels, demonstrating the effectiveness of machine learning in high-frequency environments [4]. Ji et al. (2018) introduced a map-free indoor localization method using ultra-wideband (UWB) arrays, showing that accurate LoS detection significantly enhances positioning performance even in mapless conditions [13].

Cao et al. (2018) conducted a spectral efficiency analysis in massive MIMO systems over Rician channels and highlighted how LoS components play a crucial role in maintaining high throughput and minimizing inter-user interference [3]. Similarly, Turan et al. (2024) analyzed RF signal phase behavior for angle estimation, showing that LoS conditions enable more precise mesh-based elevation angle estimations in linear antenna arrays [1]. Jeong et al. (2017) explored deployment height impacts in low power multihop networks, suggesting that maintaining LoS at optimal heights significantly reduces energy use and hop count [2].

In the domain of motion planning, Zhang et al. (2019) presented a path optimization framework for mobile agents, where reliable LoS detection helps reduce uncertainty in tree-based exploration strategies [7]. Kim (2010) demonstrated that LoS information improves self-organization in swarm robotic systems, particularly when swarm behavior depends on inter-agent visibility [8].

Beyond localization and robotics, Safaie et al. (2016) leveraged LoS properties for improved target localization in harsh environments using direction-of-arrival (DoA) information, underlining its importance in safety-critical applications [9]. Aubry et al. (2024) examined power-aperture allocation in multifunction radar systems, noting that LoS-based optimization strategies enhance both communication and detection capabilities [10]. Similarly, Wang (2021) studied active/passive beamforming in intelligent reflecting surface-assisted radar systems, where LoS knowledge guides efficient beam allocation [11].

Finally, Yin et al. (2013) provided a theoretical basis using Cramér-Rao lower bound analysis for LoS/NLoS geolocation accuracy, revealing that the presence of LoS paths fundamentally

limits the achievable localization error [12]. Collectively, these works underscore that LoS detection is not only a technical requirement but also a foundational enabler across diverse RF-based applications, ranging from communication infrastructure to robotic autonomy and geospatial sensing.

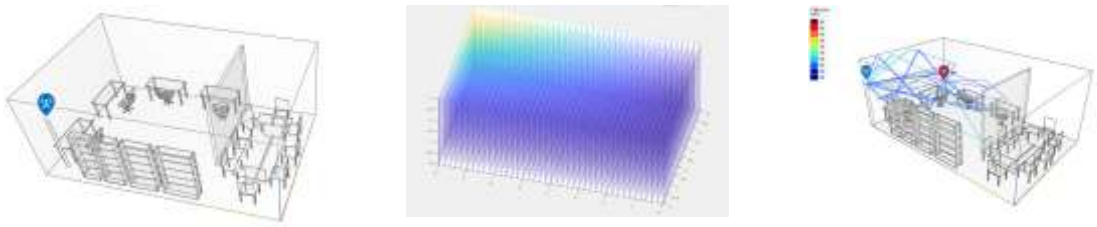
In practical scenarios, LoS detection is not a trivial task due to the influence of environmental materials on signal propagation. Surfaces such as plasterboard, wood, concrete, and metallic reflectors exhibit varying absorption and reflection properties, which affect RSS readings and thus LoS/NLoS classification. This necessitates material-aware approaches, which consider the electromagnetic behavior of the environment in modeling and detection processes.

Understanding and accurately detecting LoS conditions is important in the design of indoor localization systems, wireless sensor networks, 5G/6G communication infrastructures, and Internet of Things (IoT) applications. By incorporating knowledge of the environment's material composition and applying signal strength-based inference techniques, more robust and adaptive positioning algorithms can be developed, paving the way for reliable communication even in complex indoor settings.

In this study, a detailed simulation framework was developed to investigate Line-of-Sight (LoS) detection based on Received Signal Strength (RSS) in a controlled indoor environment. The simulation was implemented in MATLAB and modeled a typical office scenario represented in three dimensions. The office space included walls, ceilings, floors and furniture constructed from uniform materials in each simulation run, including plasterboard, wood, concrete, and a perfect electric reflector, to assess material-dependent signal behavior.

Materials and Methods

A single fixed Access Point (AP) was placed within the office environment to serve as the transmitter. To emulate mobile user positions, a total of 33,046 unique locations were uniformly distributed across the office space. At each of these locations, an identical wireless signal at the central frequency at 2.4 GHz was virtually transmitted toward the AP using a ray tracing-based channel model. This model accounted for key electromagnetic phenomena, including specular reflections, path loss, and phase shifts occurring as the signal interacted with various surfaces.



(a) (b) (c)

Figure 1: *(a) Indoor office environment with the access point (AP) placed, (b) is the 33046 different positions of the mobile device, (c) is the sample transmission from one of the mobile device positions to the AP.*

For every mobile device position, the total received signal was calculated as the superposition of all propagation paths, both direct and indirect, reaching the receiver as in Eq. 1.

$$S_R(t) = \sum_{n=1}^{N} S_n(t) \qquad \text{Eq. 1}$$

S_R is the total signal received, S_n is the signal that is transmitted from n^{th} trace with the transmission effects (pathloss attenuation, phase shift, propagation delay) applied. Received signal power calculated from the received signal samples as in Eq. 2.

$$P_R = \frac{1}{T}\sum_{t=1}^{T}|S_R(t)|^2 \quad \text{Eq. 2}$$

Each signal transmission instance was geometrically labeled as either LoS or Non-LoS (NLoS) based on the existence of a direct, unobstructed path to the AP. The LoS/NLoS label was then paired with the corresponding received signal strength value.

The obtained received signal power for each 33046 position then be examined with the statistical analysis called Cumulative Distribution Function (CDF), which gives the probability of a random value being smaller than the variable of interest. The definition of CDF is being given in Eq. 3.

$$F_X(x) = P(X \leq x) \quad \text{Eq. 3}$$

Where $F_X(x)$ is the cumulative distribution function of the random variable X, $P(X \leq x)$ is the probability that X is less than or equal to x.

Through this process, RSS distributions for LoS and NLoS were obtained for the scenarios where the uniform surface materials are plasterboard ($|\Gamma|^2$=0.0697), wood ($|\Gamma|^2$=0.0292), concrete ($|\Gamma|^2$=0.1571), and a perfect electric reflector ($|\Gamma|^2$=1) with reflectivity at 2.4 GHz. These distributions served as the foundation for analyzing how signal strength patterns differ depending on the presence or absence of direct visibility, and how these patterns are influenced by the reflective characteristics of the indoor materials. The results were subsequently used to explore statistical thresholds for classifying LoS conditions, contributing to the development of material-aware LoS detection strategies for indoor environments.

Findings and Discussion

The analysis focused on the statistical behavior of received signal strength (RSS) under LoS and NLoS conditions across various material scenarios. For each material, distributions of RSS were obtained and visualized using the cumulative distribution function (CDF) for LoS and the complementary distribution (1−CDF) for NLoS. This approach provides clear separation between distribution of RSS values for LoS and NLoS scenarios.

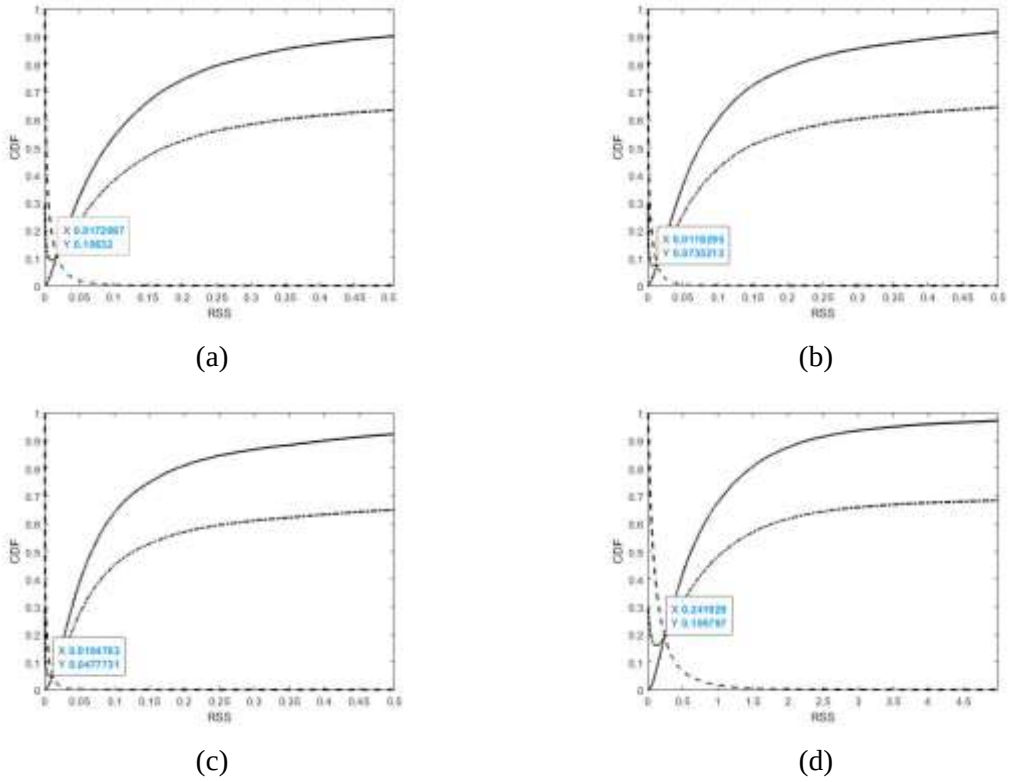


Figure 2: *CDF of RSS distribution for LoS (Straight Line), NLoS (Dashed Line), weighted some of the LoS and NLoS distribution (Dot-Dash Line) and Transmissions* ***(a)*** *Concrete,* ***(b)****Plaster Board,* ***(c)****Wood,* ***(d)****Perfect Reflector.*

The results demonstrated that the LoS and NLoS signal power distributions are material dependent. For lighter materials such as plasterboard and wood, there is a better separation between LoS and NLoS distributions. However, for each material The LoS curves sharply increased at higher RSS levels, while the NLoS curves declined at much lower RSS values. This divergence indicated that RSS thresholding is a simple yet robust approach to LoS detection. In contrast, when concrete was used as the surface material, the separation between LoS and NLoS distributions became less pronounced compared to lighter materials. Although some overlap between the two distributions was observed, the classification based solely on RSS remained effective, maintaining a high level of discriminability. Even in such dense and attenuating environments, the distinction could still be made with a success rate approaching 90%, underlying the robustness of the approach. The perfect electric reflector scenario presented a more challenging case due to uniformly high RSS values in both LoS and NLoS conditions. Nevertheless, the distribution curves were still distinguishable to a significant degree. Despite the reduced gap between signal strength levels, the detection method achieved over 80% accuracy in separating LoS from NLoS. This demonstrates that even in artificially reflective environments, RSS analysis retains substantial classification capability.

Furthermore, the weighted sum of the distributions obtained with the summation of each distribution multiplied with proportion of classified position to the total position. Weighted sum shows that taking a manipulated threshold other than the intersection of the distributions would provide better detection due to the difference in number of LoS positions to NLoS positions.

Overall, the results show that while RSS distribution profiles vary across different surface materials, the RSS thresholding approach maintains reliable LoS detection performance across

all tested scenarios. The ability to achieve high classification accuracy, even in the most challenging conditions, reinforces the applicability of RSS-based methods in diverse indoor environments, especially when calibrated with material-specific considerations.

Conclusion and Recommendations

This study demonstrated that reliable Line-of-Sight (LoS) detection in indoor environments is feasible using only Received Signal Strength (RSS), even under diverse material conditions. A ray tracing-based simulation framework was applied to an office scenario, with 33,046 unique transmission instances categorized into LoS and Non-LoS (NLoS) cases. The empirical analysis of RSS distributions for each case, across different surface materials, revealed a strong correlation between signal strength patterns and visibility conditions.

It was observed that while materials like plasterboard and wood enable clear separability between LoS and NLoS distributions, denser or highly reflective materials such as concrete and perfect electric reflectors introduce a degree of overlap. Nevertheless, the classification performance remained consistently high across all scenarios, with detection accuracies exceeding 90% for most materials and maintaining over 80% even in the most challenging cases.

These results confirm the robustness of the RSS-based LoS detection method and highlight its suitability for deployment in real-world indoor environments with heterogeneous construction materials. The findings further suggest that material-specific calibration can significantly enhance classification reliability, especially in environments prone to strong multipath effects or signal masking.

Future work may explore the integration of phase, time-domain, or directional signal features to improve performance in extreme cases. For example, the obtained phase or arrival angle information may contribute to the RSS threshold decision mechanism. Moreover, the use of data-driven classification techniques, such as machine learning models trained on material-aware signal patterns, may enable more adaptive and generalizable solutions. Nevertheless, threshold-based decision making provides a simple yet effective basis for enhancing indoor wireless communication systems, localization services, and RF environment modeling.

ABSTRACT

Communities migrated to reach areas where they could survive. Then they became acquainted with agriculture and settled down. Even though the societies that settled down made inventions and discoveries that would revolutionize the age, their utilization of nature to a great extent started to harm nature. With the Industrial Revolution in the 18th century, this damage became more noticeable and led to the climate crisis, a situation that resulted in the deterioration of the ecological balance. Changing climates have degraded the air, water and soil, leading to economic and social problems. All these environmental problems continue to cause migration of people who want to continue their lives in better conditions. This mobility leads to economic problems for both sending and receiving countries. Migration with the butterfly effect and the problems it causes globally pose economic, social and security threats. In the literature, there are studies on migration and economy in the context of the climate crisis. However, the number of studies addressing these three topics of global importance is insufficient for the literature. In this study, it is aimed to examine the two-factor relationship of the migration movement caused by the climate crisis in economic terms. Aynı zamanda iklim krizi, göç ve ekonomi kavramlarının birbiriyle ilişkisine dikkat çekmek ve çözüm yollarına giden arayışa katkı sunmak hedeflenmektedir. Belirlenen araştırma amacı çerçevesinde planlanan biçimde, kavramsal tanımlamalar yapılarak, iklim krizinin göçe sebep olması iklim krizinin ekonomik etkileri ve göç hareketliliğinin sebep olduğu ekonomik sorunlara dair literatür derlemesine yer verilerek, elde edilen bulgular ışığında politika önerileri sunmaya çalışılacaktır. Bu bağlamda çalışmanın, literatüre ve araştırmacılara katkı sunacağı düşünülmektedir.

İKLİM KRİZİNİN EKONOMİK ETKİLERİ BAĞLAMINDA GÖÇ OLGUSU

ÖZET

Topluluklar yaşamalarını devam ettirebilecekleri alanlara uluşmak için göç etmişlerdir. Daha sonra tarımla tanışmış ve yerleşik yaşama geçmişlerdir. Yerleşik yaşama geçen topluluklar, çağ atlatacak nitelikte buluş ve keşifler yapmış olsalar da büyük oranda doğadan faydalanmaları doğaya zarar vermeye başlamıştır. ,18. Yüzyılda Endüstri Devrimi ile bu zarar daha bariz bir biçimde hissedilir hale gelmiş ve iklim krizine yani ekolojik dengenin bozulması ile sonuçlanan bir duruma yol açmıştır. İklimlerin değişmesi havayı, suyu ve toprağı bozmuş, ekonomik ve sosyal sorunlara yol açmıştır. Tüm bu çevresel sorunlar yaşamını daha iyi koşullarda devam ettirmek isteyen insanların göç etmesine sebep olmaya devam etmektedir. Söz konusu hareketlilik ise hem göç veren hem de göç alan ülkeler için ekonomik sorunların oluşmasına yol açmaktadır. Kelebek etkisiyle devam eden göçler ve küresel anlamda sebep olduğu sorunlar ekonomik, sosyal ve güvenlik tehditleri oluşturmaktadır. Literatürde, iklim krizi bağlamında göç ve ekonomiye dair araştırmalar bulunmaktadır. Ancak bu araştırmalar içerisinde küresel öneme sahip bu üç başlığın ele alan çalışmaların sayısı literatür için yetersiz kalmaktadır. Bu çalışmada iklim krizinin neden olduğu göç hareketinin ekonomik açıdan çift etkenli ilişkisinin incelenmesi amaçlanmaktadır. Aynı zamanda iklim krizi, göç ve ekonomi kavramlarının birbiriyle ilişkisine dikkat çekmek ve çözüm yollarına giden arayışa katkı sunmak hedeflenmektedir. Belirlenen araştırma amacı çerçevesinde planlanan biçimde, kavramsal tanımlamalar yapılarak, iklim krizinin göçe sebep olması iklim krizinin ekonomik etkileri ve göç hareketliliğinin sebep olduğu ekonomik sorunlara dair literatür derlemesine yer verilerek, elde edilen bulgular ışığında politika önerileri sunmaya çalışılacaktır. Bu bağlamda çalışmanın, literatüre ve araştırmacılara katkı sunacağı düşünülmektedir.

Anahtar Kelimeler: İklim Krizi, Göç, Ekonomi

GİRİŞ

İklim krizi, dünya genelinde giderek artan doğa olayları, sıcaklık dalgalanmaları, kuraklık, seller ve diğer meteorolojik anormalliklerle kendini gösteren, çok boyutlu ve küresel etkileri olan bir olgudur. Bu kriz, atmosferdeki sera gazı yoğunluğunun artmasıyla birlikte, doğanın dengesinin bozulmasına ve insan yaşamını doğrudan etkileyen çevresel dönüşümlerin hız kazanmasına neden olmuştur (Birpınar, 2022; Parlak vd., 2024). Özellikle Sanayi Devrimi'yle birlikte başlayan fosil yakıt kullanımının yaygınlaşması, üretim ve tüketim desenlerinin değişmesi ve buna paralel olarak hızlanan kentleşme süreci, iklimsel bozulmayı derinleştirmiştir (Başoğlu, 2014). Bu süreçte doğanın sunduğu kaynakların bilinçsiz ve sürdürülemez şekilde kullanımı, iklim sistemlerinde köklü değişimlere yol açmıştır.

İklim değişikliğinin yalnızca çevresel bir sorun olarak ele alınması yetersiz kalmaktadır. Zira bu kriz, ekonomik, sosyal ve demografik yapı üzerinde de ciddi sonuçlar doğurmakta; özellikle kırılgan coğrafyalarda yaşam koşullarını zorlaştırarak insanların yer değiştirmesine neden olmaktadır. Nitekim günümüzde göç olgusu, iklim kriziyle iç içe geçmiş bir şekilde ele alınmaktadır. Özellikle Hindistan, Çin ve Endonezya gibi nüfus yoğunluğu yüksek ülkelerde iklim koşullarındaki bozulmalar, milyonlarca insanın daha yaşanabilir bölgelere yönelmesine sebep olmuştur (Kanbir, 2022).

Göç, insan varlığını koruyabilmek için, beslenebileceği ve güvende olabileceği alanlara doğru hareket etmiştir. Fakat göç artık iklim krizinin etkisiyle günümüzde farklı bir boyuta ulaşmıştır. İlk çağlardan itibaren insanlar, yaşam alanlarını iklimsel ve çevresel koşullara göre belirlemişlerdir. Ancak modern dönemde iklim kaynaklı göç hareketleri, ekonomik ve toplumsal yapılarda derin değişimlere neden olmaktadır. Bu çerçevede, iklim değişikliğinin doğrudan ve dolaylı olarak göçü tetiklediği; göçün ise kaynak ve hedef ülkelerde ekonomik sistemleri dönüştürdüğü bir yapı oluşmaktadır (Parlak vd., 2024). İklim değişikliğinin yarattığı sorunlar, küreselleşen dünyada, su gibi hayati bir kaynağa ulaşma konusunda, geçinebilmek için istihdam edilebilme konusunda, kalabalık nüfus kitlelerinin belirli bölgelerde yoğunlaşmasına sebep olması konusunda sadece göç veren ve hedef ülkeleri değil aynı zamanda bölgesel birlikleri ve hatta dünyanın büyük bir kısmını gittikçe tedirgin eden bir hal almaya başlamıştır. Çünkü görülen ve beklenen göç hareketliliklerinin; başta ekonomik sistemler olmak üzere, sosyal sorunlara, ulusal ve bölgesel sınır güvenliği ihlallerine ve buna bağlı çatışmalara, gıdaya ulaşma savaşlarına gebe birçok boyutlu bir gelecek kendini göstermeye başlamıştır.

Bu açıdan bakıldığında iklim kaynaklı göçlerin ekonomik etkileri oldukça geniştir. Göç eden bireylerin eğitim düzeyleri, mesleki nitelikleri, aile yapıları ve kültürel birikimleri; göçün ekonomik yansımalarında belirleyici unsurlar arasında yer almaktadır (Sırım & Demir, 2020; Aydın & Levent, 2021). Literatürde, özellikle nitelikli iş gücünün göçü- yani beyin göçü- ekonomik kalkınma üzerinde olumlu etkiler doğurduğu sıklıkla vurgulanmaktadır (Gökbayrak, 2008). Bu bağlamda göç, yalnızca bir nüfus hareketi değil; aynı zamanda iş gücünün mekânsal yeniden dağılımı olarak değerlendirilmektedir. Göç alan bölgeler iş gücünü artırarak üretim kapasitelerini genişletebilmekte; göç veren bölgeler ise döviz girişi ve dışsal ekonomik katkılar aracılığıyla ekonomik fayda elde edebilmektedir (Tunalı & Daşdemir, 2023).

Bununla birlikte göçün ekonomik etkileri sadece pozitif değildir. Göçmenlerin entegrasyon süreçleri, işgücü piyasasındaki rekabet koşulları, kayıt dışı istihdam ve ücret baskılanması gibi çeşitli zorlukları da beraberinde getirmektedir. Özellikle yasadışı göçmen istihdamı, iş gücü piyasalarında dengesizlikler yaratmakta ve yerli iş gücü ile göçmen iş gücü arasında haksız rekabet ortamı doğurmaktadır (Konya ve Kabaklarlı, 2023). Bu durum, sosyal ve ekonomik yapının sürdürülebilirliğini tehdit edebilecek boyutlara ulaşabilmektedir.

Sonuç olarak, iklim krizinin ekonomik etkileri bağlamında göç olgusu, küresel ölçekte ele alınması gereken çok katmanlı bir mesele olarak karşımıza çıkmaktadır. Bu çalışmanın amacı, iklim krizinin göç üzerindeki ekonomik etkilerini çok yönlü biçimde inceleyerek hem literatüre katkı sunmak hem de politika yapıcılar için öneriler geliştirmektir. Bu doğrultuda iklim temelli göç hareketlerinin ekonomik yansımaları sistematik biçimde ele alınacak ve mevcut literatür ışığında değerlendirmelerde bulunulacaktır.

İklim Krizi ve Göç Olguları: Kavramsal Çerçeve

İklim, yeryüzünün belirli bir bölgesinde, uzun yıllar boyunca kayıt altına alınmış, atmosferin temel unsurları olan, yağış, nem, basınç gibi hava olaylarının gözlemlenmesi ve istatistiki olarak bulguların ortaya konduğu ortalama değişimleri içeren bir olgudur (İklim Değişikliği Başkanlığı, 2025).

Tüketim döneminin hız kazanmasıyla ekonomi, doğayı sonsuz ve karşılıksız bir hammadde kaynağı olarak görmeye başlamış insan nüfusunun artmasıyla ile yaşam alanları genişlemiş ve bunun sonucunda üretim hızla artmış ve tüketim de beraberinde artmıştır. Enerji sağlayabilmek için kullanılan fosil yakıtlar hızla doğaya zarar vermeye başlamış; atık miktarları ekolojik yapının kendini yenileyebilme kapasitesini zorlar hale gelmiştir (Atvur vd., 2023). Bu durum ise iklim değişikliğine neden olmuştur. İklim değişikliği ise uzun zamanda elde edilen verilerin karşılattırılması neticesinde doğrudan ya da dolaylı olarak küresel atmosferin beşerî faaliyetlerin sonucunda iklimde oluşan değişiklik anlamına geldiğine göre (UNFCC, 2025) ekolojik dengenin bozulmasının başlıca sebebi fosil yakıtların enerji olarak kullanılması ve gıda üretimi ve gelir elde etmek için orman alanlarının tarım alanlarına dönüştürülmesi faaliyetleriyle gerçekleşmiştir. Sonucunda ise, atmosferde karbondioksit seviyesi ve ısıyı tutan diğer gazlar artmış ve küresel ısınma yol açarak iklim seyri değişmiştir. Bu şekilde birbirini tetikleyen olaylar cereyan etmiştir.

İklim değişikliği ayrıca, optimum sıcaklık aralıklarındaki değişimler nedeniyle birçok türün bütünlüğünü ve hayatta kalmasını tehlikeye atmış ve böylece ekosistem yapılarını kademeli olarak değiştirerek biyolojik çeşitlilik kaybını hızlandırmıştır (Abbass vd., 2022). Oluşan bu değişimlerin insan ve doğal yaşam üzerinde görmezden gelinmeyecek olumsuz etkileri iklim krizine neden olmuştur.

İklim değişikliğinin insanlık ve küresel ekosistemler üzerinde derin sonuçları olmaktadır. Ancak bu tür sonuçlar yalnızca çevre, yani doğa üzerinde olmayacaktır. Toprağın altının ve üstünün kirlenmesi ekolojik dengenin bozulması, biyolojik çeşitliğin azalması, ekonomik, sosyal ve politik sorunlara da yol açmaktadır (Atvur vd., 2023). Ekosistem biyolojik çeşitliliğin kaybı, besin kirliliği, türlerin aşırı avlanması, nehirlerden ve suyun azalması, toprak erozyonu ve kimyasal kirlilik gibi faktörler yoluyla önemli ölçüde değiştirilmektedir. Diğer bir deyişle iklim değişikliği çevresel, sosyal, ekonomik ve siyasal alanlara da ciddi zararalar vermektedir. Tüm bu 'diğer' küresel değişikliklerin insan refahı üzerinde büyük etkileri olacaktır ve bu etkilerin çoğu bugün hissedilmektedir (Kosmopoulos, 2024). Dolayısıyla iklim değişikliği, türler, toplulukları, endüstriler ile insanların yaşamlarının her yönünü giderek daha fazla etkilemektedir ve sonuç olarak küresel ekonomi üzerinden ciddi tehditler oluşturmaktadır (Mihailović & Rajičić, 2020). Bu etkiler insanların hayatlarını sürdürdükleri coğrafyadan, geçimlerini sağlayabilecekleri bölgelere göç etmesine neden olmaktadır. Bu hareketliliğin sonucunda hem makro ve mikro olarak hem de ulusal ve uluslararası boyutlarda ekonomik sıkıntılar ortaya çıkmaktadır.

Göç, iklim değişikliğine, ekonomik, politik ve toplumsal faktörlere bağlı olarak son yüzyılda yoğunlaşmış olsa da insanlık tarihinin her zamanında var olagelen bir hareketliliktir.

Dolayısıyla göç, ekonomik, toplumsal, siyasi sebepler dolayısıyla bireylerin veya toplulukların bir ülkeden başka bir ülkeye ya da bir yerleşim yerinden başka bir yerleşim yerine hareket etmesi; taşınma, hicret, muhaceret olarak tanımlanabilir (TDK, 2025). Ancak bu hareket hali çok çeşitli sebeplere dayanmaktadır. Nitekim insanlık ilk zamanlarında hayatta kalmak için göç ederken günümüz açlık, savaş, kıtlık ve iklim koşulları gibi zorunlu nedenlerden kaynaklanan göç nedenlerine günümüzde ek olarak kültürel, siyasi, iktisadi, dini, eğitim, sanayileşme vb. isteğe bağlı sebeplere eklenmiştir (Akıncı vd., 2015). Kısacası iklim krizinin neden olduğu zorlu yaşam koşulları nedeniyle insanlar ekonomik, sağlık vb. diğer sebeplerden göç etmektedirler.

Literatürde İklim, Göç ve Ekonomi İlişkisi

İklim değişikliği ve göç olgusu, son yıllarda sosyal bilimlerin kesişim alanlarında en çok tartışılan konular arasında yer almaktadır. İklim krizinin özellikle ekonomik etkiler bağlamında göçle ilişkisi, disiplinlerarası yaklaşımlarla ele alınmakta; çevre bilimleri, ekonomi, sosyoloji ve siyaset bilimi gibi alanlarda farklı perspektifler ortaya konmaktadır (Black vd., 2011).

Göç ve iklim ilişkisini açıklamaya yönelik ilk teorik yaklaşımlar, çevresel bozulmanın yaşam alanlarını tehdit ettiği durumlarda bireylerin daha güvenli bölgelere göç ettiğini ileri sürmektedir (Myers, 2005). Bu yaklaşım, iklim değişikliğini göçe neden olan temel bir "zorlayıcı faktör" olarak görmektedir. Ancak daha yeni çalışmalar, bu ilişkinin çok daha karmaşık bir yapıya sahip olduğunu, sosyal, ekonomik ve politik değişkenlerin göç kararında önemli rol oynadığını ortaya koymaktadır (Hunter, Luna ve Norton, 2015).

Malthusyen Yaklaşım, gıda artış oranı ile nüfus artış oranının aynı düzeyde olmadığını, gıda artışının artan nüfusa yetişemeyeceğini bu sebeple nüfus artışının önüne geçilmesi gerektiğini vurgulayan katı bir yaklaşım olmasına rağmen nüfus ve gıdaya ulaşımı ilk defa ele alan yaklaşımdır. Malthus'un bu teorisi Endüstri Devriminden hemen sonra ortaya atılmış, insanların geçim olanakları için kırdan kente adeta yığıldığı bir süreç göz önüne alınarak oluşturulmuştur.

Neo-Malthusyen Yaklaşım ise, doğal kaynakların azalması sonucu, tarım ve hayvancılığa dayalı geçim yollarının sürdürülemez bir duruma gelmesi insanları göçe zorladığını ifade etmektedir (Homer-Dixon, 1999). Teorinin çevreye bağlı kıtlıkların göç üzerinde doğrudan etkisine vurgu yaptığı görülmektedir.

Göç Sistemleri Teorisi, ise, göçün yalnızca çevresel zorunluluklarla değil; aynı zamanda sosyal ağlar, kültürel bağlar, ekonomik fırsatlar ve politik faktörlerle şekillendiğini ileri sürmektedir (de Haas, 2010). Bu teoriye göre, bir bireyin göç kararı, yalnızca mevcut iklim koşullarıyla değil; potansiyel göç destinasyonunda var olan iş fırsatları, sosyal entegrasyon imkânları ve geçmiş göç deneyimlerinin etkisiyle de alınmaktadır.

Ayrıca Sürdürülebilir Geçim Yaklaşımı da bu çerçevede önemli bir yere sahiptir. Bu yaklaşım, bireylerin geçimlerini sürdürebilecekleri kaynaklara erişiminin, göç kararlarında belirleyici olduğunu vurgular. İklim değişikliğinin bu kaynaklar üzerindeki etkisi arttıkça, bireyler daha güvenli ve sürdürülebilir bölgelere göç etmektedir (Scoones, 1998).

Bu üç yaklaşım, çalışmanın teorik zeminini oluşturarak iklim değişikliğinin göç üzerindeki ekonomik etkilerini açıklamada kullanılabilir. Özellikle iklim krizine bağlı olarak ortaya çıkan göç dinamiklerinin hem mikro (bireysel) hem de makro (ülkesel/küresel) düzeydeki etkileri bu teorik temeller üzerinden tartışılabilir.

Teorilerde ele alındığı gibi ekonomik boyut, bu tartışmalarda merkezi bir yere sahiptir. Özellikle geçim kaynaklarının yok olması, tarımsal üretimin azalması, su ve enerji kaynaklarına

erişimde yaşanan sıkıntılar gibi faktörler, iklim değişikliğinin ekonomik etkilerini doğrudan göstermektedir. Bu etkiler, özellikle iklim değişikliğine karşı kırılgan ülkelerde göç hareketlerini tetiklemektedir (Warner, 2010). Literatürde, göçün hem ekonomik maliyetleri hem de fırsatları olduğuna işaret edilmektedir. Göçmenlerin işgücü piyasasına entegrasyonu, üretkenliğin artması ve bazı sektörlerde nitelikli işgücü açığının kapatılması gibi olumlu etkiler söz konusu olabileceği gibi; işsizlik, ücretlerin düşmesi ve sosyal gerilimler gibi olumsuz sonuçlar da ortaya çıkabilmektedir (Borjas, 2014).

Cipollina vd. (2021), 96 çalışmanın meta-analizini gerçekleştirerek, iklim değişikliğinin göç üzerindeki etkisinin genel olarak pozitif ve anlamlı olduğunu, ancak bu etkinin coğrafi ve metodolojik farklılıklara göre değiştiğini belirtmişlerdir. Neal vd. (2025), geliştirilmiş ekonomik modellerle, küresel sıcaklık artışının 4°C'ye ulaşması durumunda kişi başına düşen gelirin %40 azalacağını öngörmüşlerdir. Bu çalışma, önceki tahminlerin iklim değişikliğinin ekonomik etkilerini hafife aldığını ortaya koymaktadır. Kahn vd. (2021), 1960–2014 döneminde 174 ülkeyi kapsayan analizlerinde, sıcaklık ve yağıştaki sapmaların uzun vadeli ekonomik büyümeyi olumsuz etkilediğini, özellikle tarım üretimi ve iş gücü verimliliği üzerinde belirgin etkiler olduğunu bulmuşlardır. IMF (2023): 1990–2020 döneminde 5 yıllık verilerle yapılan analizde, iklim afetlerinin tarımsal üretimi ve istihdamı azalttığı, gelir eşitsizliğini azalttığını ortaya koymuşlardır.

Türkiye özelinde yapılan araştırmalarda ise özellikle Suriyeli mülteciler örneği üzerinden iklim kaynaklı olmasa da kitlesel göçlerin ekonomik etkileri analiz edilmiştir (Delice & Tümen, 2015). Özçağ (2011): 1960–2007 döneminde Türkiye için Johansen eş bütünleşme ve ARDL analizleri kullanarak, kişi başına CO_2 emisyonları ile kişi başına gelir arasında uzun dönemli bir ilişki olduğunu ve ekonomik büyümenin emisyonları artırdığını göstermiştir. Başoğlu (2014): 1980–2011 döneminde panel veri analiziyle, iklim değişikliğinin ekonomik büyüme üzerindeki etkilerini incelemiş ve bu etkinin bölgelere göre farklılık gösterdiğini ortaya koymuştur. Güleç (2023): Türkiye'de iklim değişikliği, afetler ve göç dinamiklerinin bölgesel kalkınma üzerindeki etkilerini ele almış ve iklim değişikliğinin göçü artırarak bölgesel kalkınmayı etkilediğini belirtmiştir. Bu çalışmalar, iklim değişikliğine bağlı göçlerin gelecekte artma potansiyeli taşıdığını ve benzer ekonomik sonuçlara yol açabileceğini göstermektedir.

İklim Krizi ve Göç İlişkisi ve Ekonomik Etkileri

21. yüzyılın, ekonomik, politik, çevresel ve toplumsal en önemli sorunlarından birisi haline gelen iklim değişikliği ulusal ve uluslararası ve küresel boyutta etki alanı yaratmıştır. Yağış seyrinin azalmasıyla kuraklıkların artması, sık sık yaşanan ve şiddeti gittikçe artan hava olayları, okyanusların ısı derecesinin artması asitlenerek biyolojik yapısının bozulması, artan ve önlemesi güçleşen orman yangınları gibi iklim felaketleri, insanların sağlığı ve refah düzeyleri üzerinde ciddi etkilere sahiptir. İklim krizi tehdidi global olarak her geçen gün artarken, yaşam koşulları daha güvencesiz hale gelmektedir. İnsan nüfusunun %1 yaşanabilir coğrafyalarda ancak hayatta kalabilecek kadar zor koşullarda yaşarken, 2070'li yıllara gelindiğinde bu oranın%19'a yükselmesi öngörülmektedir (Gürçam, 2023). Tüm bu olumsuz şartlar ulusal ve bölgesel olarak iklime bağlı göçü artan bir güçle tetiklemeye devam edecektir. (Turrentine, 2019). Dolayısıyla küresel anlamda yaşanması olası büyük göç hareketlerinin çok yönlü bir kargaşaya sebep olma olasılığı insanların hayatlarını olumsuz etkileyebilecektir.

Sanayi Devriminden bu yana, özellikle gelişmiş ülkelerin yoğun şekilde fosil yakıt kullanmaları sera gazı salımının hızını artırmıştır. Az gelişmiş ülkeler ekonomik koşullarının elverişli olmaması, hukuki zeminlerinin yetersiz olması, gelişmemiş teknolojiye sahip olmaları, kurumsal altyapılarının oluşmamış olması sebebiyle iklim değişikliğinin olumsuz getirileri ile baş edebilme ve uyum sağlayabilme açısından başarısız olmuşlardır. Bu sebeple bu ülkelerde

yaşayan insanların yaşam koşulları daha kötü hale gelmiştir. Halihazırdaki riskleri daha da artacağı tahmin edilen iklim değişikliği, güvensizliği ve yaşama olan tehdidi de yükselteceği öngörüsü nedeniyle "tehdit çarpanı" kavramı ile nitelendirilmektedir (UN General Assembly, 2009). Tehdit çarpanından iklim krizi nedeniyle şiddetlenen sel, fırtına, kuraklık, sıcak dalgası gibi olayların ilk mağdurları toplumun ekonomik, sosyal ve politik olarak dezavantajlı gruplarıdır. Kırılgan grupların içinde yoksulların yanı sıra kadınlar, çocuklar, yaşlılar, yerli halklar ve yerel topluluklar yer almaktadır (Atvur & vd., 2023). Bu koşullara maruz kalan gruplar için göç bir tercih değil, hayatta kalmak için bir zorunluluk haline gelmektedir

İklim değişikliği sebebiyle gözlenen kuraklık; doğal kaynaklarda azalmaya, verimsizleşmeye, tarım ve hayvancılık başta olmak üzere birçok ekonomik faaliyetin olumsuz etkilenmesine zemin hazırlamaktadır. Ayrıca deniz seviyesinin yükselmesi, hava olaylarındaki değişiklik, yaşam alanlarındaki değişim; günden güne artan sosyo-ekonomik eşitsizlik, siyasal huzursuzluk ve veya istikrarsızlık göç hareketlerinin başlangıç noktası olarak gösterilmektedir (Uysal Oğuz & Atvur, 2023). İklim değişikliğinin baskıları para politikasının sınırlandırılması, artan enflasyon- gıda-enerji ve sigorta maliyetlerine neden olmaktadır (Afiye, 2024). İklim krizi nedeniyle ekolojik ve ekonomik anlamda yüksek risk altındaki bölgelerden göç kaçınılmaz bir durum olarak gündeme gelmektedir (Uysal Oğuz & Atvur, 2023).

Ekonomik kalkınma ve iklim değişikliği arasındaki etkileşimin küresel boyuttaki etkileri yoğun bir şekilde hissedilmektedir. Ekonomik kayıpların niceliği ile ilgili tedirginlikler ülkeleri bu konuda endişeye sürüklemektedir (Mihailović & Rajičić, 2020). Yaşanan ekolojik dengesizlikler sonucu ortaya çıkan iklim krizi bölgeleri ve ülkeleri ekonomik krizin eşiğine sürüklemektedir. Ortaya çıkan ekonomik dalgalanmalardan ülkeler ve coğrafyalar farklı şekilde etkilenmektedir. Ülkelerin coğrafi konumu (Lecocq & Shazili, 2007) ve gelişmişlik düzeyi bu farklılığın başlıca sebebi olarak gösterilmektedir. Özellikle gelişmekte olan ülkelerde ve az gelişmiş ülkelerde, yüksek sıcaklık seviyesi, ekolojik değişime adaptasyonun zayıf olması, erken uyarı sistemlerinin yeterli olmaması, diğer taraftan söz konusu ülkelerin ekonomik yapı kırılganlıkları iklim krizinin ekonomik etkilerini daha ağır yaşamalarına sebep olmaktadır. Aşırı hava koşullarının sermaye stoğuna ve işgücü arzına zarar vererek ekonomik büyümeyi zayıflatmaktadır (Afiye, 2024). İklim değişikliği sebebiyle oluşan olumsuzluklar, hammadde, işgücü ve istihdamı, enerji kaynaklarını negatif yönde etkileyeceği için üretimin azalmasına ve maliyetlerin artmasına sebep olacaktır.

İklim değişikliğinin son yıllarda artan olumsuz etkileri nedeniyle birçok sektör tehlike altındadır. Hava olaylarının dengesiz değişimleri başta tarımda vb. üretim sektörlerini olumsuz etkilemektedir ve nihayetinde ekonomik büyüme oranları üzerinde önemli bir tehdit unsuru oluşturmaktadır (Hayaloğlu, 2018). Bu bağlamda yapılan araştırmalar iklim değişikliğinin, ekonomik büyümeyi üzerinde negatif yönde bir etkisi olduğunu göstermektedir. Bu durum ülke ekonomilerine küresel anlamda zarar vermektedir. Ekonomik aksamalardan dolayı ülkenin gelişmişlik ve büyüme oranları etkilenmektedir (Er, 2025). Örneğin, kuraklığın artmasıyla beraber tarımdaki üretim miktarındaki azalış veya tüketim miktarındaki artış ekonomik dengelerin büyük ölçüde değişimine sebep olmaktadır (Bilgiç, 2017). Dolayısıyla iklim krizi insanlar, ekosistemler, politik, sosyal ve ekonomik yapılar üzerinde yıkıcı etkiler bırakmaktadır (Atvur vd., 2023). Bu etkiler çevresel ve sosyoekonomik alanlarda ortaya çıkabilmektedir. *Çevresel etkileri*; türlerin neslinin tükenmesi, hava kirliliği, suyun azalması, ormansızlaşma ve nihayetinde çölleşme gibi ciddi sorunlar olarak karşımıza çıkmaktadır. *Sosyoekonomik* olarak ise ekonomik kalkınma ve büyümenin sürdürülebilirliğinin azalması, enerji ihtiyacı, gıda ihtiyacı, yoksulluk ve göç olarak karşımıza çıkmaktadır (Türkeş vd. 2000).

Kırsal alandan kentlere doğru yaşanan göç sebebiyle ekonomik faaliyetlere paralel olarak artan enerji ihtiyacını da gündeme getirmektedir

Gözlemlenen sıcaklık artışları, doğal felaketler, yağışlardaki kontrolsüz dalgalanmalar, iklim değişikliğinin yalnızca ekosistemde bulunan canlıları değil ekonomiyi de etkilemesi sonucunu doğurmaktadır. İstihdam, sağlık, emek kayıpları, sektörel etkileri, ekonomik büyüme, ekonomik kayıplar gibi olumsuz durumların ortaya çıkmasına neden olmaktadır. Ekonomik açıdan dezavantajlı bulunan gelişmekte olan ülkeler iklim değişikliği ile ilgili gereken tedbirleri almakta yetersiz kalmaktadır. Bilinçsiz bir şekilde kıt kaynakların tüketimi, ekosistemde meydana gelen krizler, küresel ekonomik dalgalanmalar, yenilenemez enerji kaynaklarından doğan çevresel zararlar, insanları farklı çözüm arayışlarına yöneltmektedir.

Yaşanan ve yaşanması muhtemel olan ekonomik sorunlar sebebiyle istihdam, refah seviyesinde azalma meydana gelerek, yoksulluk ve sosyoekonomik güvensizlik sebebiyle sosyal istikrar sorunlarının yaşanması kuvvetle muhtemel gözükmektedir.

İklim Krizi, Göç ve Ekonomik Etkilerine Yönelik Bölgesel ve Küresel Politikalar

İklim değişikliğinin tetiklediği göç dalgaları, özellikle tarımsal üretime dayalı ekonomilerde ve altyapı kapasitesi sınırlı bölgelerde hem göç veren hem de göç alan topluluklarda ciddi ekonomik sonuçlar doğurmaktadır (Black vd., 2011). Tarımsal verimliliğin düşmesi, geçim kaynaklarının yok olması, altyapı hasarları ve yaşam koşullarının bozulması bireyleri yer değiştirmeye zorlamakta; bu zorunlu hareketlilik ise hem kaynak hem de hedef bölgelerde ekonomik kırılganlıkları artırmaktadır (IOM, 2019). Dolayısıyla, iklim kaynaklı göçü yalnızca insani bir mesele olarak değil, aynı zamanda ekonomi-politik bir sorun alanı olarak değerlendirmek gerekmektedir.

İnsanoğlu farklı sebeplerle yaşam alanlarındaki tahribat sonucunda, ülke içinde veya dışında göç hareketinde bulunmaktadır. Bu bağlamda insanları göç etmeye zorlayan belli başlı sebepler olarak; doğal afetler, alt yapı sorunları, can ve mal güvenliği, ekonomik sebepler ve kültürel aktörler gösterilebilir. (IPCC, 2022, ss.8-19). Bu sebepler dolayısıyla iklim krizine dayalı göçler hali hazırda dünyada yaşanan insan hareketlerinin fitilini ateşleyerek büyük bir hareketliliğin başlangıç noktasını oluşturmaktadır. İklim krizinin ulusal ve uluslararası etkileri, ülkeler arası eşitsizliğin yanı sıra sosyoekonomik eşitsizliği, cinsiyet eşitsizliğini ve politik istikrarsızlığı artırmaktadır. Ekonomik kayıplar ise yaşam kalitesini kötüleştireceği ve ölümlere yol açarak göçlere neden olabilmektedir (Uygur ve Atvur, 2023).

Günümüzde yaşanan, afetler, savaşlar ve iklim değişiklikleri gibi birtakım olaylar küresel anlamda birçok insanı yerinden ederek, göç hareketliliği önceki iki katına çıkmıştır (Gürçam, 2023). Dolayısıyla iklim krizi çerçevesinde oluşan insan hareketliliğinin halihazırda gözlenen düzensiz göç sorununu gündeme getirecektir. Bu sebeple olası risk ve tehditler insanların, toplumların ve devletlerin, ekosistemlerin güvenliğinin uluslararası dayanışma ve iş birliği kapsamında ele alınmayı zorunluluk haline getirmektedir (Atvur vd., 2023). Ancak her geçen gün kötü hale gelen iklim kayıpları ve daha da şiddetli hava olayları insan hareketliliğinde bir artışa neden olduğundan dolayı göç etmeyi seçen insanlar bunu çok az yasal koruma ile yapmaktadır. Var olan uluslararası hukuk sisteminde ülkeleri, iklim krizi nedeniyle göç eden kişileri desteklemeye zorlayan yasal olarak bağlayıcı anlaşmalar bulunmamaktadır (Berchin, Valduga, Garcia ve Andrade Guerra, 2017). Bu bağlamda iklim krizi nedeniyle göç eden kişiler mültecilere benzese de uluslararası hukuk sisteminde yer alan mülteci statüsünden faydalanamamaktadırlar (Lister, 2014). İklim krizi ile göç arasındaki ilişki, ulusal ve uluslararası düzeyde hâlen yeterince sistematik şekilde ele alınmamış ve çoğu zaman insani krizler bağlamında geçici çözümlerle yönetilmeye çalışılmıştır (Bettini, 2013). Ancak iklim

göçünün kalıcı, artan ve karmaşıklaşan bir olgu olduğu artık bilimsel verilerle de desteklenmektedir. Nitekim Dünya Bankası'nın 2021 yılında yayımladığı rapora göre, 2050 yılına kadar Sahra Altı Afrika, Güney Asya ve Latin Amerika'da 216 milyona yakın insanın iklim koşullarına bağlı olarak iç göçe zorlanabileceği öngörülmektedir (World Bank, 2021). Bu durum, ekonomik kaynakların yeniden dağılımı, kentleşme baskısı, iş gücü piyasalarında dengesizlikler ve sosyal uyum sorunları gibi çok sayıda yeni meydan okumayı da beraberinde getirmektedir. Bu çerçevede ulusal ve uluslararası düzeydeki örgütlerin güvenlik stratejilerinde iklim değişikliğinin yıkıcı etkileri yerini almış ve bu etkilerin sebep olduğu göç hareketlerine yönelik önlem olarak ulusal güvenlik kapsamında ele alınmaya başlamıştır (NATO, 2021; The White House, 2015; HM Government, 2010).

İklim değişikliğine bağlı zorunlu göç, giderek artan ölçüde küresel yönetişim sisteminin sınamalarından biri haline gelmiştir. Bu bağlamda, iklim göçü yalnızca çevresel değil; aynı zamanda sosyoekonomik, siyasi ve hukuki bir mesele olarak bölgesel ve küresel düzeyde çok aktörlü çözümler gerektirmektedir. Ancak hâlihazırdaki bölgesel ve uluslararası mekanizmalar, bu karmaşık sorunu yönetmekte yetersiz kalmakta; özellikle göçün temelinde yatan kırılganlıkları önleyici değil, sonuçlara tepki veren politikalar ön planda tutulmaktadır (Boas vd., 2019; IOM, 2023).

Uluslararası hukuki ve politik çerçeve ye bakıldığında ilk olarak Cenevre Mülteci Sözleşmesi'ne rastlanmaktadır. İklim göçmenlerinin veya "çevresel mültecilerin" mevcut uluslararası hukukta tanımlı bir statüsü bulunmamaktadır. 1951 Cenevre Mülteci Sözleşmesi, yalnızca ırk, din, milliyet, belli bir sosyal gruba mensubiyet ya da siyasi görüş nedeniyle zulüm gören bireyleri mülteci olarak tanımladığından, iklim değişikliği kaynaklı göçmenler bu tanıma girmemektedir (McAdam, 2012). Bu durum, özellikle ada ülkelerinde yaşayan ve deniz seviyesinin yükselmesi gibi geri döndürülemez etkilerle karşı karşıya kalan topluluklar için ciddi bir koruma açığı yaratmaktadır.

Paris İklim Anlaşması (2015), ilk defa uluslararası düzeyde yerinden edilme riskine dolaylı biçimde değinmiş, 8. maddesi ile "kayıp ve zarar" (loss and damage) mekanizması içinde göç konusuna atıf yapmıştır. Ancak bu atıf, herhangi bir bağlayıcı yükümlülük içermemektedir. Bununla birlikte, COP26 ve COP28 gibi son iklim zirvelerinde, iklim göçü meselesi daha görünür hale gelmiş; ancak somut adımlar sınırlı kalmıştır (UNFCCC, 2023). BM Küresel Göç Mutabakatı (Global Compact for Safe, Orderly and Regular Migration, 2018), çevresel göçmenlerin korunması konusunda önemli bir dönüm noktası sayılabilir. Bu mutabakat, göçün "çevresel, iklimsel ve afet kaynaklı nedenleri"ni kabul etmekte ve iklim değişikliğinin göç üzerindeki etkilerine yönelik önleyici ve uyumlayıcı önlemler geliştirilmesini teşvik etmektedir. Ancak yine bağlayıcılığı bulunmamakta, uygulama büyük ölçüde devletlerin isteğine bırakılmaktadır (UN, 2018).

Bazı bölgeler, iklim kaynaklı göç konusunda özgün uygulamalar ve politika örnekleri geliştirmiştir. Örneğin Pasifik Adaları ve Okyanusya' deniz seviyesindeki yükselme nedeniyle toprak kaybı yaşayan Tuvalu, Kiribati ve Marshall Adaları gibi ülkeler, vatandaşlarını diğer ülkelere gönüllü olarak yeniden yerleştirme stratejileri geliştirmektedir. Yeni Zelanda, bu çerçevede 2017 yılında "iklim mültecisi vizesi" üzerinde çalışmaya başlamış, ancak uygulamaya koymamıştır. Kiribati hükümeti, Avustralya'da arazi satın alarak gelecekteki yeniden yerleşim planlarını gündeme taşımıştır (Burson, 2020).

Afrika Kıtası'nda iklim değişikliği ile gıda güvensizliği, kuraklık ve su kıtlığı arasındaki bağ nedeniyle en fazla etkilenen bölgelerden biri olan Afrika'da, IGAD (Doğu Afrika Hükümetler arası Kalkınma Otoritesi), iklim göçü risklerini haritalayan ve erken uyarı sistemleri kuran politikalar geliştirmiştir (IOM, 2021). Ayrıca, Afrika Birliği'nin 2009 tarihli Kampala

Sözleşmesi, yerinden edilme olgusuna çevresel faktörler bağlamında dolaylı atıflarda bulunmaktadır. Bu durum, bölge içindeki hukuki tanımanın bir ön adımı olarak yorumlanmaktadır (AU, 2009).

Avrupa Birliği, Afrika'dan gelen düzensiz göç dalgalarını iklim temelli de olsa güvenlik odaklı ele almakta; göçü önleyici sınır politikaları ön planda tutulmaktadır. "Yeni Göç ve İltica Paktı" (2020), çevresel nedenlerle yerinden edilen bireyleri açık biçimde ele almamaktadır. Ancak AB fonları ile özellikle Sahra Altı Afrika'da dayanıklılık artırıcı projeler desteklenmektedir (Geddes & Sommerville, 2022). Bu çabalar, sorunun kaynağına değil, sonucuna odaklanması nedeniyle eleştiriye açıktır.

IOM (*International Organization for Migration*, Uluslararası Göç Örgütü), UNHCR(*United Nations High Commissioner for Refugees* Birleşmiş Milletler Mülteciler Yüksek Komiserliği), FAO(*ood and Agriculture Organization of the United Nations*, Birleşmiş Milletler Gıda ve Tarım Örgütü), UNDP(*United Nations Development Programme*, Birleşmiş Milletler Kalkınma Programı) ve WFP(*World Food Programme*, Dünya Gıda Programı) gibi çok taraflı kuruluşlar, iklim göçünün etkilerine karşı uyum politikaları, risk azaltımı ve erken müdahale çerçeveleri oluşturmaktadır. Özellikle IOM, 2021-2030 yıllarını kapsayan kurumsal stratejisi içinde iklim kaynaklı hareketliliğe özel yer ayırmış ve çevresel göçün izlenmesi için veri tabanları geliştirmiştir (IOM, 2021). Ancak uygulamalar genellikle proje temelli ve fon bağımlıdır; bu da uzun vadeli sürdürülebilirlik açısından zorluk yaratmaktadır. Yeşil İklim Fonu (GCF) ve Adaptasyon Fonu, düşük gelirli ülkelerin iklim değişikliğine uyum kapasitesini artırmaya yönelik finansman sunmaktadır. Ancak bu fonların iklim göçünü açık hedef olarak alması hâlâ sınırlıdır (UNFCCC, 2023).

Genel olarak, iklim değişikliğine bağlı göçü ele alan bölgesel ve küresel politikalar; hukuki tanım eksikliği, politika uyumsuzluğu, bağlayıcılık zafiyeti, fon dağılımı ve yönetişim sınırlılıkları gibi nedenlerle yetersiz kalmaktadır. Uluslararası toplum, iklim göçünü geçici krizler yerine, kalıcı sosyoekonomik bir gerçeklik olarak kabul etmeli; bu doğrultuda küresel iş birliğine dayalı, insan hakları temelli bağlayıcı politikalar geliştirmelidir (McLeman, 2020; Warner vd., 2022). İklim krizinin etkileri giderek derinleşirken, iklim göçünü uluslararası hukukta tanımlayan ve hak temelli yaklaşımları önceleyen bağlayıcı mekanizmaların oluşturulması artık ertelenemez bir ihtiyaçtır.

SONUÇ

Sanayi devrimi ile birlikte kontrolsüz şekilde artan üretimin sebebi olan tüketim doğanın tüm olanaklarını kullanmaya başlamıştır. Zamanla sürekli tüketim anlayışı doğanın ve insan yaşamının dengesini sarsmıştır. Nihayetinde ise iklim krizi, ekonomik sorunlar ve bunlara bağlı göç hareketleri yaşanmaya başlamıştır.

Günümüz dünyasında günden güne toplumu tehdit eden yeni sorunlara ek olarak, iklim değişikliği de kendine yer bulmuştur. İklim değişikliği sorunu çevresel, siyasal, ekonomik ve sosyal açıdan küresel ölçekte çözüm bekleyen en önemli sorunlardan birisidir. İklim değişikliğiyle küresel ısınmanın sebep olduğu etkiler arasında buzulların erimesi de yer almaktadır. Bu durum okyanus akıntılarında yön değişikliği, fırtınalar, yağışlar veya kuraklık gibi bir takım tabiat olaylarının oluşumunu sağlamayarak, ekosistemleri ve biyolojik çeşitliliği olumsuz etkilemektedir. İklim krizine karşı gereken önlemlerin alınmaması veya duyarsızlığın devam etmesi durumunda, günden güne etkileri çığ gibi büyüyerek özellikle az gelişmiş ülkelerde kendini daha fazla göstermeye devam edecektir. Bu etkiler her geçen gün daha fazla hissedildikçe insanlar ilk olarak ulusal sonrasında uluslararası düzeyde göç hareketlerine yönelmeye devam edecektir.

İklim krizi tarımsal verimliliğin düşmesine, geçim kaynaklarının azalmasına, altyapı sorunları ve yaşam koşullarının kötüleşmesine neden olmaktadır. Bu durum bireyleri göçe etmeye zorlamakta; bu zorunlu hareketlilik ise hem kaynak hem de hedef bölgelerde ekonomik kırılganlıkları artırmaktadır.

Son 10 yılda yaşanan göç hareketliliğinin kontrolsüz artışı göz önüne alındığında bu durum, ekonomik dengesizlikleri, kentleşme sorunlarını, iş gücü piyasalarında dengesizlikler ve sosyal uyum sorunları gibi çok sayıda yeni zorluğu beraberinde getirmektedir.

Bu sorunlarla mücadelede uluslararası boyutta insan haklarını koruyan ve uygulanabilir politikalar geliştirmesi gerekmektedir. Mevcut uluslararası hukuki çerçeve iklime dayalı göç eden kişilerin "mülteci" statüsünde yer almaması, bu kişilerin yasal korumadan mahrum kalmasına yol açmaktadır. Paris İklim Anlaşması ve BM Küresel Göç Mutabakatı gibi girişimler umut verici olsa da uygulama eksiklikleri nedeniyle yetersiz kalmaktadır.

Dolayısıyla, iklim krizinin neden olduğu ekonomik faaliyetler bağlamında göç kavramına etkilerinin incelenmesi ve bu kavramların birbiriyle ilişkisine dikkat çekilmesi, küresel çözümlerin geliştirilmesi açısından büyük önem taşımaktadır. İklim krizine karşı acil ve donanımlı planların yanı sıra, iklim kaynaklı göç eden kişiler için uluslararası koruma anlaşmalarının düzenlenmesi ve insani yardımların artırılması gerekmektedir.

ABSTRACT

Since the Industrial Revolution, meeting the need for energy in production from fossil fuels has led to a decrease in underground resources on the one hand, and to an increasing deterioration in the balance of the ecosystem due to wastes on the other. All these negativities have resulted in global warming and climate change. Weather events caused by climate change, drought, decrease in agriculture and food production, and difficult access to food have triggered migration movements of masses. In particular, conditions where environmental vulnerabilities are intense force the people of the region to migrate in order to change their livelihoods. This situation creates food supply and demand, security and demographic problems for both sending and receiving countries. Although war and economic conditions are the most common causes of migration in the literature, the concepts of "climate migrants-climate refugees", which have not yet been defined in international law, have started to take place in migration studies. Because it is stated in international platforms that the migration movements caused by the climate crisis will intensify. Therefore, climate crisis and migration can be considered as two important factors threatening food security. The importance of sustaining access to food and water and increasing resource efficiency has moved to a human dimension as well as being a national and regional problem. This study aims to provide sustainable agriculture, water management, food security policies, social cohesion policies and future perspectives by analyzing the effects of climate change and migration on food security. On the other hand, it is aimed to make a general evaluation in terms of the sustainability of the economies of migration-receiving and migration-giving countries and to make suggestions and to contribute to the literature in this respect.

Keywords: Climate Crisis, Migration, Food Security, Sustainability

İKLİM KRİZİ VE GÖÇÜN GIDA GÜVENLİĞİ ÜZERİNE ETKİLERİ: SÜRDÜRÜLEBİLİRLİK İÇİN POLİTİKA VE STRATEJİK YAKLAŞIMLAR

ÖZET

Endüstri Devrimi'nden itibaren üretimde enerji ihtiyacının fosil yakıtlardan karşılanması bir taraftan yeraltı kaynaklarının azalmasına diğer taraftan atıklar sebebiyle gittikçe artan şekilde ekosistemin dengesinin bozulmasına sebep olmuştur. Bütün bu olumsuzluklar küresel ısınma ve iklim değişikliği ile sonuçlanmıştır. İklim değişikliğinin yol açtığı hava olayları, kuraklık, tarım ve gıda üretiminin azalması, gıdaya ulaşmanın zorlaşması kitlelerin göç hareketlerini tetiklemiştir. Özellikle çevresel kırılganlıkların yoğun yaşandığı şartlar bölge halklarını geçim kaynaklarını değiştirmek amacıyla göç etmeye zorlamaktadır. Bu durum ise hem göç veren hem de göç alan ülkeler için gıda arzı ve talebi, güvenlik ve demografik sorunlar ortaya çıkarmaktadır. Literatürde, savaş ve ekonomik koşullar göç sebepleri arasında en çok yer alan konular olsa da henüz uluslararası hukukta tanımlanmamış olan "iklim göçmenleri-iklim mültecileri" kavramları göç çalışmalarında yer almaya başlamıştır. Çünkü iklim krizinin yaratacağı göç hareketlerinin yoğunlaşacağı uluslararası platformlarda dile getirilmektedir. Dolayısıyla iklim krizi ve göç, gıda güvenliğini tehdit eden iki önemli faktör olarak kabul edilebilir. Gıda ve suya ulaşılabilmenin sürdürülebilmesi, kaynak verimliğinin artırılmasının önemi, ulusal ve bölgesel sorun olmasının yanı sıra insani bir boyuta da taşınmıştır. Bu çalışma, iklim değişikliği ile yaşanan ve yaşanacak olan göçün gıda güvenliğini üzerine etkilerini analiz ederek, sürdürülebilir tarım, su yönetimi, gıda güvenliği politikaları, sosyal uyum politikaları ve gelecek perspektifi sunmayı amaçlamaktadır. Diğer taraftan göçe bağlı arz talep dengesinin pek çok bakımdan değişmesi göç alan ve göç veren ülke ekonomilerinin sürdürülebilirliği açısından genel bir değerlendirmenin yapılarak önerilerde bulunmak ve bu bakımdan literatüre katkı sunmayı amaçlanmaktadır.

Anahtar Kelimeler: İklim Krizi, Göç, Gıda Güvenliği, Sürdürülebilirlik

Giriş

Küresel ölçekte giderek büyüyen bir tehdit halini alan göç olgusu, her zaman savaş ya da güvenlik arayışı sebepleriyle gerçekleşmemektedir. Günümüzde küresel dönüşümlerin temel dinamiklerinden biri olarak kabul edilen iklim krizi, zorunlu göçün temel nedenlerinden biri haline gelmiştir. İklim krizi, zorunlu göçlerin bir sebebi olmakla birlikte, üretimin artarak devam edebilmesi için girdi olarak kullanılan doğal kaynakların dengesinin bozulmasının, üretim süreçlerinde ortaya çıkan ve hızlı tüketim kalıplarının yarattığı çevresel kirliliğin de bir sonucudur. Bu sebeple iklim değişikliğine hava olaylarında meydana gelen değişim olarak görmek, dar bir çerçeveyi işaret etmektedir. Çünkü günümüzde küresel sıcaklıklarda artış olması, kuraklık, sel ve fırtına gibi hava olaylarının sıklığının ve şiddetinin artması boyutundan çıkmış bir iklim krizine dönüşmüştür. Söz konusu doğa olayları artık insanları, geçimlerini sağlayabilmek, hayatta kalabilmek için gıdaya ve suya ulaşabilme, güvenli alanlarda yaşayabilme imkânı bulmak için göçe mecbur bırakmaktadır. Dolayısıyla iklim değişikliğinin nedenleri ve sonuçları üzerinde ciddiyetle durulması zorunluluk haline gelmiştir. Ekolojik dengenin bozulmasıyla iklim krizi ile mücadele eden yerkürenin yaşadığı iklimsel sorunlar sonucunda yaşanan göçler sadece belirli bir ülke ya da bölgeyi değil artık küresel bir sorun olarak bütün dünyayı etkisi altına almaya başlamaktadır. İklim krizi, 1972 Stockholm Konferansı ile uluslararası arenada mücadeleye başlanılan bir konudur.

Dünya genelinde derinleşen iklim krizi, çevresel bir tehdit olmanın ötesine geçerek sosyo-ekonomik yapılar, yerleşim dinamikleri ve temel insan hakları üzerinde çok boyutlu ve derin etkiler yaratmaktadır. Özellikle gıda ve temiz suya ulaşma konusu ilk sırada sayılabilir. Dolayısıyla tarım ve su kaynakları gibi doğal sistemlerin bozulması, iklim krizinin gıda üretimi üzerindeki doğrudan etkilerini görünür kılarken; bu durum, gıda güvenliği sorununu daha da karmaşık hale getirmektedir. Tarımsal verimliliğin azalması, aşırı hava olaylarının artması, kuraklık ve su kıtlığı gibi ekolojik riskler, yerinden edilmelere ve zorunlu göç hareketlerine zemin hazırlamaktadır. Bu bağlamda, iklim değişikliği ve göç olgusu arasındaki kesişim, gıda güvenliğini çok yönlü bir biçimde tehdit eden temel dinamiklerden biri olarak öne çıkmaktadır. İklim krizinin nedenleri çok boyutlu olduğu gibi çözümünün de çok boyutlu olması, bu duruma dair problemin daha karmaşık ve giderilmesi zor bir hal kazanmasına yol açmaktadır.

Zorunlu ya da gönüllü nitelikteki göç hareketleri, göç veren ve hedef bölgelerin gıda sistemleri üzerinde baskı oluşturmaktadır. Özellikle kırsal alanlardan kent merkezlerine yönelen iç göç hareketleri, tarımsal üretimde işgücü kaybına yol açarken, kentlerde nüfusun yoğunlaşması ise gıda talebinin artmasına neden olmaktadır. Bu durum, mevcut gıda sistemlerinin sürdürülebilirliğini tehdit ederken, aynı zamanda toplumsal eşitsizlikleri derinleştirme potansiyeli taşımaktadır. Dolayısıyla, iklim krizine bağlı ekolojik dengenin bozulmasının tetiklediği göç süreçlerinin gıda güvenliği ile olan ilişkisini geniş bir perspektiften ele almak hem akademik hem de politika yapıcı çevreler için öncelikli bir gereklilik haline gelmiştir.

Kavramsal ve Teorik Çerçeve

Yerkürenin doğal ekolojik dengesinde, insan faaliyetlerine bağlı olarak ortaya çıkan hızlı, kapsamı geniş olan ve büyük çoğunlukla olumsuz değişimleri ifade etmektedir (IPCC, 2023). Bilindiği üzere Sanayi Devrimi'nde hızlı bir ivmeyle yoğunluk kazanan üretim ve bu üretim modellerine bağlı doğal kaynakların, özellikle fosil yakıtların, kullanımı yer altı ve yer üstü dengesine geri dönülemez zararlar vermiştir. Bu zararların başında, sera gazı emisyonlarının küresel sıcaklık artışına yol açması, normal yağış seyrinde kaymalara, kurak alanların genişlemesi ve tarımsal üretim istikrarının bozulmasına, yer altı sularının miktarının azalmasına

ve kirlenmesine neden olmuştur. Diğer taraftan doğal kaynakların kullanımının adilane paylaşılamaması, ekonomik ve sosyal tahsisin denge açığının büyümesine, söz konusu ekolojik dengesizliğin ve ekonomik sıkıntıların çeşitli coğrafyalarda insan hayatını ve ülkeler arası ilişkileri olumsuz etkilemesine sebep olmuştur. Bu olumsuzluk özellikle tarımsal üretime dayalı geçim sistemlerinin sürdürülebilirliğini tehdit eder hale gelmiş ve gıda güvenliğine yönelik olan doğrudan etkileri de yaratmaya devam etmektedir.

Gıda güvenliği ise, Birleşmiş Milletler Gıda ve Tarım Örgütü olan FAO tarafından, "herkesin her zaman, aktif ve sağlıklı bir yaşam sürmesi için gerekli olan yeterli güvenli ve besleyici gıdaya fiziksel, sosyal ve ekonomik erişiminin olması durumu" olarak tanımlanmaktadır (FAO, 2020). Gıda güvenliği tanımı içinde, küresel olarak birey ya da toplum ayrımı yapmadan bütün insanların, temiz ve besleyici gıdaya ulaşmak için; eşitlik, adillik ve güvenilirlik kavramlarını barındırmaktadır. Bu kavramlar günümüzün Toplum 5.0 felsefesinin tüm toplumlar için, eşit, adil, ulaşılabilir bir şekilde, ileri teknolojilerin tüm toplumların refahını sağlamak amacıyla kullanılması hedefi ile de örtüşmektedir. Bu sebeple gıda güvenliği; gıdaya erişme, gıda arzı, tüketim kalıplarının farklılıkları, doğal kaynakların sürdürülebilir kullanımı ve politik istikrar gibi pek çok bileşeni içermektedir.

Ekolojik dengenin bozulması ekonomik, sosyal ve politik birçok sonucu ortaya çıkarmaktadır. İnsanların yaşadıkları yerlerden geçici veya kalıcı olarak başka yerlere hareket etmesi olarak tanımlanan göç ise bunlardan birisidir (IOM, 2022). Göçlerin genel prensipte itici ve çekici yönleri mevcuttur ve çoğu zaman ekonomik, sosyal, politik ve iklime bağlı nedenlerle göç hareketleri tetiklenmektedir. İklime bağlı göçler ise, kuraklık, sel, toprak kaybı, yaşanılan bölgede geçim ve yaşam alanlarının sular altında kalması, doğal afetler gibi çevresel mecburiyetler nedeniyle yerlerinden ayrılmak zorunda kalan toplulukları ifade etmektedir. İklime bağlı göçler çoğunlukla isteğe bağlı olmayan göçler olarak nitelendirilebilir.

Gıda güvenliğinin sağlanamaması, özellikle kırılgan ve düşük gelirli topluluklarda yaşam koşullarını ağırlaştırarak göç kararlarını doğrudan etkileyebilmektedir (FAO, 2017). Özellikle kuraklık, toprak erozyonu ve gıda arzındaki istikrarsızlık gibi çevresel faktörler, tarımsal üretimi olumsuz etkileyerek göçü hızlandırmaktadır (Foresight, 2011). Öte yandan, göç hareketleri yerel gıda sistemleri üzerinde baskı oluşturabilmekte ve mevcut kaynakların dağılımında dengesizliklere yol açarak gıda güvensizliğinin artmasına sebep olabilmektedir (FAO ve IFAD, 2018). Göç alan bölgelerde artan nüfus, tarımsal üretim kapasitesini aşan talepler yaratmakta, bu da gıda arzının sürdürülebilirliğini tehdit etmektedir (Maxwell ve Smith, 1992). Sonuç olarak, göç ve gıda güvenliği arasındaki etkileşim karmaşık ve çok boyutlu olup, bu ilişkiyi anlamak sürdürülebilir kalkınma ve politika geliştirme süreçlerinde kritik önem taşımaktadır (Black vd., 2011; HLPE, 2017).

İklim krizi, göç ve ekonomi arasındaki ilişkiler, yalnızca çevresel değişimlere değil; aynı zamanda bu değişimlerin bireylerin ekonomik davranışları, geçim stratejileri ve toplumsal yapılar üzerindeki etkilerine de dayanmaktadır. Bu nedenle kuramsal olarak geniş bir çerçeve ile düşünülmeli, çevresel ekonomik ve toplumsal dinamiklerin kesiştiği noktalar dikkate alınmalıdır.

Çevresel Güvenlik ve Ekonomik Kırılganlık Yaklaşımı:

Çevresel bozulmaların devletlerin, toplumların ve bireylerin ekonomik ve fiziki güvenliklerini tehdit ettiği bir çerçeve sunmaktadır (Homer-Dixon, 1999). Bu yaklaşıma göre, iklim değişikliği ile artan kuraklık, sel, toprak erozyonu gibi olaylar özellikle tarım, hayvancılık ve balıkçılık gibi iklime duyarlı sektörlerde geçimini sağlayan toplulukların ekonomik

kırılganlığını artırmakta, bu da kitlesel göçleri tetiklemektedir. Örneğin Sahel bölgesinde tarımsal çöküşün göç dalgalarıyla nasıl ilişkilendiği bu perspektiften açıklanabilir (Brown vd., 2007).

Sürdürülebilir Geçim Kaynakları Yaklaşımı (Sustainable Livelihoods):

Geçim kaynaklarını sadece gelir odaklı değil; doğal (toprak, su), sosyal (ağlar), finansal (tasarruf, kredi), insan (eğitim, sağlık) ve fiziksel (altyapı) sermaye türleri üzerinden bütüncül biçimde ele almaktadır (Scoones, 1998). İklim değişikliğiyle birlikte, sermaye modellerinin çoğu tehdit altına girmektedir. Örneğin sulak alanların kuruması hem doğal sermayeyi hem de balıkçılıkla geçinen toplulukların ekonomik gelirini ortadan kaldırmakta, bu da göçü bir tek çıkar yol haline getirmektedir. Ekonomik güvenlikten yoksun bireylerin büyük çoğunluğu kırdan kente göç etmekte, bu da kentlerdeki gıda potansiyeline ilave yükler getirmektedir (Ellis, 2000).

Neo-Malthusyen Yaklaşım:

Neo-Malthusyen teoriye göre nüfus artışı, sınırlı doğal kaynaklarla birleştiğinde kıtlık, açlık, göç ve çatışmalara yol açabilmektedir. Bu yaklaşımda iklim değişikliği, doğal kaynaklar üzerindeki baskıyı artırarak ekolojik taşıma kapasitesini aşan nüfus hareketlerine neden olmaktadır (Ehrlich, Ehrlich, 1990). Göç burada hem bir sonuç hem de potansiyel bir kriz kaynağı olarak değerlendirilebilir. Bu teorik çerçevenin özellikle su kıtlığı, tarımsal üretimde azalma ve gıda fiyatlarındaki dalgalanmalar gibi ekonomik etkileri açıklamada kullanıldığı görülmektedir.

Ekolojik Ekonomi ve Adil Geçiş Yaklaşımı:

Ekonomiyi ekosistemlerin taşıma kapasitesi çerçevesinde yeniden tanımlayarak ve doğayla uyumlu bir üretim-tüketim modeli önermektedir (Daly, 1996). Bu bağlamda iklim kriziyle baş etmede yalnızca teknolojiye değil, üretim modellerinin dönüşümüne de ihtiyaç vardır. Söz konusu dönüşüm "Adil geçiş" (just transition) ilkesi ile açıklanmakta ve iklim politikalarının sosyal eşitsizlikleri artırmadan uygulanmasını öngörmektedir. Göçmen toplulukların, kırsal yoksulların ve iklimden doğrudan etkilenenlerin gıda güvenliğinin sağlanması, sadece insani değil aynı zamanda ekonomik sürdürülebilirlik açısından da kritiktir (ILO, 2015).

Göç Sistemleri Teorisi:

Göçün yalnızca bireysel değil, aynı zamanda yapısal ve sistemsel nedenlerle ortaya çıktığını savunmaktadır. Göç hareketleri, küresel ekonomik sistemler, işgücü piyasaları, ticaret ilişkileri ve iklimle etkileşimli olarak şekillenmektedir (Mabogunje, 1970). Örneğin iklim krizi nedeniyle tarım sektörünün çökmesi, kırsal işgücü fazlası yaratmakta, bu da kentlere göçü zorunlu kılmaktadır. Ancak kentlerdeki kayıt dışı ekonomi, gıda güvencesi sağlamakta yetersiz kalmakta ve yeni bir ekonomik dışlanmışlık döngüsü yaratmaktadır.

Politik Ekoloji ve İklim Adaleti Teorileri:

Çevresel sorunların doğal yapılarla beraber, politik ve ekonomik yapılarla da doğrudan ilişkili

olduğunu savunmaktadır (Robbins, 2012). Bu teoriye göre iklim krizinin etkileri eşit dağılmamaktadır; kırılgan ve yoksul topluluklar daha fazla etkilenmekte ve göçe zorlanmaktadır. İklim adaleti yaklaşımı da bu eşitsizliği vurgulayarak, özellikle gelişmiş ülkelerin tarihi sorumluluğuna dikkat çekerek ve gelişmekte olan ülkelerdeki gıda güvencesine yönelik destek politikalarının gerekliliğini ortaya koymaktadır (Schlosberg ve Collins, 2014). Bu teorik çerçeveler, iklim değişikliği-göç-gıda-ekonomi ilişkisini hem neden-sonuç ilişkileriyle hem de sistemsel dinamiklerle anlamlandırma açısından güçlü bir temel sunduğu söylenebilir. Analitik yaklaşımların disiplinler arası doğası, politika yapımında da kapsayıcı çözümler üretilmesine olanak tanımaktadır.

İklim Krizin ve Gıda Güvenliği İlişkisi

İklim krizi, insan faaliyetlerinin özellikle Sanayi Devriminden bu yana atmosfere saldığı sera gazları nedeniyle dünyanın iklim sisteminde meydana gelen düzensiz ve çoğu zaman geri döndürülemez değişiklikleri ifade edilen çevresel bir sorunu olarak düşünülebilir. İklim krizi, yalnızca bir çevre sorunu olarak değil; kalkınma, insan hakları, halk sağlığı, gıda güvenliği ve küresel eşitlik gibi çok çeşitli alanları etkileyen yapısal bir kriz olarak ele alınmalıdır. Bu nedenle çözümü de disiplinler arası bir yaklaşım, uluslararası iş birliği ve sürdürülebilir kalkınma ilkeleriyle uyumlu politik müdahaleler gerektirmektedir.

İklim, belirli bir bölgedeki sıcaklık, yağış, rüzgâr gibi meteorolojik değişkenlerin uzun yıllar boyunca gözlemlenen ortalamalarını ifade etmektedir (IPCC, 2021). Son yıllarda insan faaliyetlerinin etkisiyle bu iklimsel dengede gözle görülür sapmalar yaşanmakta ve bu durum literatürde "iklim krizi" olarak tanımlanmaktadır (Steffen vd., 2018).

Bu bağlamda iklim krizi çok boyutlu bir durumu ifade etmesi sebebiyle, yalnızca fiziksel iklim değişiklikleriyle sınırlı kalmamakta; aynı zamanda canlı türlerinin, ekolojik sistemlerin ve insan topluluklarının bu değişim karşısında adaptasyon kapasitelerinin zayıflamasıyla da doğrudan ilişkilendirilmektedir (Adger vd., 2005). İklim değişikliği artık öngörülebilir ve lineer bir süreç olarak değerlendirilmemekte; tersine, belirsizliklerin arttığı, uyum süreçlerinin zorlaştığı ve risklerin toplumsal sistemleri tehdit ettiği bir "kriz durumu" olarak ele alınmaktadır (UNEP, 2022). Bu nedenle "iklim krizi" kavramı, sadece bir çevresel durumu tanımlamakla kalmayıp aynı zamanda küresel düzeyde acil, bütüncül ve kalıcı politika müdahalelerinin gerekliliğine dikkat çeken normatif bir çağrı niteliği de taşımaktadır (Klein, 2014). Küresel ortalama sıcaklıklardaki artış; deniz seviyelerinin yükselmesi, buzulların erimesi, ekstrem hava olaylarının (kuraklık, sel, orman yangınları vb.) artışı ve tarımsal üretkenliğin azalması gibi çeşitli etkileri beraberinde getirmektedir. Bu etkiler yalnızca çevresel olmasının yanı sıra ekonomik eşitsizlikleri derinleştiren, iklim adaleti tartışmalarını gündeme taşıyan ve küresel yönetişim mekanizmalarının yetersizliğini görünür kılan sosyo-politik sonuçlar doğurmaktadır.

Birleşmiş Milletler İklim Değişikliği Çerçeve Sözleşmesi (UNFCCC), iklim değişikliğini şu şekilde tanımlar: "İklim değişikliği, karşılaştırılabilir bir zaman diliminde doğal iklim değişkenliğine ek olarak, doğrudan ya da dolaylı insan faaliyetleri sonucu küresel atmosferin bileşiminde meydana gelen değişiklikleri ifade eder." (BM, 1992). Bu tanımda özellikle dikkat çeken husus, "iklim değişikliği" kavramının sadece doğal süreçlerle sınırlı tutulmaması; aynı zamanda insan kaynaklı etkilerin, özellikle sera gazı emisyonlarının, bu değişimi hızlandıran temel unsurlar olarak vurgulanmasıdır. Bu yaklaşım, insan etkisini merkeze alan bilimsel ve politik bir çerçeve sunar. Bu yönüyle sözleşme, "doğal iklim değişkenliği" ile "insan faaliyetlerinden kaynaklanan iklim değişikliği" arasında açık bir ayrım yapmaktadır. Dolayısıyla iklim değişikliği, insanlığın küresel atmosfer üzerindeki etkisini göz önünde

bulunduran ve bu etkiyi doğrudan politika üretiminin merkezine yerleştiren bir kavram olarak ele alınmaktadır. Bu tanım, sözleşmenin temelini oluşturarak iklim değişikliğiyle mücadelede yükümlülüklerin belirlenmesine zemin hazırlar. İklim değişikliği yaşandığı süreç itibari ile birçok değişikliğe sebep olmaktadır bunların içinde insanların ve canlıların topluluk halinde göç etmesidir. Göçlere sebep olan faktörler sadece savaş veya istihdam değildir. Güvenli gıdaya erişime sahip olmak içinde göç edilebilmektedir.

İklim temelli göç, çoğu zaman yavaş gelişen çevresel değişimlerin tarımsal üretimi ve geçim kaynaklarını olumsuz etkilemesi sonucunda ortaya çıkmakta; bu da özellikle kırsal kesimlerde yaşayan toplulukların yer değiştirme kararlarını tetiklemektedir (Black et al., 2011). Uluslararası literatürde bu tür hareketlilikler "çevresel göç" ya da "iklim mülteciliği" kavramlarıyla tanımlansa da, bu olgunun hukuki statüsü halen belirsizdir (McAdam, 2012). Birleşmiş Milletler Mülteciler Yüksek Komiserliği (UNHCR), iklim değişikliğine bağlı olarak yerinden edilen bireylerin, geleneksel mülteci tanımı kapsamına girmediğini ancak korunma ihtiyacının giderek arttığını vurgulamaktadır (UNHCR, 2021). İklim krizinin göç üzerindeki etkileri, yalnızca göç veren bölgelerde değil; göç alan bölgelerde de gıda güvenliği, işgücü dengesi ve altyapı kapasiteleri açısından ciddi baskılar yaratmaktadır. Dolayısıyla, iklim temelli göç hareketleri hem çevresel hem de sosyal politika alanlarında çok disiplinli bir yaklaşımla ele alınması gereken küresel bir çözüm arayışı olarak nitelendirilebilir.

İklim krizi, tarımsal üretim sistemleri üzerinde doğrudan ve dolaylı etkiler yaratarak gıda güvenliğini çok yönlü bir biçimde tehdit etmektedir. Artan sıcaklıklar, değişen yağış rejimleri, kuraklık, sel ve diğer aşırı hava olayları, özellikle kırılgan ekosistemlerde tarımsal verimliliği düşürmekte ve üretim sürekliliğini sekteye uğratmaktadır (FAO, 2017). Bu durum, yalnızca üretim düzeyinde değil; aynı zamanda gıdaya erişim, kullanım ve istikrar boyutlarında da ciddi sorunlar doğurmaktadır. Özellikle düşük ve orta gelirli ülkelerde iklim değişikliği, kırsal yoksulluğu derinleştirerek hem üretici hem de tüketici açısından gıda güvencesini zayıflatmaktadır (IPCC, 2022). Dolayısıyla iklim krizine karşı geliştirilecek politika ve stratejiler, çevre, sosyal adalet ve sürdürülebilir kalkınma ilkeleriyle de uyumlu olması gerekmektedir.

Gıda güvenliği, bireylerin sağlıklı ve aktif bir yaşam sürdürebilmesi için fiziksel, sosyal ve ekonomik olarak yeterli, güvenli ve besleyici gıdaya her zaman erişebilmesi durumu olarak tanımlanmaktadır. Bu kavram, gıdanın mevcut olup olmamasını, bu gıdanın erişilebilirliğini, kullanılabilirliğini ve sürdürülebilirliğini de kapsamaktadır (FAO, 2017). Birleşmiş Milletler Gıda ve Tarım Örgütü'ne (FAO) göre gıda güvenliği dört temel boyut üzerinden değerlendirilmektedir; Gıda arzının yeterliliği (mevcudiyet): Yeterli miktarda gıdanın üretilmesi ve tedarik edilmesi. Erişim: Bireylerin bu gıdaya ekonomik ve fiziksel olarak ulaşabilmesi. Kullanım: Gıdanın besin değeri, hijyenik koşullarda hazırlanması ve sağlıklı tüketimi. İstikrar: Bu üç unsurun sürekliliğinin sağlanması, ani şoklardan (iklim, ekonomik kriz, savaş vb.) etkilenmemesi.

Gıda güvenliği, yoksulluk, eşitsizlik, çevresel sürdürülebilirlik, iklim değişikliği ve gıda sistemlerinin yönetimiyle bağlantılı olduğu için, gıda güvenliği konusu disiplinlerarası bir yaklaşımla ele alınmakta ve hem ulusal hem de küresel düzeyde politika geliştirme süreçlerinin merkezinde yer almaktadır. İklim değişikliğinin göçlere sebep olma niteliği ve gıda üretimi ve erişilebilirliğine verdiği tahribat kaçınılmaz bir gerçekliktir. Güvenli gıda kavramını kullanırken burada bahsettiğimiz gıda kavramının içine su tüketimindeki güvensiz kullanımı eklediğini de belirtmek gerekmektedir.

Gıda güvencesi ve gıda güvenliği kavramları, zaman içerisinde hem içerik hem de kapsam açısından gelişmiş ve giderek birbiriyle daha bütüncül şekilde ele alınmaya başlanmıştır. Bu

çerçevede, Birleşmiş Milletler İnsan Hakları Evrensel Beyannamesi'nde (1948) gıdaya erişim, insanın en temel haklarından biri olarak tanımlanmış; böylece gıda hakkı, uluslararası insan hakları hukukunun temel ilkelerinden biri haline gelmiştir. 1970'li yıllara gelindiğinde ise küresel ölçekte artan gıda ve beslenme sorunları, bu alandaki politika tartışmalarını hızlandırmış ve 1974 yılında gerçekleştirilen Dünya Gıda Konferansı, bu tartışmaların dönüm noktası olmuştur. Konferansta yapılan tanımlamada, gıda güvencesi (food security) kavramı büyük ölçüde arz merkezli bir yaklaşımla ele alınmış; temel gıda maddelerinin dünya genelinde, gıda tüketimindeki sürekli artışı karşılayabilecek düzeyde ve fiyat dalgalanmalarına karşı istikrarlı bir şekilde erişilebilir olmasına vurgu yapılmıştır (United Nations [UN], 1975; Food and Agriculture Organization of the United Nations [FAO], 2003). Bu tanım, dönemin ekonomik ve politik öncelikleri doğrultusunda, gıda üretimi ve küresel tedarik zincirinin sürdürülebilirliğine odaklanan bir yaklaşımı yansıtmaktadır.

Birleşmiş Milletler Gıda ve Tarım Örgütü'nün (FAO) 2001 tarihli Dünyadaki Gıda Güvensizliğinin Durumu başlıklı yıllık raporunda, gıda güvenliği kavramı; "tüm bireylerin, her zaman aktif ve sağlıklı bir yaşam sürdürebilmek için gerekli olan beslenme gereksinimlerini ve gıda tercihlerini karşılayacak yeterli, güvenli ve besleyici gıdaya fiziksel, sosyal ve ekonomik açıdan erişebildiği durum" olarak tanımlanmıştır (FAO, 2002:5). Bu doğrultuda, gıda güvenliği kavramı zamanla "gıda güvenliği ve beslenme" başlığı altında daha geniş kapsamlı bir çerçevenin alt bileşeni olarak değerlendirilmeye başlanmıştır. 2000'li yıllara gelindiğinde ise, gıda güvenliği tartışmalarına yoksulluk unsurunun da dâhil edilmesi gerektiği vurgulanmış; ancak yalnızca yoksulluğun ortadan kaldırılmasının, gıda güvenliğinin tam anlamıyla sağlanması için yeterli bir koşul olmadığı genel kabul görmüştür.

İklim değişikliği, tarımsal üretimi ve su kaynaklarını doğrudan etkileyerek hem gıda güvencesini hem de zorunlu göç hareketlerini tetikleyen çok yönlü bir kriz dinamiği haline gelmiştir. Artan sıcaklıklar, azalan yağış rejimleri ve su kıtlığı, özellikle yağışa bağımlı tarım yapılan bölgelerde ürün verimliliğini ciddi biçimde düşürmektedir (FAO, 2021). Buna bağlı olarak yaşanan tarımsal üretim kayıpları, kırsal nüfusun geçim kaynaklarını tehdit etmekte; ekonomik yoksunluk ve gıdaya erişimdeki kısıtlılıklar, toplulukları göçe zorlayan temel faktörler arasında yer almaktadır (IOM, 2022).

Özellikle kuraklık, sel ve fırtına gibi iklim kaynaklı afetlerin sıklığı ve şiddetindeki artış, yerleşim alanlarının fiziksel olarak tahrip olmasına neden olmakta ve gıda üretimini aksatmaktadır (IPCC, 2022). Bu koşullar altında gıdanın hem fiziksel hem de ekonomik erişilebilirliği azalmış; düşük gelirli ve kırılgan gruplar, bu süreçten orantısız biçimde etkilenmiştir. Dolayısıyla, iklim değişikliği sadece çevresel değil; aynı zamanda sosyal adalet, kalkınma ve insan hakları alanlarında da çok boyutlu sonuçlar doğurmaktadır (Cissé vd., 2022). Gıda güvenliği, bireylerin yeterli, dengeli ve sağlıklı beslenme olanaklarına sürekli erişimini sağlamada temel bir unsur olarak öne çıkmaktadır. Gıda güvencesinin sağlanamaması durumunda, özellikle düşük gelirli gruplarda yetersiz beslenme, mikrobesin eksiklikleri ve beslenmeye bağlı hastalıklar yaygınlaşmaktadır (FAO, IFAD, UNICEF, WFP ve WHO, 2023). Gıda güvenliği yalnızca kalori alımını değil, aynı zamanda besin değeri yüksek, çeşitli ve güvenilir gıdalara ulaşımı da içermektedir. Bu nedenle, gıda güvenliği ile yeterli ve dengeli beslenme arasında doğrudan ve karşılıklı bir ilişki söz konusudur (WHO, 2020).

Göç Hareketliliği ve İklim Krizi: Çift Taraflı Etkileşim

Toplumların kuruluşundan bu zamana kadar göç, insanın hayatta kalabilme mücadelesi sürecinde devam etmektedir. Dolayısıyla göç hareketleri insanlık tarihinde sürekli var olan bir

eylemdir. Göç bireysel veya toplu olarak gerçekleşebileceği gibi, nedenleri arasında güvenli alana geçme ve ekonomik olarak varlığını devam ettirebilme veya gıda ve suya ulaşabilme yatabilmektedir.

Bu açıdan göç, bireylerin ya da toplulukların farklı nedenlerle yer değiştirmesini ifade ederken, bu hareketler çeşitli ölçütlere göre sınıflandırılabilmektedir. En yaygın ayrım iç göç ve dış göç (uluslararası göç) şeklindedir. İç göç, bireylerin aynı ülke sınırları içerisinde, genellikle kırsaldan kente doğru yaptığı yer değişimini ifade ederken; dış göç, bir ülkeden başka bir ülkeye gerçekleşen sınır aşan hareketleri kapsar (İçduygu, 2015). Bunun yanında, gönüllü göç (ekonomik nedenlerle yapılan) ve zorunlu göç (savaş, doğal afet, siyasi baskı gibi nedenlerle yapılan) ayrımı da yapılmaktadır (Kaya, 2018). Ayrıca göç, süresine göre de geçici veya kalıcı olarak sınıflandırılabilmektedir. Günümüzde özellikle iklim değişikliği, çatışmalar ve ekonomik eşitsizlikler gibi etkenler, farklı göç türlerinin iç içe geçmesine neden olmakta ve bu olguyu çok boyutlu bir hale getirmektedir.

Son yıllarda göçün boyutlarından birini oluşturan iklim değişikliği, göç hareketliliğini tetikleyen çevresel faktörler arasında giderek daha belirgin bir yer edinmektedir. Artan sıcaklıklar, kuraklık, çölleşme, sel ve fırtına gibi aşırı hava olayları, özellikle tarım ve su kaynaklarına bağımlı toplulukların yaşam koşullarını doğrudan tehdit etmekte; bu durum bireylerin yaşadıkları yerleri terk etmelerine neden olmaktadır (Türkeş, 2020). Nitekim Birleşmiş Milletlere göre iklim değişikliği, 21. yüzyılda zorunlu göçün başlıca sebeplerinden biri haline gelmiştir (Keleş, 2021). Bu çerçevede, iklim değişikliğinin yalnızca çevresel değil; aynı zamanda sosyoekonomik ve demografik etkiler doğurarak göç olgusunu çok yönlü hale getirdiği görülmektedir.

İklim krizi ile göç hareketliliği arasındaki ilişki, tek yönlü bir nedensellikten ziyade karşılıklı ve dinamik bir etkileşim biçiminde ortaya çıkmaktadır. Bir yandan, iklim değişikliğinin neden olduğu çevresel bozulmalar—kuraklık, sel, çölleşme ve deniz seviyesi yükselmesi gibi faktörler—tarımsal üretimi, geçim kaynaklarını ve yaşam koşullarını tehdit ederek bireyleri yer değiştirmeye zorlamakta; böylece göç hareketliliği üzerinde doğrudan bir baskı oluşturmaktadır (IOM, 2022; IPCC, 2022). Bu çift yönlü ilişki, iklim değişikliği ve göç arasında hem nedensel hem de sonuçsal bir bağlantı bulunduğunu göstermekte; dolayısıyla bu iki olgunun ayrı ayrı değil, bütüncül politikalarla birlikte ele alınması gerekliliğini ortaya koymaktadır.

Göç hareketliliği, yalnızca iklim krizinin bir sonucu olarak ortaya çıkmaz; aynı zamanda bu krizi derinleştiren dolaylı bir etki alanına da sahiptir. Özellikle iklimsel nedenlerle yerinden olan bireylerin yoğun olarak kentlere göç etmesi, altyapı sistemleri üzerinde baskı oluşturmakta ve plansız kentleşme, artan enerji tüketimi, atık üretimi ve doğal kaynakların aşırı kullanımı gibi çevresel sorunlara yol açmaktadır (Keleş, 2021). Bu durum, karbon salımını artırarak ve ekosistemleri baskı altına alarak iklim krizini daha karmaşık ve çok boyutlu hale getirmektedir. Ayrıca göçmen toplulukların yaşadığı alanlarda orman tahribatı, arazi kullanımında değişim ve su kaynaklarının tükenmesi gibi süreçler de, göçün çevresel etkilerini büyütmektedir (IOM, 2022). Dolayısıyla göç, yalnızca iklim değişikliğinden etkilenen bir süreç değil, aynı zamanda kriz döngüsünü tetikleyen bir unsur olarak da değerlendirilmelidir. Dolayısıyla göç ve iklim krizi arasında kümülatif bir etki olduğu söylenilebilmektedir.

Küresel iklim krizi, sıcaklık artışları, düzensiz yağış rejimleri ve ekstrem hava olaylarının sıklığı nedeniyle tarımsal üretimi olumsuz etkileyerek gıda arzında dengesizliğe sebep olduğu artık bilinen bir gerçektir (IPCC, 2022). Kuraklık, sel ve don olayları, başta temel gıda ürünleri olmak üzere üretim kayıplarına neden olmakta, bu da gıda fiyatlarının volatilitesini artırarak düşük gelirli kesimlerin beslenme güvenliğini tehdit etmektedir (FAO, 2017). Gıda fiyatlarındaki dalgalanmalar yoksul ve kırılgan grupların beslenme güvenliğini tehdit etmekte,

yoksulluğun artmasına neden olmaktadır (UNDP, 2020; Wheeler ve von Braun, 2013). Özellikle Afrika, Güney Asya ve Orta Doğu gibi kırılgan bölgelerde açlık ve yetersiz beslenme riski ciddi boyutlara ulaşmıştır (Wheeler ve von Braun, 2013).

İklim değişikliğinin bir diğer kritik etkisi su döngüsünde yaratılan bozulmadır. Azalan yağışlar, hızlanan buharlaşma ve su kaynaklarının kirlenmesi, dünya genelinde su kıtlığı riskini büyütmektedir (IPCC, 2022). Su, tarımsal üretim için vazgeçilmez bir kaynak olduğundan, su kıtlığı tarımsal üretim ve dolayısıyla gıda güvenliği üzerinde doğrudan olumsuz etkiler yaratmaktadır (FAO, 2017).

Türkiye'de ise özellikle İç Anadolu ve Güneydoğu Anadolu bölgelerinde artan sıcaklıklar ve azalan yağışlar tarımsal verimliliği düşürmekte, kuraklık riski gıda üretiminde doğrudan kayıplara yol açmaktadır (TÜBİTAK, 2021). Sulama altyapısının yetersizliği ve suyun verimsiz kullanımı bu riski daha da artırmaktadır (DİE, 2020). Türkiye'de tarım sektörü, ülke ekonomisinin önemli bir parçası olmasına rağmen, iklim değişikliğinin getirdiği risklerle birlikte kırılgan hale gelmiştir. Bölgesel ekonomik dengesizlikler, özellikle göç veren bölgelerde yoksulluğun artmasına ve sosyal sorunların büyümesine zemin hazırlamaktadır (Ulucak, 2023). Türkiye'de su kaynaklarının bölgesel dağılımında dengesizlikler ve nüfus artışı, suyun tarım dışı sektörlerde de yoğun kullanımına yol açarak, tarımsal su güvenliğini tehdit etmektedir (TÜBİTAK, 2021). Özellikle kuraklık dönemlerinde suyun yetersizliği tarımda verim kaybına sebep olmakta ve gıda fiyatlarında dalgalanmalara neden olmaktadır (Paçacı, 2019). Bu durum, gıda güvenliği açısından da risk teşkil etmektedir; göç eden ve göç alan topluluklar arasında beslenme kalitesinde düşüşler yaşanabilir, yerel gıda talebi ve arzı arasındaki dengesizlikler beslenme güvensizliğine yol açabilir (McMichael, 2017).

İklim kaynaklı çevresel değişiklikler, insanların yaşadıkları yerlerden zorunlu göç etmelerine neden olmaktadır (Black ve ark., 2011). Bu göç hareketleri hem kaynak bölgelerde ekonomik ve sosyal yapının bozulmasına, hem de göç alan bölgelerde altyapı, barınma ve hizmetlerin yetersiz kalmasına yol açmaktadır (Rigaud ve ark., 2018). Türkiye gibi transit ve hedef ülke konumundaki ülkelerde, iklim göçü ile beraber gelen mülteci akınları sosyal uyum, iş gücü piyasası ve kamu hizmetleri üzerinde baskı oluşturmakta ve toplumsal gerilimleri artırmaktadır (Çalışkan, 2021). İklim krizi ve göç, gıda güvenliği üzerinde çok boyutlu ve karmaşık riskler yaratmaktadır. Bu riskler, yalnızca üretim ve arzı değil; aynı zamanda sosyal yapıyı, ekonomik istikrarı ve çevresel sürdürülebilirliği de tehdit etmektedir. Bu bağlamda iklim değişikliğine uyum stratejilerinin güçlendirilmesi, göç yönetiminde kapsamlı politikalar geliştirilmesi ve su-gıda güvenliği alanında önleyici tedbirler alması kritik önem taşımaktadır.

İklim değişikliği, gıda güvenliği ve göçle ilişkili sağlık risklerini de beraberinde getirmektedir. Beslenme yetersizliği, özellikle çocuklar ve yaşlılar arasında sağlık sorunlarını artırmakta, iklim değişikliğinin tetiklediği bulaşıcı hastalıklar ve su kaynaklı hastalıklar sağlık sistemleri üzerinde ek yük oluşturmaktadır (Watts vd., 2018). Göç nedeniyle yer değiştiren topluluklarda sağlık hizmetlerine erişim sorunları artmakta, bu da sağlık risklerini büyütmektedir.

İklim krizi ile birlikte yaşanan ormansızlaşma, toprak erozyonu, biyoçeşitlilik kaybı ve ekosistemlerin bozulması, tarımsal üretim alanlarını azaltmakta, doğal kaynakların sürdürülebilir kullanımını zorlaştırmaktadır (IPBES, 2019). Türkiye'de özellikle Doğu Anadolu ve Akdeniz bölgelerinde bu riskler yoğunlaşmaktadır (TÜBİTAK, 2021).

İklim değişikliği ve buna bağlı kaynak kıtlıkları, göç hareketleri ve ekonomik bozulmalar, siyasi istikrarı tehdit eden unsurlar olarak ortaya çıkmaktadır (UNDP, 2020). Bölgesel çatışmalar, özellikle sınır bölgelerinde göçmen ve mülteci krizleriyle birleşince, ulusal güvenlik risklerini artırmaktadır (Çalışkan, 2021). Bu durum, sürdürülebilir gıda güvenliği için gerekli

olan uzun vadeli politikaların oluşturulmasını zorlaştırmaktadır.

Politika ve Stratejik Yaklaşımlar, Riskler

İklim değişikliği, göç ve gıda güvenliği alanları birbirinden ayrı düşünülemez. Bu nedenle, politika yapıcıların ilgili tüm sektörleri (tarım, çevre, göç, kalkınma, sağlık vb.) kapsayan, entegre ve çok disiplinli politika çerçeveleri geliştirmeleri gerekmektedir (FAO, 2021). Sadece çevresel önlemler değil, aynı zamanda sosyal ve ekonomik boyutları da dikkate alan bütüncül yaklaşımlar, krizin etkilerini azaltmada etkin olacaktır. Bu kapsamda ulusal stratejilerle uyumlu yerel uygulamalar teşvik edilmesi gerekmektedir.

İklim değişikliğine bağlı olumsuz etkileri azaltmak için, göç veren bölgelerde iklim adaptasyon kapasitesinin güçlendirilmesi üzerinde durulması gereken bir uygulama olarak karşımıza çıkmaktadır. Bu açıdan su kaynaklarının sürdürülebilir yönetimi, erozyon kontrolü, kuraklığa dayanıklı bitki türleri, modern tarım teknikleri ve agroekolojik uygulamalar desteklenmelidir (IPCC, 2022). Bu tür uygulamalarla iklime adaptasyonun sağlanması ve değişen şartlara karşı yerinde kalma amacını sağlayabilmek için ekonomik ve sosyal dayanıklılığın artırılması gerekli olan yaklaşımlardan birisi olarak kabul edilmektedir. Ayrıca, tarımsal altyapının güçlendirilmesi ve teknolojik yeniliklerin yaygınlaştırılması, üretkenliği artırarak göç baskısını azaltıcı etki yaratabilir.

Göç, uyum ve entegrasyon süreçleriyle birlikte yönetilmelidir. Göç alan bölgelerde konut, eğitim, sağlık ve istihdam politikalarının geliştirilmesi, göçmenlerin sosyal uyumunu kolaylaştıracaktır (McMichael, 2017). Sosyal dışlanma ve işsizlik riskleri azaltılmalı, göçmenlerin yerel ekonomiye entegrasyonunu destekleyecek mesleki eğitim ve kapasite geliştirme programları uygulanmalıdır. Bu, gıda üretimi ve dağıtımı zincirlerinin sürdürülebilirliğine olumlu katkılar sağlayacaktır. Bu bağlamda göçün yönetimi ve entegrasyon politikaları önem arz etmektedir.

İklim değişikliği kaynaklı göç hareketlerini ve gıda güvenliği risklerini önceden tahmin etmek için erken uyarı sistemleri kurularak uygulanması oldukça önemlidir (Rigaud ve vd., 2018). Meteorolojik, tarımsal ve sosyal göstergelerin entegre edildiği dinamik veri tabanları ve analitik modeller, krizlerin önceden tespiti ve müdahalesini mümkün kılarak zararların azaltılmasına yardımcı olabilecektir. Bu sistemler politika yapıcıların hızlı ve etkili kararlar almasını sağlaması kuvvetle muhtemeldir.

İklim değişikliği ve göçün etkileri ulusal sınırları aşan nitelikte olduğundan, uluslararası iş birliği zorunlu hale gelmiştir. Gelişmekte olan ülkelerde, iklim değişikliğine bağlı göç ve gıda güvenliği sorunlarını azaltmak amacıyla finansal destek mekanizmaları (Yeşil İklim Fonu, Adaptasyon Fonu vb.) güçlendirilmelidir (UNFCCC, 2023). Teknik bilgi paylaşımı ve kapasite geliştirme projeleri teşvik edilerek, bölgesel ve uluslararası hatta küresel iş birlikleri, ortak risk yönetimi stratejileri geliştirilerek dayanıklılığın artırılması sağlanabilecektir.

Göçlerin azaltılması veya göç sebebiyle oluşan sorunların çözülebilmesi için politika süreçlerine, göçmenler, yerel halk, sivil toplum ve akademi gibi tüm paydaşların katılımı sağlanmalıdır (FAO, 2021). Kapsayıcı ve katılımcı bir yönetim modeli temelli uygulanan stratejilerin yerel ihtiyaçlara uygunluğunu ve sürdürülebilirliğini katkı sağlayacaktır. Toplumsal farkındalık kampanyaları ile iklim değişikliği ve göçün etkileri hakkında ortak bir bilincin oluşturulması ve bu konuda uygulanacak yapıcı tüm politikaların uyumunun sağlanması olası olumsuz sonuçları bertaraf edebilecektir.

Gıda güvenliğini sağlamak için, sadece üretim artırımı değil, aynı zamanda gıda sistemlerinin

dayanıklılığı ve çeşitliliği önceliklendirilmelidir (FAO, 2017). Yerel gıda üretiminin desteklenmesi, gıda israfının azaltılması ve sürdürülebilir tüketim alışkanlıklarının teşviki önem arz etmektedir. Tarımsal üretimde iklim dostu tekniklerin yaygınlaştırılması, gıda arz zincirinin iklim şoklarına karşı dirençli hale getirilmesi ile sürdürülebilir bir gıda sistemi ve gıda ürünü çeşitliliğinin artırılması sağlanabilir. Diğer taraftan göçü azaltmak ve kırsal kalkınmayı desteklemek için, tarım dışı alternatif gelir kaynakları geliştirilmelidir. Kırsal turizm, küçük ölçekli işletmeler, yenilenebilir enerji projeleri gibi alanlar hem ekonomik çeşitliliği artıracak hem de göç baskısını hafifletecektir (McLeman, 2018).

Sonuç

Günümüzde iklim değişikliği, toplumlar üzerinde giderek çok boyutlu etkiler oluşturmaktadır. Bu durum, canlıların geçici ya da kalıcı biçimlerde yaşadıkları yerleri terk etmelerine neden olmaktadır. Ancak uluslararası hukukta iklim nedeniyle yaşanan yer değiştirmeler hala hukuksal zemine oturmamaktadır. Literatürde bu bireyler sıklıkla "iklim mültecisi" olarak tanımlansa da 1951 Cenevre Sözleşmesi'nin dar yorumlanan mültecilik tanımı, çevresel nedenlerle göç edenleri bu kapsama dahil etmemektedir (Biermann ve Boas, 2010: 67). Bu dahil edilmeyiş birçok hukuksal boşluğu doğurmaktadır. Bu durumun başlıca nedenlerinden biri, çevresel göçün ekonomik, sosyal ve siyasal unsurlarla iç içe geçmiş çok boyutlu yapısıdır (Black et al., 2011). Ayrıca, iklim değişikliği nedeniyle yerinden edilen kişi sayısındaki artışa rağmen, özellikle gelişmiş ülkelerdeki politika yapıcıların bu soruna yönelik ilgisizliği dikkat çekmektedir (Bilici, 2021: 87). Öte yandan, mevcut uluslararası hukukta mülteci statüsünün yalnızca ülke sınırlarını aşan göçleri kapsaması, bununla birlikte iklime bağlı yer değiştirmelerin büyük kısmının ülke içi hareketler şeklinde gerçekleşmesi, bu bireylerin hukuki tanımlanmasını daha da karmaşık hale getirmektedir (McAdam, 2012). Dolayısıyla, iklim mülteciliği kavramının hukuki bir zemine oturtulamaması hem kavramsal belirsizliklere hem de veri toplama, izleme ve koruma mekanizmalarının eksikliğine yol açmaktadır.

Göç olgusu, küreselleşmenin de etkisiyle yalnızca göç alan ülkeleri değil, dünya genelindeki birçok devleti ilgilendiren çok boyutlu bir mesele haline gelmiştir. Bu durum, özellikle göçmenlere yönelik toplumsal algının olumsuzlaştığı bazı ülkelerde ciddi bir göç krizine dönüşmekte ve göçmenlerin topluma entegrasyonunu zorlaştırmaktadır (Castles, de Haas & Miller, 2014). Birçok ülke göçmenlere yönelik güvenlik temelli politikaları önceliklendirirken, bunun yerine sosyal ve ekonomik entegrasyonu önceleyen daha kapsayıcı politikalara ihtiyaç duyulmaktadır. Bu bağlamda, uluslararası düzeyde farkındalığın artırılması, finansal destek mekanizmalarının güçlendirilmesi ve sürdürülebilir entegrasyon programlarının geliştirilmesi elzemdir (Betts & Collier, 2017).

Özellikle iklim değişikliğinin etkileriyle karşı karşıya kalan kırılgan ülkelerin uyum kapasitelerini desteklemek amacıyla "İklim Mültecilerinin Korunması ve Yeniden Yerleştirme Fonu" gibi çok taraflı finansal yapıların kurulması gerekmektedir (Biermann & Boas, 2010). Sanayileşmiş ülkeler, tarihsel sorumlulukları ve ahlaki yükümlülükleri doğrultusunda bu maliyetleri paylaşmalı ve savunmasız ülkelere yapısal destek sağlamalıdır (Roberts & Park, 2007). İklim mültecileri bağlamındaki söylemler, sadece siyasal ve ekonomik tartışmalarla sınırlı kalmamalı; bu kişiler küresel iklim adaletinin bir parçası olarak görülmelidir. Ayrıca, iklim değişikliğine bağlı olarak yerinden edilme riski taşıyan bölgeler için uzun vadeli göç stratejilerinin geliştirilmesi ve 1951 Cenevre Sözleşmesi'nin iklim göçmenlerini de kapsayacak şekilde revize edilmesi, bu alandaki temel hukuki boşlukların giderilmesi açısından büyük önem taşımaktadır (McAdam, 2012; Zickgraf, 2021).

İklim krizi, günümüzde sadece çevresel bir tehdit olmanın ötesinde, sosyoekonomik kırılganlıkları derinleştiren, kitlesel göçleri tetikleyen ve özellikle gıda güvenliği üzerinde ciddi etkiler yaratan küresel bir mesele haline gelmiştir. Bu çalışmada, iklim değişikliği ile göç arasındaki karşılıklı etkileşimler ve bu sürecin gıda üretimi, dağıtımı ve erişimi üzerindeki yansımaları analiz edilmiştir. Özellikle kırılgan ekosistemlerde yaşanan çevresel bozulmaların, tarım arazilerinin verimsizleşmesine, su kaynaklarının tükenmesine ve geçim kaynaklarının kaybına yol açtığı; bu durumun ise toplulukları yer değiştirmeye zorladığı vurgulanmıştır. Göçün arttığı bölgelerde altyapı baskısı, gıda arzında yetersizlik ve sosyal hizmetlerde tıkanmalar gibi sorunlar, gıda güvenliğini daha da kırılgan hale getirmektedir.

Çok katmanlı krize karşı etkili ve bütüncül çözümler geliştirilmesi, yalnızca iklim politikalarıyla değil, aynı zamanda göç ve tarım politikalarıyla da entegre edilmelidir. Gıda sistemlerinin dayanıklılığını artıracak, iklime uyumlu tarım tekniklerini destekleyecek ve göçmen toplulukların sosyal ve ekonomik entegrasyonunu kolaylaştıracak stratejiler öncelik kazanmalıdır. Bu bağlamda, uluslararası iş birliği mekanizmalarının güçlendirilmesi, savunmasız ülkeler için finansal ve teknik destek sağlanması ve iklim mültecilerine dair hukuki tanımın yeniden ele alınması gerekmektedir. Aynı zamanda yerel yönetimlerin, iklim kaynaklı göç hareketlerine hazırlıklı olabilmesi için erken uyarı sistemleri, afet risk azaltım stratejileri ve gıda güvenliği politikaları bütünleşik şekilde kurgulanmalıdır.

Sonuç olarak, iklim kriziyle birlikte derinleşen göç dinamikleri ve bunun gıda güvenliği üzerindeki yansımaları, sürdürülebilir kalkınma hedeflerini doğrudan tehdit etmektedir. Bu nedenle, çevresel adalet, sosyal dayanışma ve uluslararası sorumluluk ilkeleri doğrultusunda geliştirilecek politika ve stratejik yaklaşımlar, yalnızca bugünün krizlerine değil, geleceğin gıda ve yaşam güvencelerine de katkı sağlayacaktır. Bu şekilde hayata geçirilecek uygulamalar, uzun vadede hem sürdürülebilirliğe hem de güvenli gıda üretimine eş zamanlı olarak katkı sağlayacak; aynı zamanda gıda sistemlerinin üzerindeki baskının azalmasına yardımcı olacaktır.

HYBRID MANAGEMENT IN HEALTHCARE

Kübra ASLAN
PhD Student, Sivas Cumhuriyet University, Institute of Social Sciences, Department of Healthcare Organization Management, Sivas-Türkiye, aslankubra6058@gmail.com
(Responsible Author) ORCID: 0000-0002-3866-617X

ABSTRACT

This study aims to emphasize hybrid management in the health sector. In hybrid management, the professionalism that the manager has gained from the job he/she has been trained for and the corporate business identity that he/she has gained from the institution he/she works for are together. In the background, there are factors such as informal relations, mandatory situations, acquaintances and being deemed appropriate. However, assignments should be made by taking into consideration merit, work experience, expertise and fairness so that competent people can contribute to the institution.

Hybrid managers are frequently encountered in health institutions. Because medical education is popular, doctors are always in the foreground. Therefore, the management of health institutions is generally carried out by physicians. As a result, physicians try to cope with management problems outside their branches. There is a lack of knowledge, especially in financial matters and mastery of legislation. However, health management is a specific discipline that includes a different knowledge accumulation than the skills of a physician. In order to ensure the desired level of efficiency and quality in health service delivery, health institutions should be managed by professionals who have received training in this field. Because health service providers are specialized and complex structures that include many departments, have an uninterrupted process and where human relations and communication are very important. On the other hand, it is obvious that medical education is difficult and valuable. For this reason, it is a gain for patients that doctors practice their professions that they work hard for. Assigning doctors to management positions can turn this gain into a loss and stress doctors.

Keywords: Hybrid Management, Hybrid Business Identity, Healthcare Management, Health.

Introduction

Since both people and bureaucracy are present together in obtaining our most precious treasure, health, the structure is quite chaotic. It does not seem easy to manage a chaotic structure. As a result, many branches of business in health institutions function inseparably. There is no other service sector that can replace health institutions. Therefore, health services are unique with their unique structure.

Below; management, health management, manager physician-nurse and hybrid management concepts will be included.

Management

It is the joint effort of more than one person organized around the same goal to plan, direct, organize and control the existing resources in a harmonious manner in order to use them efficiently and functionally (Arslan, 2020). Thus, in management activities where an organized effort is essential, effective allocation of resources is crucial to ensure service flow.

Health Management

Health management is the process of planning, organizing and then controlling the human and other medical resources in a coordinated manner in order to provide patients with all health activities, from the smallest health service imaginable to the most complex and technical health service (Hayran, 2018). The first health management education in Turkey was established with the opening of the School of Health Administration in 1963 (Çınaroğlu, 2012).

Physician and Nurse in Healthcare Management Position

The management of health institutions is mainly carried out by physicians. On the other hand, head nurses are assigned as Health Care Services Managers in hospitals. With the Decree Law No. 663 published in 2011, the Public Hospitals Association was established and the structure of hospital administration was changed. It was aimed to increase the employment of health management graduates in managerial positions (Bostan & Ağaç, 2019). However, this structure was short-lived. The dominance of managerial physicians continued. Although their positions progressed in this way, physicians frequently encountered lack of knowledge in the field of management, regarding the operation, legislation and official correspondence (Baynal Doğan, Demirtaş & Doğan, 2020).

When we look at Turkey's health management policies, we see that managers who are medical school graduates and have the title of *"physician"* are appointed to the management of institutions and organizations in the sectoral structure of health. In addition, it has been read that the mentioned managerial physicians are working as managers without receiving education in sciences such as accounting and finance, labor law, business management and economics (Demir, Okan & Bostan, 2015). Nowadays, the concept of health management rather than the concept of business management is established in the management of hospitals, albeit late, because the health sector is private and too important to be replaced by the services of another sector. Therefore, the accounting and financing of health services are also complex (Altıntop vd, 2022). Bu bağlamda hastane yöneticilerinin stratejik maliyet, muhasebe ve finansman, etkin kaynak tahsisi ve verimli planlama gibi alanlara dair bilgi ve tecrübeli olmaları önerilmektedir (Elden Ürgüp, 2022).

In the readings, it is seen that some doctors look favorably on management, while others accept it as forced. This situation strengthens the possibility of doctors who continue to be involuntary managers experiencing administrative pressure. On the other hand, the success of doctors who

cannot practice their profession involuntarily may decrease and this situation may have negative effects on patients (Kaya & Kaya, 2019).

Hybrid Management

According to the definition of the *Turkish Language Association*, hybrid is expressed as *"mixed"*. It is also used in the sense of *"merger"* and *"difference of origin"*. When viewed from a business perspective, it can be briefly defined as *"different/changed working styles"* (Baycan & Ata, 2012).

Hybrid management, is the act of management carried out by individuals who are managers outside of their main job. It is possible to encounter hybrid managers especially in important public positions such as military, university and health institutions. In fact, hybrid managers are so caught up in the task of managing that they have drifted far away from their real professions. Therefore, hybrid management activity can cause ambiguity in their job identities (Yeşilyurt, 2021). Hybrid management in businesses is a work identity dilemma between those who are brought into management and those who are professionalized in management. Hybrid managers often mediate between other employees and top management (Byrkjeflot & Kragh Jespersen, 2014).

It is a fact that hybrid managers who do not practice their profession in the field they studied but work in the management cadre have insufficient knowledge of specific management disciplines. On the other hand, there is income inequality in the salary payments of doctors and managers with other professional backgrounds. However, doctors are at a disadvantage in terms of knowledge and equipment regarding management science (Baynal Doğan, Demirtaş & Doğan, 2020).

In hybrid management, it is possible to evaluate managers in the categories of *"accidental hybrid manager"* and *"willing hybrid manager"*. Individuals who accidentally sit in management positions continue to be committed to their main job and do not lose their professional professionalism. On the other hand, individuals in the position of willing managers have developed a reflex of detachment from their main job and cooling down. Thus, hybrid managers who do not mind experiencing professional atrophy are eager to do the tasks assigned by senior management (Gerry McGivern et al., 2015).

Since the functioning of health institutions is not like other service sectors, *"professionalism"* is always a requirement. After all, the person who demands and receives the service is the person. The value of the phenomenon of health cannot be compared to any other phenomenon. In this sense, health institutions should be managed by specialized human capital who have real management skills. Professional managers are essential for the proper distribution of limited resources, prevention of waste and flawless execution of performance measurements (Çınaroğlu, 2012). Having a good command of current governance issues and modern management skills is also an extremely important need for nurses (Çiftçioğlu & Tunç, 2022). In addition, communication and coordination within and between institutions are important and necessary for healthcare businesses today (Akdaş et al., 2008). Healthcare managers who are part of the team must communicate well with other employees. Because no one can say that management activities are not affected by communication (Özkan & Kalender, 2020).

Hybrid management does not only threaten the functioning of health institutions. Because the failure to keep health expenditures under control has the potential to harm the country's economy due to financial performance losses and financial failure possibilities. In this direction, the first step in taking the necessary precautions will be to employ health managers who are trained from the core. It is thought that employees who are competent in the health management

curriculum, know the operating procedures and are compatible with the ability to manage business identities will be the solution by eliminating hybridization (Baynal Doğan, Demirtaş & Doğan, 2020). A good solution would be to replace the informal manager identities of medical-based managers with formal manager identities that are not medical-based (Akdaş et al., 2008).

When the literature is read, it is seen that doctors are not very close to management science and even have a desire to *"work independently"* due to their highly perceived professional identity. Because doctors are the main heroes of the health sector. They always reflect a prestigious business identity in a popular position. Therefore, since hospital management is a team work, it is also a kind of threat to physician autonomy (Çınaroğlu, 2012). On the other hand, there are also studies that show that physicians should be supported to become managers. It has been stated that physician participation will increase hospital performance (Özkan & Kalender, 2020).

Materials and Methods

Due to the lack of sufficient studies on hybrid management in health management and the gap in the literature, this review paper was attempted to be written. In order to benefit the readers, information on the subject was compiled and solution suggestions were made.

Findings and Discussion

In a study, it was determined that manager nurses experienced problems originating from legislation and senior management. When examined in detail, it was understood that they considered it a big problem to have to get approval from senior managers while making decisions while managing. It was also seen that they wanted the head nurse position to be independent (Öztürk, Yılmaz & Demir, 2010). However, health services are a sharing between departments. On the other hand, the professionalism of nursing is specific to the nursing profession. There is no such thing as a large decision-making mechanism such as managing the entire hospital. Therefore, nurses, who must be free in their professional practice, must recognize the authority of upper management and other health professional groups in actions that exceed their education (Vatan et al., 2012).

In gender-focused studies, it has been stated that there is no problem with female physicians becoming managers. The interesting thing is that female physicians who make this statement do not want to be managers. They stated that physicians other than themselves are suitable for managers (Limon & Paçacı, 2022).

In the study of Akdaş et al. (2008); it was read that individuals in the position of managerial physician wanted to continue this job. However, the majority of the participants stated that it was necessary to receive training in management science (Akdaş et al., 2008).

If a concise general conclusion is to be made;

- Employment problems of the "*Health Management Department"*
- The weakening of the physician's ability to practice the art of medicine
- The weakening of the nurse's care giving practices
- Patients not being able to benefit from successful physicians/nurses
- The responsibility and stress of managing a hospital
- Decrease in institutional performance

- Interruption of physicians' professional advancement
- Lack of knowledge about health management science threatens the functioning of healthcare institutions
- Deterioration of managerial decision-making mechanisms in healthcare institutions

Conclusion and Recommendations

The goal in contemporary business management is to have institutions managed by professionals and to keep up with the times (Çınaroğlu, 2012). On the other hand, it is seen that clinical efforts turn into bureaucratic efforts in managerial physicians or nurses. In other words, there is a shift from their main profession to the role of health care workers to the role of health care managers. Of course, this situation negatively affects the physician's ability. For example, it is a loss for patients if a surgeon who will perform successful surgeries is involved in the hospital's purchasing and sales. On the other hand, it can also damage the physician's professional success. Therefore, the possibility of professional isolation harming public health is a significant problem.

- In order to provide the desired level of efficiency and quality in health service delivery, health institutions should be managed by professionals who have received training in this field.
- In order for competent people to contribute to the institution, appointments should be made by taking into account education, merit, work experience, expertise and justice.
- Elective management courses can be added to the medical curriculum.
- There is a lack of literature in Turkey on hybrid management in healthcare. This issue should be taken into consideration in future studies (Kaya & Kaya, 2019).

THE INNOVATIVE FACE OF HEALTH IN THE AGE OF DIGITAL TRANSFORMATION

Kübra ASLAN
PhD Student, Sivas Cumhuriyet University, Institute of Social Sciences, Department of Healthcare Organization Management, Sivas-Türkiye, aslankubra6058@gmail.com
(Responsible Author) ORCID: 0000-0002-3866-617X

ABSTRACT

In today's changing and developing world, all businesses are experiencing a digital transformation and revolutionary innovations. A rapid and systematic revolution is reflected in all institutions, thus healthcare services also get their share of this process. In order to diagnose and treat patients with increasing demand in the highest quality, least cost and most effective way, medical technologies and current developments must be utilized. The population is now aging all over the world, chronic diseases are increasing, healthcare costs and expenses are increasing and people's expectations of a healthy life are at high levels. At this point, preventive healthcare services strengthened with an innovative perspective should be provided thanks to the government's strategic planning in order to prevent disease at their source before they occur.

The integration of modern medicine with technology positively affects treatment methods. Medical technologies such as tele-medicine, artificial intelligence applications, robotic microsurgeries, wearable health technologies, online health services, digital health data management and new drug development are reflections of innovation in health. Thus, modern health services can be provided to patients. Now, the patient profile has also changed and a "questioning patient" transformation is taking place. Therefore, health institutions that aim not to fall behind the times and can make innovative decisions and approach the patient holistically will be one step ahead of their competitors.

Digitalization in healthcare facilitates patient follow up by keeping data flow dynamic. Paperless hospital applications brought by digitalization prevent waste and eliminate unnecessary paperwork. As a result, diagnostic and treatment services that capture the new and the good will undoubtedly increase patient satisfaction and contribute to the development of health.

Keywords: Digital Transformation, Innovation in Healthcare, Healthcare Organizations, Research Development.

Introduction

The transformation of humanity from an agricultural society to an industrial society, and from an industrial society to an information society, has occurred with the traces of the past developing and being carried to the present day. The dizzying effects of the internet age are reflected in new lifestyles. A lifestyle isolated from technology cannot be considered, because technology is rapidly progressing and permeating every moment of our lives. Today, as in every sector, the reflections of digital transformation are seen in health. Mobile health applications, the internet of things (IoT), artificial intelligence (AI), cloud computing, Tele-Medicine, digital hospital, electronic health data, robotic operations and wearable health technologies are on the agenda (Yalman & Filiz, 2022).

Health Information Systems

Health information systems; carry the hospital forward in many areas such as effective time management, creating the right treatment program for the right diagnosis, working hours and workforce planning, continuous patient monitoring, efficient decision-making mechanism, ensuring data security, human resources management, combating rival businesses and functional archive systems. In terms of the patient, it provides fast response, electronic monitoring and quality advantages (Peker, Van Giersbergen & Biçersoy, 2018). Electronic health data is an ideal resource for saving time and money (Avaner & Fedai, 2017).

Since health information is in a wide range, cloud computing technology and electronic health databases offer advantages to hospitals. Information chain, health communication, quality and evidence-based medical procedures are carried out through hospital information systems. All data of the health sector is included in big data (Bozbuğa, Kurtulmuş Kosif & Öncül, 2021).

Innovation and Health

Innovation, in its simplest definition, is an act of production that is *"worth spending money on"* It is the creation of goods and services from a new idea (Aslan, 2019).

Innovation is a process and depends on the contact of many institutions with each other. It calls for interaction, not isolation. Elements such as information and work sharing between institutions, state contribution, and the development of the national innovation infrastructure are like a link in a chain (Mete, Boz, & Aslan, 2019).

In innovation steps that are based on innovation while improving invention, idea or service production activities, renewed formations are marketed to the customer. When its placement in healthcare is considered; patient files are archived in the hospital information system and a fast and effective data pool is created. Thus, all parameters that need to be known about the patient are presented to the healthcare personnel without wasting time and the treatment process progresses quickly. As a result, patient satisfaction and recovery levels increase (Serbest, 2024).

Innovation is a requirement of many institutions in the sectoral market, but it is also popular in healthcare institutions. Because the customer of the healthcare sector is the patient who flows continuously. Therefore, the healthcare sector should progress and develop day by day in order to meet patient expectations. Healthcare workers should be equipped with an innovative perspective (Avcı, 2017). The effects of innovation on quality in healthcare services should not be ignored. Because the innovative healthcare understanding of healthcare institutions that want to differentiate themselves from their competitors is the driving force of continuous quality development. Leaders who care about quality also care about innovation (Kurt, 2020).

Despite contemporary IT advances, the integration of innovative approaches into institutions is not at the expected level. Employees' participation, interest and talent are reflected in the process of accepting and implementing innovation. New applications that are essentially avoided may become more complex in the future. Therefore, the process should be facilitated with timely user adaptation. Although it is difficult to embrace innovation without resisting change, it will have a positive impact on health outcomes in the long term (Serbest, 2024).

The development of renewal activities specifically for health institutions and their importance by policy makers can provide vitality to the country's economy. Because the share of health services among institutions is quite high. In addition, innovation is a basic need in the modernized medical sector. Because the network society requires it. Therefore, states should pay attention to the importance of technology and innovative solutions in order to permanently improve human health (Memişoğlu & Kalkan, 2016). On the other hand, health literacy should be increased on an individual and community basis with realistic solutions in order to illuminate the innovative face of health (Orhan, 2022).

Investing in innovative changes in health is certainly a short-term goal. However, this investment is actually a gain in controlling future health expenditures. Because the effects of innovation will spread over a long period of time and the money spent at the beginning will become a kind of insurance for public health. Therefore, governments should be generous when spending on health innovation (Kamer & Sancar O, 2022). Due to the invaluable nature of human life and the criticality of disease tables, institutional risk analyses should always be reviewed when evaluating the innovative dimension of health (Aksay & Orhan, 2013).

Digitalization of Health

Digital Transformation in Healthcare; it refers to the comprehensive integration of digital technologies, data analytics and innovative processes into services to improve the delivery of healthcare services. The digitalization of health invites institutions in both the public and private sectors to become active. The digital integration phase requires mandatory participation so that there is no business that cannot move one step ahead of its current position (Avaner & Fedai, 2017). Digital changes in healthcare are making virtualization ordinary. Innovations that would have been unthinkable years ago are captivating people today. Even if they do not aspire to use them, the conditions brought by the age somehow cause them to cross paths with these innovations. In virtualization in healthcare, there is a remote service provision such as virtual medicine and virtual nursing (Akalın & Veranyurt, 2020).

Digitalization provides the following; (Samancı, 2024).

- Personalized Patient Care
- Health Equity and Increased Access
- Increased Productivity
- Cost-Effectiveness

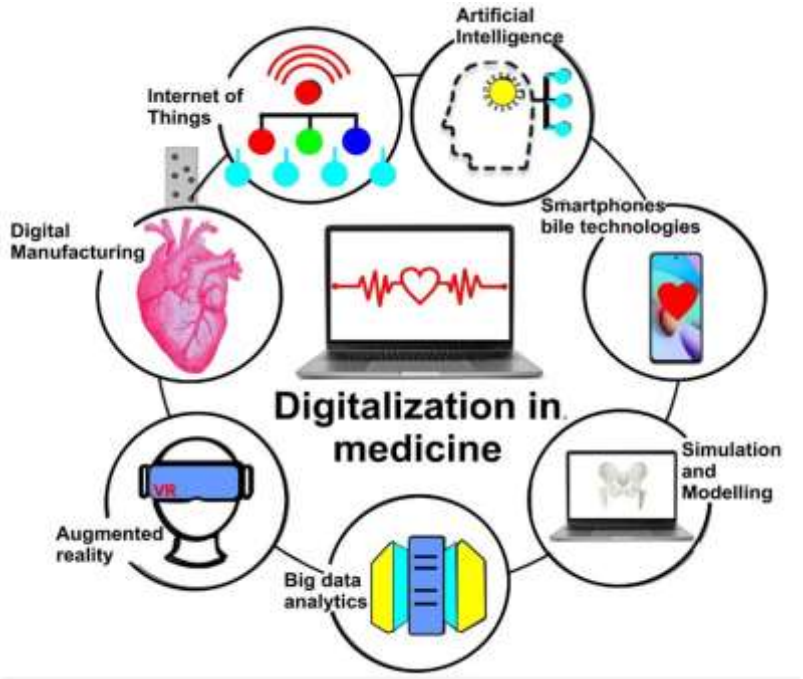

Figure 1. Digitalisation in medicine (Popov et al., 2022:).

Health 4.0

In the Health 4.0 structure, under the influence of Industry 4.0; hats that can measure body temperature and cardiac rhythms, robotic microsurgeries, smart prosthetic limbs, palm sensor reading systems, groundbreaking developments in heart and kidney treatments are emerging (Çalık et al., 2021).

In the research of Çalık et al.; Health 4.0 has been characterized as a sectoral innovation process, error-free new health, early diagnosis assistant, remote follower, individual-based applications. If we need to mention sample systems; specific applications such as *"DICOM, HES, MKYS, E-NABIZ, MHRS, ÜTS, HSYS, HBYS, EBYS"* can be listed in Turkish. Health 4.0, which is the basis of many applications, provides advantages in terms of quality and efficiency as well as disadvantages. There are negativities such as the possibility of not providing secure data management, insufficient informatics for Health 4.0, low health literacy, and lack of preparation in terms of law and economy (Çalık et al., 2021).

Health 4.0, which goes hand in hand with innovation, needs the support of the Ministry of Health in its current journey. Indeed, even though we are in the internet age, Turkey's infrastructure and medical information technology are still not fully prepared to carry out digital innovations. Therefore, collaborative, effective and smart strategies should be developed at the ministry level with ethical sensitivity. Only with these improvements can targeted original patient care and easy access to medicine be provided (Çelik & Okyay, 2023).

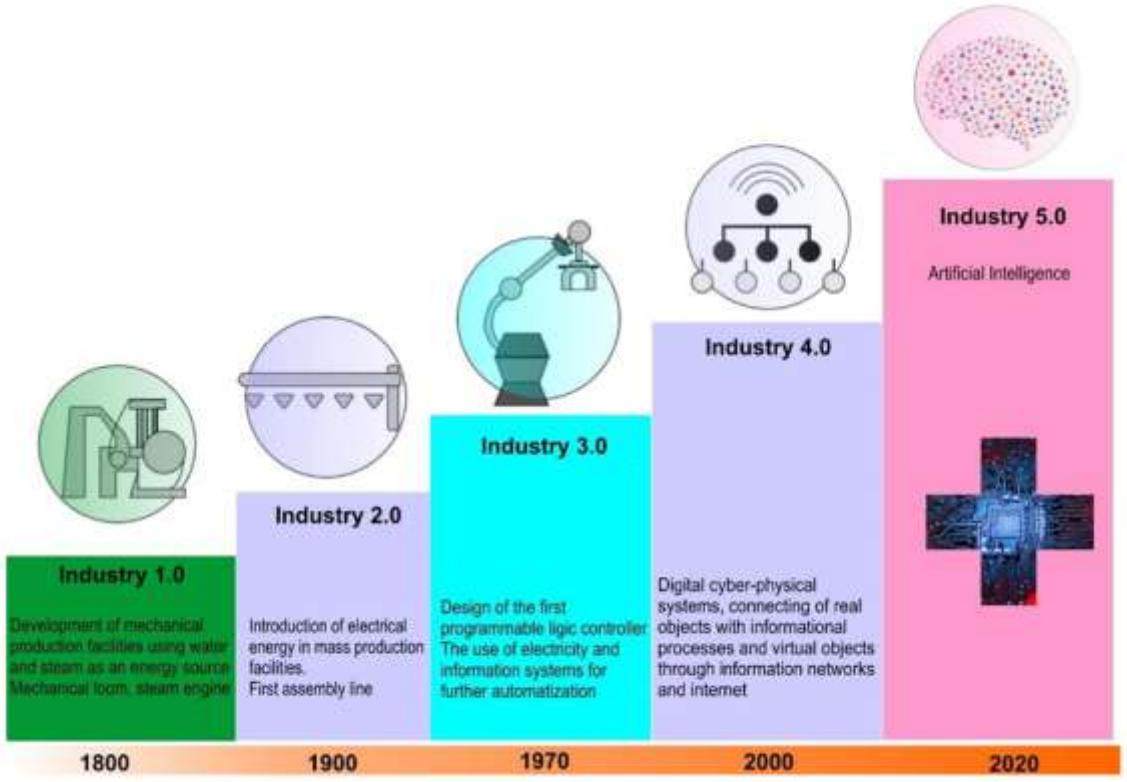

Figure 2. Evolution of industrial developments over time (Popov et al., 2022).

Benefits of Digital Transformation in Healthcare

Digitalization offers benefits in terms of providing effective and qualified services to individuals whose access to health is affected by geographical possibilities. In terms of sustainable health service provision, the greatest example was witnessed in the Covid-19 outbreak. During isolation periods, patients were followed up online and remotely, and an uninterrupted health supply was provided. Innovative approaches that serve human health in possible crises should always be supported by policy makers. Because it is known that these innovations contribute to positive health outcomes. For example, artificial intelligence can guide the physician by eliminating human error and producing flawless or nearly flawless results in disease diagnosis. Thus, even tiny lesions that may be overlooked by the physician are taken into consideration (Samancı, 2024).

Service providers offer fast, accessible, sustainable and improvable services to service recipients through digital health technologies. The reward of this synergistic effort is human health. The provision of up-to-date health-focused services in a digital framework also relieves the workload of healthcare professionals. Indeed, conducting transactions electronically saves healthcare professionals from struggling with paperwork and contributes to an increase in patient care time. Of course, in order to achieve these results, the development of our country's technical infrastructure, the elimination of cybersecurity barriers and the orientation of users to the operation are necessary (Samancı, 2024).

With medical technology opportunities, the perception of long distance is eliminated and patient observation is effectively provided by reaching the professional physician wherever he is (Kamer & Sancar O, 2022). Wearable medical technology designs provide self-control and data

flow to the physician (Akalın & Veranyurt, 2020). With the contributions of innovation in health, patient-based, original and functional treatment programs are obtained. With the leap forward in the medical industry, the examination of internal organs by sensor-based diagnostic tablets is an example of this. In addition, artificial organ designs with 3D printing technique are within the scope of digital service (Popov et al., 2022). Digital management of health data sets can reduce malpractice. More patients can be cared for with artificial intelligence-based medical systems. Big data can be controlled. (Bozbuğa, Kurtulmuş Kosif & Öncül, 2021).

Digital Hospital

The digitalization adventure in health has brought about digitalized health institutions, which are called *"digital hospitals"*. While the entire data system is electronic, patient follow-up is carried out over the network. Therefore, paperwork, filing and physical archiving processes will become history. Preventing paper waste also coincides with the theme of an environmentally friendly and green hospital. After all, resources are not unlimited. Paper waste is a serious problem in all public and private institutions and organizations. When we come to the main topic; digital hospitals are institutions that keep up with the times by using all the possibilities of the internet along with the development of medical technology (Ak, 2013).

Tele-Medicine: Telemedicine is the remote management of healthcare services with video, audio and data streaming components (Bozbuğa, Kurtulmuş Kosif & Öncül, 2021).

E-Health: Within the scope of the "Health Transformation Program", which was a resounding reform in Turkey in the 2000s, the "National Health Information System" infrastructure was established at the national level. It is a nationwide health data bank that is accessible to every citizen. On the other hand, this system stores the financial records, human resources and performance data of all health institutions (https://e-saglik.gov.tr/TR,6212/sagliknet-hakkinda.html).

E-Pulse: It is a system that allows patients to access all their health data via the network. It is an individual database where medical history is stored. All information for diagnosis and treatment planning can be accessed by relevant physicians through the system. Therefore, E-Pulse strengthens physician and patient communication (https://enabiz.gov.tr/Yardim/Index).

Materials and Methods

Since this study is a review, it is aimed to bring the information obtained by using the literature to the reader. It is aimed to create awareness about the digitalization in health and the renewed face of health, which has been the favorite subject of recent years. Therefore, accessible resources were scanned and an attempt was made to write content about the essence of the subject.

Findings and Discussion

The scenario expected to be encountered in the coming years can be expressed as follows; structurally reduced health institutions, online patient visits, continuous health monitoring with smart and wearable equipment, and more technological remote health applications. Of course, when it comes to human health, it is also possible that this distance and digitalization will create anxiety. Because the relationship between the health professional and the patient, who establish one-on-one contact for examination, will undergo a complete change (Aydamak, 2023). The status of service satisfaction is wondered due to physical conditions.

Reflections of Innovation in Healthcare ((Akalın & Veranyurt, 2020; Popov et al., 2022; Yalman & Filiz, 2022).

- Telemedicine / m-Health
- Artificial Intelligence (AI) applications
- Robotic microsurgeries
- 3D printing technology
- Wearable health technologies (VR, smartwatch, etc.)
- Online health services
- Digital health data management
- -e health records
- New drug development
- Elimination of manual processing losses (Time, labor and cost)
- Competitive advantage
- Paperlessness
- Cyber security and threat analysis
- Dynamic clinical decision system
- Contemporary processes
- Increased satisfaction
- Health 4.0

Conclusion and Recommendations

The use of digital technologies in the health sector for the purpose of improving and sustaining public health by prioritizing patient satisfaction refers to the digitalization of health. Digitalization also shapes health management policies and the most important policy is to reduce health expenditures (Stoumpos et al., 2023).

The increase in the patient population, or rather the aging of the world population, may make it difficult for hospitals to accept patients due to their physical inadequacies. In this sense, mobile health applications allow patient follow-up without the need for a physical environment. Thus, the occupancy rate of hospitals can be controlled (Bozbuğa, Kurtulmuş Kosif & Öncül, 2021). Digital transformation in health can provide convenience to physicians and reduce the number of patients' re-applications to health institutions. (Solmaz, Doğan Merih & Arga, 2020).

Orhan (2022) compares hospitals to an orchestra in his article. According to him, the result that emerges when all departments work in coordination and harmony is a perfect piece of music. In fact, this comparison is very logical since medicine is also an art. Doctors who perform their profession as artists save lives by working with zero error. It would not be wrong to say that there is no work more valuable than this. Therefore, diagnostic and treatment services that capture the new and the good will undoubtedly increase patient satisfaction and contribute to health outcomes.

Although our country's medical technology level is lower than that of the world's leading health countries, this is not an insurmountable problem. In this direction, our goal should be to produce technology instead of using it. Industrial enterprises, university research centers and the public sector should cooperate to produce technology so that this is a concrete effort. In short, we should produce instead of consuming (Şengün, 2016).

Recommendations;

- Strengthening cybersecurity to reduce the risk of data breaches for hospitals and healthcare facilities
- Creating an organizational structure that encourages collaboration and does not resist change
- Keeping patient expectations at the forefront

Abstract

In this study, we introduce a new generalization of classical Mersenne numbers by extending them into the quaternionic domain. We define the concept of Mersenne quaternions, which are built upon the traditional Mersenne number sequence and expanded using the algebraic rules of quaternions. Starting from the recursive definition of Mersenne numbers, we establish a second-order non-homogeneous recurrence relation for the corresponding quaternion sequence and derive its characteristic equation. Using this foundation, we then present the Binet formula for Mersenne quaternions, providing an explicit closed-form representation.

Furthermore, we construct both the ordinary generating function and the exponential generating function for Mersenne quaternions. These functions play a central role in analyzing the sequence's growth behavior and algebraic properties, while also serving as a bridge to deeper theoretical insights. The derivation of these formulas follows a systematic approach, employing initial conditions and known identities from classical sequence theory.

Although this study primarily focuses on the definition and core properties of Mersenne quaternions, it lays the groundwork for further exploration. In the continuation of this work, we aim to investigate Catalan, Cassini, and d'Ocagne identities in the quaternionic setting, as well as explore their potential applications in number theory and algebra. The results herein demonstrate that the rich structure of classical integer sequences can be successfully extended into higher-dimensional algebraic systems.

Keywords: Mersenne numbers, Mersenne quaternions, Binet formula, generating function, exponential generating function, recurrence relation, hypercomplex numbers.

1. Introduction

Classical integer sequences have long played a foundational role in number theory and algebra, offering deep insights through their recursive structures, generating functions, and closed-form expressions. Among these, Mersenne numbers—defined as numbers of the form $M_n = 2^n - 1$ hold a prominent place due to their rich arithmetic properties and connections to prime numbers, perfect numbers, and cryptographic algorithms. As mathematical inquiry continues to push the boundaries of classical frameworks, one natural direction of extension lies in the exploration of higher-dimensional algebraic structures such as quaternions.

In this study, we present a novel generalization of Mersenne numbers into the quaternionic domain by introducing the concept of *Mersenne quaternions*. Building upon the recursive formulation of classical Mersenne numbers, we define a corresponding second-order non-homogeneous recurrence relation for the quaternion sequence and derive its characteristic equation. This foundational step allows us to develop an explicit Binet-type formula for Mersenne quaternions, providing a closed-form representation that reveals the underlying structure of the sequence.

In addition, we construct both the ordinary and exponential generating functions associated with the sequence. These tools not only offer valuable algebraic representations but also shed light on the growth behavior and theoretical significance of Mersenne quaternions. By systematically deriving these results through established techniques in sequence analysis and quaternion algebra, this work bridges classical number theory with non-commutative algebraic systems.

While the primary aim of this paper is to define and explore the fundamental properties of Mersenne quaternions, our findings set the stage for further investigations. Potential extensions include examining quaternionic analogues of well-known identities such as those of Catalan, Cassini, and d'Ocagne, as well as exploring applications in abstract algebra and computational number theory. This study thus contributes to the broader effort of extending classical mathematical constructs into richer algebraic environments, highlighting both the versatility and depth of modern mathematical generalizations.

Among the most prominent integer sequences in mathematics, the Fibonacci sequence holds a central place due to its wide-ranging applications and rich structural properties. Scholars such as Hoggart and Koshy have contributed extensively to its study, and numerous researchers have explored polynomial extensions of such integer sequences as well (Koshy, 2001). A notable generalization of the Fibonacci sequence was introduced by Horadam (Horadam, 1963), whose formulation paved the way for further developments. In a more recent contribution, Yazlik and Taskara (Yazlık et al, 2012) proposed a broader generalization denoted by $\{H_{k,n}\}$, encompassing several classical second-order sequences, including Fibonacci, Lucas, k-Fibonacci, k-Lucas, generalized k-Fibonacci and k-Lucas, Horadam, Pell, Jacobsthal, and Jacobsthal-Lucas numbers.

Another noteworthy class of integer sequence is the Fermat numbers, first introduced in the 17th century by the French mathematician Pierre de Fermat. Defined by $F_n = 2^n + 1$, these numbers were named posthumously and have attracted significant mathematical interest. Tsang et al. have conducted detailed studies on Fermat numbers (Tsang et al., 2010, Boussayoud et al., 2018), and the potential relationships between Fermat and Fibonacci numbers have also been explored in the literature (Tsang et al., 2010, Abd-Elhameed et al., 2016, Robinson, 1954). Around the same period, Marin Mersenne, another French mathematician, introduced the sequence known as Mersenne numbers, defined by $M_n = 2^n - 1$. These numbers have been

the subject of extensive research across various mathematical domains, particularly number theory and combinatorics (Eser et al., 2023, Suvarnamani et al., 2015, Dişkaya et al., 2022, Aydin, 2018, Luna et al., 2012).

2. (p, q) −Mersenne Quaternions

Definition 1. (p, q) −Mersenne numbers are defined as follows,

$$M_{n+2}(p,q) = 3pM_{n+1}(p,q) - 2qM_n(p,q) \quad (1)$$

$n \geq 2$, with initial conditions $M_0(p,q) = 0, M_1(p,q) = 1,$

where p and q are nonzero real numbers such that $9p^2 - 8q > 0$.

Taking $p = 1, q = 1$ we obtain Mersenne numbers.

$M_2(p,q) = 3p,$

$M_3(p,q) = 9p^2 - 2q,$

$M_4(p,q) = 27p^3 - 12q,$

$M_5(p,q) = 81p^4 - 54p^2q + 4q^2$

The characteristic equation of (1) and its roots are given as follows,

$$\varphi(p,q) = \frac{3p - \sqrt{9p^2 - 8q}}{2} \quad , \qquad \phi(p,q) = \frac{3p + \sqrt{9p^2 - 8q}}{2}$$

One can easily see that

$$\varphi(p,q).\phi(p,q) = 2q$$

Binet formula of (p, q) −Mersenne numbers holds the following relation,

$$M_n(p,q) = \frac{\varphi^n(p,q) - \phi^n(p,q)}{\sqrt{9p^2 - 8q}} \quad (2)$$

where

$$\varphi(p,q) = \frac{3p - \sqrt{9p^2 - 8q}}{2} \quad , \qquad \phi(p,q) = \frac{3p + \sqrt{9p^2 - 8q}}{2}$$

Quaternions are among the most studied in algebra. In 1843, Hamilton [20] first introduced quaternions that extended complex numbers. These numbers are defined as follows,

$$H = \{1h_0 + e_1h_1 + e_2h_2 + e_3h_3 : h_0, h_1, h_2, h_3 \in \mathbb{R}\}$$

where $\mathbb{R}$ is the set of real number set and e_1, e_2, e_3 satisfies following equations.

$e_1{}^2 = e_2{}^2 = e_3{}^2 = -1,\ e_1e_2 = -e_2e_1 = e_3, e_2e_3 = -e_3e_2 = e_1, e_1e_3 = -e_3e_1 = e_2.$

Let us point out that quaternions are not commutative. Quaternions arise in quantum mechanics, physics, mathematics...etc.

Ipek [21] presented (p, q) − Fibonacci quaternions as follows,

$$QF_n(p,q) = F_n(p,q) + F_{n+1}(p,q)e_1 + F_{n+2}(p,q)e_2 + F_{n+3}(p,q)e_3$$

where $F_n(p,q)$ is the n-th $(p,q)-$ Fibonacci numbers and e_1, e_2, e_3 satisfies the rules in (22).

Definition 2. (p,q) −Mersenne quaternions are defined by

$$QM_n(p,q) = M_n(p,q) + M_{n+1}(p,q)e_1 + M_{n+2}(p,q)e_2 + M_{n+3}(p,q)e_3 \tag{3}$$

where $M_n(p,q)$ is the n-th $(p,q)-$ Mersenne numbers and e_1, e_2, e_3 satisfies the rules in (22). The recurrence relation of $(p,q)-$ Mersenne quaternions is given by

$$QM_{n+2}(p,q) = 3pQM_{n+1}(p,q) - 2qQM_n(p,q). \tag{4}$$

Therefore, the characteristic equation of (23) is

$$\sigma^2 - 3p\sigma + 2q = 0. \tag{5}$$

The roots of (24) are

$$\underline{\varphi}(p,q) = \sum_{s=0}^{3} \varphi^s(p,q)e_s = 1 + \varphi(p,q)e_1 + \varphi^2(p,q)e_2 + \varphi^3(p,q)e_3$$

$$\underline{\phi}(p,q) = \sum_{s=0}^{3} \phi^s(p,q)e_s = 1 + \phi(p,q)e_1 + \phi^2(p,q)e_2 + \phi^3(p,q)e_3.$$

Theorem 3. Binet formula of $(p,q)-$ Mersenne quaternions $\{QM_u\}$ is given by for $u \geq 0$,

$$QM_n = \frac{\underline{\varphi}(p,q)\varphi^n(p,q) - \underline{\phi}(p,q)\phi^n(p,q)}{\varphi(p,q) - \phi(p,q)} \tag{6}$$

Proof. By using (2), we have the following equation:

$$QM_n(p,q) = \sum_{s=0}^{3} M_{n+s}(p,q)e_s$$

$$QM_n = \frac{\underline{\varphi}(p,q)\varphi^n(p,q) - \underline{\phi}(p,q)\phi^n(p,q)}{\varphi(p,q) - \phi(p,q)} + \frac{\underline{\varphi}(p,q)\varphi^{n+1}(p,q) - \underline{\phi}(p,q)\phi^{n+1}(p,q)}{\varphi(p,q) - \phi(p,q)}e_1$$
$$+ \frac{\underline{\varphi}(p,q)\psi^{n+2}(p,q) - \underline{\phi}(p,q)\phi^{n+2}(p,q)}{\varphi(p,q) - \phi(p,q)}e_2$$
$$+ \left(\frac{\underline{\varphi}(p,q)\varphi^{n+3}(p,q) - \underline{\phi}(p,q)\phi^{n+3}(p,q)}{\varphi(p,q) - \phi(p,q)}\right)e_3.$$

Thus, the Binet formula of $(p,q)-$ Mersenne quaternions is obtained easily.

Here we present generating function, exponential generating function of (p,q) −Mersenne quaternions.

Theorem 4. The generating function of $(p,q)-$ Mersenne quaternions is defined by

$$G_{QM(p,q)}(t) = \frac{QM_0(p,q) + (QM_1(p,q) - 3pQM_0(p,q))t}{(1 - 3pt + 2qt^2)}$$

Proof.

$$G_{QM(p,q)}(t) = QM_0(p,q) + QM_1(p,q)t + QM_2(p,q)t^2 + \cdots + QM_m(p,q)t^m + \cdots$$

$$-3ptG_{QM}(t) = -3pBCQM_0t - 3pBCQM_1t^2 - 3pBCQM_2t^3 + \cdots + -3pBCQM_mt^{m+1} + \cdots$$

$$\begin{aligned} 2qt^2G_{QM(p,q)}(t) &= 2qQM_0(p,q)t^2 + 2qQM_1(p,q)t^3 + 2qQM_2(p,q)t^4 + \cdots \\ &+ 2qQM_m(p,q)t^{m+2} + \cdots \end{aligned}$$

Summation the both side of equations,

$$\begin{aligned} (1 - 3pt + 2qt^2)\, G_{QM}(p,q)(t) &= QM_0(p,q) + (QM_1(p,q) - 3pQM_0(p,q))t \\ &+ (QM_2(p,q) - 3pQM_1(p,q) + 2qQM_0(p,q))t^2 + \cdots \\ &+ (QM_m(p,q) - 3pQM_{m-1}(p,q) + 2qQM_{m-2}(p,q)) + \cdots \end{aligned}$$

Using (17) and initial conditions we get

$$(1 - 3pt + 2qt^2)G_{BM}(t) = QM_0(p,q) + (QM_1(p,q) - 3pQM_0(p,q))t$$

$$G_{QM(p,q)}(t) = \frac{QM_0(p,q) + (QM_1(p,q) - 3pQM_0(p,q))t}{1 - 3pt + 2qt^2}$$

Now we give exponential generating function of $\{QM_u(p,q)\}$ as follows,

Theorem 5. Exponential generating function of (p,q) − Mersenne quaternions is defined by

$$E_{QM(p,q)}(t) = \frac{\underline{\varphi}(p,q)e^{\varphi t} - \underline{\phi}(p,q)e^{\phi t}}{\varphi(p,q) - \phi(p,q)}$$

where

$$\acute{\varphi}(p,q) = 1 + \varphi(p,q)e_1 + \varphi^2(p,q)e_2 + \varphi^3(p,q)e_3$$

$$\acute{\phi}(p,q) = 1 + \phi(p,q)e_1 + \phi^2(p,q)e_2 + \phi^3(p,q)e_3.$$

Proof.

$$e^t = \sum_{t=0}^{\infty} \frac{t^u}{t!} \tag{6}$$

Using above equations, we get

$$EQM_n(p,q)(t) = \sum_{n=0}^{\infty} QM_n(p,q)\frac{t^n}{n!}$$

If we write Binet formula instead of $QM_n(p,q)$ and do some algebraic calculation, we get desired conclusion.

Theorem 6. (Catalan identity)

$$\begin{aligned} QM_{n-r}(p,q).QM_{n+r}(p,q) - (QM_n(p,q))^2 &= \\ \frac{2^{n+1}q^n\underline{\varphi}(p,q)\varphi^n(p,q)\left(1 - \underline{\varphi}^{-r}(p,q)\phi^r(p,q)\right)}{9p^2 - 8q} & \end{aligned}$$

Proof.

Using Binet formula for Mersenne quaternions at (6)

$$QM_{n-r}(p,q).QM_{n+r}(p,q) - (QM_n(p,q))^2$$
$$= \frac{2\underline{\varphi}(p,q)\underline{\phi}(p,q)(2q)^n(1-\varphi^{-r}(p,q))\phi^r(p,q)}{(\varphi(p,q)-\phi(p,q))^2}$$
$$= \frac{2^{n+1}q^n\underline{\varphi}(p,q)\varphi^n(p,q)\left(1-\underline{\varphi}^{-r}(p,q)\phi^r(p,q)\right)}{9p^2-8q}$$

Theorem 7. (Cassini identity)

$$QM_{n-1}(p,q).QM_{n+1}(p,q) - (QM_n(p,q))^2 = \frac{2^{n+1}q^n\underline{\varphi}(p,q)\varphi^n(p,q)\left(1-\frac{\phi(p,q)}{\varphi(p,q)}\right)}{9p^2-8q}$$

Proof. Taking $r = 1$ in Catalan identity we get the desired conclusion.

Theorem 8. (D'ocagne identity)

$$QM_n(p,q).QM_{m+1}(p,q) - QM_m(p,q).QM_{n+1}(p,q) = \frac{\underline{\varphi}(p,q)\underline{\phi}(p,q)(2q)^n(\phi^{m-n}(p,q)-\varphi^{m-n}(p,q))}{\varphi(p,q)-\phi(p,q}$$

Proof.

$$QM_n(p,q).QM_{m+1}(p,q) - QM_m(p,q).QM_{n+1}(p,q$$
$$= \frac{\underline{\varphi}(p,q)\underline{\phi}(p,q)\varphi^n(p,q)\phi^m(p,q)(\varphi(p,q)-\phi(p,q)) - \underline{\varphi}(p,q)\underline{\phi}(p,q)\varphi^m(p,q)\phi^n(p,q)(\varphi(p,q)-\phi(p,q))}{(\varphi(p,q)-\phi(p,q))^2}$$
$$= \frac{\underline{\varphi}(p,q)\underline{\phi}(p,q)(2q)^n(\phi^{m-n}(p,q)-\varphi^{m-n}(p,q))}{\varphi(p,q)-\phi(p,q)}$$

Theorem 9. (Honsberger identity)

$$QM_{m-1}(p,q).QM_n(p,q) - QM_m(p,q).QM_{n+1}(p,q)$$
$$= \frac{-\underline{\varphi}(p,q)\underline{\phi}(p,q)(\varphi^{m-1}(p,q)\phi^n(p,q)) + \underline{\varphi}^2(p,q)\varphi^{m+n}(p,q)\left(\underline{\varphi}^{-1}(p,q)+\varphi(p,q)\right) + \underline{\phi}^2(p,q)\phi^{m+n}(p,q)\left(\underline{\phi}^{-1}(p,q)+\phi(p,q)\right)}{9p^2-8q}$$

Proof.

$$\frac{\underline{\varphi}(p,q)\varphi^{m-1}(p,q)-\underline{\phi}(p,q)\phi^{m-1}(p,q)}{\varphi(p,q)-\phi(p,q)}.\frac{\underline{\varphi}(p,q)\varphi^n(p,q)-\underline{\phi}(p,q)\phi^n(p,q)}{\varphi(p,q)-\phi(p,q)}$$
$$+\frac{\underline{\varphi}(p,q)\varphi^m(p,q)-\underline{\phi}(p,q)\phi^m(p,q)}{\varphi(p,q)-\phi(p,q)}.\frac{\underline{\varphi}(p,q)\varphi^{n+1}(p,q)-\underline{\phi}(p,q)\phi^{n+1}(p,q)}{\varphi(p,q)-\phi(p,q)}$$

If we do some algebraic calculations, we get desired conclusion.

3. Conclusion

This work introduces Mersenne quaternions as a hypercomplex extension of classical Mersenne numbers. After defining the sequence and establishing its recurrence structure, we derived the characteristic equation and Binet formula. Additionally, both the ordinary and exponential

generating functions of Mersenne quaternions were obtained. These results reveal the structural richness of the quaternionic generalization and demonstrate that traditional methods in number theory can be extended into the quaternion domain. Future research will aim to deepen this framework by deriving analogs of known identities such as Catalan and Cassini, further expanding the theoretical landscape of special number sequences in hypercomplex settings.

ABSTRACT

This study presents a comprehensive analysis of Permanent Magnet Synchronous Motors (PMSMs), which are widely employed in electric vehicles. Due to their high efficiency, compact structure, low maintenance requirements, and reliable operation, PMSMs hold a critical position within electric vehicle technology. The paper initially emphasizes the role of electric vehicles in achieving sustainable transportation goals, and subsequently examines in detail the structural characteristics, operational principles, advantages, and technical comparisons of PMSMs with other motor types. The analysis includes the two main variants of PMSMs—Surface-mounted PMSMs (SPMSM) and Interior PMSMs (IPMSM)—highlighting their respective torque production capabilities, efficiency levels, and resistance to demagnetization. The function of PMSMs within the electric drivetrain is elucidated through their contributions to acceleration, deceleration, and regenerative braking. Furthermore, the study evaluates the impact of PMSMs on key vehicle performance parameters, such as speed, torque, driving range, comfort, and safety. A comparative assessment with DC motors, induction motors, and switched reluctance motors (SRMs) is also provided, wherein PMSMs are demonstrated to outperform their counterparts particularly in terms of energy efficiency, noise reduction, and compact design. Additionally, their regenerative braking capability enables energy recovery, thereby extending battery lifespan and enhancing vehicle range. In conclusion, the study underscores PMSMs as the most suitable motor type for electric vehicles from both technical and environmental perspectives, reaffirming their critical role in advancing sustainable transportation solutions.

Keywords: Permanent Magnet Synchronous Motor (PMSM), Electric Vehicles, Sustainable Transportation, Energy Efficiency, Motor Performance Analysis

Introduction

Electric vehicles (EVs) have emerged in recent years as alternative modes of transportation developed to address critical global issues such as global warming, energy crises, air pollution, and the depletion of petroleum resources (Havale et al., 2025). EVs convert electrical energy—sourced from batteries or other electrical systems—into mechanical energy via electric motors, enabling vehicle propulsion (Rausa et al., 2025). The electric motors used in EVs significantly impact vehicle performance, efficiency, safety, and comfort (Kıyak & Kaya, 2020). Among the electric motor types employed in EVs, the Permanent Magnet Synchronous Motor (PMSM) is widely used (Yang et al., 2020). A PMSM is a synchronous motor that features permanent magnets on the rotor and is supplied with three-phase AC current in the stator. These motors offer numerous advantages, including high power density, high efficiency, low noise, reduced maintenance costs, wide speed range, and excellent controllability. PMSMs serve as the core components of the EV traction system, which converts electrical energy into mechanical energy to drive the vehicle. The traction system consists of the battery, charging unit, power electronics, electric motor, transmission, differential, and wheels. Within this system, the PMSM receives AC current from the power electronics and generates mechanical power that adjusts the vehicle's speed and torque (Sain et al., 2021).

This article provides a comprehensive overview of the PMSMs used in electric vehicles. The subsequent sections detail the structure, operating principles, advantages, and role of PMSMs within the traction system, as well as comparisons with other types of electric motors. Furthermore, the relationship between PMSMs and EV performance is analyzed. The final section emphasizes the critical role of PMSMs in modern electric vehicle technologies.

Electric Vehicles (EVs)

An electric vehicle is a type of transportation that converts electrical energy—supplied by a battery or other electrical sources—into mechanical energy through an electric motor to enable vehicle movement. During the design phase of electric vehicles, the generation and distribution of energy within the vehicle are managed by the components of the traction system (Kerem, 2014). Compared to internal combustion engine (ICE) vehicles, electric vehicles are more efficient, quieter, cleaner, and more economical (Ghodrati, 2024). Additionally, they can be categorized into various types, such as battery electric vehicles (BEVs), hybrid electric vehicles (HEVs), series hybrid electric vehicles, parallel hybrid electric vehicles, series-parallel hybrid electric vehicles, fuel cell electric vehicles (FCEVs), and solar-powered electric vehicles. These vehicles typically share common components including an electric motor, battery, charging unit, power electronics, transmission, differential, and wheels. The selection, design, and control of these components play a crucial role in determining the vehicle's performance, efficiency, safety, and comfort.

Electric Vehicles and the Importance of Sustainable Transportation

Electric vehicles are a vital component of sustainable transportation. Sustainable mobility aims to provide economically efficient movement, foster local economic development, and ensure functional performance. From a social perspective, the objectives of sustainable transportation include ensuring human safety and health, promoting social equity, overcoming economic challenges, fostering social cohesion, and preserving cultural values. Environmentally, sustainable transportation seeks to reduce air, noise, and water pollution, conserve natural resources, protect open spaces, and maintain biodiversity (Alomare et al., 2025).

Sustainable transportation refers to a mode of transport that enables the movement of people and goods without causing harm to the environment, human health, or the economy. It has been

developed in response to critical issues such as global warming, energy crises, air pollution, and the depletion of petroleum resources. In the context of promoting sustainable transportation, electric vehicles offer the following advantages:

• Higher Efficiency: Compared to internal combustion engine (ICE) vehicles, EVs are significantly more efficient. While EVs convert approximately 80–90% of electrical energy into mechanical energy, ICE vehicles only convert 20–30% of the fuel's energy. This means EVs can travel longer distances with less energy consumption.

• Lower Emissions: EVs are cleaner than ICE vehicles. They emit no harmful gases through tailpipes, thereby contributing to reductions in air pollution, greenhouse gas emissions, and global warming (Sudjoko et al., 2021).

Permanent Magnet Synchronous Motors (PMSM)

PMSMs are a class of synchronous motors widely used in various applications. These motors are powered by three-phase alternating current (AC) in the stator and feature permanent magnets on the rotor. PMSMs operate based on synchronization between the magnetic field generated in the stator windings and the magnetic field of the rotor magnets. Additionally, since the rotor magnets directly produce the rotor's magnetic flux, these motors exhibit very high efficiency (Koçaş, 2023).

PMSMs can be categorized into the following subtypes:

• Surface-Mounted Permanent Magnet Synchronous Motor (SPMSM): In this type, the rotor magnets are mounted on the surface of the rotor. SPMSMs offer advantages such as high speed, high power density, and low torque ripple. However, they also have drawbacks including high cost, limited torque capability, and susceptibility to demagnetization.

• Interior Permanent Magnet Synchronous Motor (IPMSM): In this configuration, the rotor magnets are embedded within the rotor core. IPMSMs provide benefits such as lower cost, higher torque output, improved efficiency, and greater resistance to demagnetization. On the downside, they have a more complex structure, lower power density, and higher torque ripple.

The structural differences between SPMSM and IPMSM configurations are illustrated in Figure 1.

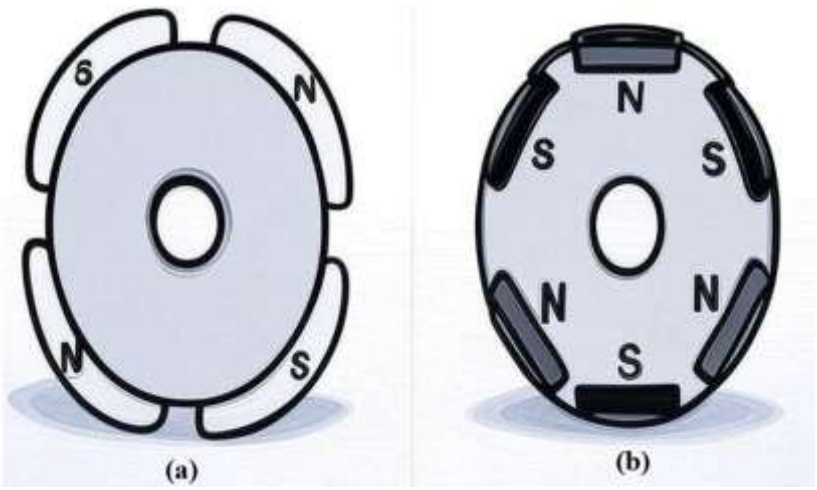

Figure 1. Surface-Mounted Permanent Magnet Synchronous Motor (a) and Interior Permanent Magnet Synchronous Motor (b) (Tören & Mollahasanoğlu, 2023)

Working Principle of PMSM

A Permanent Magnet Synchronous Motor is not fundamentally different from any other rotary electric motor in that it consists of a rotor and a stator. The stator is the stationary part, while the rotor is the rotating component. What distinguishes a PMSM from an asynchronous (induction) motor lies in the rotor structure, which includes permanent magnets. The PMSM can be considered a hybrid structure combining features of both induction motors and brushless DC motors. Like a brushless DC motor, it has a permanent magnet rotor and a wound stator. However, the stator windings are designed to produce a sinusoidal flux density in the air gap, similar to that of an induction motor's stator design. The general structure of a PMSM is illustrated in Figure 2.

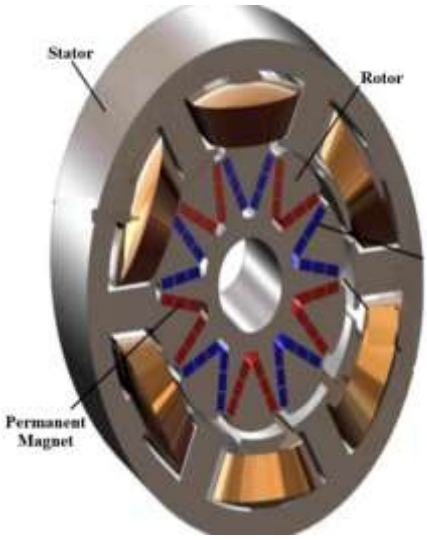

Figure 2. General Structure of PMSM (Zhao et al., 2022).

Regarding the operating principles of PMSM motors, the stator structure of a PMSM resembles that of an asynchronous motor, while the rotor contains permanent magnets that produce a constant magnetic field. These permanent magnets provide a lossless excitation without the need for an external electrical circuit. In asynchronous motors, a rotating magnetic field is generated by a three-phase symmetric AC supply to the stator windings. Since synchronous motors cannot start by themselves, PMSMs require an initial starting mechanism. As there are no windings on the rotor, induction-based starting methods are not suitable for such motors, which is why a variable-frequency power supply is required (Dursun et al., 2018).

When the magnetic field of the rotor interacts with the synchronous AC current applied to the stator windings, a torque is generated that causes the rotor to rotate. To maintain a constant average torque, the rotor must follow the stator's rotating field and spin at the same synchronous speed. During operation, the three-phase windings—similar to those in an asynchronous motor—are energized either with a trapezoidal current waveform (as in brushless DC motors) or a sinusoidal current waveform (as in synchronous AC motors). These currents generate a magnetic field that rotates at the same speed as the rotor, or at synchronous speed. By adjusting the frequency of the stator current, the rotor speed (i.e., synchronous speed) can be regulated accordingly (Meenakshi & Paramasivam, 2017).

Advantages of PMSM Motors

Permanent Magnet Synchronous Motors are widely used in many applications due to their numerous advantages, including high efficiency, high power density, simple structure, and

reliable operation (Singh et al., 2023). Compared to other types of electric motors, PMSMs offer the following benefits:

• High energy efficiency: Since PMSMs use permanent magnets on the rotor, there are no rotor-related energy losses. Additionally, the reduced amount of copper used in stator windings leads to lower copper losses. This means PMSMs can convert electrical energy into mechanical energy more efficiently.

• High power density: The permanent magnets in the rotor generate a strong magnetic flux density, enabling PMSMs to deliver higher power output in a more compact size.

• Low noise and vibration: Due to the synchronization between rotor magnets and stator windings, torque ripple and speed fluctuations are minimized. As a result, PMSMs operate more smoothly and quietly.

• Low maintenance cost and reliable operation: As PMSMs do not include brushes, commutators, belts, or gears—components prone to wear or failure—they require less maintenance and offer longer operational lifespans.

Role of PMSM Motors in the Traction System

PMSM motors serve as the primary component of the traction system in electric vehicles. The traction system is responsible for converting electrical energy into mechanical energy to drive the vehicle. It consists of the battery, charging unit, power electronics, electric motor, transmission, differential, and wheels. Within this system, the PMSM receives AC current supplied by the power electronics and produces mechanical power that regulates the vehicle's speed and torque (Huang et al., 2023).

PMSM motors perform the following functions within the traction system:

• Enable the acceleration, deceleration, and stopping of the vehicle.

• Allow the vehicle to adapt to various road conditions and driver demands.

• Improve the energy efficiency and driving range of the vehicle.

• Reduce the levels of noise, vibration, and emissions generated by the vehicle.

Comparison of PMSM Motors with Other Motor Types

PMSM motors can be compared to other types of electric motors commonly used in electric vehicles as follows:

• DC Motors: DC motors operate on direct current and include mechanical switching components such as brushes and commutators. They offer advantages such as simple control, high torque output, and a wide speed range. However, they suffer from drawbacks including brush and commutator wear, higher maintenance costs, noise, sparking, and electromagnetic interference. Compared to DC motors, PMSM motors are more efficient, more reliable, quieter, and have a longer operational lifespan (Gore & Ugale, 2022).

• Induction Motors: Induction motors are asynchronous machines powered by three-phase AC current in the stator and feature either squirrel-cage rotors or wound rotors with short-circuited windings. These motors are known for their simple construction, low cost, high reliability, and durability. Nevertheless, they have disadvantages such as lower power density, reduced efficiency, low power factor, higher losses, and more complex control requirements. PMSM motors, in comparison, offer better efficiency, a more compact structure, higher performance, and simpler control (Kıyak & Kaya, 2020).

The architectural comparison between an induction motor and a permanent magnet motor is illustrated in Figure 3.

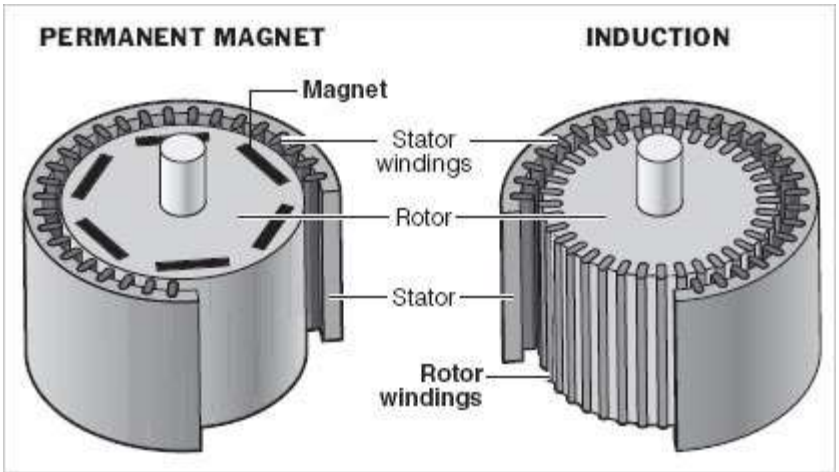

Figure 3. Structural comparison of a Permanent Magnet Synchronous Motor and an Induction Motor (New Energy and Fuel, 2010).

• Switched Reluctance Motors (SRMs): SRMs are synchronous motors powered by three-phase AC current in the stator, with no permanent magnets or windings on the rotor. These motors offer advantages such as simple structure, low cost, high-speed operation, high reliability, and strong resistance to demagnetization. However, they also present several disadvantages, including low power density, reduced efficiency, high noise levels, significant torque ripple, and complex control strategies. Compared to SRMs, PMSM motors are more efficient, quieter, smoother in operation, and easier to control. When comparing the torque characteristics of all motor types, it is evident that PMSMs exhibit less torque ripple due to the demagnetization effects in the air gap caused by the presence of permanent magnets. Torque ripple content directly influences the overall efficiency of the motor (Pandraka et al., 2024).

The Importance of PMSM Motors in Electric Vehicles and Their Relationship with Performance

PMSM motors are closely associated with the performance of electric vehicles. EV performance refers to various characteristics such as vehicle speed, torque, acceleration, deceleration, range, efficiency, safety, and comfort. PMSM motors influence electric vehicle performance in the following ways:

• Speed and Torque: Thanks to their high-power density and wide speed range, PMSM motors provide electric vehicles with high speed and torque capabilities. PMSMs allow precise control of speed and torque via power electronics and control systems.

• Acceleration and Deceleration: Due to their high torque capability and fast dynamic response, PMSM motors deliver excellent acceleration and deceleration characteristics. These functions are dynamically managed through power electronics and control systems. Additionally, PMSM motors support regenerative braking, which enables energy recovery. In regenerative braking, the motor operates as a generator during deceleration, converting mechanical energy into electrical energy and feeding it back into the battery.

• Range and Efficiency: PMSM motors provide high range and efficiency due to their high energy conversion efficiency and low energy losses. They convert electrical energy into

mechanical energy with minimal loss, reducing energy consumption from the battery. Through regenerative braking, additional energy can be recovered, which in turn extends battery life and reduces charging frequency.

• Safety and Comfort: With their low noise, low vibration, reduced heating, and low maintenance characteristics, PMSM motors contribute significantly to the safety and comfort of electric vehicles. These motors minimize noise, vibration, and thermal effects inside the vehicle, improving cabin conditions. Moreover, since they lack components prone to wear or failure—such as brushes, commutators, belts, and gears—they reduce the need for maintenance and the risk of mechanical failure (Rusli et al., 2023).

The importance of PMSM motors in electric vehicles is evident from the advantages described above. PMSMs provide high performance, high efficiency, high safety, and superior comfort. Additionally, they enhance the positive impact of electric vehicles on the environment, human health, and the economy. PMSM motors are fundamental in making electric vehicles a key component of sustainable transportation. They play a pivotal role in the development and widespread adoption of electric vehicle technology.

In EV systems, the electrical energy required by the PMSM-based drive system is supplied by the battery. In addition to controlling the battery modules and PMSM, there are also several external factors—such as the transmission, wheels, axles, and other dynamic cycle components—that influence the overall system stability, as illustrated in Figure 4. Therefore, the condition of both the PMSM and the onboard battery pack are of critical importance (Zhang et al., 2023).

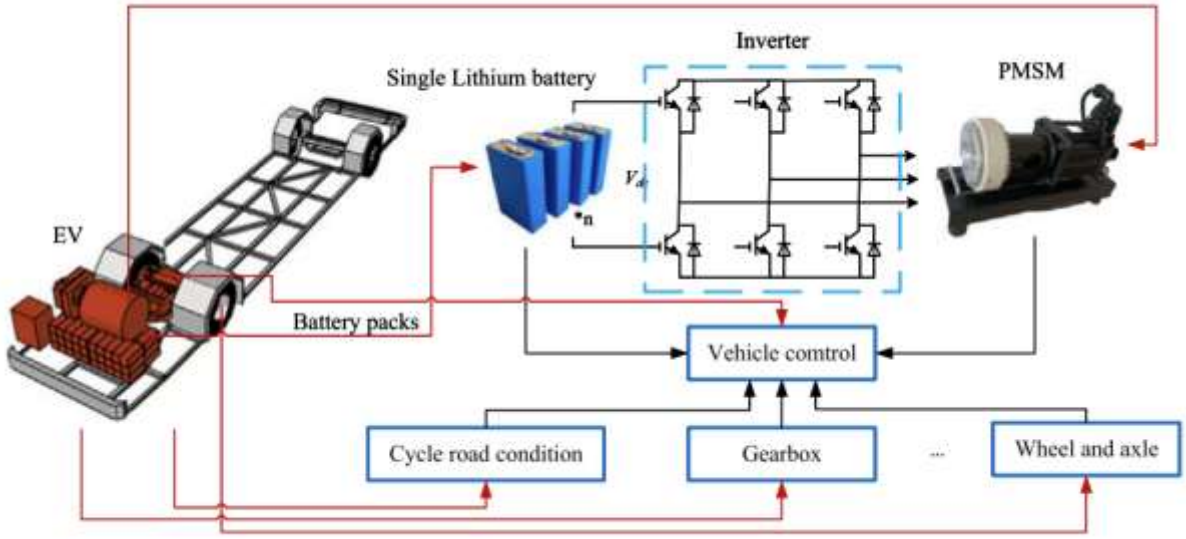

Figure 4. Schematic diagram of EV system (Zhang et al., 2023).

Conclusion

Electric vehicles are a crucial component of sustainable transportation. Compared to internal combustion engine (ICE) vehicles, EVs are more efficient, quieter, cleaner, and more economical. The electric motors used in EVs significantly influence vehicle performance, range, and reliability. This study focused on Permanent Magnet Synchronous Motors (PMSMs), which are among the most commonly used motor types in electric vehicles. A PMSM is a synchronous motor that operates using a magnetic field generated by permanent

magnets. PMSMs offer several advantages, including high efficiency, high power density, low noise, low maintenance, simple control, and a wide speed range. They serve as a critical component of the EV traction system. PMSMs provide high torque, rapid acceleration, regenerative braking capability, and high energy efficiency. When compared to other types of motors, PMSMs deliver superior performance in electric vehicle applications. This study examined the structure, operating principle, advantages, role in the traction system, and comparison of PMSMs with other motor types. Additionally, the relationship between PMSMs and electric vehicle performance was analyzed. In conclusion, the use of PMSMs in electric vehicles is found to be a highly suitable option for achieving the goals of sustainable transportation.

ABSTRACT

As the demand for renewable energy continues to rise, wind power has become one of the most prominent and widely adopted sources of sustainable electricity. Wind turbines, however, are complex systems influenced by numerous environmental and operational variables. Accurately forecasting their power output is essential for improving efficiency, optimizing maintenance strategies, and ensuring reliable integration into power grids. In this project, machine learning regression models were employed to predict the active power output of a wind turbine based on multidimensional sensor data. After pre-processing steps, including the removal of redundant features and imputation of missing values, three regression algorithms were developed and evaluated: Linear Regression, Random Forest Regressor, and Extra Trees Regressor. The models were trained on a selected set of input features encompassing environmental conditions and internal turbine metrics. Performance evaluation using the coefficient of determination (R^2) revealed a clear advantage for ensemble learning methods. Linear Regression yielded an R^2 score of 0.8978, while Random Forest and Extra Trees achieved significantly higher scores of 0.9962 and 0.9967, respectively. These results indicate that tree-based ensemble models are highly effective in capturing complex, nonlinear relationships within turbine data. The study demonstrates the potential of data-driven approaches in modelling wind turbine behavior and provides a foundation for intelligent decision-making in the field of renewable energy systems.

Keywords: Machine Learning, Renewable Energy Forecasting, Wind Turbine Power Prediction, Active Power Estimation

Introduction

The global imperative to transition towards sustainable energy systems has significantly amplified the role of renewable sources, with wind power emerging as a leading technology in this paradigm shift. Wind energy offers a substantial contribution to mitigating climate change and enhancing energy security, driven by its increasing technological maturity and economic competitiveness. At the heart of this technology are wind turbines, complex electromechanical systems designed to convert the kinetic energy of wind into electrical power. The performance of these turbines is intrinsically linked to a dynamic interplay of fluctuating environmental conditions and internal operational parameters. Consequently, the ability to accurately predict their active power output is of paramount importance. Such predictions are crucial not only for optimizing the operational efficiency of individual turbines and entire wind farms but also for ensuring their reliable integration into power grids, facilitating proactive maintenance strategies, and supporting informed decision-making in energy markets.

Despite its advantages, the inherent intermittency and variability of wind resources pose considerable challenges to the stable operation of power systems and the predictability of energy generation. To address these challenges, extensive research has been dedicated to developing sophisticated forecasting models. While traditional physics-based models provide foundational understanding, they often encounter limitations when dealing with the complex, non-linear dynamics characteristic of wind turbine operations and the diverse geographical and meteorological contexts in which they operate. In recent years, machine learning (ML) methodologies have gained significant traction as powerful alternatives, demonstrating a remarkable capacity to discern intricate patterns and relationships directly from historical operational data, thereby offering enhanced predictive accuracy.

The application of ML in the domain of wind energy is multifaceted, extending beyond simple power forecasting. Researchers have explored ML for comprehensive optimization of wind energy systems, including predictive maintenance through anomaly detection and the development of adaptive control systems to enhance energy capture based on real-time environmental and operational data (Udo et al., 2024). Such holistic approaches aim to reduce downtime and improve overall turbine performance significantly. For short-range wind power estimation specifically, ML has introduced novel techniques, including hybrid models that combine the strengths of different algorithms, such as generalized regression neural networks (GRNN) with optimization techniques like whale optimization, to improve forecasting accuracy and quantify uncertainty (Al-Samalek et al., 2024). These advancements are vital for the effective management of active power within wind energy systems.

Among the various ML paradigms, deep learning models, particularly those designed for sequential data, have shown considerable promise. Multilayer Long Short-Term Memory (LSTM) networks, for instance, have been effectively utilized for estimating active power by leveraging time-series data from SCADA (Supervisory Control and Data Acquisition) systems, adeptly capturing temporal dependencies and the influence of environmental factors (Çelebi & Karaman, 2023). A broader investigation into various neural network architectures—including Artificial Neural Networks (ANNs), Recurrent Neural Networks (RNNs), Convolutional Neural Networks (CNNs), in addition to LSTMs—has further confirmed the robustness of these approaches in wind power forecasting, with LSTMs often exhibiting superior performance due to their inherent ability to model long-term temporal relationships (Karaman, 2023). Comparative analyses of different ML techniques, such as feed-forward neural networks (often referred to as Backpropagation Neural Networks or BPNNs) and Support Vector Regression

(SVR), have also been conducted to evaluate their efficacy and provide a clearer understanding of their respective strengths and weaknesses in this application (Kannan, 2023).

Ensemble learning methods, which combine multiple learning algorithms to obtain better predictive performance, have also been a focal point of recent research. Advanced ML techniques including LightGBM, Random Forest (RF), CatBoost, and XGBoost have been evaluated for very-short-term wind power forecasting, demonstrating high accuracy crucial for real-time operational decisions and maintenance planning (Ponkumar et al., 2023). Furthermore, studies have specifically proposed and validated the use of models like Support Vector Regression (SVR) and Random Forest Regression (RFR) for forecasting wind energy production, highlighting the versatility and effectiveness of these established ML algorithms (Margarat et al., 2023).

Despite the considerable advancements in applying ML to wind power prediction, the optimal selection of input features, appropriate data preprocessing techniques, and the most suitable ML model architecture remain critical research questions that depend on specific dataset characteristics and application requirements. This study aims to contribute to this evolving field by conducting a systematic evaluation of three distinct regression models: Linear Regression, Random Forest Regressor, and Extra Trees Regressor. These models are applied to predict the active power output of a wind turbine using a multidimensional set of sensor data. Through rigorous data preprocessing, including handling missing values and removing redundant features, and by employing the coefficient of determination (R^2) for performance evaluation, this work seeks to elucidate the effectiveness of these models, particularly tree-based ensemble methods, in capturing the complex, non-linear relationships inherent in wind turbine operational data. The findings are intended to provide valuable insights for the development of intelligent, data-driven decision-making tools within the renewable energy sector.

Materials and Methods

This section details the methodology employed in this study to predict the active power output of a wind turbine using machine learning techniques. It encompasses a description of the dataset utilized, an overview of the data preprocessing steps undertaken, and a comprehensive explanation of the machine learning algorithms implemented and evaluated.

Dataset Description

The data utilized in this study was sourced from a publicly available dataset on the Kaggle platform, a well-known repository for data science projects and competitions. This dataset comprises time-series recordings of various operational and environmental parameters from a wind turbine. Such datasets, rich in sensor readings, are characteristic of those used in the monitoring and performance analysis of wind energy systems. While the exact provenance of this specific Kaggle dataset is not detailed here, similar datasets focusing on wind speed or energy system parameters have been foundational in numerous forecasting studies. For instance, research on long-term wind speed forecasting often relies on meteorological bureau data exhibiting periodic patterns and seasonal effects, which are then modeled using time-series techniques (Guo et al., 2010). Similarly, analyses of complex time-series data, including those from energy or environmental systems, frequently employ hybrid modeling approaches to capture both linear and non-linear dynamics (Zhang, 2003). The dataset employed herein includes 19 distinct features, such as ambient temperature, wind speed, rotor RPM, generator RPM, various component temperatures, blade pitch angles, and nacelle position, with "ActivePower" serving as the target variable for prediction.

Machine Learning Methods

Three distinct regression algorithms were selected and implemented to predict the active power output. These models were chosen to represent a range from simple linear approaches to more complex, non-linear ensemble methods. Each model was integrated into a Pipeline that included a StandardScaler step to standardize the input features, ensuring that all variables contribute equitably to the model training process, particularly for algorithms sensitive to feature magnitudes.

Linear Regression (LR)

LR is a fundamental statistical approach for modeling the linear relationship between a dependent variable (ActivePower) and one or more independent variables (input features). It assumes that the target variable can be predicted as a weighted sum of the input features. Despite its simplicity, LR serves as a crucial baseline for evaluating the performance of more complex models (Montgomery et al., 2021).

Random Forest Regressor (RF)

RF is an ensemble learning method that operates by constructing a multitude of decision trees at training time and outputting the mean prediction (regression) of the individual trees (Breiman, 2001). It is known for its robustness against overfitting, its ability to handle high-dimensional data, and its capacity to capture non-linear relationships. The inherent randomness introduced through bootstrap sampling of the data and random subset selection of features for splitting at each node contributes to its strong generalization performance.

Extra Trees Regressor (ET)

ET is another ensemble learning technique similar to Random Forest (Geurts et al., 2006). However, it introduces further randomization in the tree-building process. While RF considers the optimal split among a random subset of features, ET selects a split point completely at random for each randomly chosen feature and then picks the best split among these random splits. This increased randomness can sometimes lead to reduced variance and improved computational efficiency, often resulting in models with comparable or even superior predictive accuracy.

Findings and Discussion

This section presents the performance evaluation of the machine learning models developed for predicting the active power output of the wind turbine. The coefficient of determination (R^2) was employed as the primary metric to assess the predictive accuracy of the different regression algorithms. The findings reveal significant differences in the capabilities of these algorithms to model the wind turbine's power generation.

LR model, while successful in capturing the fundamental linear relationships within the dataset, achieved an R^2 score of 0.8978. This result indicates a substantial linear correlation between the input features and the active power output. However, it also suggests that the model was unable to account for the entirety of the variance present in the data, implying that the inherent non-linear interactions characteristic of wind turbine behavior limited the performance of this simpler linear approach.

In stark contrast, the ensemble learning methods, namely RF Regressor and ET Regressor, demonstrated markedly superior performance. The Random Forest Regressor achieved an R^2 score of 0.9962, while the ET Regressor attained a slightly higher R^2 score of 0.9967. These high R^2 values underscore the efficacy of tree-based ensemble models in effectively capturing

the complex, non-linear, and interactive relationships present in the operational and environmental data of the wind turbine. The aggregation of multiple decision trees, coupled with the principles of randomization in feature and data selection, allows these models to discern intricate patterns and subtle details within the dataset that are often missed by simpler models. The marginally better performance of the Extra Trees Regressor compared to Random Forest suggests that the additional level of randomization introduced in its tree-building process may have further enhanced the model's generalization capability for this particular dataset.

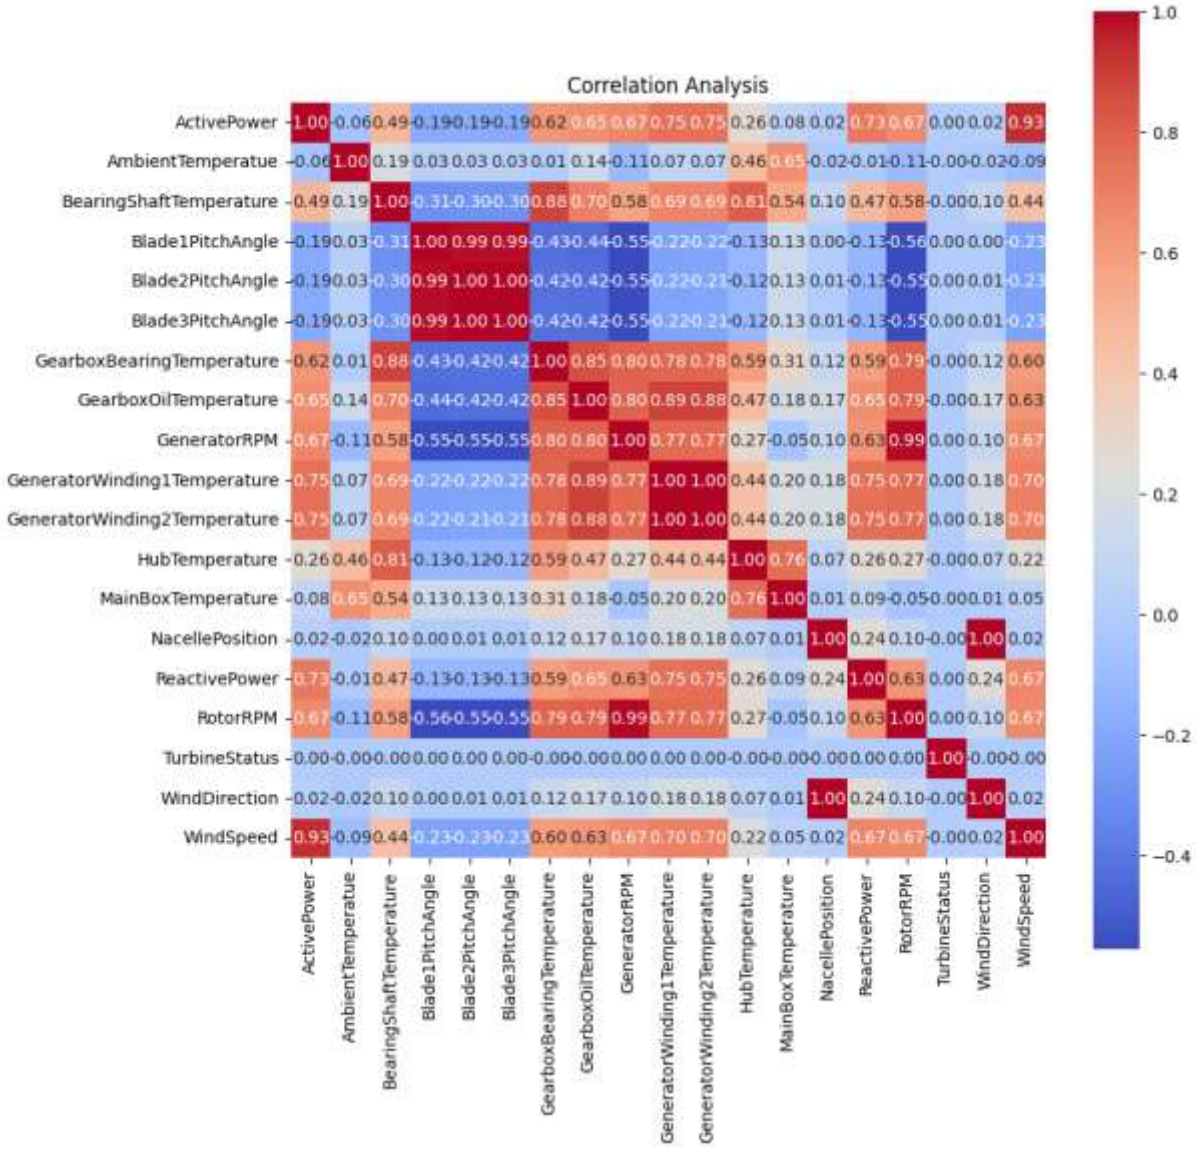

Figure 1. Correlation heatmap of dataset

The correlation heatmap presented in Figure 1 illustrates the linear relationships between the operational variables of the wind turbine. Several strong positive correlations are evident: for instance, a high correlation exists between ActivePower and WindSpeed (0.93), GeneratorRPM (0.67), and RotorRPM (0.67), indicating that as wind speed and rotational speeds increase, so does power generation. Similarly, various temperature measurements, such as GeneratorWinding1Temperature and GeneratorWinding2Temperature (1.00), and GearboxBearingTemperature with related component temperatures (e.g., 0.78 with

GeneratorWinding1Temperature), exhibit strong positive correlations, reflecting the interconnected thermal behavior of the system. As expected, Blade1PitchAngle, Blade2PitchAngle, and Blade3PitchAngle are almost perfectly correlated with each other (0.99-1.00). Some negative correlations are also observed; for example, RotorRPM shows negative correlations with Blade1PitchAngle (-0.56), Blade2PitchAngle (-0.55), and Blade3PitchAngle (-0.55). Similarly, the pitch angles also exhibit negative correlations with GeneratorRPM.

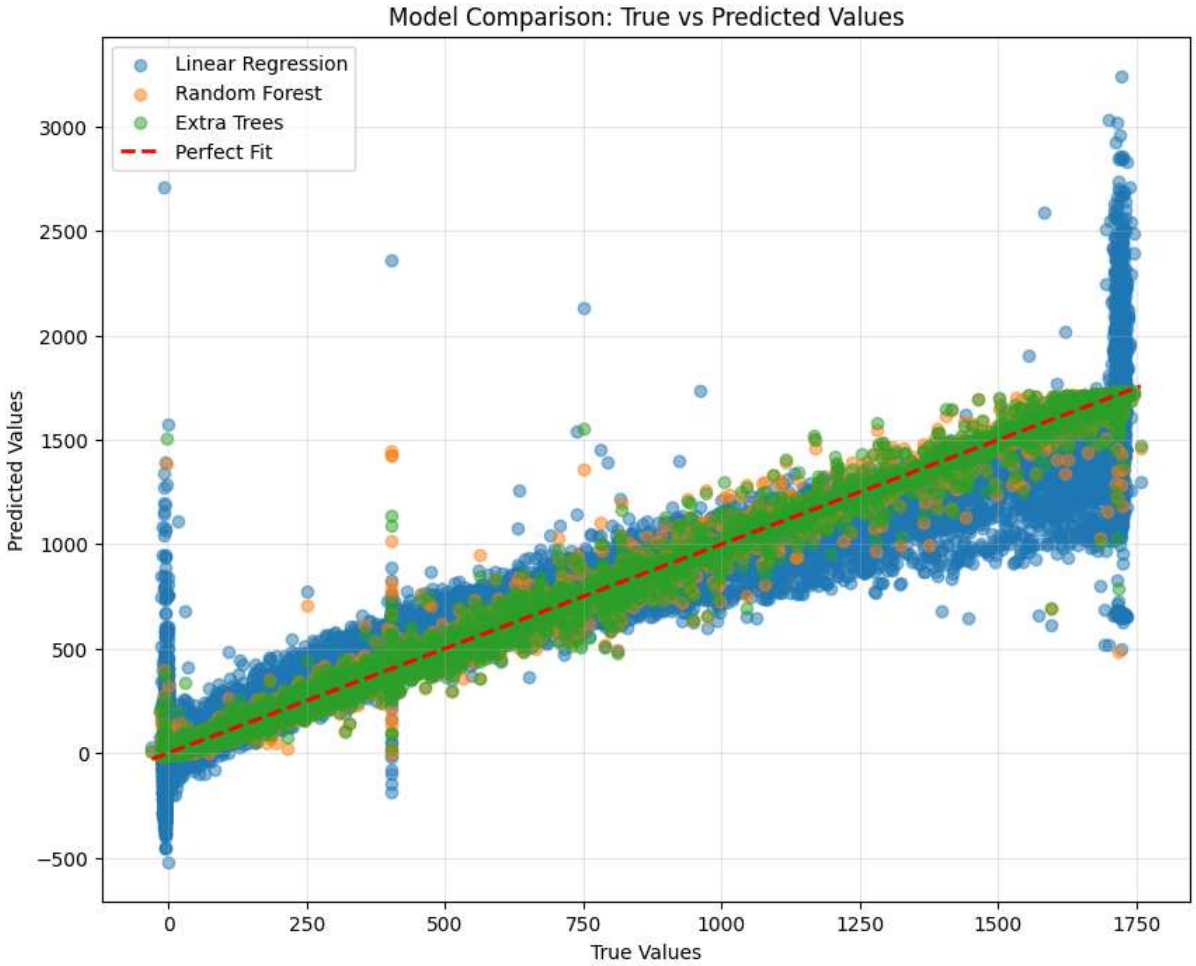

Figure 2. Scatter plot of true vs. predicted values

Figure 2 presents a scatter plot illustrating the relationship between the true active power values from the test set and the corresponding values predicted by the Linear Regression, Random Forest, and Extra Trees models. The red dashed line represents the ideal scenario where predicted values perfectly match true values (Y=X). It is visually apparent that the predictions from the Linear Regression model (blue markers) exhibit considerable scatter around this perfect fit line, indicating a higher degree of prediction error; notably, this model occasionally yields negative power predictions for low true active power values, which is physically implausible. In stark contrast, the predictions generated by the Random Forest (orange markers) and Extra Trees (green markers) models demonstrate a significantly tighter clustering around the perfect fit line. This closer alignment signifies a substantially higher predictive accuracy and a better ability to capture the underlying data patterns compared to Linear Regression. While both ensemble methods perform exceptionally well, the Extra Trees predictions appear

marginally more concentrated along the ideal line, consistent with its slightly superior R^2 score, visually corroborating the quantitative performance metrics and highlighting the superior capability of the ensemble-based regressors in accurately estimating active power output.

Conclusion and Recommendations

This study investigated the application of machine learning regression models for predicting the active power output of a wind turbine using multidimensional sensor data. Following essential preprocessing steps, including the removal of irrelevant features and imputation of missing values, three distinct regression algorithms were developed and evaluated: Linear Regression, Random Forest Regressor, and Extra Trees Regressor. The models were trained on selected input features encompassing environmental conditions and internal turbine operational metrics.

The performance evaluation, primarily based on the coefficient of determination (R^2), unequivocally demonstrated the superior efficacy of ensemble learning methods over the traditional linear approach. While Linear Regression achieved a respectable R^2 score of 0.8978, indicating its ability to capture a significant portion of the variance, the Random Forest and Extra Trees Regressors yielded substantially higher R^2 scores of 0.9962 and 0.9967, respectively. These results highlight the remarkable capability of tree-based ensemble models to effectively model the complex, non-linear relationships and interactions inherent in wind turbine operational data. The marginal performance advantage of the Extra Trees Regressor over Random Forest suggests that the increased randomization in its construction may contribute to slightly better generalization on this particular dataset. The visual analysis of predicted versus true values (Figure 2) further corroborated these quantitative findings, clearly illustrating the tighter clustering of predictions around the perfect fit line for the ensemble models compared to the more dispersed predictions of the Linear Regression model, which also exhibited a tendency for physically implausible negative power predictions at low actual power outputs.

The strong positive correlations observed in the heatmap (Figure 1) between Active Power and variables such as Wind Speed (0.93), Generator RPM (0.67), and Rotor RPM (0.67) underscore the physical drivers of power generation and affirm the relevance of these features in the predictive models. The high R^2 values obtained, particularly by the ensemble methods, confirm that machine learning regression models are powerful tools for estimating wind turbine active power output.

Based on these findings, the following recommendations are proposed for future work and practical application:

- Deployment of Ensemble Models: For operational active power forecasting in similar wind turbine systems, the deployment of Random Forest or Extra Trees Regressors is highly recommended due to their demonstrated high accuracy and robustness in handling complex data.
- Hyperparameter Optimization: While the default parameters yielded excellent results, further fine-tuning of the hyperparameters for the Random Forest and Extra Trees models (e.g., number of trees, tree depth, features per split) using techniques like GridSearchCV or RandomizedSearchCV could potentially lead to incremental performance gains.

- Exploration of Other Advanced Algorithms: Investigating other state-of-the-art machine learning algorithms, such as Gradient Boosting machines (e.g., XGBoost, LightGBM, CatBoost) or deep learning architectures (e.g., LSTMs, GRUs, or hybrid CNN-LSTMs, especially if finer-grained temporal dynamics are of interest), could offer further improvements or insights.
- Dynamic Feature Selection and Engineering: Future research could explore dynamic feature selection techniques or more advanced feature engineering to create interaction terms or time-lagged variables, which might capture more nuanced operational aspects.
- Uncertainty Quantification: While this study focused on point predictions, future work should incorporate methods for uncertainty quantification (e.g., prediction intervals) to provide a measure of confidence associated with the forecasts, which is crucial for risk assessment and decision-making in grid operations.
- Model Interpretability: For ensemble models, applying techniques like SHAP (SHapley Additive exPlanations) or LIME (Local Interpretable Model-agnostic Explanations) could provide deeper insights into feature importance and model decision-making processes, enhancing trust and understanding.
- Generalization Across Turbines and Conditions: Testing the developed models on data from different turbines, locations, or varying operational and environmental conditions would be essential to assess their generalization capabilities more broadly.

In conclusion, this study effectively demonstrates the significant potential of data-driven, machine learning approaches for modeling wind turbine behavior. The high predictive accuracy achieved by ensemble learning methods provides a solid foundation for developing intelligent decision-making systems in the renewable energy sector, contributing to more efficient energy production, improved grid management, and optimized wind turbine performance.

ABSTRACT

The widespread use of synthetic human voices generated through deep learning techniques has raised serious concerns regarding privacy, security, and misinformation, especially on social media platforms. These synthetic voices, produced using advanced Natural Language Processing (NLP) and Text-to-Speech (TTS) systems, are often indistinguishable from real human speech by the human ear. Consequently, they pose risks of identity misuse, defamation, and unjust accusations. This study presents a deep learning and machine learning (ML)-based framework to classify real and synthetic voices with high accuracy and reliability. The proposed method transforms audio signals into Mel-Frequency Spectrograms—a time-frequency representation that aligns with human auditory perception—serving as robust input for feature extraction via a pre-trained ResNet50 model. Features were extracted from the flatten layer of ResNet50, capturing high-level semantic representations of the input. To address class imbalance, data augmentation and class weighting strategies were applied. The extracted features were then evaluated using classical machine learning classifiers, including Random Forest (RF), k-Nearest Neighbors (KNN), and Support Vector Machine (SVM), to assess generalizability. Experimental results revealed that both the deep learning model and ML classifiers achieved high performance, with accuracy rates exceeding 95% across most methods. These findings highlight the effectiveness of combining Mel-spectrogram-based representations with deep and classical learning models in differentiating real from synthetic speech, offering a promising approach for audio integrity verification.

Introduction

The rapid advancement of synthetic voice technologies has enabled the production of fake voices, thereby increasing associated security risks. This situation has necessitated the development of new and effective solutions for distinguishing between synthetic and real voices. In particular, the recent emergence of software that clones human voices using deep learning (DL) and Natural Language Processing (NLP) techniques—and generates speech through Text-to-Speech (TTS) tools—has undermined the credibility of human voices shared on social media platforms (Amezaga& Hajek, 2022; Lyu, 2020; McUba et al. 2023; Xie et al., 2024; Tiwari et al., 2023).

In response to these emerging threats, recent studies have explored a range of approaches for detecting synthetic speech, from traditional machine learning methods to advanced DL-based architectures. These approaches can be broadly divided into two main categories: (1) Feature-based methods, which rely on handcrafted audio descriptors such as MFCCs, chroma features, and spectral centroids to train classifiers like Support Vector Machine (SVM) and XGBoost; and (2) End-to-end DL models, which learn patterns directly from raw or preprocessed audio using convolutional, recurrent, or hybrid neural networks. More recently, attention-based and contrastive learning architectures (e.g., GALIP, Siamese networks) have also been employed to improve generalization to unseen spoofing attacks (Oyuncu et al., 2024).

Table 1 presents an overview of recent approaches in synthetic voice detection. Bird and Lotfi (2023) utilized Extreme Gradient Boosting (XGBoost) trained on statistical audio features extracted from the DEEP-VOICE dataset, which includes real and RVC-transformed speech from eight celebrities. Their approach achieved a high classification accuracy of 99.3%. Oyuncu et al. (2024) proposed a hybrid DL architecture consisting of two convolution (Conv1D) layers followed by two Long Short-Term Memory (LSTM) layers. Trained on a balanced dataset containing 5,889 real and 5,889 fake samples, their model reached an accuracy of 99.2% and an F1-score of 99.2%.

Table 1. Literature comparison

Article	1. Method	2. Dataset	3. Performance Metrics
Bird & Lotfi (2023)	Extreme Gradient Boosting (XGBoost) based on statistical audio features	DEEP-VOICE (real + RVC-transformed speech from 8 celebrities)	Accuracy: 0.993
Oyuncu et al. (2024)	2 × Conv1D + 2 × LSTM hybrid network	Balanced dataset with 5,889 real and 5,889 fake samples	Accuracy: 0.992 F1-score: 0.992
Ballesteros et al. (2021)	CNN (2 Conv + Dense) + histogram-based input	2,092 original/imitation + 2,092 Deep Voice samples (train); 476 test samples	Global Accuracy: 0.985 Precision=0.997 Recall=0.997
Khan & Malik (2023)	Quick-SpoofNet – LSTM-based Siamese + Triplet loss + Euclidean metric	ASVspoof 2019-LA (train/test), cross-tested with ASVspoof 2021-DF and VSDC	Accuracy: 0.987

Ballesteros et al. (2021) employed a DL model based on Convolutional Neural Network (CNN) with two convolutional layers and a dense layer, using histogram-based input features. Their model, trained on 2,092 real/fake samples and an equal number of Deep Voice samples, achieved a global accuracy of 98.5%, with imitation detection precision and recall reaching 99.7%. Lastly, Khan and Malik (2023) introduced Quick-SpoofNet, a lightweight LSTM-based Siamese network trained with triplet loss and Euclidean distance. Evaluated on the ASVspoof 2019-LA dataset and cross-tested on unseen attacks from ASVspoof 2021-DF and VSDC, their system achieved an accuracy of 98.7% on previously unseen spoofing scenarios.

With the increasing accessibility of deepfake voice generation tools, voice spoofing detection has become a critical area of research. Techniques developed in the literature can be broadly categorized into traditional feature-based methods and modern DL-based approaches. While feature-based methods offer interpretability and efficiency, DL models provide superior performance on complex tasks. Nevertheless, several significant challenges persist. The rapid evolution of voice synthesis techniques often outpaces the capabilities of existing detection systems. Many models fail to generalize across datasets or spoofing types, particularly in scenarios involving partially manipulated speech.

In this study, a DL approach based on ResNet50 was used to detect synthetic speech. Audio signals were converted into Mel-spectrograms to make them suitable for 2D CNN input. Instead of using the final classification layer, features from the Flatten layer of ResNet50 were extracted and classified using traditional machine learning techniques. The study focused on synthetic speech generated by the TTS systems, particularly ElevenLabs. Given the limited size of the dataset, this hybrid approach serves as an initial investigation into combining DL-based feature extraction with classical classifiers for voice spoofing detection.

Materials and Methods

Dataset

In this study, the audio data were categorized into two classes: real and synthetic. As shown in Table 2, the real voice data consisted of 657 short audio files from 24 different individuals, obtained from the Common Voice Mozilla dataset (*https://commonvoice.mozilla.org/en/datasets*). Each audio file ranged from 3 to 9 seconds in duration, resulting in a total of 65.52 minutes of real voice recordings. The synthetic voice data were generated using the TTS tool available on the popular ElevenLabs platform, based on real human voice profiles. A total of ten voice profiles—five males and five females—were used. Each profile was assigned 20 short text inputs, generating synthetic audio samples with an average length of 15 seconds. Additionally, five long text inputs per profile were used to produce synthetic audio samples averaging 40 seconds in length. The total duration of synthetic voice recordings amounted to 78.97 minutes.

Table 2. Dataset information

Dataset/TTT Tool	4. Number of Voice Profiles	5. Number of Files	6. Total Duration (min)
Common Voice (Real data)	24	657	65.52
Elevenlabs (Fake/synthetic data)	10	248	78.97

There was a class imbalance within the dataset. Although the total audio durations of both classes were relatively close, a significant discrepancy existed in the number of files. To enable more effective learning by the model, it was aimed to increase the duration of each file in the real voice class. For this purpose, multiple audio files were concatenated to reduce the number of files while increasing the average audio duration from the 3–9 second range to approximately 15 seconds. The *Pydub* library was utilized for this operation, and as a result, the number of real voice files was reduced from 657 to 329. Although the duration of the audio samples was increased, the difference in the number of files remained. To address the imbalance in the dataset, the use of class weights was adopted. Class weights were calculated by applying an inverse proportionality between the number of files and a coefficient derived by multiplying the inverse with a scaling factor. As shown in Table 3, this approach significantly reduced the class imbalance and helped form a more balanced dataset for model training.

Table 3. Class weights of the dataset

Dataset/TTS Tool	7. Number of Files	8. Class Weight Coefficient
Common Voice	329	0.876
Elevenlabs	248	1.163

Data Processing

In this study, 2D visual representations of audio data were first generated using Mel-spectrograms, which are commonly used in audio processing due to their alignment with human auditory perception. A Mel-spectrogram is a time-frequency representation of a sound signal that maps energy intensity across different frequency bands using the Mel scale, which spaces frequencies more densely at lower ranges and more sparsely at higher ones, mirroring how humans perceive pitch. This transformation enables effective use of computer vision architectures, such as CNNs, for audio classification tasks.

As shown in Figure 1, the Mel-spectrogram of a real voice sample exhibits natural variations and consistent frequency patterns. In contrast, Figure 2 displays the Mel-spectrogram of a synthetic voice generated by a TTS system, revealing differences in spectral texture and energy distribution across time and frequency domains.

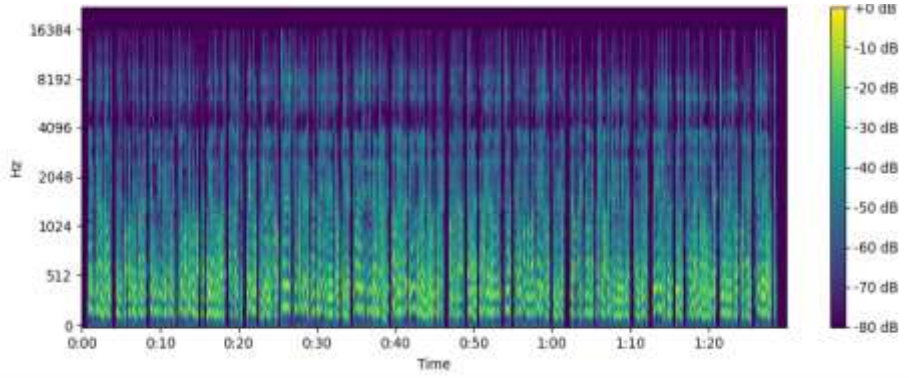

Figure 1. Mel-spectrograms of real voice

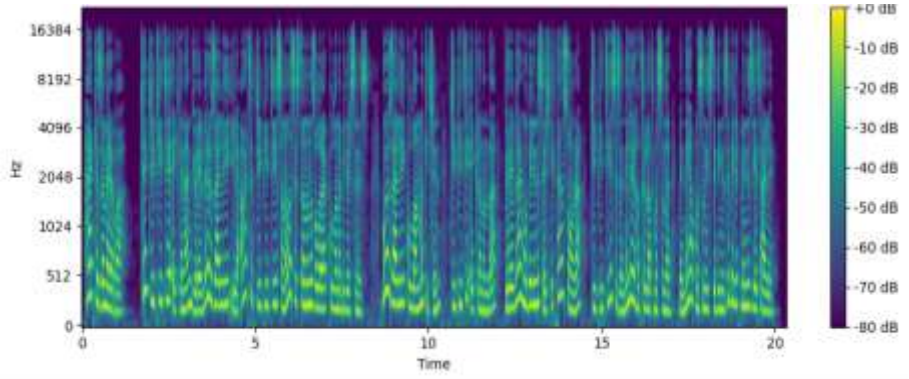

Figure 2. Mel-spectrograms of synthetic voice

Following Mel-spectrogram generation, a ResNet50 model was trained from scratch using these 2D representations. Once trained, feature vectors were extracted from the Flatten layer of the ResNet50 model. These deep features were then fed into traditional machine learning (ML) classifiers, including Random Forest (RF), k-Nearest Neighbors (KNN), and Support Vector Machine (SVM), to perform the final classification between real and synthetic voice samples. This hybrid architecture enabled the utilization of deep feature representations alongside interpretable and efficient ML classifiers.

Deep Learning Model

As illustrated in Figure 3, the DL framework used in this study is based on the ResNet50 architecture, a well-known CNN that introduces residual connections to facilitate the training of very deep networks. These shortcut connections allow gradients to flow more effectively through earlier layers, mitigating the vanishing gradient problem and enabling the model to learn more complex features.

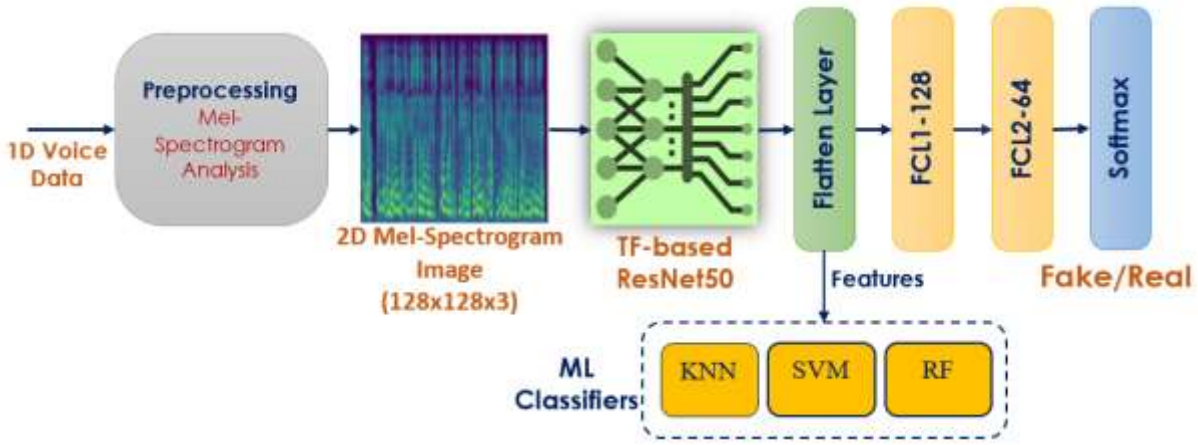

Figure 3. The proposed DL and DL-based ML classification framework

In this study, one-dimensional audio signals are first converted into 2D Mel-spectrogram representations to allow the use of image-based DL models. The generated spectrograms serve as input to the ResNet50 network, which processes them through multiple convolutional and residual blocks. Unlike conventional end-to-end classification pipelines, the focus here is on using the Flatten layer output of ResNet50 as a high-level feature vector. These extracted features are either passed through fully connected layers (FC1–128, FC1–64, and Softmax) or classified using ML algorithms such as k-Nearest Neighbors (KNN), Support Vector Machine (SVM), and Random Forest (RF). This dual-path setup enables performance comparison between pure DL-based classification and hybrid DL-based ML approaches.

In this study, SVM with an RBF kernel was used to capture non-linear relationships in the feature space and was configured to produce probabilistic outputs. RF leveraged an ensemble of 100 decision trees to enhance robustness and reduce overfitting by aggregating multiple decision paths. KNN classified each test sample based on the majority vote among its 3 nearest neighbors, offering a simple yet effective approach for local pattern recognition. All models were applied within a standardized pipeline using feature normalization for consistency.

The DL model was implemented using the Keras library with TensorFlow, and all training experiments were conducted in the Google Colab environment. ADAM optimizer was employed for the weights+biases values of DL model updates, configured with a learning rate of 0.0001 and a momentum coefficient of 0.9. The model was trained for 30 epochs with a batch size of 16. Additionally, data augmentation and class weighting were applied to enhance generalization and mitigate class imbalance during training. In the comparison of all models, accuracy, precision, recall, and F1-score metrics were used.

Result and Discussion

Table 4 presents a comprehensive comparison between the end-to-end DL model (ResNet50) and DL-based ML classifiers (KNN, SVM, RF). Among the ML models, the RF classifier achieved the highest overall performance with precision, recall, and F1-score all at 0.98, indicating strong discriminative capability and robustness to both false positives and false negatives. The KNN model also demonstrated balanced and consistent results, achieving 0.96 in all three metrics, which reflects its simplicity yet competitive performance when deep features are properly extracted. In contrast, the SVM model exhibited noticeable imbalance: it performed perfectly on the real class in terms of precision (1.00) but showed a significant drop in recall (0.78), suggesting a tendency to under-detect real samples. This trade-off led to a slightly lower overall F1-score (0.90) compared to other models. The ResNet50 model, trained

in an end-to-end manner, achieved 0.97 across all three evaluation metrics, confirming its strong generalization ability.

Table 4. The comparative performance results of the ResNet50-based DL model and DL-based ML classifiers

ML-Model	Class	Precision	Recall	F1-Score
KNN	Real	0.91	1.00	0.95
	Fake	1.00	0.92	0.96
	Overall	0.96	0.96	0.96
SVM	Real	1.00	0.78	0.88
	Fake	0.86	1.00	0.92
	Overall	0.92	0.91	0.90
RF	Real	0.96	1.00	0.98
	Fake	1.00	0.97	0.98
	Overall	0.98	0.98	0.98
ResNet50	Real	0.96	0.99	0.97
	Fake	0.98	0.94	0.96
	Overall	0.97	0.97	0.97

Figure 4 illustrates that RF achieved the highest accuracy (0.98), slightly outperforming ResNet50 (0.97) and KNN (0.96), while SVM showed the weakest performance with 0.91. These results suggest that RF and ResNet50 are more effective in distinguishing between real and synthetic voices based on accuracy alone.

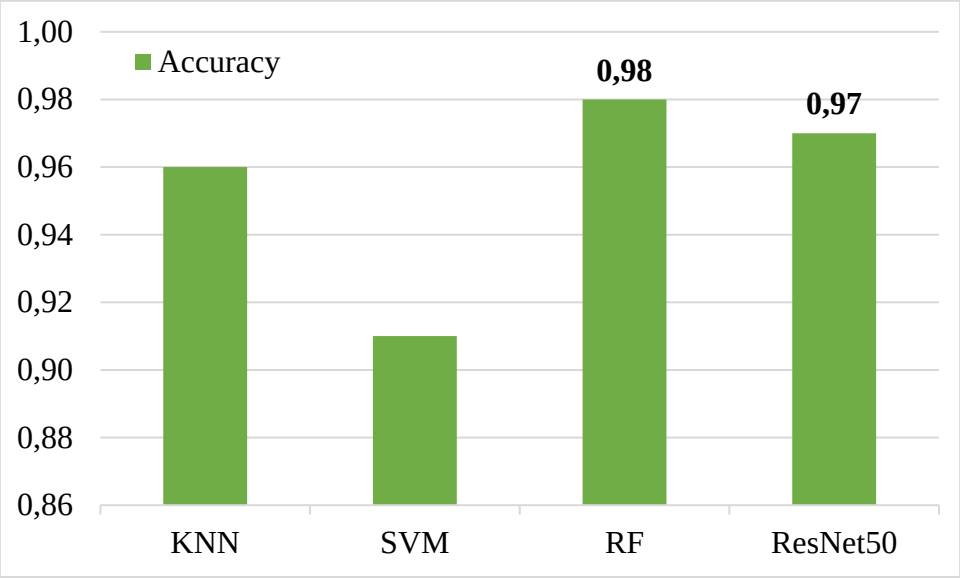

Figure 4. The accuracy values of the classifiers

Although the results obtained in this study are comparable to those reported in the literature, it is important to note that the dataset used was relatively small and specific to ElevenLabs-generated synthetic voices. Therefore, while the findings demonstrate strong model

performance, further validation on larger and more diverse datasets is necessary to confirm their generalizability.

Conclusion

This study demonstrated the effectiveness of deep learning-based approaches in distinguishing between real and synthetic voices, with a particular focus on audio generated by the ElevenLabs TTS system. Despite the limited dataset size, the proposed ResNet50-based architecture and ML classifiers yielded promising results. As part of future work, the dataset will be expanded by incorporating synthetic voices generated by various TTS platforms to improve generalization. Ultimately, the study aims to evolve into a web-based system capable of providing real-time audio authenticity analysis, offering practical value in detecting voice-based manipulations across digital platforms.

Acknowledgements

This study was carried out with publicly available voice datasets. Synthetic data were produced using Elevenlabs' creator version. Real voice samples were provided via the Common Voice Mozilla project.

ABSTRACT

The rising global life expectancy has led to a significant increase in the prevalence of neurodegenerative diseases, among which Alzheimer's Disease (AD) stands out as a major global health challenge. As AD is progressive and currently incurable, early and accurate diagnosis is crucial for timely intervention, slowing disease progression, and improving the quality of life for patients. In recent years, brain magnetic resonance imaging (MRI) combined with deep learning techniques has gained attention as a promising non-invasive tool for early diagnosis. In this study, we propose a deep learning-based model to classify AD and Cognitively Normal (CN) subjects using brain MRI data. The architecture employs the InceptionV3 convolutional neural network as a backbone for deep feature extraction. To investigate the effect of feature aggregation strategies on classification performance, six different pooling methods were systematically compared. These include traditional techniques such as Flatten, Global Average Pooling (GAP), and Global Max Pooling (GMP), as well as advanced mechanisms like Attention-based Pooling (AP), Learnable Weighted Pooling (LWP), and CBAM-based Pooling (CBAMP). All pooling strategies were followed by fully connected layers and a softmax classification layer. Experimental results showed classification accuracies ranging from 91% to 92%. Notably, LWP and CBAMP outperformed other methods in terms of generalization ability and computational efficiency by emphasizing discriminative spatial features. These findings demonstrate that incorporating learnable and attention-enhanced pooling operations improves feature representation, providing a more effective and compact alternative to conventional flattening strategies in AD classification tasks.

Keywords: Alzheimer's disease classification, attention mechanism, deep learning, pooling methods, learnable weighted pooling.

Introduction

Alzheimer's Disease (AD) is one of the most common neurodegenerative disorders, particularly affecting older adults. It causes memory loss, confusion, personality changes, and difficulties in daily functioning. AD is progressive and irreversible, meaning its symptoms gradually worsen over time. Pathologically, it is linked to the accumulation of amyloid-beta plaques and neurofibrillary tangles in the brain, which disrupt neural communication and lead to neuronal damage (Marzban et al., 2020; Dong et al., 2019). As healthcare advances and life expectancy increases, the global population is aging rapidly. By 2050, older adults are expected to represent over one-fifth of the world's population. This demographic shift is accompanied by a rise in age-related diseases, with AD standing out as a major public health concern due to its significant impact on memory, cognition, and independent living.

Early diagnosis is crucial in managing AD. Since there is no cure, identifying the disease at an early stage allows treatments that may delay progression, improve quality of life, and help families prepare for future care (Alsubaie et al., 2024; Huang et al., 2018). It also enables participation in clinical trials targeting early-stage AD. Neuroimaging plays a vital role in the diagnosis and monitoring of AD. It helps visualize structural, functional, and metabolic changes in the brain. Techniques such as Magnetic Resonance Imaging (MRI), Computed Tomography (CT), Positron Emission Tomography (PET), and Diffusion Tensor Imaging (DTI) provide valuable insights. Among them, MRI is the most widely used, offering high-resolution images to detect early signs of atrophy, particularly in the hippocampus. MRI is non-invasive, radiation-free, and widely accessible, making it suitable for longitudinal follow-up (Zhang et al., 2020; Amini et al., 2021; Chen et al., 2021).

In the past, machine learning (ML) methods have been used to classify neuroimaging data. These models often rely on handcrafted features—such as regional brain volumes or cortical thickness—selected by experts, and then classified using algorithms like Support Vector Machines (SVM) or Random Forest (Liu et al., 2018; Zaharchuk et al., 2018). However, these approaches require domain expertise, are time-consuming, and can suffer from reproducibility issues due to subjectivity in feature selection.

Recently, deep learning (DL) has emerged as a powerful approach for analyzing medical images. Among DL models, Convolutional Neural Networks (CNNs) have demonstrated the ability to automatically learn complex spatial features from raw MRI data without the need for manual feature engineering (Krizhevsky et al., 2012; LeCun et al., 2015; Yapici et al., 2022; Karakis et al., 2023). CNNs have achieved high accuracy in AD classification tasks, effectively distinguishing between AD, Mild Cognitive Impairment (MCI), and Cognitively Normal (CN) individuals.

To address the common limitation of insufficient training data in medical imaging, especially in AD classification, many studies have adopted transfer learning. In this approach, CNN architectures pretrained on large-scale datasets such as ImageNet are fine-tuned on domain-specific medical datasets. Popular architectures such as VGG (Simonyan & Zisserman, 2014), ResNet (He et al., 2016), DenseNet (Huang et al., 2017), Inception (Szegedy et al., 2016), and EfficientNet (Tan & Le, 2019) have been widely used for this purpose.

Several studies have demonstrated the effectiveness of transfer learning in AD research. Ashraf et al. (2021) evaluated DenseNet, ResNet, and Inception on the ADNI dataset comprising 379 subjects classified as AD, MCI, or CN. DenseNet achieved the highest accuracy (99.05%) in the three-class classification task, followed by ResNet50 and Inception. Similarly, Savaş et al.

(2022) applied EfficientNet variants to 4306 sagittal T1-weighted MRI images from ADNI and reported that EfficientNetB0 and B3 yielded the best results.

Arafa et al. (2024) used VGG16 with transfer learning on the Kaggle Alzheimer's classification dataset, achieving 97.44% accuracy in differentiating AD from CN. They also employed various data augmentation techniques to improve model generalization. Further improvements were reported by Sertkaya et al. (2024), who extracted features using VGG16 and applied Minimum Redundancy Maximum Relevance (MRMR) for feature selection on the OASIS-2 dataset, achieving 98.6% accuracy.

Mahmud et al. (2024) also used the OASIS-2 dataset and developed an ensemble of pretrained models. By applying extensive augmentation strategies to mitigate class imbalance, they achieved 96% classification accuracy. Collectively, these studies underscore that transfer learning significantly enhances the performance of CNN-based models for AD classification, particularly when dealing with limited or imbalanced datasets.

In our previous study, we conducted a five-class classification of neurodegenerative stages—Cognitively Normal (CN), Early Mild Cognitive Impairment (EMCI), Mild Cognitive Impairment (MCI), Late Mild Cognitive Impairment (LMCI), and AD—using transfer learning-based CNN models (ResNet50, DenseNet121, and InceptionV3) across three MRI views (axial, coronel, sagittal) (Gurkahraman et al., 2025). Without applying data augmentation, all models achieved high accuracy (ranging from 0.9158 to 0.9246), with the sagittal view yielding slightly better results. However, consistent with prior research, the models struggled to differentiate CN from EMCI, emphasizing the need for enhanced strategies to detect early-stage cognitive decline.

Despite these promising results, the reliability of transfer learning models in clinical practice still depends on data quality, class balance, and appropriate preprocessing. Although data augmentation increases sample diversity at the pixel level, it does not replicate true pathological variation, which limits generalizability in real-world applications. Therefore, continuous efforts are needed to evaluate and improve transfer learning models for AD classification under more realistic clinical conditions.

In addition to addressing data challenges, another important factor influencing classification performance is the choice of pooling strategy, particularly at the transition point from feature extraction to classification. In conventional deep learning pipelines, methods such as Flatten, Global Average Pooling (GAP), and Global Max Pooling (GMP) are commonly used to aggregate spatial feature maps before classification. However, these standard approaches may not always capture the most discriminative aspects of the learned features.

In this study, we investigated the role of pooling strategies specifically at the final feature aggregation stage, following feature extraction and just before classification. Our aim was to evaluate how different pooling methods influence classification outcomes in the context of AD stage discrimination. By comparing traditional and alternative pooling techniques, we sought to identify configurations that enhance model generalization and robustness in clinically relevant settings. Building upon our recent binary classification study involving AD and CN subjects, we systematically compared six pooling strategies—Flatten, GAP, GMP, Attention-based Pooling (AP), Learnable Weighted Pooling (LWP), and Convolutional Block Attention Module-based Pooling (CBAMP). The results demonstrated that LWP and CBAMP yielded superior generalization and computational efficiency by emphasizing salient spatial features, highlighting the value of adaptive pooling mechanisms in medical image analysis.

Material and Methods

In this study, axial-view MRI slices from the Alzheimer's Disease Neuroimaging Initiative (ADNI) dataset (https://adni.loni.usc.edu/) were used, as illustrated in Figure 1. The dataset includes T1-weighted MPRAGE scans from two diagnostic categories: CN and AD. A total of 36,859 axial slices were extracted—18,476 from AD cases and 18,383 from CN cases.

The original MRI scans were provided in DICOM format and were first converted into 3D NIfTI volumes during preprocessing. From each subject, between 90 and 120 axial slices were selected and saved as individual 2D images for subsequent analysis.

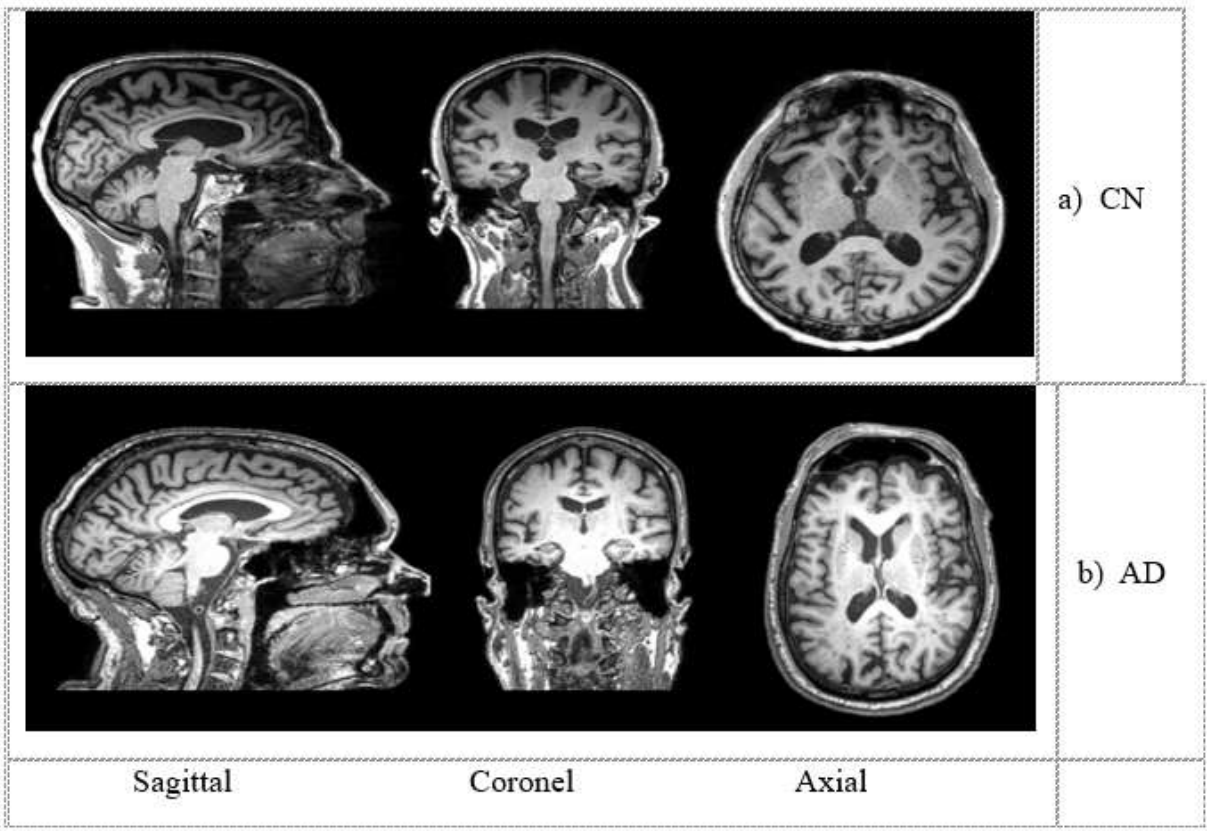

Figure 1. Example MRI images from ADNI, depicting CN and AD cases across three anatomical views: sagittal, coronal, and axial (Gurkahraman et al., 2025)

The proposed model processes 2D axial MRI slices (256×256 pixels) using an InceptionV3-based architecture, as shown in Figure 2. We selected InceptionV3 due to its demonstrated superiority in medical image analysis, particularly its multi-scale feature extraction capability through parallel convolutional pathways (1×1, 3×3, and 5×5 filters with dimensionality-reduction bottlenecks), which outperformed alternative architectures in our previous neuroimaging studies (Gurkahraman et al., 2025). As illustrated in Figure 3, the InceptionV3 architecture consists of three distinct types of modules—namely, Module A, Module B, and Module C—each designed to enhance multi-scale feature extraction (Szegedy et al., 2016). Module A focuses on reducing computational cost by using 1×1 convolutions followed by 3×3 convolutions and includes an average pooling branch. This configuration allows the model to capture local spatial information efficiently. Module B employs factorization into smaller convolutions, such as 1×7 and 7×1, which reduces the number of parameters and enables deeper and wider networks without increasing complexity. Module C further refines spatial feature

learning by separating convolutions into 1×3 and 3×1 operations, effectively improving learning capacity with fewer computations. Each module ends with a filter concatenation step, combining outputs from parallel branches to form a rich multi-scale feature representation (Szegedy et al., 2016). These modules collectively improve the network's ability to capture hierarchical features relevant to AD classification from 2D axial MRI slices.

As shown in Figure 2, the InceptionV3 based DL model evaluates six feature aggregation approaches: Flatten, GAP, GMP, AP, LWP, and CBAMP. Extracted features pass through two fully connected layers (256 → 128 neurons) before Softmax classification (CN vs. AD). The network was trained end-to-end on ADNI-derived slices, with InceptionV3 initialized using pre-trained ImageNet weights and subsequently fine-tuned to optimize performance on the target domain.

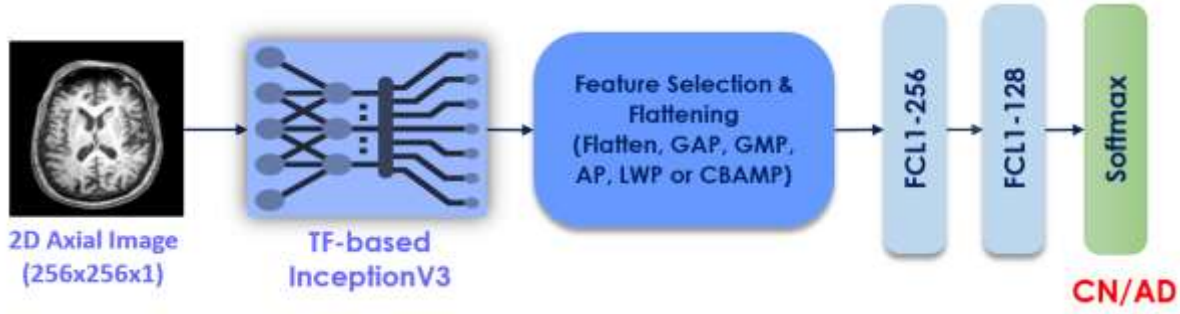

Figure 2. The proposed InceptionV3-based DL model

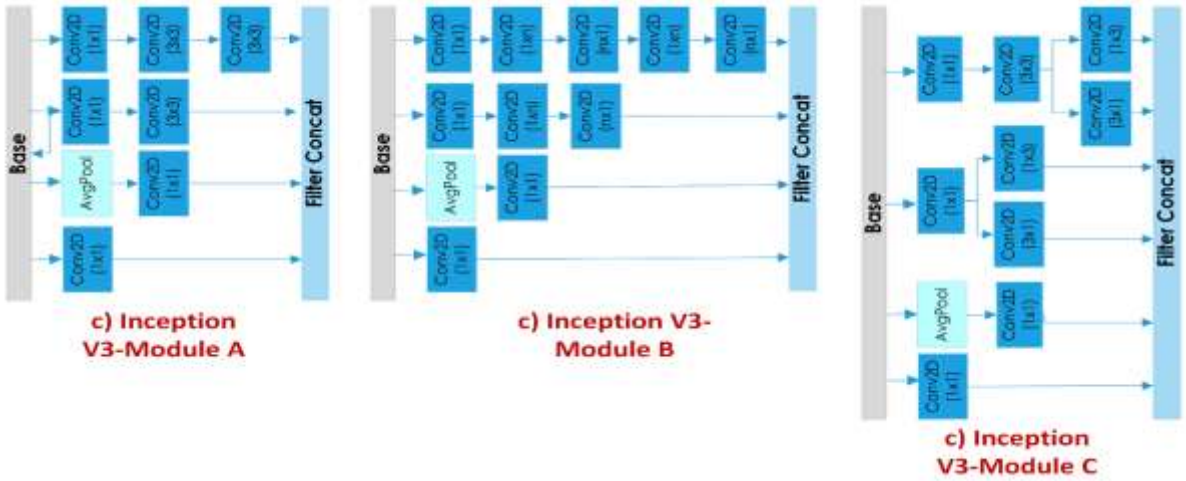

Figure 3. The modules of InceptionV3

The model was implemented using Keras with a TensorFlow backend in a Python 3.9 environment. All experiments were conducted on a workstation equipped with an Intel i9-12900KS CPU (3.40 GHz), an NVIDIA RTX A6000 GPU (48 GB), and 64 GB of RAM. Model optimization was performed using the Adam optimizer with binary cross-entropy as the loss function. To prevent overfitting, both dropout (0.3) and L2 regularization techniques were applied. Training was carried out for 200 epochs with a batch size of 32. The learning rate was set to 0.0001, momentum was fixed at 0.9, and weight decay was set to 0.00001. Model

performance was evaluated using standard classification metrics, including accuracy, specificity, precision, recall, and F1-score.

***Feature Aggregation Methods**:* In this study, six pooling types (Flatten, GAP, GMP, AP, LWP, and CBAMP) were used between feature extraction and classification layers.

Flatten Layer: This method converts the entire feature map $F \epsilon \mathbb{R}^{HxWxC}$ into a 1D vector. Although simple, it significantly increases the number of parameters and may lead to overfitting.

Global Average Pooling (GAP): For each channel *c*, GAP computes the average value over all spatial locations (Eq. 1):

$$GAP_c = \frac{1}{\mathrm{H}\times\mathrm{W}} \sum_{i=1}^{H} \sum_{j=1}^{W} F_{i,j,c} \quad (1)$$

GAP reduces dimensionality and enhances generalization while preserving spatial context.

Global Max Pooling (GMP): For each channel *c*, GMP selects the maximum value across the spatial dimensions (Eq. 2):

$$GMP_c = \max_{i,j} F_{i,j,c} \quad (2)$$

GMP emphasizes the most salient features and is robust to noise.

Attention Pooling (AP): A learnable attention map $\alpha_{i,j} \in [0,1]$ is applied to weigh each spatial location (Eq. 3):

$$AP_c = \sum_{i=1}^{H} \sum_{j=1}^{W} \alpha_{i,j} F_{i,j,c} \quad (3)$$

Attention weights are typically learned via auxiliary convolutional layers.

Learnable Weighted Pooling (LWP): Instead of soft attention, a set of trainable weights $w_{i,j}$ is applied directly to each spatial position (Eq. 4):

$$LWP_c = \sum_{i=1}^{H} \sum_{j=1}^{W} w_{i,j} F_{i,j,c} \quad (4)$$

LWP allows the model to focus on informative regions while suppressing irrelevant ones.

CBAM-based Pooling (CBAMP): The CBAM applies sequential attention along channel and spatial dimensions. Channel attention M_c is computed as in Eq. 5:

$$M_c = \sigma(MLP(AvgPool(F)) + MLP(MaxPool(F))) \quad (5)$$

followed by spatial attention M_s computed from the concatenated average and max maps across channels. The final feature map becomes (Eq. 6):

$$F' = M_c F;\ F'' = M_s F' \quad (6)$$

where M_s is computed by $M_s = \sigma(Conv3D([F_{avg}, F_{max}]))$.

The dual attention in the CBAMP answers both *"what to focus on"* and *"where to focus"*.

Results and Discussion

Table 1 and Figure 4 summarize the classification performance of various pooling types integrated into the proposed deep learning model. Among the methods evaluated LWP achieved the highest overall performance with an accuracy of 0.9227 and F1-score of 0.9275. It also demonstrated superior precision (0.8831) and specificity (0.8674), indicating its robustness in both identifying true positives and minimizing false positives. CBAMP also performed strongly, with an accuracy of 0.9213 and the highest F1-score after LWP (0.9264). Its balance between recall (0.9785) and specificity (0.8627) suggests effective attention allocation across spatial and channel dimensions. GMP followed closely, highlighting its ability to extract dominant features, with a respectable accuracy (0.9209). In contrast, the Flattening method, while yielding a relatively high recall (0.9825), suffered from the lowest specificity (0.8451), indicating possible overfitting due to the high number of parameters. Overall, traditional methods such as Flatten, GAP, and GMP showed relatively lower metrics, indicating that attention-based and learnable pooling strategies contribute more effectively to feature aggregation and classification performance.

Table 1. The performance results of the pooling types

Pooling Type	Accuracy	Specificity	Precision	Recall	F1-score
Flatten	0.9147	0.8451	0.8667	0.9825	0.9210
GAP	0.9183	0.853	0.8727	0.9820	0.9241
GMP	0.9209	0.8591	0.8772	0.9812	0.9263
AP	0.9181	0.8627	0.8789	0.9720	0.9232
CBAMP	**0.9213**	**0.8627**	**0.8797**	**0.9785**	**0.9264**
LWP	**0.9227**	**0.8674**	**0.8831**	**0.9766**	**0.9275**

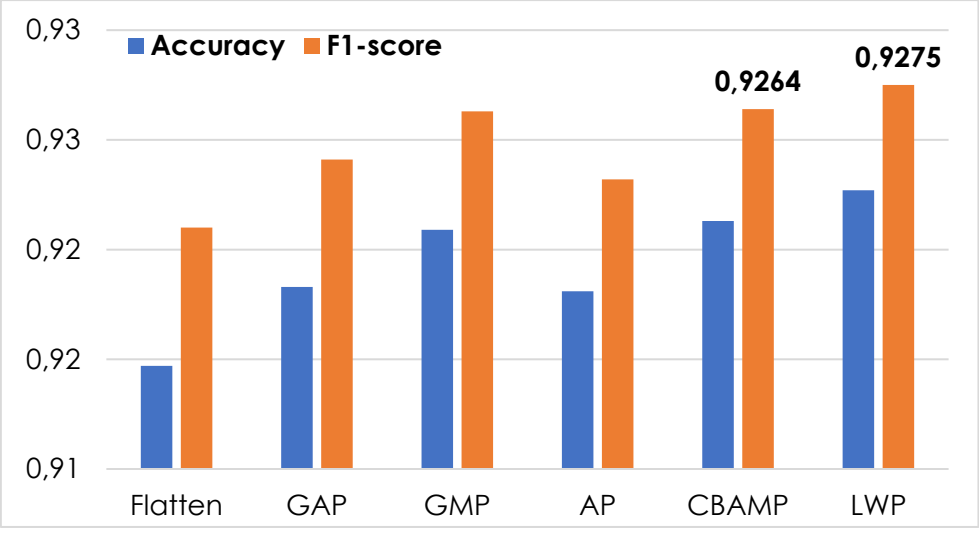

Figure 4. Comparison of pooling types based on Accuracy and F1-score

Figure 5 illustrates the confusion matrices corresponding to each pooling method. The LWP-based model achieved the highest true positive count for AD classification (3146), followed closely by CBAMP (3129). These results indicate that attention-driven or learnable pooling mechanisms enhance the model's ability to distinguish between CN and AD cases. In contrast, the Flatten method showed a notable number of false negatives (562), suggesting limited generalization in complex scenarios.

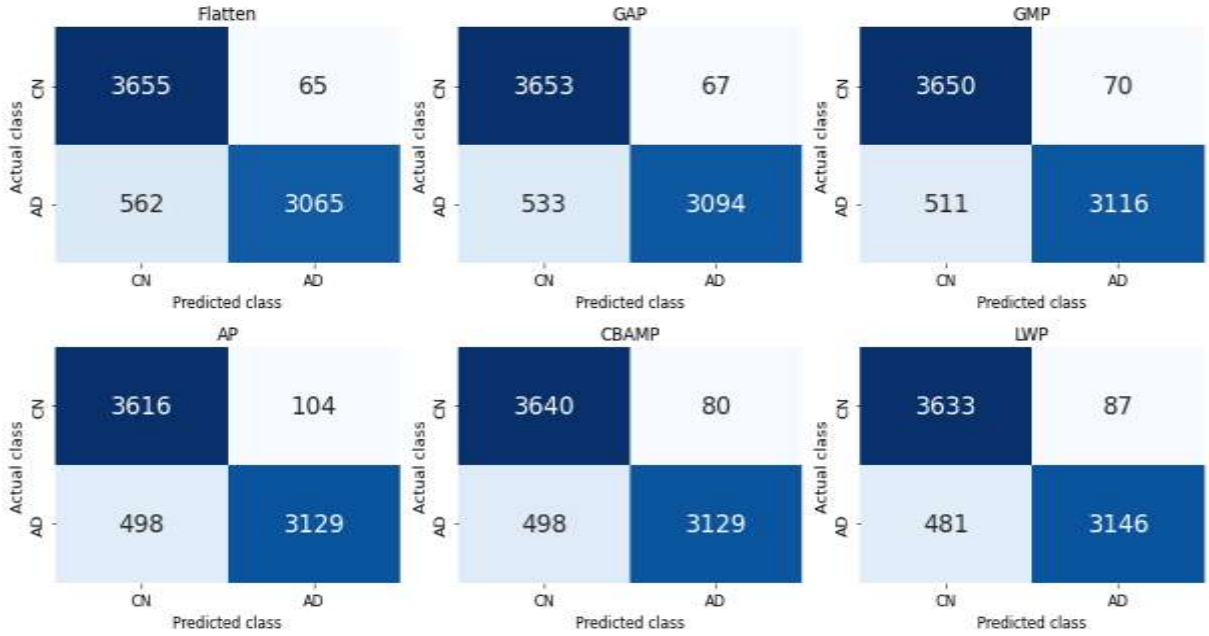

Figure 5. Confusion matrices of the pooling types for CN/AD classes.

In our previous study (Gurkahraman et al., 2025), we performed a five-class classification of neurodegenerative stages (CN, EMCI, MCI, LMCI, and AD), using transfer learning-based CNN models, including InceptionV3, across three MRI views (axial, coronal, sagittal). Among these, the sagittal view yielded slightly superior results; however, the axial view also performed competitively, with InceptionV3 achieving an accuracy of 0.9212 and an F1-score of 0.9178. Notably, that study did not apply subject-level separation between training and testing sets, which is a common limitation also observed in several Kaggle-based studies in the literature (Ashraf et al., 2021; Savaş et al., 2022; Arafa et al., 2024; Sertkaya et al., 2024). This lack of subject independence may have led to inflated performance metrics due to data leakage.

In contrast, the current study adopts a more rigorous and clinically realistic approach by performing subject-level train-test splitting using the ADNI dataset. Focusing on binary classification (CN vs. AD) with axial MRI slices, we again utilized the InceptionV3 backbone but enhanced it with advanced pooling strategies. The LWP-based configuration outperformed all others, achieving an accuracy of 0.9227 and an F1-score of 0.9275. Despite the reduced class complexity, this subject-independent setup provides more reliable insights into the model's generalization ability, highlighting the effectiveness of learnable pooling mechanisms in realistic clinical scenarios.

Conclusion

In this study, we investigated the impact of different feature aggregation strategies on AD classification using axial-view MRI slices and a transfer learning-based InceptionV3 model.

Among the evaluated methods, the LWP and CBAM-based pooling approaches significantly outperformed conventional techniques such as Flatten, GAP, and GMP, demonstrating superior classification performance and generalization capability. Importantly, the use of subject-level train-test splitting in this study ensured a more realistic and clinically relevant evaluation compared to prior works. In future studies, we aim to extend this analysis to multi-class classification scenarios involving early-stage cognitive decline and to explore multi-view and multimodal data fusion strategies.

ABSTRACT

In this study, zinc oxide (ZnO) nanoparticles were synthesized via a low-temperature solution method and doped with cobalt (Co^{2+}) and iron (Fe^{3+}) ions. The effects of these dopants on the crystal structure, surface morphology, and optical properties of ZnO were systematically investigated using X-ray diffraction (XRD), scanning electron microscopy (SEM), UV-Visible spectroscopy, and photoluminescence (PL) analysis.

XRD results confirmed that all samples retained a hexagonal wurtzite crystal structure. The incorporation of dopants resulted in a reduction of crystallite size and slight shifts in lattice parameters. SEM images revealed a transition from the uniform, spherical morphology of pure ZnO to more porous and dispersed structures in doped samples.

Optical analysis showed a notable narrowing of the bandgap and a red shift in absorption edges for Co and Fe doped ZnO, indicating enhanced absorption in the visible region. PL spectra demonstrated that the dopants significantly influenced photon emission behavior by introducing surface defects.

These findings suggest that Co and Fe doped ZnO nanoparticles have promising potential for enhancing light absorption in solar cell applications, contributing to the development of cost-effective and environmentally friendly photovoltaic materials.

Introduction

Zinc oxide (ZnO), a wide-bandgap semiconductor with a direct energy gap of approximately 3.3 eV, has garnered considerable attention due to its unique optical, electrical, and chemical properties, making it suitable for a wide range of applications including optoelectronics, sensors, and photocatalysis (Özgür et al., 2005). Among these applications, dye-sensitized solar cells (DSSCs) stand out as a promising and cost-effective alternative to traditional silicon-based photovoltaics, with ZnO being frequently explored as a photoanode material due to its high electron mobility and ease of synthesis (Keis et al., 2002).

However, the practical efficiency of ZnO in DSSCs is often limited by its wide bandgap and insufficient visible-light absorption. One of the effective strategies to overcome this limitation is doping with transition metal ions such as cobalt (Co^{2+}) and iron (Fe^{3+}). Doping can introduce intermediate energy levels into the band structure, facilitate enhanced light absorption in the visible region, and modify the electronic and defect structures, potentially improving charge transport and separation (Singh et al., 2013; Babu et al., 2018).

In this context, the present study aims to investigate the structural and optical properties of Co- and Fe-doped ZnO nanoparticles synthesized via a low-temperature aqueous solution method. The influence of dopants on crystallinity, morphology, bandgap energy, and photoluminescence behavior is examined. Furthermore, the suitability of these doped materials for use in DSSCs is evaluated by fabricating and testing complete devices. The outcomes of this work may contribute to the design of more efficient and environmentally sustainable photoanode materials for next-generation photovoltaic technologies.

Experimental Part

Synthesis of Undoped and Doped ZnO Nanoparticles

ZnO nanoparticles were synthesized via a low-temperature aqueous solution method. Zinc acetate dihydrate [$Zn(CH_3COO)_2 \cdot 2H_2O$] was used as the zinc precursor, and sodium hydroxide (NaOH) was added dropwise under continuous stirring to adjust the pH and initiate nanoparticle formation. For doped samples, cobalt nitrate hexahydrate [$Co(NO_3)_2 \cdot 6H_2O$] or ferric nitrate nonahydrate [$Fe(NO_3)_3 \cdot 9H_2O$] was added to achieve a 2 mol% doping concentration with respect to Zn^{2+}. The resulting mixtures were aged at 60 °C for 3 hours, centrifuged, washed with deionized water and ethanol, and then dried at 80 °C for 12 hours.

Characterization Techniques

Structural characterization was carried out using X-ray diffraction (XRD) with Cu Kα radiation ($\lambda = 1.5406$ Å) to analyze the crystal structure and phase purity. Surface morphology and elemental composition were investigated by scanning electron microscopy (SEM) equipped with energy-dispersive X-ray spectroscopy (EDX). UV–Visible spectroscopy was performed to assess optical absorption in the 200–800 nm range, while photoluminescence (PL) measurements were conducted at room temperature using a 325 nm excitation wavelength.

Fabrication of Dye-Sensitized Solar Cells (DSSCs)

The DSSCs were constructed in a sandwich-type configuration: FTO/ZnO (or doped ZnO)/N719 dye/I^-–I_3^- electrolyte/Pt/FTO.

The synthesized ZnO, Co-doped ZnO, and Fe-doped ZnO nanoparticles were each dispersed in ethanol and ultrasonicated to form a homogeneous slurry. The slurries were doctor-bladed onto cleaned fluorine-doped tin oxide (FTO) glass substrates and sintered at 450 °C for 30 minutes

to form mesoporous photoanode films. After cooling, the films were immersed in a 0.5 mM ethanol solution of N719 dye (cis-bis(isothiocyanato)bis(2,2'-bipyridyl-4,4′-dicarboxylato)ruthenium(II)) for 24 hours to facilitate dye sensitization.

Counter electrodes were prepared by coating FTO substrates with platinum paste followed by annealing at 400 °C for 15 minutes. The working and counter electrodes were assembled using a hot-melt Surlyn spacer, and an iodide/triiodide-based liquid electrolyte was injected between them. The J–V characteristics were measured under simulated solar light (AM 1.5G, 100 mW/cm²) using a digital source meter.

Results and Discussion

Figure 1 presents the X-ray diffraction (XRD) patterns of pure ZnO, Co-doped ZnO, and Fe-doped ZnO nanoparticles synthesized via a sol-gel method. The diffraction peaks of the undoped ZnO correspond well to the hexagonal wurtzite structure (JCPDS Card No. 36-1451), with prominent reflections observed at approximately 31.7°, 34.4°, and 36.2° corresponding to the (100), (002), and (101) planes, respectively.

Upon doping with cobalt and iron, the main peaks of ZnO are retained, indicating that the wurtzite structure is preserved. However, slight peak shifts are observed in both doped samples: towards higher 2θ in Co-doped ZnO and towards lower 2θ in Fe-doped ZnO. These shifts can be attributed to lattice distortion due to substitution of Zn^{2+} ions (ionic radius ~0.74 Å) with Co^{2+} (~0.72 Å) and Fe^{3+} (~0.64 Å), affecting the unit cell parameters.

In addition, peak broadening is noted in the doped samples, suggesting a slight reduction in crystallite size. According to the Scherrer equation, the crystallite sizes were calculated to be approximately 22.0 nm for ZnO, 20.4 nm for Co-doped ZnO, and 20.9 nm for Fe-doped ZnO. The relatively small decrease in crystallite size may be associated with mild strain and lattice disorder induced by dopant incorporation.

Minor secondary peaks around 36.8° and 42.3° in the Co-doped sample, and at ~33.2° and 35.6° in the Fe-doped sample, may correspond to secondary phases such as Co_3O_4 or Fe_2O_3, indicating limited solubility or surface precipitation at higher doping levels.

These findings confirm successful doping of ZnO with Co and Fe, with minor structural distortions and modest changes in crystallite size, while preserving the fundamental wurtzite structure.

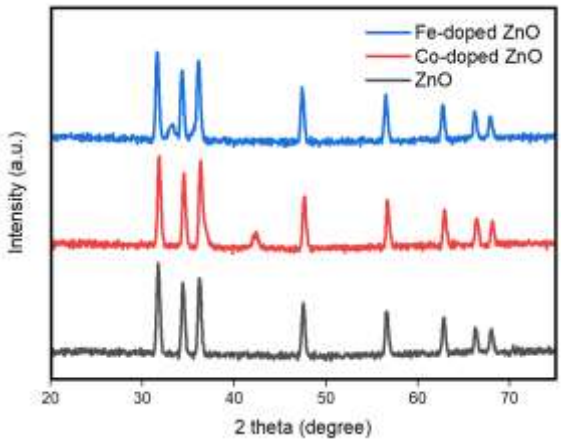

Figure 1. XRD patterns of pure ZnO, Co-doped ZnO, and Fe-doped ZnO nanoparticles.

Figure 2 illustrates the energy-dispersive X-ray spectroscopy (EDX) spectra of pure ZnO, Co-doped ZnO, and Fe-doped ZnO nanoparticles. The EDX spectrum of pure ZnO reveals prominent peaks corresponding to zinc (Zn) at approximately 1.0 keV (Lα) and 8.6 keV (Kα), along with a characteristic oxygen (O) peak at around 0.52 keV, confirming the elemental composition of ZnO.

In the spectrum of Co-doped ZnO, additional peaks appear near 0.78 keV and 6.9 keV, which can be attributed to cobalt (Co) Lα and Kα lines, respectively. Similarly, the Fe-doped ZnO spectrum exhibits distinct iron (Fe) peaks around 0.71 keV and 6.4 keV, corresponding to Fe Lα and Kα emissions. These additional peaks validate the successful incorporation of cobalt and iron dopants into the ZnO matrix.

No unexpected elements or significant contaminations were detected, indicating the chemical purity of the samples. The relative intensity of dopant-related peaks is lower than that of Zn and O, which is consistent with the low dopant concentration used in synthesis. Overall, the EDX results are in good agreement with the intended stoichiometry and confirm the elemental distribution within the nanoparticles.

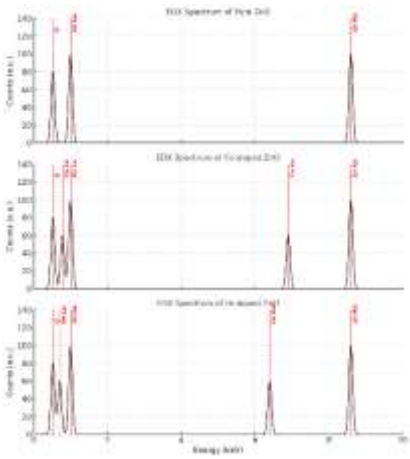

Figure 2. EDX spectra of pure ZnO, Co-doped ZnO, and Fe-doped ZnO nanoparticles.

Figure 3 shows the UV–Vis absorption spectra of pure ZnO, Co-doped ZnO, and Fe-doped ZnO nanoparticles recorded in the wavelength range of 200–700 nm. All samples display strong absorption in the UV region, with a steep absorption edge typical of ZnO due to its wide direct band gap and excitonic effects.

The absorption edge for pure ZnO is located around 360 nm, corresponding to an optical band gap of approximately 3.44 eV. Upon doping with cobalt and iron, the absorption edges are red-shifted toward longer wavelengths (~370 nm for Co-doped ZnO and ~380 nm for Fe-doped ZnO), indicating a reduction in band gap energies to ~3.35 eV and ~3.26 eV, respectively. This observed narrowing of the energy band gap can be attributed to the incorporation of Co^{2+} and Fe^{3+} ions into the ZnO lattice, which introduces localized states within the band structure and alters the electronic transitions.

Such band gap narrowing is beneficial in extending the optical response of ZnO into the visible range, enhancing its potential for photocatalytic or solar energy conversion applications. Additionally, the slight differences in absorbance intensity and profile among the samples suggest that the dopants also influence the optical density and defect states of the nanoparticles.

These results confirm that transition metal doping not only preserves the fundamental optical behavior of ZnO but also provides an effective means of tuning its band gap and absorption characteristics.

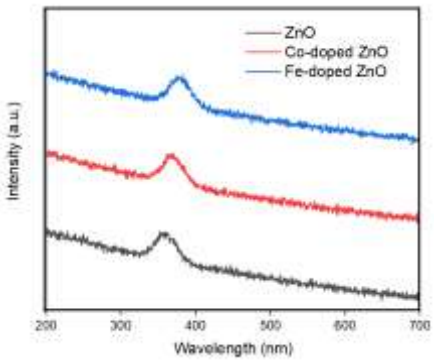

Figure 3. UV–Vis absorption spectra of pure ZnO, Co-doped ZnO, and Fe-doped ZnO nanoparticles.

Figure 4 presents the photoluminescence (PL) spectra of pure ZnO, Co-doped ZnO, and Fe-doped ZnO nanoparticles in the spectral range of 350–750 nm. The PL spectrum of pristine ZnO exhibits a characteristic near-band-edge (NBE) emission at ~390 nm, attributed to excitonic recombination of photogenerated electron–hole pairs, and a broad visible emission centered around ~560 nm, generally associated with intrinsic defects such as oxygen vacancies and zinc interstitials.

Upon doping with Co and Fe, a significant quenching of PL intensity is observed in both the UV and visible emission regions. This suppression of radiative recombination suggests the introduction of non-radiative pathways, most likely due to the formation of defect-related trap states or enhanced charge separation mechanisms induced by the dopants. Moreover, a slight redshift in the emission maxima of the doped samples implies a perturbation of the local electronic environment, potentially resulting from dopant-induced lattice distortions and band structure modifications.

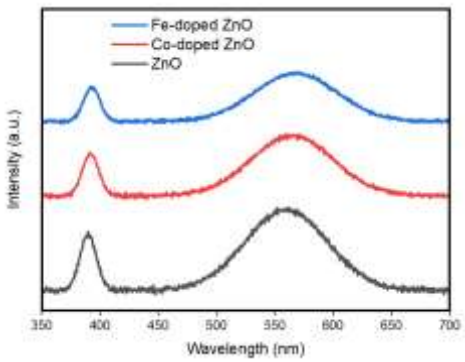

Figure 4. PL spectra of pure ZnO, Co-doped ZnO, and Fe-doped ZnO nanoparticles.

Figure 5 illustrates the current density–voltage (J–V) characteristics of DSSCs fabricated using pure ZnO, Co-doped ZnO, and Fe-doped ZnO as photoanodes under standard illumination conditions (AM 1.5G, 100 mW/cm²). All devices exhibit typical diode-like response, confirming effective charge generation and separation.

The ZnO-based device delivers a short-circuit current density (Jsc) of 7.5 mA cm^{-2} and an open-circuit voltage (Voc) of 0.56 V, resulting in a power conversion efficiency (PCE) of

approximately 2.86 %. Upon doping with Co and Fe, significant enhancement in photocurrent density is observed, reaching 8.8 and 9.4 mA cm^{-2}, respectively. These improvements are attributed to enhanced light-harvesting and more efficient electron injection, likely due to the introduction of intermediate energy states within the ZnO band structure by transition metal ions.

The Co- and Fe-doped ZnO-based devices exhibit PCEs of 3.33 % and 3.52 %, respectively, surpassing that of the pristine ZnO cell. Although a slight decrease in Voc is recorded for the doped samples, the overall increase in Jsc and fill factor (FF) compensates for this drop, leading to superior device performance. In particular, the Fe-doped ZnO cell achieves the highest efficiency, highlighting its promise for use in high-performance DSSCs.

These findings underscore the efficacy of transition metal doping in tailoring the optoelectronic properties of ZnO, thereby enhancing its potential as a photoanode material in dye-sensitized photovoltaic devices.

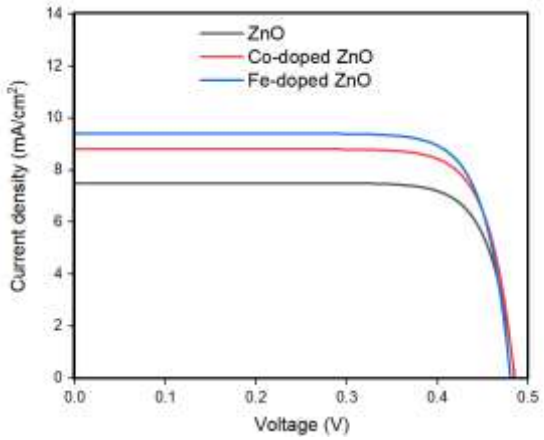

Figure 5. J–V characteristics of DSSCs based on ZnO, Co-doped ZnO, and Fe-doped ZnO photoanodes.

Conclusions

Undoped ZnO, Co-doped ZnO, and Fe-doped ZnO nanoparticles were successfully synthesized and implemented as photoanodes in dye-sensitized solar cells (DSSCs). Structural analyses confirmed the retention of the hexagonal wurtzite phase upon doping, with minor modifications in crystallite size and band gap energy.

Optical measurements revealed enhanced light absorption in the doped samples, while photovoltaic testing demonstrated that doping significantly improved device performance. The power conversion efficiencies (PCE) of the fabricated DSSCs were determined to be 2.86% for ZnO, 3.33% for Co-doped ZnO, and 3.52% for Fe-doped ZnO. The Fe-doped ZnO device exhibited the highest short-circuit current density (9.4 mA/cm^2), indicating improved charge generation and transport.

These results demonstrate that transition metal doping is an effective approach to enhance the optoelectronic properties of ZnO and improve the overall efficiency of ZnO-based DSSCs.

ABSTRACT

In this study, copper (Cu) and silver (Ag) doped cadmium sulfide (CdS) thin films were synthesized using the chemical bath deposition method, and their structural, optical, and electrical properties were thoroughly investigated. The influence of Cu and Ag ion incorporation on the morphology, band gap, and conductivity of CdS films was systematically examined. Characterization was performed using X-ray diffraction (XRD), UV-Visible spectroscopy, scanning electron microscopy (SEM), and the four-point probe method.

XRD analysis confirmed that all samples exhibited a hexagonal structure, with crystallite size reduction observed due to doping. SEM images revealed that the dopants improved film homogeneity and surface density. Optical measurements indicated a red shift in the absorption edge, with the band gap decreasing from 2.36 eV (pure CdS) to 2.28 eV (Cu-doped) and 2.22eV (Ag-doped), enhancing visible light absorption.

Electrical measurements showed that Cu doping significantly increased carrier concentration, thereby improving conductivity. These enhanced optoelectronic properties suggest that Cu and Ag doped CdS thin films hold great promise as buffer layers in heterojunction solar cell devices.

Keywords: Thin film, visible light, band gap, optoelectronic

Introduction

Thin-film semiconductors have gained significant attention due to their potential applications in optoelectronic devices, particularly in photovoltaic systems. Among these, cadmium sulfide (CdS) has emerged as a favorable n-type semiconductor because of its suitable band gap (~2.4 eV), high absorption coefficient, and good chemical stability (Sharma et al., 2019). However, the relatively wide band gap limits its absorption in the visible light spectrum, necessitating material modifications to enhance its performance under solar irradiation.

Doping with transition metals has been widely investigated as an effective strategy to tailor the optical and electrical properties of semiconductor materials. In particular, incorporating copper (Cu) and silver (Ag) ions into CdS thin films has been shown to induce beneficial modifications such as band gap narrowing, improved carrier mobility, and enhanced light absorption (Kumar et al., 2020; Sahu et al., 2018). These enhancements are especially critical for the development of efficient buffer layers in heterojunction solar cell architectures.

The chemical bath deposition (CBD) technique offers a simple, low-cost, and scalable method for the fabrication of uniform and adherent CdS thin films. The method allows for controlled doping by adjusting the chemical precursors in the bath, making it suitable for large-scale production of functional thin-film materials (Pathak et al., 2021). Moreover, Cu and Ag ions can be easily incorporated into the CdS lattice due to their similar valence states and compatible ionic radii, leading to structural alterations that influence electronic band structure and optical transitions.

This study focuses on the synthesis of Cu- and Ag-doped CdS thin films via the CBD method and aims to systematically investigate the structural, morphological, optical, and electrical changes induced by the dopants. The correlation between doping and material properties is analyzed in the context of potential optoelectronic applications, especially as efficient buffer layers in solar cell devices.

Materials and Methods

Experimental Part

CdS, Cu-doped CdS, and Ag-doped CdS thin films were deposited onto standard glass substrates by the chemical bath deposition (CBD) technique. Prior to deposition, the glass substrates were ultrasonically cleaned in acetone, ethanol, and deionized water for 10 minutes each to ensure the removal of surface impurities. The substrates were then dried with nitrogen gas and stored in a clean container.

For the preparation of undoped CdS films, 25 mL of 0.01 M cadmium chloride ($CdCl_2 \cdot 2.5H_2O$) was mixed with 25 mL of 0.02 M thiourea ($CS(NH_2)_2$) in deionized water. Ammonia solution (NH_4OH, 25%) was added dropwise to adjust the pH of the solution to approximately 10.5, promoting the complexation of cadmium ions. The final volume of the bath solution was adjusted to 100 mL with deionized water. The solution was stirred magnetically for 10 minutes and maintained at 70 ± 2 °C in a thermostatic water bath. Glass substrates were immersed vertically in the bath and deposition was carried out for 60 minutes. After deposition, the films were removed, rinsed thoroughly with deionized water, and allowed to dry at room temperature.

For Cu-doped CdS films, copper(II) chloride dihydrate ($CuCl_2 \cdot 2H_2O$) was added to the cadmium chloride solution at a concentration corresponding to 1 atomic percent (1 at.%) relative to Cd^{2+} ions. For Ag-doped CdS films, silver nitrate ($AgNO_3$) was similarly added at 1 at.% with respect to Cd^{2+}. In both cases, dopant salts were added prior to the addition of thiourea to ensure homogeneous distribution. All other experimental conditions, including pH,

temperature, total volume, and deposition time, were kept constant for all samples to maintain experimental comparability.

After deposition, all films were rinsed with deionized water and dried in ambient conditions. The structural properties of the films were characterized using X-ray diffraction (XRD) with Cu-Kα radiation. Surface morphology was examined by scanning electron microscopy (SEM). Optical absorption measurements were performed using a UV-Vis spectrophotometer in the range of 300–800 nm. Electrical properties were measured using the four-point probe method, and elemental composition was analyzed via energy-dispersive X-ray spectroscopy (EDX).

Findings and Discussion

Figure 1 shows the XRD patterns of undoped CdS, Cu-doped CdS, and Ag-doped CdS thin films prepared via the CBD method. All samples exhibit prominent diffraction peaks that correspond to the hexagonal wurtzite structure of CdS. The primary reflections appear at 2θ values of approximately 24.8°, 26.5°, 28.2°, 36.7°, 43.8°, and 47.9°, which match well with the (100), (002), (101), (102), (110), and (103) crystal planes. These peaks confirm the polycrystalline nature of the films and the preservation of the hexagonal phase after doping.

In the undoped CdS film, the relatively high intensity and sharpness of the peaks indicate good crystallinity. After doping with Cu and Ag, all main peaks are retained, confirming that the basic crystal structure is not disrupted. However, slight broadening of the peaks and small reductions in intensity are observed, especially in the doped samples. The Cu-doped CdS film exhibits minor peak shifts toward higher 2θ values, suggesting a reduction in lattice parameters due to the incorporation of smaller Cu^{2+} ions (0.73 Å) in place of Cd^{2+} (0.97 Å). In contrast, Ag-doped CdS films show slightly more pronounced peak broadening and a minor decrease in intensity, which may be attributed to lattice distortion caused by the larger Ag^{+} ions (1.15 Å).

Based on the analysis of the most intense (101) diffraction peak, the average crystallite sizes are estimated to be 21.2 nm for undoped CdS, 19.3 nm for Cu-doped CdS, and 18.7 nm for Ag-doped CdS. These values indicate a modest but consistent decrease in crystallite size with doping, which is typically associated with the introduction of lattice strain or inhibition of grain growth during film formation. Importantly, no secondary phases such as CuS or Ag_2S are detected, confirming the successful incorporation of the dopants into the CdS lattice without forming separate compounds.

In conclusion, the XRD results reveal that Cu and Ag doping have no significant impact on the crystal phase of CdS, but they do influence the microstructural properties. The slight reduction in crystallite size and peak broadening in the doped samples point to the presence of dopant-induced strain and structural disorder. These structural changes are expected to affect the optical and electrical behavior of the films, enhancing their potential as buffer layers in heterojunction solar cells.

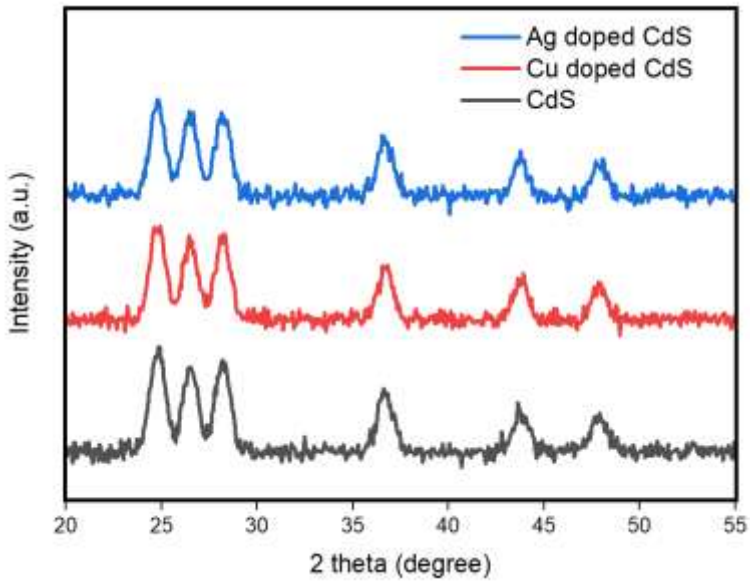

Figure 1. XRD patterns for undoped CdS, Cu-doped CdS, and Ag-doped CdS thin films prepared via the CBD method.

Film thickness is an essential parameter that affects not only light absorption and charge carrier dynamics but also correlates closely with the structural properties of semiconductor thin films. In this study, the thickness of the undoped and doped CdS thin films was measured using a profilometer, and the results were analyzed in conjunction with the X-ray diffraction (XRD) findings.

The undoped CdS film exhibited a thickness of approximately 325 nm, while the Cu-doped and Ag-doped CdS films showed slightly increased thicknesses of 333 nm and 337 nm, respectively. These marginal increases in thickness are consistent with the observed structural changes in the XRD patterns. Specifically, both Cu and Ag doping led to slight peak broadening and reduced crystallite sizes (from ~21.2 nm for pure CdS to ~19.3 nm and ~18.7 nm for Cu- and Ag-doped CdS, respectively), indicating that the dopants influenced the nucleation and growth behavior during the deposition process.

The slight increase in film thickness upon doping may be attributed to a higher nucleation density or modified surface chemistry caused by the incorporation of Cu^{2+} and Ag^{+} ions. These dopants can alter the local supersaturation conditions in the chemical bath, promoting more uniform and denser film growth.

Figure 2 displays the SEM surface images of CdS (a), Cu-doped CdS (b), and Ag-doped CdS (c) thin films deposited via CBD. All images were taken at the same magnification with a 500 nm scale bar, allowing for a direct comparison of the surface morphology of the samples.

The undoped CdS film (Figure 2a) exhibits a relatively rough surface with non-uniform grain distribution and evident particle agglomeration. This morphology suggests limited grain control during growth and correlates with the XRD results, where the crystallite size was estimated to be around 21.2 nm. The measured film thickness for this sample is approximately 325 nm, indicating moderate vertical growth without significant lateral grain compaction.

The Cu-doped CdS film (Figure 2b), in contrast, presents a more compact and uniform surface. The grains appear finer and more evenly distributed, with fewer voids or discontinuities. These features are in agreement with the XRD data, which showed a slight reduction in crystallite size

to 19.3 nm, and a measured film thickness of 333 nm. The improved morphology suggests that Cu doping enhances nucleation density and promotes more uniform film formation, both laterally and vertically. This also supports the electrical findings where increased carrier concentration and improved conductivity were observed for Cu-doped films.

The Ag-doped CdS film (Figure 2c) also shows a dense and granular morphology with grain sizes appearing slightly smaller than those in the pure CdS film. While comparable to Cu-doped CdS in grain uniformity, the Ag-doped surface is marginally less compact, possibly due to the larger ionic radius of Ag^{+} introducing localized strain in the lattice. The crystallite size for this sample was calculated as 18.7 nm, with a corresponding film thickness of 337 nm, the highest among the three. This may indicate that Ag incorporation enhances vertical growth slightly more than Cu, likely due to modified bath chemistry or surface energy interactions during deposition.

The correlation between SEM morphology, crystallite size, and film thickness indicates that dopant incorporation not only alters the atomic structure of CdS films but also affects their surface texture and macroscopic growth behavior. Both Cu and Ag dopants improve the homogeneity and density of the CdS film surface while slightly increasing the thickness—without introducing significant roughness or secondary phases.

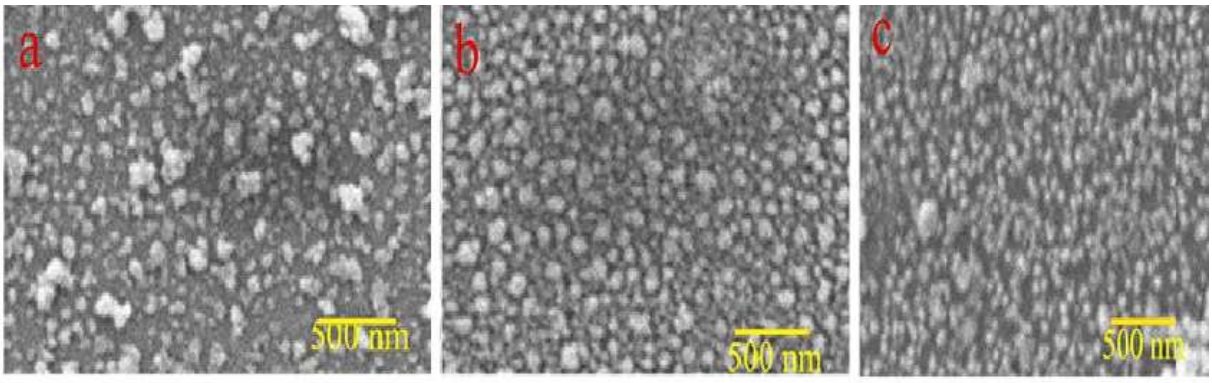

Figure 2. Surface SEM images of (a) undoped CdS, (b) Cu-doped CdS, and (c) Ag-doped CdS thin films synthesized by the CBD method.

Figure 3a shows the UV-Vis absorption spectra of undoped CdS, Cu-doped CdS, and Ag-doped CdS thin films synthesized by CBD. The measurements were performed in the wavelength range of 300–800 nm to assess the films' ability to absorb visible light, which is critical for their application as buffer layers in photovoltaic devices.

The undoped CdS film exhibits a sharp absorption edge at approximately 515 nm, corresponding to an optical band gap of around 2.36 eV. Upon doping with Cu and Ag, the absorption edges shift gradually towards longer wavelengths (redshift), indicating a narrowing of the band gap. For the Cu-doped CdS film, the absorption onset occurs around 550 nm, while for the Ag-doped CdS film, it is further shifted to approximately 565 nm. This redshift can be attributed to the incorporation of Cu^{2+} and Ag^{+} ions into the CdS lattice, which causes localized states in the band structure and modifies the electronic transitions.

The increased visible light absorption observed in the doped films suggests that both Cu and Ag doping enhance the optical response of CdS films in the solar spectrum range. These results are in agreement with the previously discussed structural changes, where a reduction in crystallite size and modified morphology were observed via XRD and SEM analyses, respectively.

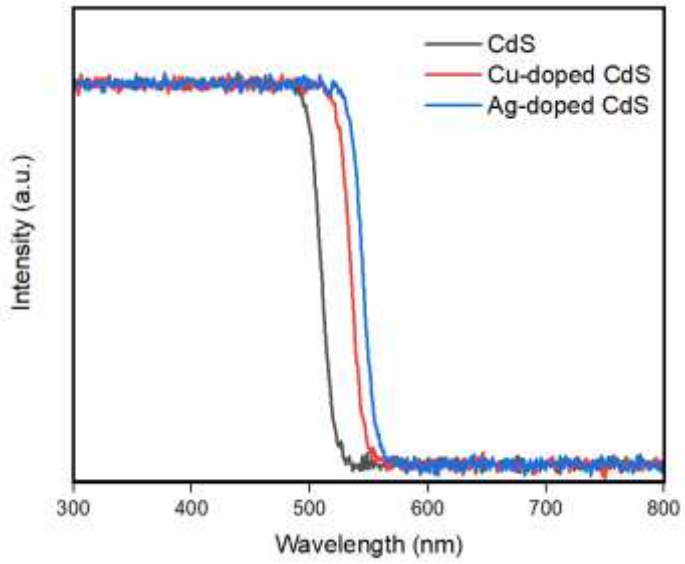

Figure 3a. The UV-Vis absorption spectra of undoped CdS, Cu-doped CdS, and Ag-doped CdS thin films synthesized by CBD

Figure 3b presents the Tauc plots $(\alpha h\nu)^2$as a function of photon energy ($h\nu$) for CdS, Cu-doped CdS, and Ag-doped CdS thin films. This method allows for the estimation of the optical band gap (Eg) by extrapolating the linear region of each curve to the photon energy axis, where $(\alpha h\nu)^2=0$. Since CdS is a direct band gap semiconductor, this representation is appropriate.

The undoped CdS film shows a linear intercept near 2.36 eV, consistent with typical band gap values reported for hexagonal CdS. Upon doping, a noticeable reduction in the band gap is observed: (1) Cu-doped CdS exhibits a band gap of approximately 2.28 eV and (2) Ag-doped CdS shows a further narrowed band gap of about 2.22 eV.

The gradual narrowing of the band gap with increasing dopant incorporation can be attributed to several factors, including the formation of localized impurity states within the band structure and increased carrier density, which influence the electronic transitions. Additionally, the lattice strain and crystallite size reduction observed in XRD analyses may contribute to the observed optical band gap shifts through quantum confinement effects or lattice distortion.

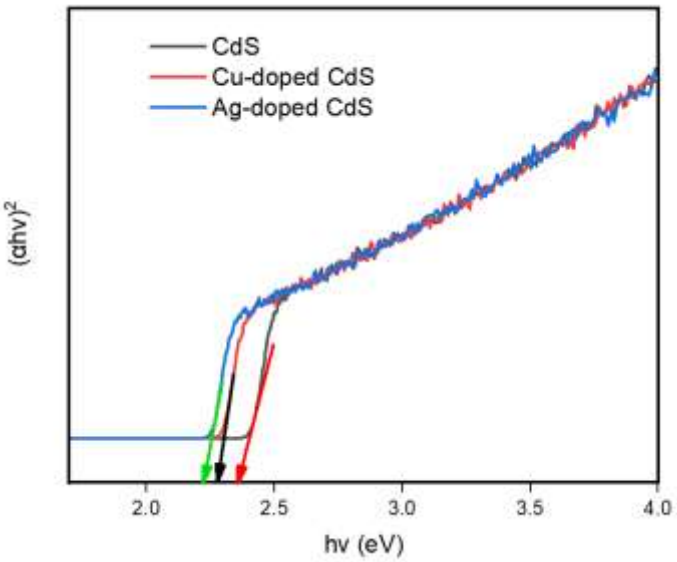

Figure 3b. The Tauc plots $(\alpha h\nu)^2$as a function of photon energy (hν) for CdS, Cu-doped CdS, and Ag-doped CdS thin films.

Figure 4 shows the electrical conductivity results of undoped CdS, Cu-doped CdS, and Ag-doped CdS thin films measured by the four-point probe technique at room temperature. The measured conductivity values are summarized as follows:

Sample	Conductivity (S/cm)
CdS (undoped)	1.6×10^{-4}
Cu-doped CdS	8.3×10^{-3}
Ag-doped CdS	4.7×10^{-3}

The undoped CdS film exhibited the lowest conductivity, consistent with its wide band gap (2.36 eV) and intrinsic semiconductor nature. Its low carrier concentration and relatively rough morphology, as observed in the SEM analysis, contribute to the limited electrical transport capability.

In contrast, the Cu-doped CdS film showed a significant increase in conductivity, with a value over 50 times greater than that of the undoped film. This enhancement is attributed to the incorporation of Cu^{2+} ions into the CdS lattice, which creates shallow acceptor levels and increases the free hole concentration. Additionally, the Cu-doped film displayed improved surface compactness and smaller grain boundaries (SEM), as well as reduced crystallite size (XRD), which likely support better charge transport by reducing scattering and recombination losses.

The Ag-doped CdS film also demonstrated improved conductivity, with a value nearly 30 times higher than the undoped CdS. Ag^{+} ions, having a larger ionic radius, may introduce localized states that aid in charge carrier generation, though possibly with slightly more lattice distortion compared to Cu. This is in agreement with the intermediate electrical performance of the Ag-doped sample and its marginally less compact SEM morphology.

These results reveal a strong correlation between dopant incorporation and electrical performance. The notable increase in conductivity for Cu- and Ag-doped films not only

complements the observed band gap narrowing and structural refinements but also supports their potential application as effective buffer layers in heterojunction solar cell devices.

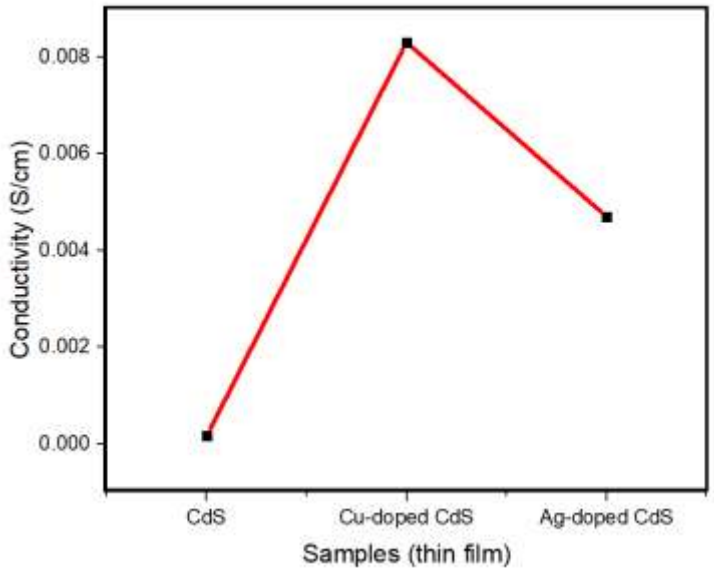

Figure 4. The electrical conductivity of CdS, Cu-doped CdS, and Ag-doped CdS thin films.

Figure 5 shows the EDX spectra of CdS, Cu-doped CdS, and Ag-doped CdS thin films synthesized via the chemical bath deposition (CBD) method. EDX analysis was carried out to confirm the elemental composition of the films and to verify the successful incorporation of dopant ions (Cu and Ag) into the CdS matrix.

The spectrum of the undoped CdS film displays characteristic peaks corresponding to cadmium (Cd) and sulfur (S), with prominent Cd L and Cd K peaks around 3.1 keV and 6.2 keV, and an S K peak near 2.3 keV. These peaks confirm the formation of stoichiometric CdS in the film.

In the Cu-doped CdS film, the EDX spectrum reveals the same Cd and S peaks as in the undoped film, along with an additional Cu K peak around 8.0 keV. The presence of this copper peak clearly confirms the successful incorporation of Cu ions into the CdS structure. Furthermore, the intensity of the Cd and S peaks remains relatively stable, suggesting that Cu has substituted into the lattice without significantly disrupting the stoichiometry.

Similarly, the spectrum of the Ag-doped CdS film shows Cd and S peaks along with an additional Ag L peak at approximately 3.0 keV. This verifies the incorporation of Ag into the CdS thin film. The Ag signal, along with consistent Cd and S signals, indicates that the doping occurred without the formation of secondary phases such as Ag_2S or metallic Ag, which is in agreement with the XRD results.

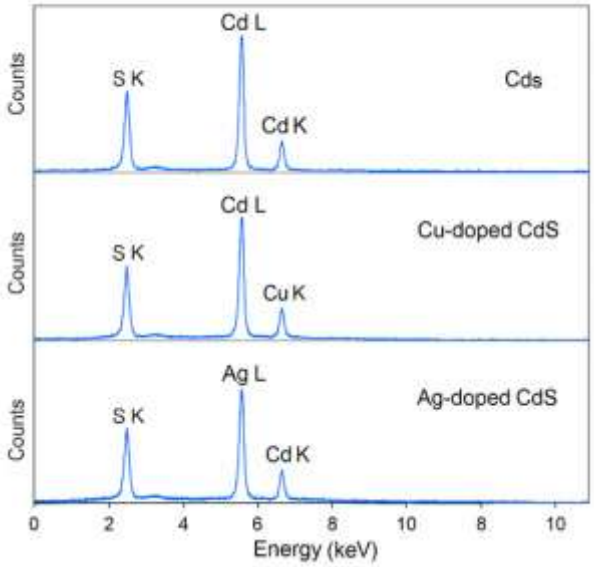

Figure 5. The EDX spectrum of CdS, Cu-doped CdS, and Ag-doped CdS thin films.

Conclusions

In this study, CdS thin films were successfully synthesized with Cu and Ag dopants using the chemical bath deposition method. The structural, optical, electrical, and compositional properties of the films were comprehensively analyzed. XRD results confirmed that all films retained the hexagonal crystal structure of CdS, with a slight reduction in crystallite size due to doping. SEM images showed improved surface uniformity and compaction in the doped samples. Film thickness increased slightly upon doping, from 325 nm for undoped CdS to 333 nm and 337 nm for Cu- and Ag-doped films, respectively. UV-Vis spectroscopy revealed a redshift in the absorption edge upon doping, indicating band gap narrowing from 2.36 eV (CdS) to 2.28 eV (Cu-doped) and 2.22 eV (Ag-doped). Tauc plot analysis supported these findings, highlighting the enhanced optical absorption in the visible range. Electrical measurements demonstrated that Cu doping significantly increased conductivity, from 1.6×10^{-4} S/cm (undoped) to 8.3×10^{-3} S/cm, with Ag doping resulting in 4.7×10^{-3} S/cm. These improvements are attributed to increased carrier concentration and improved film morphology. EDX spectra confirmed the successful incorporation of Cu and Ag into the CdS matrix without forming secondary phases.

Overall, the enhanced structural integrity, reduced band gap, and improved conductivity of Cu- and Ag-doped CdS thin films make them promising candidates for use as buffer layers in heterojunction solar cell applications.

ABSTRACT

Activated carbon (AC) is a commonly used catalyst support material and adsorbent due to its high specific surface area, porosity structure, and surface reactivity. Activated carbons with a specific surface area of more than 2000 $m^2.g^{-1}$ (super activated carbon) are becoming more popular. However, commercially available activated carbon is expensive and may not be economical. Therefore, preparing activated carbon from no-cost or locally sourced biomass materials from agricultural wastes such as coconut shells, olive stones, walnut shells, nut shells, citrus peels, vine wood, corncob, various fruit seeds, and barks is an attractive option. Thus, these wastes can be converted into economically valuable materials, and their environmental impact can also be reduced. For this purpose, in this study, super activated carbon was synthesized from pomegranate (*Punica Granatum L.*) peels via NaOH chemical activation and was characterized by FT-IR, XRD, SEM, and BET analysis.

The functional groups specific to AC were obtained in the FTIR spectrum. According to XRD analysis, the characteristic peaks of hexagonal crystalline activated carbon were observed. SEM micrographs showed that the external surfaces of AC were full of irregular pores. The BET specific surface area, total pore volume, and average pore width of AC were determined as 2309.0388 $m^2.\ g^{-1}$, 1.10367 $cm^3.g^{-1}$, and 2.23 nm, respectively. The N_2 adsorption/desorption isotherm of AC was confirmed to type I isotherm model according to the IUPAC classification.

Consequently, food waste materials with unique advantages, such as eco-friendly nature, availability, and low cost, are suitable precursors for preparing activated carbon. Moreover, the synthesized super activated carbon can be an efficient adsorbent for removing toxic pollutants from water supplies owing to its high surface area.

Keywords: Pomegranate peel, Super activated carbon, NaOH activation, Waste treatment, Characterization.

INTRODUCTION

Activated carbons are widely preferred adsorptive materials, especially in water treatment processes, environmental protection, and catalyst support, thanks to their highly developed specific surface area, porosity, and high stability properties (Saadi et al., 2022). The evolution of technology has led to an expansion in the range of applications for activated carbons, including their use in supercapacitors, electrodes, and gas storage. Therefore, super activated carbon is increasingly favorable due to its specific surface area, which exceeds 2000 m^2. g^{-1} to satisfy developed technology requirements (Li et al., 2017; Danish et al., 2018).

Currently, the production of commercial activated carbons involves the utilization of expensive and non-renewable feedstocks, including coal, petroleum coke, and precursors with high carbon content, such as wood, bituminous coal, anthracite, and peat. Consequently, traditional activated carbons are not cost-effective. Moreover, the regeneration of used activated carbon is a highly challenging process. As a result, significant efforts have been dedicated to preparing amorphous activated carbon from renewable sources, particularly lignocellulosic materials and agricultural by-products (Li et al., 2017; Gayathiri et al., 2022). It is reported various agricultural biomass sources such as fruit stones and nutshell (hazelnut shells, peanut hulls), palm oil shell waste, spent coffee ground, apricot stones, wheat straw, *Jatropha curcas* fruit shells, neem leaves, cassava peel, etc. were used to produce low-cost activated carbon (Danish et al., 2018).

The pomegranate fruit *(Punica granatum L.)* is a member of the Punicaceae family and has been cultivated since ancient times in the Mediterranean region, with a current global production of approximately 1 million tons (Saadi et al., 2022). The species is native to India, Malaysia, Iran, Turkey, and Africa. Turkey is a prominent producer of pomegranate, ranking among the top five countries in the world in terms of annual production, and ranking 4th with a yield of approximately 681,460 tons in 2022 (Polat et al., 2024). An important industry has grown up around the pomegranate. People consume it freshly or use it in many different ways in the kitchen, like as a garnish on food, in smoothies, and drinks like cocktails and wine (Saadi et al., 2022). These industries create a lot of lignocellulosic waste, which is mostly made of pomegranate peels. The peel of the pomegranate fruit constitutes approximately 40 – 50% of the total fruit weight (Khalo et al., 2023). Therefore, the synthesis of activated carbon from pomegranate peel could be viable to reuse and valorize this waste.

The objective of this study is synthesis and characterization of super activated carbon from pomegranate peels. For this purpose, pomegranate *(Punica Granatum L.)* peel derived super activated carbon was synthesized via the NaOH chemical activation method. The material was characterized by FT-IR, XRD, SEM, and BET analysis.

MATERIALS AND METHODS

All chemicals used were of analytical grade. Sodium hydroxide (NaOH) was purchased from the Merck company.

Preparation of pomegranate peels

The pomegranate fruit used in the study was obtained from local markets. After domestic consumption, the pomegranate peels were rinsed with tap water and cut into thin slices. Then, the peels were thoroughly cleaned with deionized water and dried in an oven at 60°C for 72 h. The dried pomegranate peels were ground into powder using a coffee grinder.

Synthesis of pomegranate peel derived super activated carbon

First, 25 g of pomegranate peel powder was pre-carbonized in a muffle furnace at 400°C for 2 hours. The NaOH solution was prepared in 50 mL of distilled water, with a weight ratio of 1:5 (w/w %) based on the amount of carbonized material for the NaOH activation step. The NaOH solution was then poured into the carbonized pomegranate peels, and the mixture was stirred at 450 rpm for 2 hours. Then, the mixture was dried in an oven at 130°C for 6 h. The dried material was taken to a muffle furnace and kept at 810°C for 2 h to ensure complete carbonization. The activated carbon was cooled and washed with distilled water for ≈ 10 days until the pH of the wash water became neutral. Then, it was dried in an oven at 70°C for 24 h (Esmaeili Bidhendi et al., 2020).

Characterization studies

The surface functional groups were determined by FT-IR analysis in the range of 400 – 4000 cm^{-1} using a Bruker brand FT-IR device. The crystal structure of the material was determined by XRD analysis using nickel-filtered Cu Kα radiation in a Rigaku Miniflex 600 brand device at 40 kV and 15 mA, 2θ=10°–90° conditions. The morphological structure of super activated carbon was determined by a TESCAN MIRA3 XMU model SEM device. The specific surface area, total pore volume, and average pore width of the pomegranate peel derived super activated carbon were determined with the nitrogen adsorption technique at 76.256 K using Micromeritics ASAP 2020V 3.00 G Brunauer-Emmett-Teller (BET) surface area analyzer. Before BET measurement, the activated carbon was degassed at 150°C under vacuum for 2 h.

RESULTS AND DISCUSSIONS

Characterization of pomegranate peel derived super activated carbon

FT-IR analysis

FT-IR analysis was performed to determine the surface functional groups in the structure of the synthesized super activated carbon, and the obtained FT-IR spectrum is presented in Figure 1.

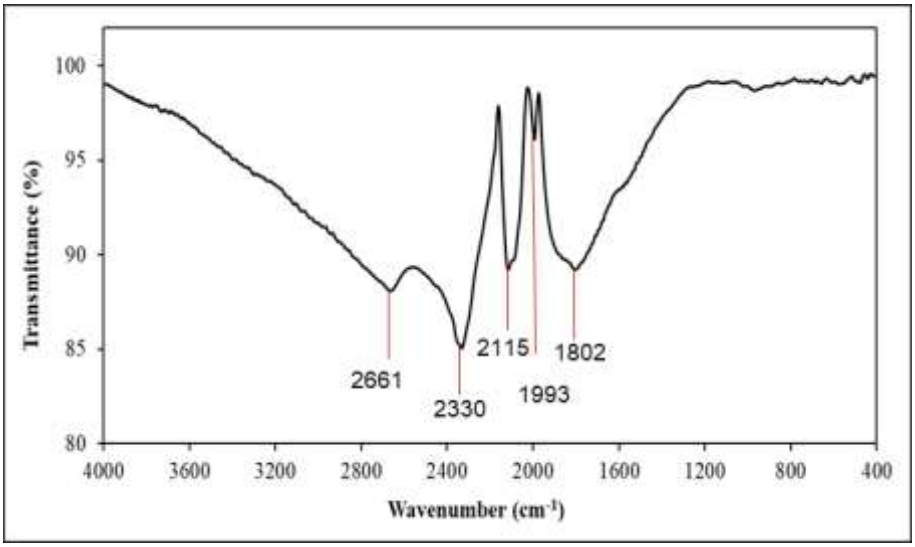

Figure 1. FT-IR spectrum of pomegranate peel derived super activated carbon

In this study, the pomegranate peel derived super activated carbon synthesized by NaOH activation was similar to the FT-IR spectrum of the super activated carbon prepared from gulfweed by KOH activation in the literature (Li et al., 2017). The presence of a band at 2661 cm^{-1} in the FT-IR spectrum suggests the potential presence of chemically bound metallic sodium within the pore structure, despite prolonged washing. The bands observed at 2330 cm^{-1} and 2115 cm^{-1} can be attributed to multivalent inorganic hydride or oxide components (Li et al., 2017). The vibration band observed at 1993 cm^{-1} is consistent with the methylcellulose peaks (Solmaz et al., 2023). The band at 1802 cm^{-1} is attributed to the C=O stretching vibration originating from carbonyl groups (Chen et al., 2014).

XRD analysis

The phase composition, the crystal structure, and the purity of the synthesized super activated carbon were determined by XRD analysis. The XRD pattern of pomegranate peel derived super activated carbon is presented in Figure 2.

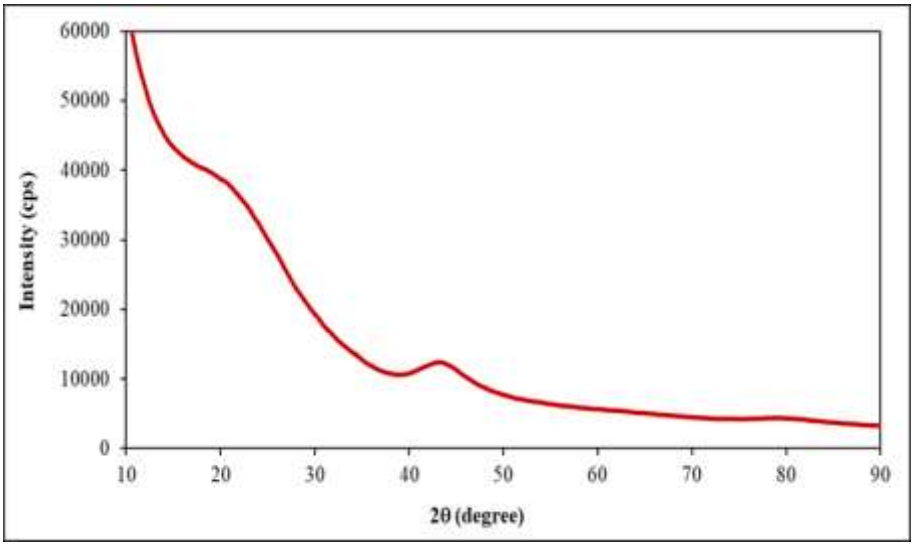

Figure 2. XRD pattern of pomegranate peel derived super activated carbon

As illustrated in Figure 2, the broad peak observed between $2\theta \approx 20° - 25°$ and the weak peak at $2\theta = 43°$ are attributed to the diffraction of turbostratic carbon (002) and the diffraction of graphitic type carbon with disordered or amorphous structure (001), respectively. These peaks are characteristic of hexagonal crystalline activated carbon (Sabaa et al., 2022).

SEM analysis

The surface physical morphology of the super activated carbon was observed through the SEM analysis. Figure 3 presents the SEM micrographs of pomegranate peel derived super activated carbon at different magnifications.

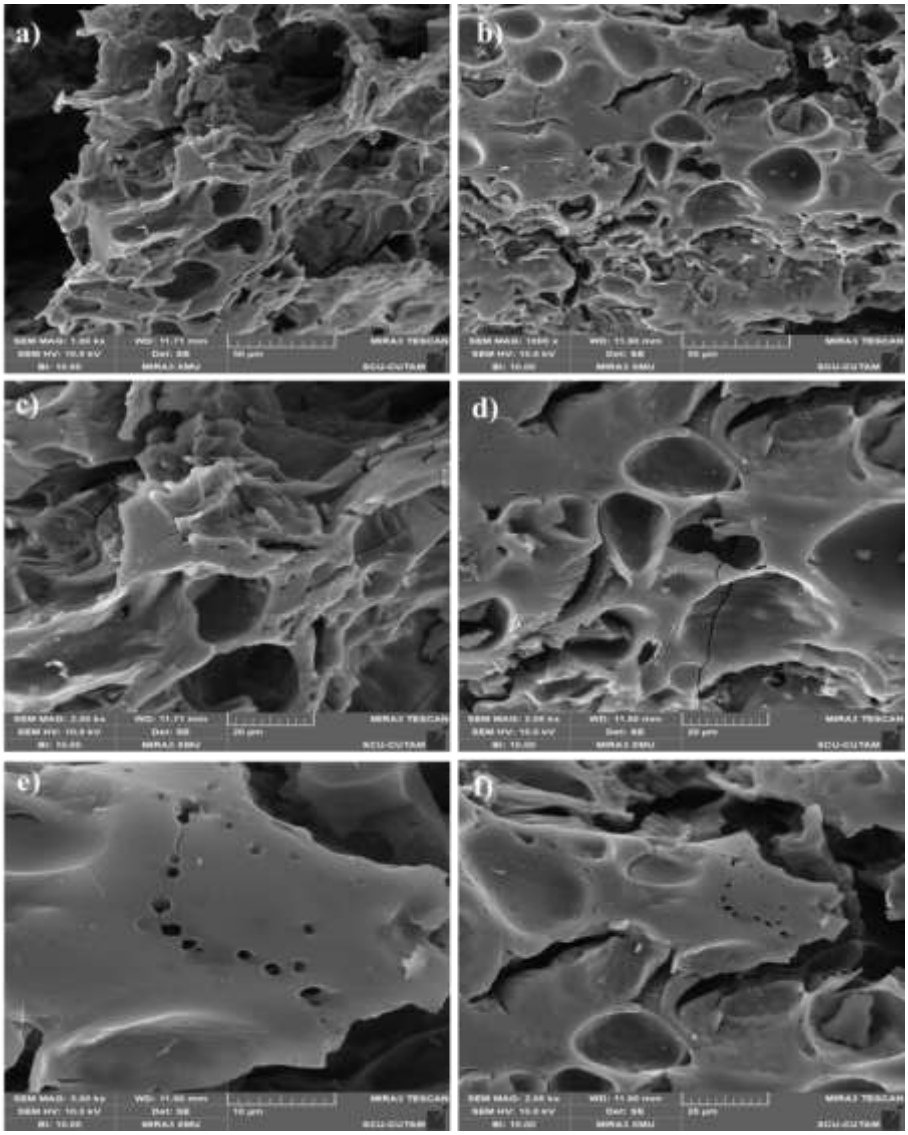

Figure 3. SEM images of activated carbon at different magnifications (a-b): 50µm-1kx, (c-d): 20µm-2kx, (e): 10µm-5kx, (f): 20µm-2kx

As illustrated in Figure 3, the external surfaces of the activated carbon are both porous and quite irregular. The distinct pore morphologies result from the interaction between the carbon atoms and NaOH and the impact of elevated temperatures during the activation process.

N_2 adsorption-desorption isotherms, and the BET specific surface area

Nitrogen adsorption at 77 K is a frequently utilized method to measure the porosity and surface areas of porous materials. This method is advantageous due to the comparatively smaller diameter of nitrogen molecules. It is the standard procedure to determine the porosity structure of carbon-based adsorbents. The adsorption isotherm is a key component of the analysis, providing critical insights into the pore structure of the adsorbent. This information includes the adsorption heat and the physical characteristics of the adsorbent (Chen et al., 2014). The classification of adsorption isotherms established by the International Union of Pure and Applied Chemistry (IUPAC) is illustrated in Figure 4. The IUPAC classification identifies six

types of isotherms: microporous (type I), nonporous or macroporous (types II, III, and VI), and mesoporous (types IV and V) (ALOthman 2012).

The N_2 adsorption-desorption isotherms of pomegranate peel derived super activated carbon are presented in Figure 5. According to Figure 5, the N_2 adsorption-desorption isotherm of pomegranate peel derived super activated carbon conforms to the type I isotherm model (Figure 4), which is frequently observed in microporous solids such as activated carbon and zeolite according to the IUPAC classification. The type I isotherm is defined by the presence of microporous solids and is concave concerning the P/P^o axis. As the $P/P^o \rightarrow 1$, the uptake value approaches a limiting value. The region of significant inclination at low P/P^o is attributable to the saturation of exceedingly confined pores. The constrained uptake is contingent on the accessible micropore volume, as opposed to the internal surface area (Chen et al., 2014).

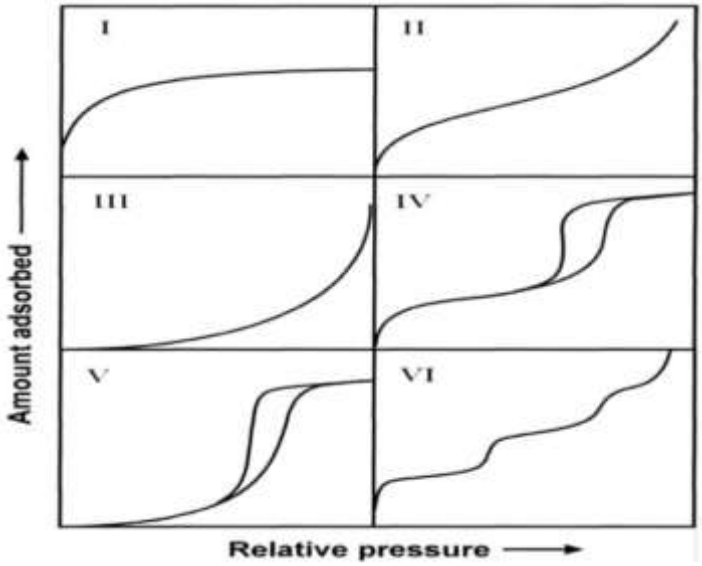

Figure 4. The IUPAC classification of adsorption isotherms shows the adsorption and desorption pathways (ALOthman 2012).

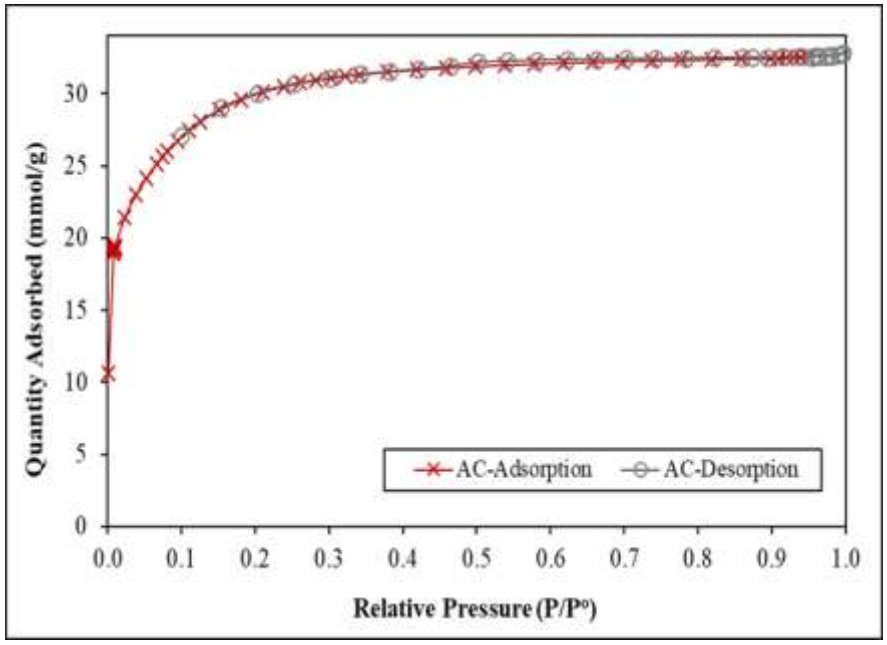

Figure 5. The N_2 adsorption-desorption isotherms of pomegranate peel derived super activated carbon

The BET specific surface area (S_{BET}), total pore volume (V), and adsorption average pore width (W_d: $4V/S_{BET}$) of the prepared super activated carbon were obtained by applying the BET equation to N_2 adsorption isotherm at 77 K, are presented in Table 1, also a number of the studies for the biomass-derived activated carbons in the literature are also listed in Table 1. As seen in Table 1, the specific surface area (S_{BET}), total pore volume (V), and adsorption average pore width (W_d) of the super activated carbon prepared from pomegranate peel were determined as 2309.04 ± 23.19 $m^2 . g^{-1}$, 1.10367 $cm^3 . g^{-1}$, and 2.23 nm, respectively. The IUPAC pore dimension classifications group pores into micropores ($d < 2$ nm), mesopores ($d = 2–50$ nm), and macropores ($d > 50$ nm) (Chen et al., 2014). Accordingly, the synthesized super activated carbon has a mesoporous structure according to the type I adsorption isotherm model.

The surface area and pore properties of the super activated carbon obtained in this study resemble those of similar activated carbons reported in the literature. However, the specific surface area and pore properties of the synthesized activated carbons can vary depending on the biomass utilized, the activation agent, the activation temperature, time, the impregnation ratio of activation agent, pyrolysis conditions, or the carbonization temperature and time.

Table 1. The surface area and pore properties of super activated carbon synthesized in this study, and some of the studies for the biomass-derived activated carbons in the literature.

Biomass	Activation Method	BET specific surface area ($m^2 g^{-1}$)	Total pore volume ($cm^3 g^{-1}$)	Pore width (nm)	Reference

CONCLUSIONS

In this study, super activated carbon with a high specific surface area and large pore volume was synthesized through an efficient biosynthesis method using pomegranate (*Punica Granatum L.*) peels. The characterization studies (FT-IR, XRD, SEM, and BET) showed that the super-activated carbon was prepared successfully. Accordingly, the reuse of

food waste by-products not only prevents environmental pollution arising from these wastes but also reduces carbon emissions. Furthermore, this approach offers the potential for the transformation of locally abundant industrial and domestic wastes into new and cost-effective valuable materials. Moreover, the synthesized super-activated carbon can be utilized for many areas such as wastewater treatment, supercapacitor, and CO_2 adsorption applications owing to its high surface area.

ABSTRACT

Environmental pollution is a significant problem that threatens the health of living beings and the balance of the ecosystem. This pollution is caused by human activities as well as natural processes and is classified into three main categories: physical, chemical, and biological. Especially dyes used in industries such as the textile sector have serious negative effects on the environment. These substances, which have toxic, carcinogenic, and mutagenic properties, disrupt the balance of nature and pose a threat to both humans and other living things. Physical, chemical, and biological methods are used to remove dyes from the environment. Phytoremediation is one of the environmentally friendly and sustainable biological methods that aim to clean pollutants through plants. Although it has advantages such as being economical, not requiring energy, and not harming environmental resources, the application of this method can take a long time, and there may be limitations in reaching deep underground pollutants. When suitable conditions are provided, phytoremediation offers an effective solution in combating environmental pollution and contributes to the sustainability of the ecosystem. Natural adsorption processes are an economical and environmentally friendly solution for removing these harmful substances. By utilizing the adsorption properties of plants such as *Spirodela polyrrhiza, Ceratophyllum demersum L., Eichhornia crassipes, Pistia stratiotes,* and *Lemna minor,* environmental sustainability is targeted, and fewer side effects are provided compared to chemical methods. These studies aim to create a model for both ecosystem protection and future environmental solutions.

Keywords: Phytoremediation, Water treatment, Adsorption, Textile dyestuffs, Aquatic plants.

SU BİTKİLERİ KULLANILARAK TEKSTİL BOYAR MADDELERİNİN FİTOREMEDİASYONU

ÖZET

Çevre kirliliği, canlıların sağlığını ve ekosistemin dengesini tehdit eden önemli bir sorundur. Bu kirlilik, doğal süreçlerin yanı sıra insan faaliyetlerinden kaynaklanmakta ve fiziksel, kimyasal ve biyolojik olmak üzere üç ana kategoride sınıflandırılmaktadır. Özellikle tekstil sektörü gibi endüstrilerde kullanılan boyar maddeler, çevre üzerinde ciddi olumsuz etkilere sahiptir. Toksik, kanserojen ve mutajenik özelliklere sahip bu maddeler, doğanın dengesini bozarken hem insanlar hem de diğer canlılar için tehdit oluşturur.

Boyar maddelerin sucul ortamdan giderilmesi amacıyla fiziksel, kimyasal ve biyolojik yöntemler kullanılmaktadır. Fitoremediasyon, kirleticileri; bitkiler aracılığıyla bertaraf etmeyi amaçlayan çevre dostu ve sürdürülebilir biyolojik yöntemlerden biridir. Ekonomik olması, enerji gerektirmemesi ve çevresel kaynaklara zarar vermemesi gibi avantajları olmasına rağmen bu yöntemin uygulanması uzun zaman alabilir ve derin yeraltı kirleticilerine ulaşmada sınırlamalarla karşılaşılabilir. Uygun koşullar sağlandığında fitoremediasyon, çevre kirliliği ile mücadelede etkili bir çözüm sunar ve ekosistemin sürdürülebilirliğine katkıda bulunur. Doğal adsorpsiyon süreçleri, bu zararlı maddelerin giderilmesinde ekonomik ve çevre dostu bir çözümdür. *Spirodela polyrrhiza, Ceratophyllum demersum L., Eichhornia crassipes, Pistia stratiotes* ve *Lemna minor* gibi su bitkilerinin adsorplayıcı özelliklerinden faydalanılarak çevresel sürdürülebilirlik hedeflenmekte, kimyasal yöntemlere kıyasla daha az yan etki sağlanmaktadır. Bu çalışmalar hem ekosistemin korunması hem de gelecekteki çevresel çözümler için bir model oluşturmayı amaçlamaktadır.

Anahtar Kelimeler: Fitoremediasyon, Su arıtımı, Adsorpsiyon, Tekstil boyar maddeleri, Su bitkileri

1. Giriş

Endüstrideki hızlı değişim ve bu değişime bağlı olarak üretilen ürünler, doğal kaynakların hızla tükenmesine, atık miktarının artmasıyla çevrenin kirlenmesine neden olmaktadır. Özellikle tekstil sektöründe renkli ürünler elde etmek amacıyla yaygın olarak kullanılan boyar madde ve pigmentler, üretim sonrası toksik ve kanserojen organik maddeler içeren atık suların oluşmasına yol açmaktadır. Bu zararlı maddelerin çevreye yayılmadan önce atık sulardan giderilmesi, gerekmektedir (Süzen, 2015). Boyar madde atıklarının çevreye zararları oldukça ciddi ve çok yönlüdür. Üretim sonrası belirli bir deşarj seviyesine indirilmeden su kaynaklarına bırakılan boyar maddeler suyun rengini değiştirerek ışık geçirgenliğini azaltır, toksik ve kanserojen moleküller içerdiğinden su canlılarının yaşamını olumsuz etkiler. Ayrıca bu organik maddeler toprağa sızarak toprak yapısının bozulmasına ve tarımsal verimin düşmesine neden olabilir. Özellikle içme suyuna karıştığında insan sağlığı için büyük risk oluşturan boyar maddelerin canlı sağlığı üzerinde de olumsuz etkileri vardır. Bu maddeler canlılarda genetik mutasyonlara, hormonal bozukluklara ve kansere yol açabilir (Özdemir Koçak vd., 2024).

Boyar madde içeren atık suların gideriminde fiziksel, kimyasal ve biyolojik yöntemler kullanılır. Her yöntemin kendine özgü avantajları ve dezavantajları bulunmaktadır. Atık su arıtımında kullanılan yaygın yöntemler ve avantaj ve dezavantajları Tablo 1'de sunulmuştur.

Tablo 1. Atık su arıtımında kullanılan yaygın yöntemler (Namal, 2017).

Yöntem	Kullanılan reaktif/kaynak	Kategori	Avantaj	Dezavantaj
Adsorpsiyon	Aktif karbon, zeolit, kil	Fiziksel/ Kimyasal	Yüksek verim, geniş yüzey alanı	Yüksek maliyet, doygunluk sorunu
Membran Filtrasyonu	Ultrafiltrasyon, nanofiltrasyon, ters ozmoz	Fiziksel	Yüksek ayırma kapasitesi, kompakt sistem	Yüksek enerji tüketimi, membran kirlenmesi
Koagülasyon-Flokülasyon	Kimyasal çöktürücüler	Fiziksel	Kolay uygulanabilirlik, düşük maliyet	Kimyasal kullanımı, çamur oluşumu
Oksidasyon	Ozon, hidrojen peroksit, Fenton reaktifi	Kimyasal	Etkili renk giderimi, geniş uygulama alanı	Yüksek maliyet, yan ürün oluşumu
Fotokatalitik Yöntemler	UV ışığı ve katalizör (örneğin TiO_2)	Kimyasal	Yüksek etkinlik, düşük enerji tüketimi	Katalizör maliyeti, uzun işlem süresi
Elektrokimyasal Arıtma	Elektrik akımı	Kimyasal	Yüksek verim, kimyasal kullanımı yok	Yüksek enerji tüketimi, elektrot aşınması
Aktif çamur Prosesi	Mikroorganizmalar	Biyolojik	Düşük maliyet, doğal süreç	Uzun işlem süresi, hassas denge
Biyoreaktörler	Özelleştirilmiş mikroorganizmalar	Biyolojik	Yüksek verim, kompakt sistem	Yüksek maliyet, karmaşık işletim
Fitoremediasyon	Algler , su bitkileri ve mantar türleri	Biyolojik	Doğal süreç, düşük maliyet	Uzun işlem süresi, sınırlı etkinlik

Bu yöntemlerden biri olan fitoremediasyon, düşük maliyetli ve çevre dostu olması nedeniyle boyar madde içeren atık suların arıtımında tercih edilen bir yaklaşımdır. Bitkiler, kendi doğal ortamlarında adsorbent görevi görerek kökleri aracılığıyla boyar madde moleküllerini tutarak sucul ortamdan ayırır.

2. Fitoremediasyon: Bitkilerle Atık Su Arıtımı ve Çevresel Sürdürülebilirlik

Fitoremediasyon, bitkilerin kirleticileri doğal yollarla arıtma yeteneğine dayanan bir yöntemdir. Kelime kökeni Latince olup, "phyto" (bitki) ve "remediation" (iyileştirme) kavramlarının birleşiminden türetilmiştir. Çevresel sürdürülebilirlik açısından önemli bir teknik olan fitoremediasyon süreci, bitkisel arıtım, yeşil ıslah veya ekolojik iyileştirme gibi farklı isimlerle de anılmaktadır (Tiryaki ve Potur, 2017).

Bu süreçte adsorpsiyon, kirleticilerin bitki yüzeylerine veya kök sistemlerine bağlanarak sudan veya topraktan uzaklaştırılmasını sağlayan temel mekanizmadır. Özellikle ağır metaller, pestisitler ve organik kirleticiler, bitkilerin kökleri, yaprak yüzeyleri veya hücresel yapıları tarafından adsorbe edilerek ortamdan elimine edilir. Adsorpsiyon, kirleticilerin doğrudan suya veya toprağa karışmasını önleyerek ekosistemin korunmasına katkı sağlar. Bu mekanizma sayesinde bitkiler, kirleticileri bünyelerine alarak su ve toprak kalitesini iyileştirmede etkili rol oynar. Bu yöntem, özellikle düşük maliyetli ve çevre dostu bir alternatif sunması nedeniyle dikkat çekmektedir (Hamutoğlu vd., 2012).

Bu süreç, kirleticinin türüne ve ortam koşullarına bağlı olarak farklı mekanizmalarla gerçekleşir. Örneğin, bazı bitkiler kirleticileri kökleriyle adsorbe edip sudan uzaklaştırırken (rizofiltrasyon), bazıları kirleticileri bünyesine alıp biriktirerek ortamdan temizlenmesini sağlar (fitoekstraksiyon). Mikroorganizmalarla etkileşim halinde gerçekleşen süreçlerde kirleticiler parçalanarak etkisiz hale getirilir (rizodegradasyon, fitodegradasyon), ya da bitkiler belirli kirleticileri bünyelerine aldıktan sonra yaprakları aracılığıyla atmosfere salar (fitovolatilizasyon). Ayrıca, bazı bitkiler kirleticilerin hareketliliğini azaltarak onların yayılmasını engeller ve stabil hale getirir (fitostabilizasyon) (Hamutoğlu vd., 2012).

3. Fitoremediasyon Yönteminin Avantaj ve Dezavantajları

Fitoremediasyon, çevresel kirleticilerin bitkiler aracılığıyla giderilmesini sağlayan sürdürülebilir bir yöntemdir. Ancak, bu yöntemin uygulanabilirliği avantajları ve bazı sınırlamalarla birlikte değerlendirilmelidir.

Fitoremediasyon yönteminin avantajları aşağıdaki sunulmuştur:

• Ekonomik ve düşük enerji gereksinimi: Geleneksel fizikokimyasal arıtma yöntemlerine kıyasla, fitoremediasyon daha az maliyetli olup ek enerji girdisi gerektirmez. Bitkiler doğal süreçler aracılığıyla kirleticileri uzaklaştırdığı için işletme maliyetleri düşüktür.

• Yerinde arıtım imkânı: Kirlenmiş alanın taşınmasına gerek kalmadan, kirleticilerin bulunduğu yerde giderilmesini sağlar. Bu, ek lojistik maliyetleri ortadan kaldırarak süreci daha verimli hale getirir (Aybar vd., 2015).

• Tekli ve ikili karışımların giderimi: Fitoremediasyon, yalnızca tek bir kirleticiye odaklanmak yerine, ağır metaller, organik bileşikler ve diğer kirleticileri aynı anda temizleyebilir.

• Ekosistem dostu ve sürdürülebilir: Bitkiler, kirleticileri absorbe ederek veya metabolize ederek çevreye zarar vermeden doğal bir arıtma süreci sunar. Bu yöntem, ekolojik dengeyi koruyarak uzun vadeli çevresel iyileştirme sağlar (Hamutoğlu vd., 2012).

Fitoremediasyon yönteminin dezavantajları ise aşağıdaki gibi sıralanabilir:

• Bazı bitkilerin toksik bileşiklere karşı hassasiyeti: Hiperakümülatör bitkiler belirli kirleticilere karşı dayanıklı olsa da yüksek toksisiteye sahip bileşikler bitkilerin büyümesini ve metabolik süreçlerini olumsuz etkileyebilir. Bu nedenle, uygun bitki türlerinin seçimi kritik öneme sahiptir.

• Toprak ve su koşullarına bağımlılık: Fitoremediasyonun başarısı, kullanılan bitkilerin edafik ve biyotik faktörlere uyum sağlamasına bağlıdır. Uygun olmayan çevresel koşullar, bitkilerin kirleticileri etkili şekilde absorbe etmesini zorlaştırabilir (Aybar vd., 2015).

• Arıtma süresinin uzunluğu: Fitoremediasyon, fizikokimyasal yöntemlere göre daha uzun sürede sonuç verir. Kirleticilerin bitkiler tarafından alınması ve metabolize edilmesi zaman gerektirdiğinden, hızlı arıtma gerektiren durumlarda yeterli olmayabilir (Hamutoğlu vd., 2012).

4. Fitoremediasyon Yönteminde Kullanılan Bazı Bitkiler ve Literatür Çalışmalarından Örnekler

Fitoremediasyon yönteminde genellikle hiperakümülatör bitkiler kullanılmaktadır. Bu bitkiler seçici özellik göstererek farklı türdeki kirleticileri adsorplayarak atık suların arıtımında etkili olabilirler.

Süreli yayınlar incelendiğinde, su bitkilerinin boyar madde, farmasötik bileşik ve ağır metal iyonu gibi kirleticilerin gideriminde kullanımına yönelik sınırlı sayıda çalışmaya rastlanmıştır.

Keskinkan tarafından 2006 yılında yürütülen bir çalışmada; *Ceratophyllum demersum* ve *Myriophyllum spicatum* su bitkilerinin Bazik Mavi 41 (Basic Blue 41, BB 41) azo boyarmaddesinin gideriminde adsorbent olarak kullanımı incelenmiştir. Çalışma sonuçlara göre, BB 41 boyar maddesinin adsorpsiyonunda, *Myriophyllum spicatum* ile yürütülen çalışmalarda maksimum adsorpsiyon kapasitesi 64,9 mg/g; *Ceratophyllum demersum*'un adsorbent olarak kullanıldığı çalışmalarda ise maksimum adsorpsiyon kapasitesi 50,0 mg/g olarak belirlenmiştir. Sonuç olarak, bu iki su bitkisinin fitoremediasyon ile boyar madde gideriminde efektif birer adsorbent olarak kullanılabileceği görülmüştür (Keskinkan, 2006).

Aasim ve Nadeem tarafından 2024 yılında yapılan bir araştırmada, *Ceratophyllum demersum*'un sucul ortamda bulunabilen kirleticileri adsorplama potansiyeli incelenmiş, bu bitkinin fitoremediasyon süreçlerindeki etkisini ortaya konulmuştur. Özellikle kadmiyum (Cd) gibi ağır metalleri sudan adsorplayabilme özelliği değerlendirilmiş ve biyokonsantrasyon faktörü (BCF) ile metal giderme yüzdesi analiz edilmiştir. Sonuçlar, *Ceratophyllum demersum*'un yüksek adsorpsiyon kapasitesi sayesinde etkili bir adsorbent olabileceğini göstermiştir. Çalışma ayrıca, yapay zekâ tabanlı modellemeler ile bitkinin kirletici giderim süreçlerinin tahmin edilmesine katkı sağlamıştır. (Aasim & Nadeem, 2024).

Ewadh, 2020 yılında yaptığı bir çalışmada, *Ceratophyllum demersum*'un metilen mavisi boyar maddesinin adsorpsiyon ile giderimini araştırmıştır. *Ceratophyllum demersum* ile Metilen Mavisi adsorpsiyonunda %96 oranında boyarmadde giderimi elde edildiği belirtilmiştir. Adsorpsiyon mekanizmaları açısından, bitkinin kirleticiyi hücre duvarı ve yüzey yapılarına bağlayarak sudan adsorpladığı vurgulanmıştır. Bu çalışma, boyar maddelerin fitoremediasyonunda bitkilerin kullanımının düşük maliyetli ve çevre dostu bir çözüm olabileceğini göstermiştir (Ewadh, 2020).

Konuk 2008 yılında yürüttüğü çalışmada, su sümbülü 'nün *(Eichhornia crassipes)* Malahit Yeşili, Metilen Mavisi ve Reaktif Sarı 145 boyar maddelerinin adsorpsiyon ile giderimini araştırmıştır. Çalışma sonucunda; su sümbülünün endüstriyel atık sulardaki katyonik boyarmaddelerin giderilmesinde etkili bir adsorbent olarak kullanılabileceği ortaya konulmuştur. Bitkinin geniş yüzey alanı ve biyolojik yapısı sayesinde su kirliliğini azaltmada doğal ve sürdürülebilir bir çözüm sunduğu vurgulanmıştır (Konuk, 2008).

Ayrıca, yapılan bazı çalışmalarda, bitkilerin farklı ağır metalleri de adsorplayabildiği görülmüştür. Boyar maddelerin ve ağır metallerin su bitkileri ile giderimine yönelik literatürde yer alan bazı çalışmalar Tablo 2'de sunulmuştur.

Tablo 2. Boyar maddelerin ve ağır metallerin su bitkileri ile giderimine yönelik literatürde yer alan bazı çalışmalara örnekler

Bitki	Yöntem	Hedef Kirletici	Verim	Kaynak
Ceratophyllum demersum	Adsorpsiyon, Fitoremediasyon	Metilen Mavisi	%96 oranında boyar madde giderimi	(Ewadh, 2020)
Myriophyllum spicatum	Adsorpsiyon	Bazik Mavi 41	Maksimum adsorpsiyon kapasitesi: 64,9 mg/g	(Keskinkan, 2006)
Eichhornia crassipes	Adsorpsiyon, fitoremediasyon	Malahit Yeşili, Metilen Mavisi	pH 9-10 arasında yüksek adsorpsiyon kapasitesi	(Konuk, 2008)
Ceratophyllum demersum	Fitoremediasyon	Kadmiyum (Cd)	Adsorbent özelliği gösterme	(Aasim & Nadeem, 2024)
Eichhornia crassipes	Adsorpsiyon	Krom (Cr)	Krom metaline seçiciliği yüksek	(Ubale & Ahuja, 2024)

5. Sonuç ve Öneriler

Fitoremediasyon, tekstil boyar maddelerinin alıcı su ortamından giderilmesinde çevre dostu ve sürdürülebilir bir alternatif sunmaktadır. Ancak yöntemin etkinliği, seçilen bitki türüne, boyar maddeye, çevresel koşullara ve uygulanan stratejilere bağlı olarak değişmektedir. Daha verimli bir arıtma süreci için uygun bitkilerin belirlenmesi büyük önem taşımaktadır. Çünkü, sürecin seçici özellik göstermesi nedeniyle her su bitkisi, her kirletici maddeyi adsorplama özelliği göstermemektedir.

Fitoremediasyonun daha etkin hale getirilmesi için fizikokimyasal arıtma teknikleriyle entegre edilmesi önerilmektedir. Örneğin, koagülasyon gibi yöntemlerle desteklenen sistemler, arıtma sürecinin verimini artırabilir. Diğer yandan, bitki kök bölgesinde bulunan mikroorganizmalar

kirleticilerin biyolojik olarak parçalanmasını destekleyebilir. Bu nedenle, bitki-mikroorganizma etkileşiminin artırılmasıyla fitoremediasyon verimi artırılabilir. Çevresel faktörlerin iyileştirilmesi de süreç için önemli bir unsurdur. Su kültürü ortamında yetiştirilen hiperakümülatör bitkiler, boyar maddelerin gideriminde kullanılabilir. Bitkilerin büyüme hızını artırmak amacıyla uygun pH, sıcaklık ve besin içerikleri sağlanmalıdır.

Bu adımların doğru şekilde uygulanması, fitoremediasyonun tekstil boyar maddelerinin gideriminde daha etkili bir çözüm haline gelmesini sağlayacaktır.

ABSTRACT

In biology departments of science faculties, education is provided on subjects such as living beings, nature and environment. Therefore, revealing the cognitive structures of students studying in this department about clean water and sanitation is essential in order to rapidly eliminate false information and lack of knowledge before starting their professional lives. Based on this, this study aimed to examine the cognitive structures of biology department students of science faculty about clean water and sanitation. The survey model was used in the study. Word association test was used as a data collection tool in the study. The sample of the study consists of ??? students studying in biology department of science faculty. In order to determine the results of the word association test, the answer words given to the key concepts of "Clean water" and "Sanitation" were examined. The answer words given for the key concept were written one by one and a frequency table was created. During the data analysis, the answer words given by the students to the key concept were used and the analyses were performed by two different raters in order to ensure the consistency of the data. Content analysis was performed on the relevant data to obtain common themes for each response. As a result, the most evocative theme for the concept of clean water was determined as life, while the least used theme was determined as water purification. Scientific inaccuracies include the views that clean water can only be obtained by boiling or that transparency is the only indicator of cleanliness. The most commonly used words for the concept of sanitation are: water, hygiene and health. Scientific inaccuracies include the views that sanitation can only be done in facilities or that it is a directly biological concept.

Keywords: Clean water, sanitation, word association test

Introduction

When you consider that three-quarters of the world is covered with water, that approximately 50-80% of the body weight of animals and 60% of an average adult human is water, it becomes easier to understand the importance of water for living things. However, the water on our planet is not as much as it is thought. Approximately 97.5% of the water on the planet consists of salt water. Drinking water is only 2.5%. 79% of this low amount of drinking water is hidden in glaciers and 20% underground. The part that we can easily reach to meet our needs is only 1% of the total drinking water. This part is renewed thanks to precipitation. Water is constantly polluted when used. When we do not recycle the polluted water, most of this water pollutes the areas it passes through and ends up in the oceans. Not the total amount of water, but the amount of drinkable water decreases in this way. And as a result of all this, an unwanted water shortage begins. Water scarcity affects more than 40% of humanity. More and more countries are experiencing water stress every day, and it is estimated that at least a quarter of the world's population will experience recurrent water deprivation by 2050 (WHO & UNICEF, 2019).

Although our country is very rich in terms of water resources, the rate of water pollution is also quite high. Water pollution is an important problem that directly affects the environment (MEB, 2012a; MEB, 2012b; MEB, 2014). Any change caused by water pollution, which is a sub-parameter of environmental pollution, also affects environmental pollution. Environmental pollution affects water the most among natural resources and causes water pollution (Menteşe, 2017). In order to protect and ensure the continuity of water resources that give life to everything around us, water pollution should be emphasized (Yılmaz & Yanarateş, 2020).

In general, water is used for irrigation of agricultural areas, meeting industrial needs and general purposes in homes. In recent years, due to changes in lifestyle and food habits, an increase in water consumption per person has been observed (Söylemez, Coşkun & Ardor, 2014). Despite the decreasing usable water potential, the fact that the world population needs more water every day has caused an increase in national and global sensitivity regarding water resources. Chemical fertilizers, agricultural pesticides, sewage, animal waste, toxic substances, solid and liquid wastes used to increase field yields are the main causes of water pollution. Although people themselves have caused all these negative activities, the water they need to sustain their lives must be delivered to them in a clean and healthy way. To ensure this, water must be purified from harmful factors and microorganisms that can cause diseases. In addition, appropriate measures must be taken to prevent used water from harming people and other living things and from polluting clean water resources.

On a global scale, approximately 80% of all industrial and human wastewater is released into the environment without pretreatment, with harmful effects on human health and ecosystems (Elerman, Yazıcı & Gültekin, 2022). This rate is much higher in underdeveloped countries where wastewater treatment facilities and sanitation are quite lacking (UNWWD Report, 2021). As of 2020, the difference between high-income and low-income countries in terms of access to international clean water is sharp. While the rich countries of the North generally have sufficient water reserves, it is seen that water shortages are experienced more in southern countries (Figure 1). Therefore, it is clearly seen today that water services should be considered together with sanitation (Çolakoğlu, 2011). Sanitation is the establishment of healthy cleaning and hygienic conditions and ensuring their continuity (Bulduk, 2003). Seafood products are products that can spoil quickly when the necessary hygiene, sanitation and storage conditions are not applied. For this reason, if the necessary conditions are not met, chemical and microbiological changes are observed in the product, which can lead to food poisoning. In order to prevent such problems, it will be possible to fulfill the hygiene, sanitation and protection

conditions of the fishery products from the time they are caught to the table. The fact that sanitation is a right and that it is addressed with water in terms of international water law is quite new. It is thought that by defining the right to sanitation, which means that every individual has access to adequate, safe and accessible sanitation where physical safety can be ensured, diseases such as cholera, malaria and dysentery, which are transmitted through water, can be prevented (Çolakoğlu, 2011).

When we look at the data on the issues discussed in this context, according to the report published jointly by the World Health Organization (WHO) and the United Nations Children's Fund (UNICEF) in 2019, it is stated that nearly 2.2 billion people in the world do not have access to clean water when needed, and 4.2 billion people do not have access to sanitation facilities (UNICEF and WHO, 2019). In relation to this, the United Nations Development Program (UNDP) also emphasizes that 41 countries experienced water shortages in 2011 and that renewable water resources are on the verge of depletion in 10 of these.

Considering the suggestions about clean water and sanitation, it is obvious that individuals need to be conscious. At this point in terms of water usage and drinking water resources in the world; Are individuals not aware of the limitedness of water resources? Are individuals not conscious water consumers? Do individuals have knowledge about issues such as water transformation, cleaning, purification? Do they know the concepts of sanitation, cleaning and hygiene? Questions such as these come to mind. The answer to all these questions depends on how individuals structure these concepts in their minds. In learning a concept, the individual focuses on the structure, content or differences of the information they acquire. Therefore, knowing the individual's prior knowledge and structuring this information correctly and establishing meaningful connections with new information will ensure that the concept is taught correctly (Kurt & Ekici, 2013). Concept learning is a formation that is completed by becoming aware of the existing concepts in the mind and structuring a new scientific concept in the mind (Tsai & Huang, 2002). When there are incorrect or incomplete structures in the conceptual structures in the minds of students, students come to the classroom with alternative concepts that are far from scientific aspects. These concepts can negatively affect students when they want to learn a new concept (Mintzes, Wandersee, & Novak, 2001; Palmer, 2001). For this reason, knowing the student's prior knowledge is considered very important in determining the cognitive structure (Tsai & Huang, 2002; Vosniadou, Ioannides, Dimitrakopoulou, & Papademetriou, 2001). Gilbert, Boulter, and Rutherford (1998) emphasize that it is very difficult to explain the cognitive structures of individuals, but revealing their thoughts about key concepts is very important in this regard and these key concepts reveal the cognitive structures of individuals regarding the main concept. Especially during the conceptual change process, revealing alternative concepts that exist in students' cognitive structures is important for them to achieve meaningful learning (Kurt & Ekici, 2013). Revealing the cognitive structures of individuals about clean water and sanitation is also important in terms of teaching and understanding concepts related to the environment and water. In the literature, there are studies on the subject: the views of prospective teachers on conscious water consumption, the knowledge of prospective science teachers about water and water pollution, the conceptual understanding levels of 7th grade secondary school students on water pollution, the metaphorical perceptions of prospective teachers on the concept of water pollution, the increase in water awareness of kindergarten students, and the perceptions of university students on water and water pollution (Alaş, Tunç, Kışoğlu & Gürbüz, 2009; Kıryak, 2013; Köseoğlu, 2017; Kriper, 2014; Ursavaş & Aytar, 2018; Yılmaz & Yanarateş, 2020). When the relevant studies are examined, it is seen that the concept of water is mostly addressed in terms of water pollution and information is collected through surveys or opinions. No study has been found in which individuals' cognitive

structures about water and water-related concepts are examined in depth. For this reason, it is not clear how the cognitive structure is for concepts such as clean water and related sanitation, which concepts these concepts are associated with, and what the incorrect or incomplete understandings are. Although the concept of environment is the most common, there are also studies examining the cognitive structure for concepts such as recycling and renewable energy (Aktaş, 2021; Bakar, 2019; Çelik, 2019; Polat & Bahar, 2012; Özcan & Demirel, 2019; Özyurt & Yalman, 2020). In these studies, since the environment and environmental relations are questioned more generally, concepts such as water and water resources, sanitation, and hygiene have not been examined. However, it can be thought that the more correct the cognitive structure is about clean water, sanitation and its use, the easier it will be to prevent other negative situations related to the environment caused by unconsciousness in water use.

It will be possible to improve global water problems and prevent new problems with the contributions of all individuals, young and old. In particular, determining the cognitive status of the young generation on this issue can be considered important for the future. In a study conducted by Kariper (2014) on the awareness of university students about water pollution, it was revealed that although very simple and general questions were asked about the concepts of dirty water, water hardness, purification and disinfection, why or how water becomes dirty and how it becomes drinkable, students did not have enough knowledge about water pollution and could not comment on some issues, and even did not internalize the environment and water very much. Alaş et al. (2009) concluded in their study that teacher candidates did not pay attention to water saving. In biology departments of science faculties, education is provided on subjects such as living beings, nature and environment. Therefore, revealing the cognitive structures of students studying in this department about clean water and sanitation is essential in order to quickly eliminate misinformation and lack of knowledge before they start their professional lives. It is thought that revealing the necessary prior knowledge and alternative concepts of biology students about clean water and sanitation will help to organize the content of the courses given about environment and water resources during undergraduate education and to see the deficiencies in the field.

Based on all these, the problem of the research is “What are the cognitive structures of biology department students of science faculty about clean water and sanitation?” In order to serve this general purpose, the following sub-objectives are focused on:

1. What are the cognitive structures of biology department students about the concept of clean water?

2. What are the cognitive structures of biology department students about the concept of sanitation?

Methods

This research is a descriptive study designed in the survey method. Descriptive studies are used to understand the structure of objects, societies and the functioning of events (Cohen, Manion & Morrison, 2007). Since it is necessary to obtain a lot of information about a phenomenon in order to define it, a lot of data is needed (Metin, 2014:80). Another aspect of survey studies is that the sample makes generalizations about the universe that is thought to be represented in the light of the obtained data (Cohen et al., 2007). In this study, it was deemed appropriate to choose the survey method to determine the cognitive structures of the students in the biology department of the faculty of science about clean water and sanitation.

Data Collection Tool

In the research, WAT was used as a data collection tool to determine the cognitive structures of the students regarding the concepts of clean water and sanitation. The word association test reveals the connections between the concepts in the cognitive structure of the students and helps to determine whether the relationship between the concepts in the long-term memory is sufficient or meaningful (Bahar, Johnstone & Sutcliffe, 1999). In this technique, students are asked to write down the concepts that come to mind with a given key concept related to a topic within a certain period of time. The key concept chosen for the WAT is the concepts of clean water and sanitation. During the application of the test, university students were asked to write down the related concepts that come to mind with the key concept within 30 seconds. The thirty-second time period was determined as the most appropriate time period in the pre-tests conducted in previous academic studies (Ercan, Taşdere & Ercan, 2010; Özatlı & Bahar, 2010; Polat, 2013). The reason for writing the key concept ten times under each other is to prevent the risk of chain response. Because if the key concept does not return to the university student in each concept writing, he/she may write the words that come to mind with the concept he/she wrote as an answer instead of the key concept, which may prevent the test from achieving its purpose. Before the WAT was applied, students were given brief information about the word association test and examples from different fields were shown.

Sample

The sample of this study consists of a total 429 biology students studying at a university. The sample was determined by simple random sampling method. The voluntary participation of the students in the study was taken into consideration.

Analysis of Data

In order to determine the results of the KIT, the response words given to the key concepts of “Clean water” and “Sanitation” were examined. The response words given for the key concept were written one by one and a frequency table was created. During the analysis of the data, the response words given by the students to the key concept were used and analyses were carried out by the project owner and the consultant in order to ensure the consistency of the data. Common themes were obtained for each answer by performing content analysis. Inter-observer reliability calculation was made for the obtained themes. The numbers with consensus and disagreement in the common decisions were determined and calculated using the reliability=consensus/consensus+disagreement formula. At this point, 82% consensus was obtained for clean water and 81% consensus was obtained for sanitation. In this context, reliable coding was obtained by finding the scores above 80% for consensus (Kabapınar, 2003).

Findings and Discussion

The findings regarding the evocative words and sample sentences related to the concept of clean water in the word association test are presented in Table 1.

Table 1. Evocative words and example sentences for the concept of clean water

Theme	Code	Frequency	Total f	Example Sentences
Environment	Stream	14	47	Fruits and vegetables are thoroughly washed with clean water.Clean water is very important for living organisms in nature.Clean water is the most important element in the ecosystem.
	Living Being	7		
	Sea	6		
	Fish	5		
	Nature	4		
	Animal	4		
	Rain	3		
	Ecosystem	2		
	Habitat	2		
Soil	Mineral	10	24	Clean water contains minerals.Seas are blue in color.
	Plant	6		
	Soil	4		
	Blue	3		
	Agriculture	1		
Cleanliness	Hygiene	17	57	Water is essential for cleanliness.There must be clean water so the universe can be hygienic.The rain that fell was very clear.
	Cleanliness	12		
	Pure	10		
	Clear	9		
	Purified	7		
	Sterile	1		
	White	1		
Water Treatment	pH	4	18	Clean water can be obtained by boiling.Distillation purifies dirty water.The pH of clean water is 7.
	Chlorine-Free	4		
	Transparent	3		
	Distillation	3		
	Distilled	2		
	Boiling	1		
	Steam	1		
Life	Health	29	59	The most important thing for a healthy life is water.Clean water is necessary for a healthy life.Clean water gives people a sense of relief.
	Life	26		
	Relief	2		
	Compassion	1		
	Love	1		

When Table 1 is examined, it is seen that 5 themes were obtained for the concept of clean water. The theme of life consists of the word group that evokes the most for the word clean water. The theme of water purification is seen as the least used theme for the concept of clean water.

Among the most used words, words such as Health (29), Life (26) and Hygiene (17) stand out. Words that appear larger in the word cloud are words that are used more frequently (Figure 4).

When sample sentences about clean water were analyzed scientifically, scientific errors were revealed. Below are the findings consisting of misconceptions/misconceptions about clean water, the reason for the mistake and corrections to these concepts.

"Clean water can be obtained by boiling."

Incorrect: The boiling process can increase the hygiene of water, but this alone is not enough for water to be pure and clean. Purification and water taken directly from sources are healthier.

Correction: Clean water can be obtained by purification processes.

"There must be clean water so that the universe can be hygienic."

Incorrect: The word "universe" here has a very general and abstract meaning. The expression "the universe being hygienic" may not make much sense in a sentence describing the hygiene of water.

Correction: There must be clean water so that our living spaces can remain hygienic.

"Clean water is essential for a healthy life" and similar expressions (for example, "Clean water is very important for our health.")

Incorrect: Although all of these sentences are correct, they may be repetitive expressions. If they are used in a text, they should not be used in the same way every time.

Correction: It would be good to use variety in such sentences. For example, instead of "Clean water is essential for health.", different expressions such as "Clean water is the guarantee of a healthy life." can be used.

"Clean water is pure water that does not contain chemicals."

Incorrect: This sentence is correct, but we can clarify. The term "pure water" refers to the complete purity of water, especially in terms of chemistry and biology. Clean water, on the other hand, generally refers to water that is free of pollutants.

Correct: "Clean water is water that is free of pollutants and has not lost its natural properties."

"Clean water is transparent."

Incorrect: Clean water can be transparent, but it does not always have to be transparent. For example, even if mineral water is transparent, it contains minerals.

Correction: Clean water is usually transparent.

"Clean water should have a transparent color."

Incorrect: They are repetitive and the concept of transparency is not directly related to the cleanliness of water.

Correction: Clean water should be transparent and should not contain foreign matter.

"Water is essential for the life of living things."

Incorrect: This sentence is correct, but it could be more fluent.

Correction: Water is essential for the life of all living things.

The findings regarding the evocative words and sample sentences related to the concept of sanitation in the KİT test are presented in Table 2.

Table 2. Evocative words and example sentences for the concept of sanitation

Theme	Code	Frequency	Total f	Example Sentences
Nature	Living Being	6	31	• Sanitation is important for the environment. • Seas are not hygienic for sanitation. • Sanitation is a biology concept.
	Sea	4		
	Nature	4		
	Plant	3		
	Animal	3		
	Human	3		
	River	2		
	Soil	2		
	Ecology	2		
	Ocean	1		
	Biology	1		
Health	Health	16	56	• Sanitation must be done to stay healthy. • Dirt is cleaned with soap. • The process of separating undrinkable water from microorganisms to obtain clean water is called sanitation.
	Hygiene	17		
	Bacteria	7		
	Sterilization	4		
	Microorganism	5		
	Disinfection	3		
	Soap	1		
	Blood Pressure	1		
	Hospital	1		
	Second	1		
Water Treatment	Water	24	74	• Treatment is part of sanitation. • Cleaner water can be obtained through sanitation. • Boiling makes water cleaner.
	Treatment	15		
	Chlorine	9		
	Pure	8		
	Sewage	7		
	Distillation	5		
	Filtration	2		
	White	1		
	Boiling	2		
	Tap	1		
Waste	Pollution	14	37	• Sanitation can be the transformation of something. • Sanitation separates waste from dirt. • Sanitation is the transformation of wastewater.
	Waste	10		
	Transformation	6		
	Efficiency	3		
	Separation	2		
	Wastefulness	1		
	Chemical	1		
Planning	System	5	21	• Sanitation should be done regularly. • Sanitation is a process carried out with planned and specific mechanisms. • Sanitation is important for our health.
	Order	4		
	Process	4		

	Plan	2		
	Community	2		
	Facility	2		
	Mechanism	1		
	Important	1		
Environment	Environment	5	18	•Sanitation is economically costly. • Sanitation is necessary for efficient agriculture.
	Agriculture	3		
	Plant	3		
	Natural	3		
	Soil	2		
	Economy	1		
	Protection	1		

When Table 2 is examined, it is seen that 6 themes were obtained from the answers regarding the concept of sanitation. The theme of purification consists of the words that evoke the most for the concept of sanitation. The theme of environment consists of the words that evoke the least for the concept of sanitation. Among the most used words, words such as Water (24), Hygiene (17) and Health (16) stand out. Words that appear larger in the word cloud are words that are used more frequently.

When sample sentences about sanitation were analyzed scientifically, scientific errors were revealed. Below are the findings consisting of misconceptions/misconceptions about sanitation, the reason for the mistake, and corrections to these concepts.

"Purification is a part of sanitation."

Misconception: Purification and sanitation may be similar concepts, but they are not exactly the same. Sanitation generally refers to a broader cleaning and hygiene management. Purification, on the other hand, is the process of cleaning water or other substances from contaminants.

Correction: Water treatment is an important part of sanitation.

"Sanitation is done in facilities."

Misconception: Sanitation is not only done in facilities; it can also be applied in homes, cities, factories, and nature.

Correction: Sanitation is done in various environments, especially in facilities.

"Sanitation can be the transformation of something."

Misconception: The expression "transformation of something" is ambiguous here. Sanitation is generally the process of removing pollution, ensuring cleanliness, and creating hygienic conditions.

Correction: Sanitation is the process of eliminating environmental pollution.

"Drinking water is obtained by sanitation."

Incorrect: Drinking water is not obtained directly by sanitation. Sanitation is the process of cleaning water, but the water must be purified initially.

Correction: Drinking water is provided by sanitation and purification processes.

"Sanitation is a biological concept."

Incorrect: Sanitation may be related to biology, but it is not directly a biological concept. It is related to environmental hygiene, cleanliness and health.

Correction: Sanitation is a process related to environmental health and hygiene.

"Sanitation is the main part of cleanliness."

Incorrect: Sanitation not only provides cleanliness, but also regulates hygiene and health conditions.

Correction: Sanitation is a process that regulates hygiene and health conditions as well as cleanliness.

"The process that separates non-consumable water from microorganisms and enables us to obtain clean water that can be drunk is called sanitation."

Incorrect: This sentence is complicated and long. In addition, the processes of water purification and sanitation could be stated more clearly.

Correction: Sanitation is a process that makes water drinkable by removing microorganisms.

Conclusion and Recommendations

1. The associations for the concept of clean water are grouped under 5 themes.

2. The most associated theme for the concept of clean water is Life, while the least used theme is Water Purification.

3. The most commonly used words for the concept of clean water are: health, life, and hygiene.

4. Scientific inaccuracies include the views that clean water can only be obtained by boiling or that transparency is the only indicator of cleanliness.

5. The associations for the concept of sanitation are grouped under 6 themes.

6. The most commonly used theme for sanitation is purification, while the least commonly used theme is environment.

7. The most commonly used words for the concept of sanitation are: water, hygiene, and health.

8. Scientific inaccuracies include the views that sanitation can only be done in facilities or that it is a directly biological concept.

9. Many scientific concepts related to clean water and sanitation have been used incorrectly.

10. Expressions such as "Let the universe be hygienic" in the sample sentences have a very general or abstract meaning.

11. The majority of students have understood how important water is for living things and its relationship with health.

12. There is a general consensus that water must be clean.

13. It has been understood that purifying water is necessary to obtain clean water.

14. There is confusion about what exactly concepts such as sanitation and purification mean.

15. There are incorrect generalizations such as water must always be transparent.

16. Ambiguous and incorrect uses such as "Sanitation can be the transformation of something" are striking.

17. It is not fully understood that sanitation is not only about water but also a broader concept of environmental hygiene.

18. There is a lack of information about different water purification methods and their working principles.

19. There is a lack of information about not only the physical properties of water but also its chemical properties.

This study aimed to reveal students' associations with the concepts of water and sanitation and their cognitive structures on this subject. The findings show that students understand the importance of water but have deficiencies in the scientific dimensions of these concepts. For example, simple misconceptions such as "Boiling provides clean water" indicate that the hygiene and purification processes of water are not sufficiently understood.

Students generally associate water and sanitation with basic concepts such as life, health and hygiene. However, it is observed that they lack knowledge on more specific issues such as purification and the environment. This situation can be interpreted as these issues are not sufficiently covered in the curriculum or that students cannot relate these issues to their daily lives.

Another important point that emerged in the study is that students have scientific misconceptions. Misconceptions such as water can only be cleaned by boiling or that sanitation can only be done in facilities stem from students' lack of scientific knowledge. This situation emphasizes the importance of providing students with more accurate and comprehensive information.

Confusing similar concepts such as sanitation and purification also shows that students do not fully understand the nuances between these concepts. This situation suggests that the concepts should be defined more clearly and supported with examples.

In the literature, misconceptions are often emphasized in the context of environmental education. According to Ausubel's Meaningful Learning Theory, students' incorrect or incomplete prior knowledge makes it difficult for them to understand new information. Therefore, constructivist approaches should be adopted on environmental health, water properties, and sanitation processes.

Studies examining students' perceptions of water and sanitation concepts provide significant knowledge on this subject. Researchers such as Gilbert and Boulter (2000) state that students tend to simplify complex scientific concepts and this leads to misconceptions. Especially concepts that need to be supported visually, such as the water cycle, can be challenging for students.

Studies in the field of environmental education also examine students' awareness of the importance of water resources and pollution problems. For example, in a study conducted by Özerdinç and Hamalosmanoğlu (2021), it was determined that students did not have sufficient knowledge about the protection of water resources and their sensitivity on this issue was low. This situation shows that more effective environmental education programs should be developed for students.

There are also different pedagogical approaches developed to eliminate misconceptions about water and sanitation in the literature. For example, it is stated that methods such as experimental learning, problem solving and project-based learning deepen students' conceptual understanding and contribute to permanent learning.

The literature emphasizes that the materials used in water and sanitation education also play an important role in students' learning processes. Visual materials, simulations and realistic models can help students concretize abstract concepts. However, in order to use these materials effectively, teachers must have pedagogical knowledge and skills.

Finally, it is emphasized that water and sanitation education is linked to sustainable development goals and plays an important role in raising students as individuals who are sensitive to the environmental problems they will encounter in their future lives. Therefore, water and sanitation education should not only be based on scientific knowledge, but should also be designed in a way that shapes students' value judgments and behaviors.

Misconceptions about clean water and sanitation indicate a lack of awareness that this concept is not limited to obtaining clean water, but also includes hygiene and environmental health processes. These concepts are of vital importance not only for individual but also for social health. Therefore, the following suggestions can be given in connection with the emerging cognitive structure and the resulting misconceptions/misconceptions:

- Scientific truths and practical examples should be added to the course content about clean water and sanitation.
- The differences between boiling, purification and hygiene processes should be explained clearly for students.
- Concept tests should be regularly applied to identify students' misconceptions and feedback should be provided.
- Education programs should be rearranged on the sustainability of water resources and the importance of sanitation.

Thanks and Information Note

This study was supported within the scope of TÜBİTAK 2209-A project. We thank TÜBİTAK for their support.

ABSTRACT

Although teacher training policies in Turkey have been around for over a century, the teacher training model has not been sustainable. Although it has been removed from time to time, teachers continue to be trained with the pedagogical formation program outside of education faculties. It is obvious that students of science faculty, one of the faculties participating in pedagogical formation training, do not start their education-teaching life only with the aim of becoming teachers. When it is considered that the main purpose of science faculties is to train scientists, the questions of why their students turn to pedagogical formation and why they choose the teaching profession by moving away from the general purpose of the faculty come to mind. Therefore, the aim of this research is to examine the reasons for the profession preferences of science faculty students with their justifications. The survey method was used in this research. The sample of the research consists of 429 students studying in the 1st and 4th grades of the Faculty of Science at Sivas Cumhuriyet University. The data of the study was obtained with the help of a survey consisting of open-ended questions. The obtained data was analyzed using content analysis. As a result of the study, it was seen that science faculty students' own desires were the most effective in their career choices and that they mostly preferred the mathematics department. In addition, it was seen that science faculty students' reasons for turning to the teaching profession were being useful, comfort and job opportunities. The relevant views are also similar for 1st and 4th year students. In order for students to make conscious decisions in their career choices, it is important to increase career guidance services, promote interdisciplinary fields and develop policies to increase the attractiveness of the teaching profession.

Keywords: Faculty of science, career choices, teaching profession

Introduction

The aim of universities is to train professionals who are equipped and qualified in their fields (Başer 1994). In order to receive a university education in Turkey, it is necessary to have a certain score and ranking. In this way, it is ideal for students to be placed in the professions that they dream of and that are close to their areas of interest. However, research indicates that career choices are largely based on economic factors, and therefore people's career choices differ from their real interests (Behymer & Cockriel, 2005; Kniveton, 2004). The situation is not much different for the teaching profession, because research draws attention to the role played by external factors in choosing the teaching profession (Bastick, 2000; Boz & Boz, 2008; Papanastasiou & Papanastasiou, 1998). Studies investigating the career preferences of prospective teachers indicate that career preferences are shaped based on factors in three main categories (Bastick, 2000; Boz & Boz, 2008; Brown, 1992; Chuene, Lubben & Newson, 1999; Kyriacou & Coulthard, 2000; Saban, 2003). One of the most important points that distinguishes the teaching profession from other professions is that it has some affective characteristics (Alım et al., 2018). In Article 43 of the National Education Basic Law No. 1739, it is defined as "a special specialized profession that undertakes the education, training and related administrative duties of the state" and it is stated that "teachers are obliged to perform these duties in accordance with the objectives and basic principles of Turkish National Education" (MEB, 2018). Teacher training has been seen as a very important field throughout history. Although teacher training policies in Turkey have been around for over a century, the teacher training model has not been sustainable. In Turkey, in addition to the task of training teachers being given to faculties of education in 1982, the pedagogical formation program has been structured many times. The Council of Higher Education (YÖK) closed the pedagogical formation programs in the 1997-1998 academic year, claiming that they were far from being implemented and inadequate in terms of content and duration, and decided that the education period would be carried out in two ways: 3.5+1.5 years for students of faculties of education and 4+1.5 years for graduates of faculties of science and literature. Later, with the decision it made in 2010, a new application was initiated and students who graduated from many different departments, including senior students of faculties of science and literature, were given the right to apply for teaching in specified fields. YÖK abolished the formation program once again in 2012, but later decided to continue it again. With the latest change, pedagogical formation education can now be given as an elective course in all faculties.

Historically, where, how and by whom teachers will be trained has always been a matter of debate. In this respect, it is seen that the relevant literature examines the perceptions, self-efficacy, attitudes and metaphors of teacher candidates and pedagogical formation students towards the teaching profession (Alım et al., 2018; Çocuk, Yokuş & Tanrıseven, 2015; Gün, 2017; Kiraz, & Dursun, 2015). In pedagogical formation education, the target audience is generally science faculties, social sciences faculties, literature faculties, and faculties such as engineering and architecture can also benefit. It is obvious that science faculty students do not start their education and training lives only with the aim of becoming teachers. When it is considered that the main purpose of science faculties is to train scientists, the question of why students turn to pedagogical formation and why they prefer the teaching profession by moving away from the general purpose of the faculty comes to mind. However, it is seen that the relevant literature bases its examinations on education faculty graduates or pedagogical formation program students in terms of the teaching profession. No research has been found on why these students turn to the teaching profession before or during the process. Considering that with the latest regulation, teaching profession courses can be taken as elective courses for students in formal education programs starting from the 3rd semester, it is important to see how

the examination changes during the academic years. In addition, it is thought that examining various dimensions of the pedagogical formation process through scientific methods will provide a more pedagogical approach to these discussions. It is planned that the current study will form the basis for the changes to be made both in teacher education and formation training in terms of revealing and justifying the reasons for the "teaching profession" choice of students in science faculties. The implementation process of the project will constitute an example for determining the professional tendencies of science faculty students. It is thought that the current project will form the basis for investigating the professional preferences in other faculties and determining the relationships in terms of the teaching profession. The problem of the research is "What are the professional preferences and justifications of science faculty students?"

The aim of this project is to examine the reasons for the career choices of science faculty students with their justifications. In order to serve this general purpose, the following sub-objectives are focused on.

1. What are the career choices of science faculty students according to their departments at the beginning of their education?

2. What are the reasons for the career choices of science faculty students according to their departments at the beginning of their education?

3. What are the career choices of science faculty students according to their departments at the end of their education?

4. What are the reasons for the career choices of science faculty students according to their departments at the end of their education?

5. Why do science faculty students turn to the teaching profession?

Methods

The scanning method was used in this study. This method, also known as field scanning or survey, is a type of research conducted to determine the current situation (Çepni, 2012). The easiest method to use to reach a large sample is surveys. Scanning studies basically have a descriptive structure. This research method is used to make sense of the structure of objects, institutions or societies and the functioning of events (Cohen, Manion & Morrison, 2007). Since it is necessary to obtain a lot of information about any phenomenon in order to define it, scanning studies are usually carried out based on a large amount of data (Metin, 2014:79-80). Since it is desired to determine the situation of science faculty students in their career choices in this project, it was deemed appropriate to use the scanning method in terms of the need for a large sample and to find answers to many questions that come to mind about the subject. The cross-sectional scanning method, which is one of the scanning methods, was used in the study. Cross-sectional scanning, in which data collection is carried out at a single time, is similar to taking a photograph of the universe at any moment (Metin, 2014: 81). The characteristics of a section in time were described for the examined career choice phenomenon.

Sample of Study

Simple random sampling method was used in the sample selection of this research. The sample of the research consists of 429 students studying in the 1st and 4th grades of the Faculty of Science at Sivas Cumhuriyet University.

Data Collection Tools

The data of the study were obtained using surveys consisting of open-ended questions. A survey is a data collection tool used to determine the opinions of the sample in a short time and

systematically in order to get answers to the questions determined about a subject (Metin, 2014: 164). It is possible to collect a wide variety of data with the survey method. We can reveal people's opinions on many subjects such as feelings, behaviors, attitudes, and knowledge through surveys (Çepni, 2012: 212). The students were asked the following questions within the scope of the survey: "Which professions did you prefer in your university preferences?" "Explain in detail the reasons for your preference of these professions." "What is your reason for turning to the teaching profession?" They were asked to write their opinions by leaving a blank space under the survey questions. The survey questions were applied face to face.

Analysis of Data

The data collected with the surveys in the study were analyzed with content analysis. The main purpose of content analysis is to reach concepts that can explain the obtained data (Yıldırım & Şimşek, 2005). First, the surveys were divided into departments and classes. The transcripts, which are the data, were read in detail before the coding process. Within the scope of content analysis, the data were coded and categorized, themes were found, and the data were organized according to codes and themes. In the last stage, the themes obtained from the data were interpreted and the meaning integrity was ensured. The relevant themes and codes were also made by another expert in the field of education. A consensus was reached on the themes and codes obtained. Data losses occurred in the data due to incomplete answers given to some questions.

Findings and Discussion

Below are the findings regarding the data obtained regarding the career preferences and reasons of the science faculty students.

Table 1. The most preferred departments by freshman students in the Faculty of Science

Preferences	B	P	C	M	MBG	S	f	%
Mathematics	4	5	5	57			71	24.23%
Molecular Biology & Genetics (MBG)	6				51		57	19.45%
Biology	39				8		47	16.04%
Physics	3	28	6		4		41	13.99%
Nursing/Midwifery	4	4	4	16	12		38	12.97%
Software/Cybersecurity		8				17	25	8.53%
Biochemistry	5					4	9	3.07%
Engineering	5						5	1.71%
Total	66	45	14	73	75	21	293	100%

B: Biology, P: Physical, C: Chemistry, M: Mathematics, MBG: Molecular Biology and Genetics, S: Statistic

When Table 1 is examined, it is seen that the department most preferred by the students of the faculty of science is mathematics (%24.23) and the department least preferred by them is engineering (%1.71). It is seen that the students of the biology department prefer their own department the most and prefer the physics department the least. It is seen that the students of the physics department prefer their own department the most and prefer the nursing and midwifery department the least. The students of the chemistry department prefer the physics

department the most and prefer the nursing and midwifery department the least. The students of the mathematics department prefer their own department the most and prefer the nursing and midwifery department the least, the students of molecular biology and genetics prefer their own department the most and prefer the physics department the least, the students of the statistics department prefer the software and cyber security department the most and prefer the biochemistry department the least.

Table 2. Career choice reasons of freshman students in the Faculty of Science

Reason	P	C	B	M	MBG	S	Total (f)	%
Own interest	9	5	16	21	21	6	78	39.80%
Job opportunities	4		13	6	9	7	39	19.90%
Recommendation	3	6	8	4	11		32	16.33%
Exam score / ranking			13	6	9		28	14.29%
Pressure / Obligation		5	5		4	5	19	9.69%
Total	16	16	55	37	54	17	196	100%

When Table 2 is examined, it is seen that the students of the science faculty department mostly chose their professions because of their own will (39.80%) and least because of pressure and necessity (9.69%). The students of the physics department mostly chose this department because of their own will. The students of the chemistry department mostly chose this department because of recommendation. The students of the biology department mostly chose this department because of their own will. The students of the mathematics department mostly chose this department because of their own will. The students of the statistics department preferred this department because of job opportunities.

Table 3. The most preferred departments by senior students in the Faculty of Science

Department	P	C	B	M	MBG	S	Total (f)	%
Mathematics			3	40		2	45	38.46%
Physics	14						14	11.97%
Physiotherapy (PT)				6	6		12	10.26%
Statistics						11	11	9.40%
Biology	2		8				10	8.55%
Faculty of Education	4		5				9	7.69%
Chemistry		6	3				9	7.69%
Nursing			4				4	3.42%
Engineering						3	3	2.56%
Total	20	6	23	46	6	16	117	100%

When Table 3 is examined, it is seen that the department most preferred by 4th grade students is the mathematics department (%38.46) and the department they least preferred is the

engineering department (%2.56). Physics department students preferred their own department the most and the biology department the least. Chemistry department students preferred only their own department. Biology department students preferred their own department the most and the chemistry and mathematics department the least. Mathematics department students preferred their own department the most and the physical therapy and rehabilitation department the least. Molecular biology and genetics students preferred only the physical therapy and rehabilitation department, statistics department students preferred their own department the most and the mathematics department the least.

Table 4. Career choice reasons of senior students in the Faculty of Science

Reason	F	K	B	M	MBG	İ	Total (f)	%
Own interest		6	7	20		4	37	44.58%
Job opportunities		3		5	7	3	18	21.69%
Recommendation		4	3	5		5	17	20.48%
Pressure / Obligation	8				3		11	13.25%
Total	8	13	10	30	10	12	83	100%

When Table 4 is examined, it is seen that 4th grade students mostly preferred their professions by their own will (44.58%) and least by necessity (13.25). All of the physics department students preferred due to pressure and necessity. Chemistry department students mostly preferred because of their likes and least because of job opportunities. Biology department students mostly preferred because of their likes and least because of environmental factors. Mathematics department students mostly preferred their departments by their own will and least because of environmental and job opportunities. Molecular biology and genetics students mostly preferred because of job opportunities and least because of necessity. Statistics department students mostly preferred because of environmental factors and least because of job opportunities.

Table 5. Reasons for Science Faculty students to choose the teaching profession

Reason	F	K	B	M	MBG	İ	f	%
To be useful	5		5	17	12	3	37	27.41
Comfort	3	2	5	11	4		26	19.26
Job opportunity	5	6	1	7	5		24	17.78
Childhood dream		2	3	5	3		13	9.63
Interest/Love	2	3	3	2	1		11	8.15
Respected profession	2		3	2	4		11	8.15
Suitable for women		2	3		2	1	8	5.93
Family wish		2			3		5	3.70
Total	17	17	23	44	31	7	135	100

When Table 5 is examined, it is seen that the reasons why science faculty students turn to the teaching profession are to be useful (27.41%) and the least because their families want it (3.70%). Physics department students turned to the teaching profession mostly because of job opportunities and being useful. Chemistry department students turned to the teaching profession mostly because of job opportunities. Biology department students preferred the teaching profession mostly because they saw it as a useful and comfortable profession. Mathematics department students preferred the teaching profession mostly because of being useful. Molecular biology and genetics students turned to the teaching profession mostly because of being useful. Statistics department students turned to the teaching profession mostly because of being useful and their families wanting it.

Conclusion and Recommendations

The following results were obtained within the scope of the study:

1. It was observed that the first-year students of the faculty of science preferred the mathematics department the most and the engineering department the least.

2. It was revealed that the first-year students of the faculty of science preferred the profession mostly by their own will and least out of necessity.

3. It was observed that the senior students of the faculty of science preferred the mathematics department the most and the engineering department the least.

4. It was observed that the senior students of the faculty of science preferred the profession mostly by their own will and least out of necessity.

5. It was observed that the reasons for the students of the faculty of science to turn to the teaching profession were mostly due to the idea of being useful and least due to family requests.

The findings obtained show that the factors determining the profession preferences of the students of the faculty of science are shaped by both individual and environmental dynamics. The fact that the mathematics department is the most preferred department among both the first-year and final-year students reveals that the advantages offered by the mathematics branch in terms of job opportunities are realized by the students. Individuals who graduate from the mathematics department have access to a wide job market thanks to their analytical thinking and problem-solving skills. This can be considered as one of the basic factors that guide the preferences of science faculty students. The increasing importance of STEM (science, technology, engineering and mathematics) fields in the global labor market supports the popularity of basic sciences such as mathematics.

The fact that physical therapy and rehabilitation and education faculties are rarely included in the preferences of senior students suggests that the popularity of these fields is decreasing. In the literature, the reasons for the decline in the professional status of education and health fields include the increasing number of graduates and the decrease in the financial satisfaction of these professions (Çifçi, Bülbül, Bayar Muluk, Çamur Duyan, & Yılmaz, 2011). On the other hand, the preference for disciplines such as software/cyber security and nursing shows that the attractiveness of these professions has increased due to the impact of technology and digitalization.

Most of the students stated that they chose the departments of their own volition. Although there are many issues such as field of interest, score and ranking in career choices, it can be said that science faculty students are mostly studying in science branches with their own will. In

addition, it is among the results obtained that job opportunities and recommendations are also important in career choices.

Science faculty students have also stated a small number of education faculties among their most preferred departments in the 4th grades. This may be due to the fact that the scores are not enough for education faculties. However, it is seen that departments such as software and cyber security are also preferred despite being higher than science faculties in terms of score and ranking. For this reason, it can be said that science faculty students prefer fields such as software and cyber security and nursing more than teaching profession even if their scores are sufficient.

The fact that students' own interests and desires are at the forefront in their career choices emphasizes the importance of individual motivations and career goals. However, it has been observed that factors such as obligations and environmental pressures also affect preferences. In the literature, it is stated that individual interest, score-ranking pressure, family expectations and economic conditions are among the factors affecting career choices (Vurucu, 2010). In this context, the fact that students' scores are not sufficient for education faculties or that they exclude some preferences due to ranking pressure shows the restrictive effect of the higher education system in Turkey on students. This situation can be evaluated as a reason for the limited preferences especially for the teaching profession.

The fact that the idea of being useful to people is at the forefront among the reasons for turning to the teaching profession shows that the profession has a social benefit-oriented structure. It is stated in the literature that tendencies towards the teaching profession are shaped by motivations such as childhood dreams, perception of social benefit and job security (Ekinci, 2017). However, it is stated that low salaries and negative perceptions about the social status of the profession limit this preference. In addition, the fact that formation courses in science faculties have become elective is another factor affecting the number of students considering the teaching profession. This situation causes the tendency towards the teaching profession to be limited to a more conscious and limited group of students.

As a result, it can be said that factors such as individual interest, job opportunities, family pressure and score-ranking are effective in the career preferences of science faculty students. The popularity of the mathematics department is a result of the fundamental sciences' position in the labor market.

Thanks and Information Note

ABSTRACT

In this study, wild plants that are widely used in Muş Province and consumed by collecting from nature and their usage methods were investigated. The majority of the people in Muş utilise the plants collected from nature with the arrival of spring, either fresh or cooked. In Muş, mostly *Arum* sp., *Asparagus officinalis* L., *Crataegus* sp., *Eremurus spectabilis* BIEB., *Ferula* sp., *Gundelia tournefortii, Lepidium* sp., *Malva sylvestris* L., *Mentha longifolia, Nasturtium officinale, Ornithogalum wiedemannii, Tragopogon* sp., *Urtica dioica* L., *Plantago* sp., *Polygonum* sp., *Portulaca oleracea* L., *Pyrus elaeagnifolia, Rheum ribes* L., *Rumex* sp. were used as food. These plants are organic because they grow in nature. They are rich in vitamins, minerals and essential oils and have a special place in human nutrition as most of them are also medicinal plants. Population densities and distribution areas of these plants collected from nature as food are gradually decreasing. Plant collection should be carried out by conscious people in a controlled manner. In addition, it is useful to carry out cultivation and breeding studies in endangered species and species that can be grown economically.

Keywords: Muş province, Natural plants, wild edible plants, plant collection.

MUŞ İLİNDE GIDA OLARAK TÜKETİLEN YABANİ BİTKİLER VE KULLANIM ŞEKİLLERİ

ÖZET

Bu çalışmada Muş İli'nde yaygın olarak kullanılan ve doğadan toplanarak tüketilen yabani bitkiler ve bunların kullanılma şekilleri araştırılmıştır. Muş'ta halkın büyük çoğunluğu ilkbaharın gelmesi ile birlikte doğadan toplanan bitkileri taze olarak ya da pişirerek, değerlendirmektedir. Ayrıca bu tüketim alışkanlığı bitkileri değişik şekillerde muhafaza ederek yıl boyunca devam etmektedir. Muş'ta daha çok *Arum* sp., *Asparagus officinalis* L., *Crataegus* sp., *Eremurus spectabilis* BIEB., *Ferula* sp., *Gundelia tournefortii*, *Lepidium* sp., *Malva sylvestris* L., *Mentha longifolia*, *Nasturtium officinale*, *Ornithogalum wiedemannii*, *Tragopogon* sp., *Urtica dioica* L., *Plantago* sp., *Polygonum* sp., *Portulaca oleracea* L., *Pyrus elaeagnifolia*, *Rheum ribes* L., *Rumex* sp. türlerinin gıda olarak kullanıldığı tespit edilmiştir. Bu bitkiler doğada yetiştiği için organiktir. Vitamin, mineral ve esensiyal yağlar bakımından zengindir ve çoğu aynı zamanda şifalı bitki olduğu için insan sağlığı açısından ayrı bir yeri vardır. Doğadan gıda olarak toplanan bu bitkilerin popülasyon yoğunlukları ve yayılış alanları giderek azalmaktadır. Bitki toplamalarının kontrollü olarak bilinçli kişiler tarafından yapılması gerekmektedir. Ayrıca tehlike altında olanlarda ve ekonomik olarak yetiştirilebilecek türlerde kültüre alma ve ıslah çalışmaları yapılmasında fayda vardır.

Anahtar Kelimeler: Muş ili, Doğal bitkiler, yabani yenilebilen bitkiler, bitki toplama.

GİRİŞ

Ülkemizde doğada kendiliğinden yetişen otsu bitkilerin sebze olarak tüketimi oldukça yaygındır. Tüm dünyada olduğu gibi ülkemizde de doğal florada bulunan bitkilerin halk arasında tedavi amaçlı, gıda, çay, baharat vb., olarak kullanımı uzun yıllardan beri süregelen geleneksel kültürel zenginliğimizin bir parçası olmuştur. Ancak bu olgu şehirleşmeyle paralel olarak kaybolmaya başlamıştır (Faydaoğlu ve Sürücüoğlu, 2011).

Yabani bitkilerin kültür bitkilerine göre mineral madde ve vitaminler bakımından daha zengin olduğu bilinmektedir (Doğan ve ark., 2004; Alarcón, R., ve ark., 2006; Doğan, 2013). Ayrıca önemli miktarda kalsiyum, fosfor ve demir gibi mineralleri de içermektedirler (Alarcón ve ark., 2006; Aktan ve Bilgir, 1978). Ayrıca yapılan bazı çalışmalar, sağlıklı diyetin önemli bir parçası olarak kabul edilen yenilebilir otların yaşlılıkla ilintili hastalıkların geciktirilmesinde önemli bir potansiyele sahip olduğunu belirtmektedir. (Knight, 2000). Gıda olarak kullanılan bu bitkiler, çiğ veya pişmiş olarak yenildiği gibi kurutularak, salamura halinde veya turşu şeklinde de tüketilmektedir (Faydaoğlu ve Sürücüoğlu, 2011).

Dünya genelinde gıda olarak kullanılan yabani bitki türlerinin 10.000'nin üzerinde olduğu rapor edilmiştir (Baytop, 1999; Yücel ve ark., 2010; Yücel ve ark., 2011). Anadolu'da gıda, çay, atıştırmalık, koku ve tat vericilerle beraber 1200 civarında doğal bitkiden gıda olarak yararlanıldığı belirtilmiştir (Ertuğ, 2014).

Yenilebilen yabani bitkilerle ilgili sahip olduğumuz kültürel mirasın korunması ve gelecek nesillere aktarılabilmesi için, tür ve çeşitlerimizin kayıt altına alınması oldukça önemli bir konudur. Bu konunun hayata geçirilmesi için ise bahsedilen bitkilerin halk tarafından çeşitli kullanım şekillerinin tespit edileceği etnobotanik çalışmaların ülke genelinde başlatılarak sürdürülmesi gerekmektedir (Kargıoğlu ve ark., 2008; Satıl ve ark., 2008).

Yenilebilir otlardan çorbalar, sebze yemekleri, sarma ve salatalar yapıldığı gibi, özel aromaya sahip olanlar taze ve kurutularak tat verici olarak mutfaklarda kullanılmakta ve çay olarak içilmektedir. Yemek olarak kullanılan otlar bir anlamda sebzelerin kendiliğinden yetişenleridir (Baysal, 2003).

İyigün ve Özer (2001), Muş ili ve çevresinde gıda olarak tüketilen yabancı otları araştırmak amacı ile yürüttükleri çalışmada, yörede en fazla gıda olarak tüketilen yabancı ot türlerinin; *Eremurus spectabilis Bieb., Salvia sclarea* L.,*Gundelia tournefortii* L., *Amaranthus retroflexus* L., *Urtica dioica* L., *Urtica urens* L., *Silene vulgaris (Moench) Garcke., Capsella bursa-pastoris (*L.*) Medik., Rumex crispus* L., *Mentha aguatica* L., *Portulaca oleracea* L. olduğunu bildirmişlerdir.

Bu çalışmada Muş İlinde yaygın olarak doğadan toplanarak gıda olarak tüketilen yabani bitkiler ve bunların kullanım şekilleri belirlenmeye, aktarılmaya çalışılmıştır. Bu bitkilerin değerlendirme şekillerinin kaybolmadan gelecek kuşaklara aktarılması, kayıt altına alınması yanında, bu bitmez tükenmez sanılan hazinenin, sürdürülebilirliği ve korunmasına dikkat çekmek amaçlanmıştır.

Materyal ve Metot

Bu çalışma; 2024 yılında Doğu Anadolu Bölgesi'nde yer alan Muş ili sınırları içerisinde yapılmıştır. Muş, Doğu Anadolu Bölgesi'nin Yukarı Murat-Van Bölümü'nde yer almaktadır. Yaklaşık 8116 km² yüz ölçümü bulunmaktadır. Kuzeyde Erzurum, güney ve güneybatıda Bitlis, Diyarbakır ve Batman, batıda Bingöl ile doğuda Ağrı ve Bitlis illeriyle komşudur. Bölge 3000

metre yüksekliği geçmeyen engebeli dağlık araziler ve 1200-1500 metre yükseltideki ovalık arazilerden oluşmaktadır. Muş, gündüz ile gece sıcaklık farkının yüksek olduğu, donlu, soğuk ve uzun kışların geçtiği karasal iklim tipine sahiptir. Yıllık sıcaklıklar kışın ortalama -10 °C yazın ise 25 °C'nin üzerindedir. Yağış miktarı ise yıllık ortalama 765 mm'dir (Sönmez, 2010).

Saha çalışmasında Muş'ta doğadan toplanarak gıda olarak tüketilen bitkilerin kullanım şekilleri hakkında, kadınlar başta olmak üzere 16 kaynak kişiye şifaen sorular sorulmuş ve elde edilen bilgiler aktarılmıştır. Çalışmada literatür bilgilerinden de istifade edilmiştir. Kaynak kişilere ait bilgiler Çizelge 1'de verilmiştir.

Çizelge 1. Kaynak kişiler ve bilgileri

Kaynak kişi	Adı-Soyadı	Cinsiyeti	Yaşı	Yerleşim Yeri
KK1	A. Y.	**E**	**52**	Durugöze köyü/Merkez/Muş
KK2	B. Ç.	**K**	**65**	Varto/Muş

Araştırma Bulguları ve Tartışma

Muş İlinde gıda amaçlı yaygın olarak toplanan bitkiler Çizelge 2'de verilmiştir.

Çizelge 2. Muş İlinde Gıda Amaçlı Yaygın Olarak Toplanan Bitkiler

Bitkinin latince adı	**Türkçe adı**	**Yöresel adı**	**Familyası**	**Kullanılan kısmı**
Arum sp.	Yılanyastığı	Karî-Karik-Kardî	Araceae	Herba
Asparagus officinalis L.	Kuşkonmaz	Melajo	Liliaceae	Sap
Chaerophyllum bulbosum L.	Orman maydanozu-Frenk maydanozu	Mendik-Mendo	*Apiaceae*	Herba
Crataegus sp.	Alıç	Givîj	Rosaceae	Meyve
Eremurus spectabilis BIEB.	Çiriş, Dağ pırasası	Gulik, Gülbahar	Liliaceae	Herba
Ferula orientalis L.	Çakşır-Kasnı	Cağ	Apiaceae	Herba ve Kök
Ferula szowitsiana DC.	Çakşır	Heliz	Apiaceae	Sap
Gundelia tournefortii var. *tournefortii*	Kenger	Kereng, dardak	Asteraceae	Kök ve Sap
Lepidium sp.	Dağ teresi	Kersim	Brassicaceae	Herba
Malva sylvestris L.	Ebegümeci	Tolık	Malvaceae	Yaprak
Mentha longifolia subsp. *typhoides* var. *typhoides*	Yarpuz	Punk	Lamiaceae	Yaprak
Nasturtium officinale R. BR.	Su teresi	Kıce	Brassicaceae	Herba
Ornithogalum wiedemannii BOISS var. *wiedemannii*	Tükürük otu	Spidak, Serbışk	Liliaceae	Herba
Tragopogon sp.	Yemlik	Sipînk	Asteraceae	Herba
Urtica dioica L.	Isırgan	Gezgezok-Gezgezg	Urticaceae	Herba
Plantago lanceolata L.	Dar yapraklı sinir otu		Plantaginaceae	Herba
Plantago sp.	Sinirli ot	Pelheves	Plantaginaceae	Yaprak
Polygonum sp.	Madımak	Nane, civika	Polygonaceae	Herba
Portulaca oleracea L.	Semizotu	Parpar	Portulacaceae	Herba
Pyrus elaeagnifolia PALLAS	Ahlat, yaban armudu	Karçin	Rosaceae	Meyve
Rheum ribes L.	Işkın	Ribes, uçkun, eşkın, yayla muzu	Polygonaceae	Kök ve Sap
Rumex sp.	Kuzukulağı, Labada	Tirşo	Polygonaceae	Herba, tohum

Muş İlinde doğadan yaygın olarak toplanarak tüketilen bitkilerin kullanılış şekilleri Çizelge 3'de verilmiştir.

Çizelge 3. Muş ilinde doğadan yaygın olarak toplanan bitkilerin kullanım şekilleri

Latince ve Türkçe adı	**Kullanım Şekilleri**
Arum sp. Yılanyastığı	Taze tüketim şekli bulunmamaktadır. Toplanıp örülür ve asarak kurutulur. Kış aylarında yemek yapmak için kullanılır. Yemek yapımında toplanan ve örülen otlar sıcak suyla iyice haşlanır. Acılığından dolayı haşlama ve süzme işlemi 3 defa tekrar edilir. Suyu süzüldükten sonra haşlanmış olan otlar sos eşliğinde yağda güzelce pişirilir.(sos: soğan ve tereyağının ayrı bir kapta kavrulmasıyla elde edilir.) (KK13). Mevsiminde toplanıp kurutulur. Kışın kaynar suda haşlanır, suyu süzülür, pancarı* yada çorbası yapılır (KK10). Önce kurutulur daha sonra salça ve soğan ile yağda kavrulur (KK5; KK9). Önce orta boy içli köfte hazırlanır. Sonra 100 gr. kuru gari (yılanyastığı) kaynatılıp süzülür. Yarım çay bardağı zeytinyağı soğanla kavrulur, salça eklenir, biraz daha kavrulur. Üzerine bir su bardağı haşlanmış yeşil mercimek, bir su bardağı haşlanmış yarma, bir su bardağı haşlanmış nohut, bir çay bardağı tanesi kaynatılmış sumak suyu konur, suyu ayarlanır kaynatılır. Kıvam alınca içli köfteler atılır, piştikten sonra afiyetle yenir (KK2). Kurutulmuş olan yılanyastığı suda haşlanır, yumuşatılır, ayrı tavada soğan kavrulur, yılanyastığı eklenir kavrulur, üzerine yumurta kırılarak servis yapılır (KK15).
Asparagus officinalis L Kuşkonmaz.	Kesilen bitkiler soğuk suda yıkanır. Kuşbaşı olarak doğranır. Az suda haşlanır ve hafif ateşte yağda kızartılıp üstüne yumurta kırılarak servis edilir (KK6). Tuzlu su ile salamura (Turşu) yapılır 15-20 gün bekletildikten sonra çıkarılarak yumurta ile kızartılarak tüketilir (KK5A; KK9). Haşlanarak ekşili salatalarda kullanılır ya da domates sosu ile soteleyerek zeytinyağlı olarak pişirilip tüketilir (KK11).
Chaerophyllum bulbosum L. Orman maydanozu	Yaprakları atılıp gövdesi haşlanıp kışlık olarak bidonlarda tuzlu su ile saklanır. Kış ayında tüketilir. Tüketimi çakşır otu ile aynı şekilde olmaktadır. Suda haşlanır, sonra yağda yumurta ile kavrulur (KK1; ;KK15; KK16). Turşusu yapılır. Kışın yumurtaya bulanıp kızartılır Turşusu yapılır. Kışın yumurtaya bulanıp kızartılır (KK14). Salamura yapılır bir iki hafta olgunlaşması beklenir sonra çökelek veya peynirde kullanılır. Haşlayıp sonra kavrulur, un ve yumurta karışımı üstüne dökülüp biraz daha pişmesi sağlanır daha sonra yenilir. Tuzlu su ile salamura (Turşu) yapılır 15-20 gün bekletildikten sonra direk yemeklerin yanında tüketilir (KK5A; KK9). Toplanan bitkiler temizlenir, sirke ile turşusu yapılır, sarardıktan sonra çökelek veya peynire katılır (KK11).
Crataegus sp. Alıç	Meyve olarak tüketildiği gibi çay olarak demlenerek te tüketilir (KK10; KK11). Marmelatı yapılır (KK10). Meyve olarak direk yenilir. Ezilerek çekirdeği çıkarılır sonra reçel kıvamında tüketilir (KK5; KK9).
Eremurus spectabilis Çiriş	Yemek yapmak için az suda haşlanır, suyu süzülüp sıkılır. 1. Yağda kızartılıp üstüne yumurta kırılabilir. 2. Çorba yapılacaksa soğuk suda yıkanır, kuşbaşı şeklinde doğranır, içine bulgur veya pirinç atılarak bol suyla pişirilir ve sos eşliğinde servis edilir. (sos:tereyağında salça pul biber, kuru soğan ile kavrulur ve çorbanın üstüne gezdirilir (KK4). Önce haşlanır, sonra yumurta ile yağda kavrulur. Ayrıca tavuk eti ile çiriş beraber haşlanıp dövülerek ezilir ve çalma denilen bir yemek yapılır (KK16). Çiriş yumurta ile kavrulur ya da yumurta un ile de kavrulabilir (KK3). Bulgur veya buğdayla çorbası yapılır. Pide ve Pancarı yapılır. Ispanak gibi kavrulur (KK10). Baş ve Kök kısmı kesilir yıkandıktan sonra haşlanır derin dondurucuda muhafaza edilir kullanılmak istendiğinde yumurta ile kavrularak yenilir veya böreklerin içinde ıspanak gibi kullanılır (KK5; KK9). Çiriş otunun kök kısmında bir zar olur bu zar çıkarılır, bitki yaprak yaprak ayrılır. Sonra bir kapta su içerisine konur biraz bekletilir akabinde birkaç kere güzelce yıkanır. Süzgeçe alınır, suyu alındıktan sonra doğranır. Tencerede önce zeytinyağı konur, soğanlar yemeklik doğranır, 3 dakika kısık ateşte kavrulur, üzerine salça eklenir 1-2 dakikada böyle kavrulduktan sonra çirişler eklenir. Kısık ateşte çirişler yumuşayınca, bulguru, suyu, tuz ve biberi eklenir, kapağı kapatılır, kısık ateşte çirişler yumuşayıncıya kadar pişirilir ve sonra tüketilir (KK11; KK15).
Ferula orientalis L. Çakşır-Cağ	Haşlanan çakşırlar suyu elde iyice süzüldükten sonra küçük küçük doğranmakta ve bir süre yağda kavrulmaktadır. Daha sonra daha önceden bir kabın içine kırılmış, çırpılmış ve içine tuz ilave edilmiş yumurtalar kavrulan çakşırın üzerine dökülmekte ve yumurtalarla birlikte bir süre piştikten sonra yenmektedir. (KK7). Yeşil yaprakları ve gövdesi yumurtaya bulayarak kızartma şeklinde, haşlama veya turşu formunda tüketilebiliyor. Kökü kaynatılıp içilir (Sever ve Yenikalaycı, 2024). Toplandıktan sonra turşu gibi tuzlu suda bidonlara kurulur, fermente edilir. Turşu hali haşlanır, yumuşayınca yumurta, un, süt karışımına bulanarak yağda kızartılır (KK3; KK16). Turşusu, pancarı ve yumurtalı kızartması yapılır (KK10). Tuzlu su ile salamura (Turşu) yapılır 15-20 gün bekletildikten sonra çıkarılarak yumurta ile kızartılarak ya da direk yemeklerin yanında tüketilir (KK5; KK9). Çay olarak tüketilir. Bunun için bir tatlı kaşığı toz veya kökü kaynar suya konur 15 dakika bekletilir, sonra süzülerek içilir. Toplanan otlar ayıklanır ve iyice yıkanır. Küçük küçük doğranır, kendi suyunda haşlanır ve sonra sıkılır. Tencerede önce soğan kavrulur, üzerine otlar eklenir. Tuz, karabiber eklenir. Son olarak üzerinde açılan çukurlara yumurta kırılır. Turşusu da yapılır. Bunun için ayıklanıp temizlenen çakşırlar tencerede bol suda yumuşayıncıya kadar haşlanır, bol tuzla harmanlanıp kavanoza konur ağzı hava almayacak şekilde iyice kapatılır, buzdolabında bir hafta bekletilir. Çakşırlar ekşiyip salamura halini alınca tüketilir (KK11).
Ferula szowitsiana	Taze olarak tüketilirse zehirlenmeye sebep olur, saç örgüsü gibi yapılır ve kurutulur, sonra tüketilir.

DC. Çakşır-Heliz	Yemekleri yapılır (Sever ve Yenikalaycı, 2024). Haşlandıktan sonra çökelek ile yağda kavrulur (KK16). Turşusu yapılır. Peynir yapımında (otlu peynir gibi) ve pancarı yapılır (KK10). Tuzlu su ile salamura (Turşu) yapılır 15-20 gün bekletildikten sonra direk yemeklerin yanında tüketilir. Kurutulup keledoş isimli yöresel yemekte kullanılır (KK5; KK9). Turşusu çakşır gibi yapılır. Tencerede kaynatılır, sonra yağda kızartılır, üzerine yumurta kırılarak tüketilir (KK11).
Gundelia tournefortii Kenger	Yemek olarak tavada kızartma yapılacaksa, soğuk suyla temizce yıkanır. 5 dk kaynar suya haşlanıp soğuk suya bırakılır sonra bidonlara doldurulup üstüne tuzlu su eklenip en az 20 gün bekletilir. 20 gün sonra bidonlardan yeteri miktarda alınıp. Daha öncesinde yapılmış olan yumurta un ve süt (çiğ olarak bulunan) karışıma yatırılıp sonrasında kızarmış yağlı tavada pişirilir. (KK7; KK15). Dardak (Kenger) (Gundelia tournefortii): Yaşlanmış kengere yöresel olarak Dardak denir. Gövdesi toplanır, dikenlerinden ayırt edilir ve gövdesi soyularak yenir. (KK1). Un, yumurta ve yoğurt ile çorbası yapılır (KK16). Turşu, pancar yemeği yapılır. Bir de ayran aşına katılır (KK10). Tuzlu su ile salamura (Turşu) yapılır 15-20 gün bekletildikten sonra çıkarılarak yumurta ile kızartılarak tüketilir. Diğer bir kullanım şekli ise ayran aşı çorbasına (yöresel adı: Gırar) haşlanıp ilave edilir. Haşlanıp bulgur pilavı içerisine katılarak tüketilir. Tuzlu su ile salamura (Turşu) yapılır 15-20 gün bekletildikten sonra direk yemeklerin yanında tüketilir (KK5; KK9). Kengerler koyu kabuklarından ayrılır, temizlenir. 15 dakika suda bekletilir, yıkanır. Tencerede bol suda haşlanır, sonra süzgeçe alınır. Tavaya yağ konur, eriyince yumurta kırılır, süzgeçteki kengerler avuç içerisinde sıkılarak tavaya konur, kavrulur, tuz, biber eklenir ve yenir. Çiğ olarakta tüketilir (KK11).
Lepidium sp. Dağ teresi	Temiz yaprakları toplanır ve güzelce yıkanıp sıcak su ile haşlanır. Çekilmiş buğday (dövme buğdaydan) ile sarması yapılır. Sarımsaklı yoğurt ile servis edilir. (KK7). Haşlanıp sarma yapılarak tüketilir (KK5; KK9).
Malva sylvestris L. Ebegümeci	Pancar yemeği* yapılır (KK10). Kurutulup çay gibi demlenir ve suyu içilir. Çorbaların içine de katılarak tüketilir. Haşlanıp süzüldükten sonra sarımsaklı yoğurt ile tüketilir veya yumurta ile pişirilerek yenilir (KK5; KK9). Ebegümeci yaprakları ve sapları ince ince doğranır. Bir tencerede soğanlar 5 dk. kavrulduktan sonra ebegümeci eklenir ve yumuşayıncaya kadar kavrulur, ara sıra karıştırılır. Salça eklenir karıştırılır, bulgur eklenir karıştırıldıktan sonra sıcak su ilave edilir, tuzu eklenir. Kısık ateşte ara ara karıştırarak suyu çekinceye kadar pişirilir ve tüketilir. Ebegümeci kurutulup çayı da yapılır (KK11; KK15).
Mentha longifolia Yarpuz	Yöresel olarak yapılan ayran aşı çorbasına çeşni vermesi için katılır. Kuru yapraklarından yapılan bitki çayı mide rahatsızlığında kullanılır. (Sever ve Yenikalaycı, 2024). Ayran aşı denilen yoğurtlu çorbalara taze olarak konur (KK16). Kurutulup baharat olarak kullanılır. Çiğ olarak da tüketilir (KK10). Kurutulup çay gibi demlenir ve suyu içilir. Ayrıca çorbaların içine de yaş veya kurutulmuş olarak özellikle ayran aşı çorbasında kullanılır (KK5; KK9). Ekşili punk (yarpuz) yemeği yapılır. Bunun için aşurelik buğday ve nohut haşlanır. Buğday tencereye konur haşlanır, nohut üzerine konur birlikte karışım sağlanır, üzerine yarpuz eklenir karıştırılır ve kaynatılır. Diğer tarafta bir tavada sıvı yağ konur, salça eklenir kavrulur, pul biber eklenir, karıştırılır, kaynayan tencereye dökülür, önceden suya koyduğumuz ekşili sumak suyu konur ve yemek hazır olur (KK11) .
Nasturtium officinale Su teresi	Çiğ olarak sebze gibi tüketilir (KK5A; KK9).
Ornithogalum wiedemannii Tükürük otu	Yemek yapımında taze yapraklar güzelce soğuk suyla yıkanır, yağda hafif ateşte pişirilir isteğe bağlı olarak pul biber ve üzerine yumurta kırılarak servis edilir. Örgü yapılarak kurutulan bitkilerde ise ilk başlangıçta güzelce yıkanır sonra sıcak suya doğranır ve haşlanır, sıcak sudan alınıp suyunun süzülmesi beklenir. Sonrasında yağ, kuru soğan ve pul biber eşliğinde hafif ateşte iyice pişirilir isteğe bağlı olarak üzerine yumurta kırılabilir. (KK12; KK15) Soğanla beraber küçük şekilde doğranır, açılan hamur içine konur, sonra mantı gibi haşlanır ve tüketilir. Mevsiminde toplanıp kurutulur. Suda haşlanıp kavrulur. Buğdayla da çorbası yapılır (KK10). Yaş hali erken ilkbaharda toplanır saç örgüsü gibi bağlanıp gölgede kurutulur. Yemek yapılacağı zaman ihtiyaç kadar kesilir ve keledoş yemeğinin içerisinde kullanılır. Direk haşlanarak üzerine sarımsaklı yoğurt katılarak yemeğide yapılır. Katı çorba (Yöresel ismi: Gebol) olarakta tüketilir (KK5; KK9).
Tragopogon sp. Yemlik	Çiğ olarak tüketilir (KK15). Bazen diğer otlarla haşlanıp pancar* gibi tüketilir (KK14.). Yıkandıktan sonra direk veya tuz ile tüketilir. Yaprakları kaynatılarak haşlanır ve derin dondurucuda saklanır. Sonra yumurta ile veya direk olarak kavrulup tüketilir (KK5; KK9; KK11).
Urtica dioica L. Isırgan	Isırgan otu çorbalara katılmakta, haşlanmakta, yumurta ve soğan gibi malzemelerle kavrulmakta ve çiğ olarak tuza bandırılıp tüketilmektedir. Isırgan otu çorbası: Isırgan otları ayıklanıp bol suda yıkanır ve doğranır. Bir tencerede soğanlar zeytinyağıyla birlikte kavrulur. İçerisine ısırgan otları ve un eklenerek birkaç dakika daha kavrulmaya devam edilir. Sonra bir miktar süt yavaş yavaş ilave edilerek durmadan karıştırılır. Su, tuz ve karabiber eklenerek pişirilir. Çorbanın daha lezzetli olmasını sağlamak için kemik suyu ile pişirilmesi önerilmektedir (KK13). Soğan, pirinç ve salça ile çorbası yapılır (KK16). Pancarı yapılır. Böreklerde ve salatada kullanılır (KK10; KK14.). Domates, soğan ve yumurta ile beraber menemen gibi kahvaltıda tüketilir. Kurutularak veya taze olarak çorbası yapılır veya Kurutulmuş yaprakları kışın çay olarak tüketilir. Haşlanıp süzüldükten sonra yoğurt ile tüketilir veya yumurta ile pişirilerek yenilir (KK5; KK9). Toplanan ısırganalar yıkanır, küçük küçük doğranır, haşlanır, sonra tavada yağda salça kavrulur, üzerine haşlanan ısırganlar, bulgur, tuz ve su

	eklenir pişirilir (KK15).
Plantago lanceolata L.	Çiğ olarak sebze gibi tüketilir (KK5; KK9).
Plantago sp. Sinirli ot	Çiğ olarak mide rahatsızlığı için tüketilir. Pancarı yapılır (KK10;KK14.). Yaş halinde toplanarak salamura yapılır. Sarma yaparak tüketilir (KK5; KK9).
Polygonum sp. Madımak	Diğer otlarla haşlanıp pancar* şeklinde kavrulup yenir (KK10; KK14; KK15). Muş'ta yemek olarak tüketilir (Sever ve Yenikalaycı, 2024).
Portulaca oleracea L. Semizotu	Muş'da sıkça tüketilen hem çiğ olarak hem de pişirilerek yenilen bir sebze türüdür. Anadolu'nun birçok yerinde semizotu olarak adlandırılmaktadır. Diğer isimleri ise temizlik otu, soğukluk ve can otudur. Mayıs ve Haziran aylarında yetişmekte, Temmuz ve Ağustos aylarında toplanmaktadır. Mutfakta oldukça geniş bir kullanıma sahiptir. Çiğ olarak salatalarda ve pişirilerek yemeklik olarak değerlendirilmektedir. Parpar yemeği: Soğanlar yemeklik doğranır ve pembeleştikten sonra kuşbaşı etle salça ilave edilir. Bir süre daha kavrulan yemeğe parparlar ve bulgur eklenir. Bir miktar su eklendikten sonra sebzelerin vitaminini öldürmemek için çok kısık ateşte pişirilir (KK12). Haşlanır, yoğurt, pul biberi ve yağ eklenerek servis yapılır, Çiğ hali ile salatalarda tüketilir (KK16). Çorbası, salatası ve yemeği yapılır. Çorbası pirinçli veya bulgurlu olabilir. Yoğurtlu, sarımsaklı salatası yapılır. Ayrıca kıymalı bulgurlu yemeği de yapılır (KK3). Taze olarak yendiği gibi birde kurutulup kompostoya katılır (KK10; KK14.). Çiğ olarak toplanıp salata yapılarak tüketilir. Haşlanıp süzüldükten sonra yoğurt ile tüketilir veya yumurta ile kavrularak yenilir (KK5; KK9).
Pyrus elaeagnifolia Ahlat	Meyve olarak yenilir (KK5; KK9). Toplanan küçük armutlar ince ince doğranır, güneşte kurutulur, kışın hoşafı yapılır (KK15).
Rheum ribes L. Işkın	Erzurum'da ışkın kabuğu soyularak tuza batırılıp çiğ olarak yenmektedir. Ülkemizde bazı yörelerde ışkınlı yumurta veya fırında ışkın gibi isimlerle pişirilerek tüketildiği de görülmektedir. (KK4). Doğu Anadolu Bölgesinde ilkbahar aylarında değişik şekillerde gıda maddesi olarak tüketilmektedir. Işkınlı yumurta, kavurma, kapuska yapıldığı gibi ekşili yemeği, turşusu ve ışgınlı dondurma gibi ürünler yapılmaktadır. Pişirilerek veya sebze olarak da kullanımı vardır (Yenikalaycı, 2023). Kabukları soyulup meyve olarak yenilir. Kökü haşlanıp, tüketilir özellikle şeker hastaları tercih eder (KK5; KK9). Soylarak çiğ tüketilir, ekşimsi bir tadı vardır (KK11).
Rumex sp. Kuzukulağı	Kuzukulağı çorbası: Bir tencereye yağ konur, kuzukulağı ve küçük küçük doğranmış patatesler eklenerek kavrulur. Et suyu ilave edilir, kaynamaya bırakılır. Kaynayan çorbaya krema ve limon sıkılır. Karabiber serpilerek servis edilir (KK6). Yaprakları taze olduğunda çiğ olarak tüketilebilmektedir. Ekşi bir tada sahiptir ve tuzlanarak yendiğinde daha lezzetli olduğu düşünülmektedir. Böreklerin içinde, çorbalarda ve bazı yemeklerde kullanılır (KK6). Haşlanır sonra yumurta ile yağda kavrulur. Pirinçli sarması da yapılır (KK16). Salatalarda tüketilir (KK10; KK14.). Hafif haşlanır sonra sarma yapılıp yenilir. Kurutulur soğan ile pişirildikten sonra yenilir. Kurutulup ekşi tadından dolayı nane gibi çorbaların üstüne katılarak yenilir (KK5; KK9).

*:Pancar ya da pancar yemeği: Otlar yıkanır küçük küçük doğranır, sonra suyu süzülür, tavada soğanı kavrulur, haşlanan, suyu sıkılan otlar üstüne eklenir yağda kavrulur, isteyen yumurta kırar veya istemeyen serviste üstüne sarımsaklı yoğurt ekler. Yoğurdun üstüne kızgın tereyağ dökülür. Sonra afiyetle yenir. Otlarla kavrularak yapılan bütün yemeğe Muş'ta pancar ya da pancar yemeği denir. Yöresel ağızda böyle söylenir (KK10.).

Sonuç ve Öneriler

Muş İli geniş ovaları ve verimli toprakları ile büyük bir tarımsal potansiyele sahiptir. Diğer illerden farklı olarak Muş'ta hala tarımla uğraşan nüfus oranı % 70 civarındadır. İlde doğadan toplanarak tüketilen bitkiler çok fazladır. Muş halkı doğadaki bitkilerden maksimum düzeyde istifade etmektedir. Doğadan toplanan bitkiler batı illerine de büyük miktarda gönderilmekte, bir ekonomik değere ve kazanca dönüşmektedirler. İlde Bu bitkiler sadece ilkbahar aylarında değil, su içerisinde bidonlarda bekletilerek, salamura yapılarak ya da kurutularak yıl boyunca kullanılmaktadır. Halk genel olarak et tüketimi yanında doğal bitkilerden yeterince faydalandığı için obezite oranı da düşüktür, caddelerde aşırı kilolu çok fazla insan göremezsiniz. Bu otların tüketme şekli diğer illere benzemekle birlikte, Muş'ta kendine özgü bir şekilde bunları etlerle, yumurta veya et suyu ile lezzetlendirme, besin değerini böylece artırma biçimi farklılık gösterebilir. Bir bakıma yabani otlar ile ana yemekler yapılmaktadır.

Muş'ta doğadan büyük oranlarda bitki toplanması doğa tahribatına ve bitki türlerinin azalmasına neden olmaktadır. Bitki toplamada dengeli, bilinçli bir politika izlenmesi gerekiyor. Bitkilerin en azından % 15-20'sinin doğada bırakılarak çiçeklenmesine, tohum bağlamasına ve

neslinin devamına fırsat verilmesi sürdürülebilirlik açısından önemlidir. Işkın gibi bazı bitkilerde bitki kökleri şeker hastalığına karşı kullanıldığı için kökleri ile sökülmekte, doğada bitki tamamen yok edilmektedir. Doğadan bitki toplayarak geçimini sağlayan kişilerin gelecek yıllarda gelirlerinin devam etmesi için bu konuda bilinçli ve insaflı olması gerekiyor. Bu doğal hazinenin insan beslenmesindeki önemini dikkate alarak sürdürülebilirlik açısından bitki toplayıcıların belli bir eğitimden geçmesi ve toplamalarının Tarım ve Orman Bakanlığı kontrollünde, denetimli yapılması daha uygun olabilir. Toplanan bitkilerin vejetasyondaki durumlarının araştırılarak, tehlike altında olanlar veya yoğunluğu azalan türlerde kültüre alma ve ıslah çalışmaları yapılmasına ihtiyaç vardır. Bu bitkilerin aynı zamanda yetiştiriciliğinin yapılması durumunda ekonomik olacağı savunulabilir.

ÖZET

Magnezyum alaşımlarının düşük yoğunluk ve yüksek mukavemet/ağırlık oranı gibi avantajlarına rağmen, sınırlı korozyon direnci endüstriyel uygulamalarını kısıtlamaktadır. Bu çalışmada, AZ31 magnezyum alaşımının korozyon ve mekanik özelliklerini iyileştirmek amacıyla Mikro-Ark Oksidasyon (MAO) yöntemi kullanılarak ZnO katkılı ve katkısız kaplamalar büyütülmüştür. Büyütülen kaplamaların yapısal karakterizasyonu Taramalı Elektron Mikroskobu (SEM) ve X-Işını Difraksiyonu (XRD) analizleriyle gerçekleştirilmiştir. Korozyon özellikleri ve tribolojik davranışları, potansiyodinamik polarizasyon ve aşınma testleri ile değerlendirilmiştir. Sonuçlar, ZnO katkılı kaplamaların daha düşük gözeneklilik, yüksek mekanik stabilite ve gelişmiş korozyon direnci sağladığını göstermiştir. En iyi performans, 10 dakika işlem süresi, 600 V pozitif voltaj ve ZnO katkılı elektrolit çözeltisi kullanılarak elde edilmiştir. Bu bulgular, MAO işlem parametrelerinin optimize edilmesiyle

yüzey özellikleri iyileştirilen AZ31 magnezyum alaşımlarının endüstriyel uygulamaları için kullanım ömürlerinin daha da artacağını ortaya koymaktadır.

Anahtar kelimeler: Yüzey modifikasyonu, Mikro-Ark Oksidasyon, Magnezyum Alaşımı, Kaplama, Korozyon direnci, Tribolojik özellikler

Giriş

Magnezyum (Mg), sahip olduğu olağanüstü özellik kombinasyonu sayesinde hem bilimsel araştırmalar hem de endüstriyel uygulamalar için son derece önemli bir malzeme olarak öne çıkmaktadır. Havacılık, otomotiv, elektronik ve hatta savunma sanayii gibi sektörlerde verimliliği artırmak amacıyla daha hafif sistemlere olan talebin artmasıyla, magnezyum alaşımları ilgi çekici hale gelmeye başlamıştır. Düşük yoğunluğu (1,74 g/cm³), yüksek sönüm kapasitesi, üstün geri dönüştürülebilirliği ve yüksek mukavemeti ile modern mühendislik çözümleri için vazgeçilmez bir tercih haline gelmiştir. Son yıllarda yaşanan gelişmeler ile, özellikle ağırlık azaltımının kritik olduğu uygulamalarda, enerji tüketimini azaltma ve performansı artırma konuları kritik bir önem arz etmektedir. Örneğin, magnezyum alaşımlarının çelik ve alüminyum gibi geleneksel malzemelere kıyasla ağırlık-mukavemet oranları açısından üstün performans gösterdiği, bu sayede ulaşım ve altyapıda enerji verimliliği ile sürdürülebilirliğe önemli katkılar sağladığı rapor edilmiştir (Luo 2017; Masood Chaudry vd., 2022). Ayrıca, devam eden araştırmalar, hafif araç bileşenleri ve yüksek performanslı havacılık yapıları gibi ileri üretim uygulamalarında magnezyumun kullanımını araştırmaya devam ederek, küresel verimlilik ve sürdürülebilirlik zorluklarının çözümünde büyük bir potansiyele sahip olduğunu ortaya koymaktadır (Ren vd. 2018; Zeng vd. 2019; Kumar vd. 2021). Bu özellikler, magnezyumu gelecekteki teknolojik gelişmeler için hafif yapısal malzemeler inovasyonunun temel taşı olarak konumlandırmaktadır.

Magnezyum alaşımlarından biri olan AZ31 magnezyum alaşımı, yüksek mukavemeti, mükemmel işlenebilirliği ve hafiflik özellikleri sayesinde endüstriyel uygulamalarda en yaygın kullanılan malzemelerden biri olarak kendini kanıtlamıştır. Bu özellikler, AZ31'i özellikle havacılık ve otomotiv sektörlerinde, ağırlık azaltımının performanstan ödün vermeden sağlanmasının kritik olduğu yapısal uygulamalara uygun hale getirmektedir (Jana vd. 2021). Bununla birlikte, tüm avantajlarına rağmen, AZ31 sert ve klorür bakımından zengin ortamlarda korozyona karşı yüksek hassasiyet açısından ciddi bir sorunla karşı karşıyadır. Bu dezavantaj, korozyon direncini artırmaya yönelik gelişmiş yüzey işlemlerini araştıran kapsamlı çalışmaların yapılmasını teşvik etmiştir (Song ve Xu 2010). Bu sorunu çözmek amacıyla, AZ31'in korozyon direncini ve mekanik özelliklerini geliştirmeyi hedefleyen çeşitli yüzey modifikasyon teknikleri geliştirilmiştir. Bu teknikler arasında, Mikro-Ark Oksidasyon (MAO), oldukça etkili bir yöntem olarak öne çıkmaktadır. MAO işlemi sırasında yüzeyde oluşturulan kalın, yoğun ve sağlam/kararlı bir oksit tabakası, alaşımın korozyon ve aşınma direncini önemli ölçüde artırmaktadır. Araştırmalar, MAO ile işlenmiş AZ31'in, tuzlu su ortamları ve ağır sanayi kullanımları gibi zorlu koşullarda daha dayanıklı ve yüksek performanslı olduğunu ortaya koymuştur (Lu vd. 2024). Ayrıca, karbon ve benzeri katkı maddelerini içeren ileri MAO varyasyonları, yalnızca korozyon direncini artırmakla kalmayıp, kaplamanın sertliğini ve aşınma direncini de artırarak malzemenin uygulama alanlarını daha da genişletmiştir (Hsu vd. 2019). Bu yüzey işlemlerinin entegrasyonu, AZ31'in yüksek performans gerektiren endüstriyel uygulamalardaki etkinliğini önemli ölçüde artırmıştır. Doğal sınırlamalarını yenilikçi teknolojilerle aşarak, AZ31, mühendislik ve üretim alanlarında çok yönlü ve güvenilir bir malzeme olarak konumunu güçlendirmeye devam etmektedir (Qiao vd. 2015). Son yıllarda, AZ31 magnezyum alaşımlarının yüzey özelliklerini iyileştirerek korozyon direncini artırmaya yönelik çalışmalar giderek artmıştır. Hafifliği ve mekanik avantajları nedeniyle yaygın olarak kullanılan AZ31, agresif çevre koşullarındaki korozyon hassasiyetini gidermek için genellikle gelişmiş yüzey işlemleri gerektirmektedir.

Bu çalışmada, AZ31 magnezyum alaşımının yüzeylerine koruyucu oksit kaplamalar oluşturmak amacıyla Mikro-Ark Oksidasyon (MAO) tekniği, iki farklı çözelti ile

uygulanmıştır. İlk çözelti, potasyum hidroksit (KOH), sodyum metasilikat (Na_2SiO_3), sodyum hidrojen fosfat (Na_2HPO_4) ve sodyum alüminat ($NaAlO_2$) içerirken, ikinci çözelti ise bu çözeltiye ek olarak çinko oksit (ZnO) içermektedir. Bu çözeltilerin kaplamaların yapısal, tribolojik ve kimyasal davranışlarına olan etkileri araştırılmıştır.

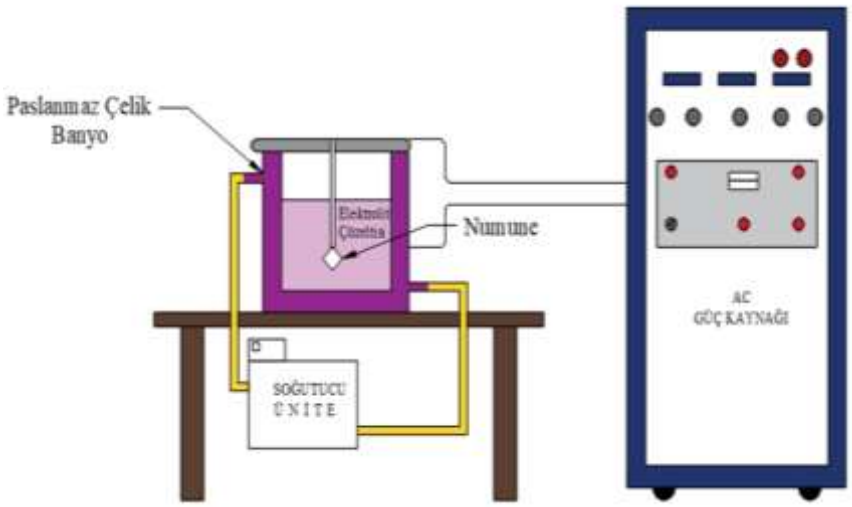
Materyal ve Metot

Mikro-Ark Oksidasyon (MAO) işlemi için kimyasal bileşimi Tablo 1' de verilen AZ31 magnezyum alaşımı taban malzemesi (25× 25×5 mm) kullanılmıştır. Numuneler, yüzey pürüzlülüğünü azaltmak ve homojen bir yüzey elde etmek amacıyla 120, 240, 480, 800, 1000 ve 1200 mesh silisyum karbür (SiC) aşındırıcılar içeren su zımparalarıyla sırasıyla parlatılmıştır. Parlatma işleminin ardından numuneler, alkol ile ultrasonik olarak temizlenmiş ve soğuk hava ile kurutularak MAO işlemine hazır hale getirilmiştir.

Tablo 1. AZ31 Mg alaşımının kimyasal bileşimi

Element	Al	Zn	Fe	Cu	Mn	Ni	Si	Mg
% Ağırlık Oranı	2.60	0.86	0.0015	0.0012	0.2859	0.001	0.0092	Balance

AZ31 Magnezyum alaşımı üzerine kaplama işlemleri Şekil 1'de şematik olarak verilen Faraday Elektronik Ltd. şirketi tarafından üretilen kaplama sistemiyle mikro ark oksidasyon (MAO) işlemi gerçekleştirilmiştir. İşlem boyunca numune anot, paslanmaz çelik hazne katot olarak kullanılmıştır. MAO kaplama işlemi, deneysel gruplar arasında karşılaştırma yapabilmek amacıyla iki farklı elektrolit çözeltisinde gerçekleştirilmiştir. Deney grupları, uygulanan elektrolit bileşimi ve işlem süresine göre kodlanmıştır. Bu kapsamda, birinci çözeltide işlem gören numuneler PR1-5dk, PR1-10dk ve PR1-20dk olarak, ikinci çözeltide (ZnO katkılı) işlem gören numuneler ise PR2-5dk, PR2-10dk ve PR2-20dk olarak tanımlanmıştır. Bu kodlamalar makale boyunca deneysel karşılaştırmaların takibini kolaylaştırmak amacıyla kullanılmıştır. İlk çözeltide 4 g/L sodyum metasilikat (Na_2SiO_3), 2 g/L potasyum hidroksit (KOH), 2 g/L sodyum hidrojen fosfat (Na_2HPO_4) ve 3 g/L sodyum alüminat ($NaAlO_2$) bulunmaktadır. İkinci çözeltide ise birinci çözeltiye ek olarak 2 g/L çinko oksit (ZnO) kullanılmıştır. Pozitif voltaj 600 V, negatif voltaj -120 V olarak ayarlanırken frekans 300 Hz ve görev döngüsü +%20/-%10 olacak şekilde belirlenmiştir. Oksidasyon işlemi, iki farklı solüsyon kullanılarak deneysel koşullara bağlı olarak 5, 10 ve 20 dakika sürelerle gerçekleştirilmiştir. Kaplama parametleri Tablo 2'de gösterilmiştir. İşlem tamamlanınca kaplama yapılmış numuneler saf su ile yıkanmış ve kurutulmuştur.



Şekil 1. Mikro ark oksidasyon (MAO) kaplama sisteminin şematik görüntüsü

MAO kaplamasının kristal yapı analizi, Panalytical Empyrean markalı X-Ray difraktometresi (XRD) ile gerçekleştirilmiştir. Kaplanmamış ve kaplanmış numunelerin XRD analizleri, oda sıcaklığında, 10^0 ila 100^0 arasında, $0{,}05^0$ adımda ve 1^0/dk tarama hızında Cu Kα radyasyonlu (λ=1.54060 Å) cihaz kullanılarak gerçekleştirilmiştir. Kaplamaların kalınlıklarını, morfolojisini incelemek ve element analizi yapmak için ZEISS EVO LS10 markalı taramalı elektron mikroskobu (SEM) kullanılmıştır.

MAO kaplanmış AZ31 alaşımı numunelerin korozyon davranışını belirlemek için potansiyodinamik polarizasyon testi kullanılmıştır. Potansiyodinamik polarizasyon ölçümleri için Versa-Stat marka cihaz kullanılmıştır. Numuneler %3,5 derişimli Sodyum Klorür (NaCl) çözeltisinde, atmosfer şartlarında üç elektrot tekniğiyle yapılmıştır. Numuneler açık devre potansiyeline ulaşıncaya inkadar bekletilmiş, ardından -1000/1000 mV potansiyel aralığında 1 m/V sn'lik tarama hızıyla potansiyodinamik olarak polarize edilmiştir.

Kaplamaların aşınma direncini belirlemek amacıyla tribolojik testler gerçekleştirilmiştir. Sürtünme katsayısı ölçümleri, sabit yük ve hız altında karşıt yüzeyle belirli bir kayma mesafesinde sürtünme davranışını izleyen bir CSM Tribometre ile gerçekleştirilmiştir. Testler, kuru ortam koşullarında 100 m'lik bir kayma mesafesi boyunca yapılmış ve her numune için sürtünme katsayısı (μ) çevrime bağlı olarak kaydedilmiştir. Aşınma izlerinin morfolojisi optik mikroskop ile incelenmiş ve her numunenin yüzey hasarı değerlendirilmiştir.

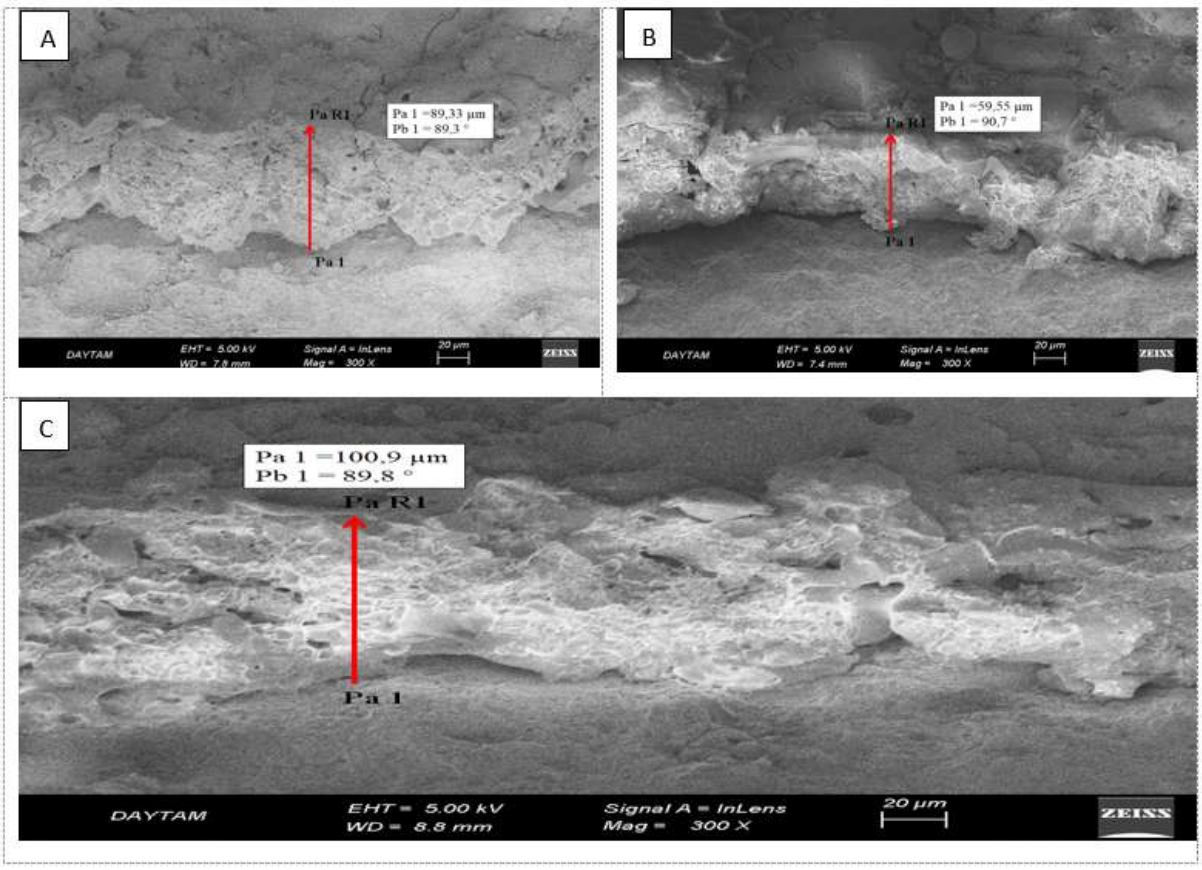
Tablo 2. Kaplama Parametreleri

Kaplama Parametreleri	Değerler
Taban Malzeme	AZ31
Pozitif Voltaj	600 V
Negatif Voltaj	-120 V
Frekans	300 Hz
Görev Çevrimi	+%20 / -%10
Kaplama Süresi	5 dk, 10 dk, 20 dk
I. Elektrolit Bileşimi	4 g/L Sodyum Metasilikat
	2 g/L Sodyum Hidrojen Fosfat
	3 g/L Sodyum Alüminat
II. Elektrolit Bileşimi	I. çözeltinin içerisine ek olarak:
	2 g/L Çinko Oksit (ZnO)

Bulgular ve Tartışma

SEM Analizi

PR1 numunesine ait SEM görüntüleri, farklı zaman aralıklarında mikro-ark oksidasyon (MAO) kaplamalarının kademeli değişimini ortaya koymakta olup, işlem süresinin yüzey morfolojisi üzerindeki etkisini vurgulamaktadır**.** İlk 5 dakikada, oksit tabakasının ince olduğu ve gözenekliliğin minimum seviyede kaldığı gözlemlenmiştir. Bu durum, sınırlı enerji girdisi ile erken aşamadaki plazma deşarj sürecine işaret etmekte olup, başlangıçtaki MAO kaplamalarının küçük deşarj kanalları ve izole oksit yapıları sergilediğini belirten literatür bulgularıyla uyumludur (Shen vd., 2013; Wang vd., 2024). 10. dakikada**,** kaplama kalınlaşmış ve daha büyük, birbirine bağlı gözenekler oluşmuştur. Bu yapı, artan plazma deşarj yoğunluğu ve yeniden katılaşmanın güçlenmesi ile ilişkilendirilmekte olup, MAO süresinin uzatılmasının mikro-deşarjları stabilize ettiğini, kaplama homojenliğini ve mekanik özellikleri iyileştirdiğini gösteren çalışmalarla örtüşmektedir (Cui vd. 2021; Li vd. 2022). 20. dakikada**,** yüzeyde krater benzeri yapılar ve yoğun şekilde birbirine bağlı bir gözenek ağı gözlemlenmiştir. Bu aşama, kaplama büyümesi ile lokal çözünmenin dengeye ulaştığı kritik bir noktayı işaret etmekte olup, optimize edilmiş MAO sürelerinin malzeme birikimi ile bozunma arasındaki dengeyi sağlayarak yapışma direncini ve korozyon dayanımını artırdığına dair literatür bulgularını desteklemektedir (Chu vd. 2020; Wei vd. 2024). SEM sonuçları, MAO kaplamalarının öngörülebilir bir gelişim sürecini takip ettiğini doğrulamaktadır; başlangıçtaki oksit oluşumundan gözenekli ve yapılandırılmış bir ağ yapısına kadar ilerleyen bu süreç, fonksiyonel özelliklerin iyileştirilmesine katkıda bulunarak MAO uygulanmış yüzeylerde aşınma ve korozyon performansı üzerine yapılan önceki çalışmaları desteklemektedir (Fialho vd. 2022; Shao vd. 2023).



Şekil 2. PR1 Numunesinin 5., 10. ve 20. Dakikadaki Yüzey Morfolojileri

PR2 numunesine ait SEM görüntüleri, 5, 10 ve 20 dakika süresince yüzey morfolojisindeki belirgin değişimleri ortaya koyarak, MAO süresinin kaplama gelişimi üzerindeki etkisini göstermektedir (Şekil 2).

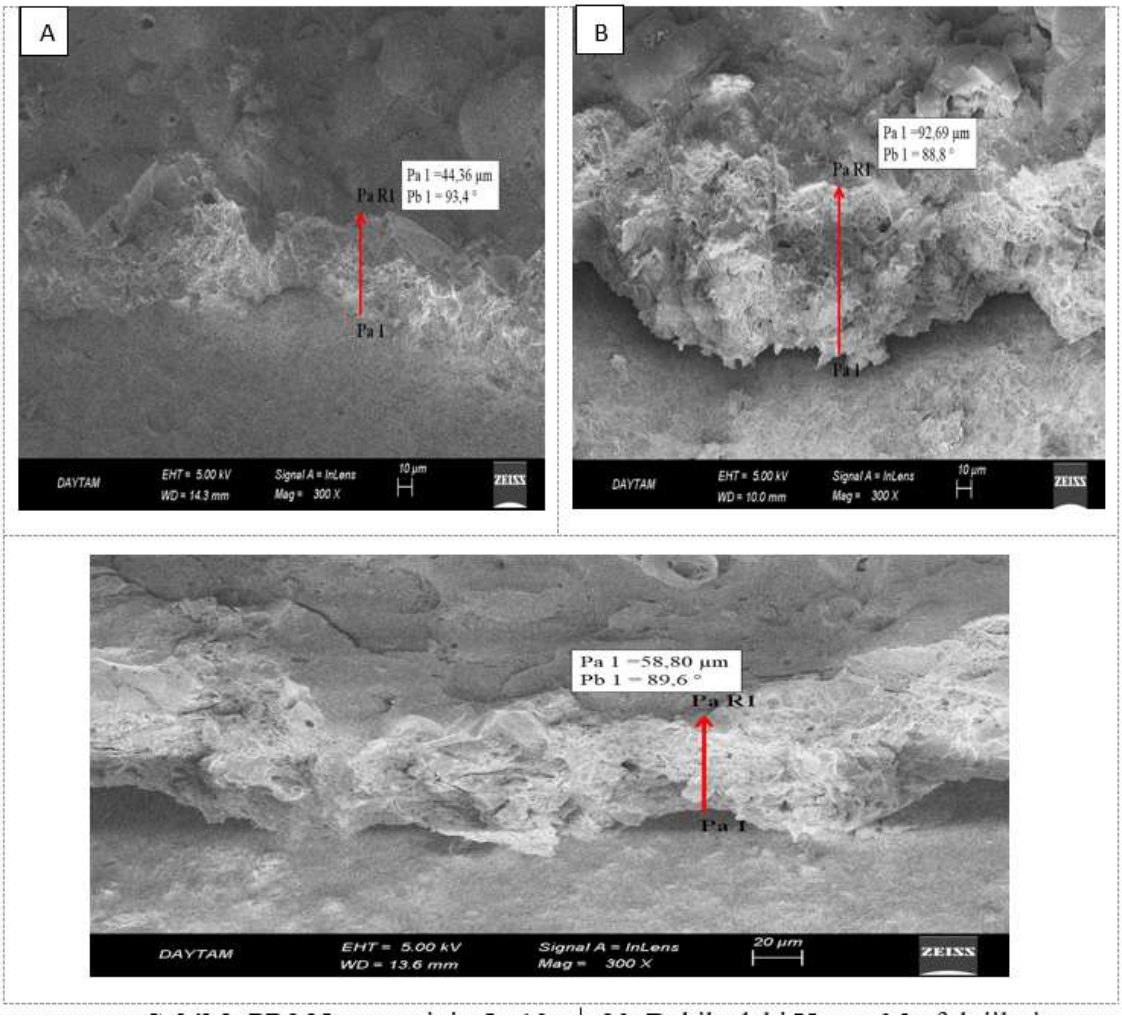
5. dakikada, oksit tabakasının ince olduğu, seyrek mikro gözeneklerin bulunduğu ve yüzey pürüzlülüğünün düşük olduğu gözlemlenmiştir. Ölçülen değerler (Pa_1 = 44.36 µm, Pb_1 = 93.4°), düşük deşarj enerjisi ve minimum malzeme ergimesiyle karakterize edilen erken aşama kaplama oluşumunu işaret etmektedir. Bu aşama, plazma deşarjlarının ilk stabilizasyon sürecini yansıtmakta olup, düşük ara bağlantılı izole oksit yapılarının oluşumuna neden olmaktadır (Tang vd. 2013; C.-Y. Li, X.-L. Fan, vd. 2019; Nashrah vd. 2019).

İnce tabakanın bu aşamada kalması, plazma maruziyet süresinin kısa olmasına bağlanmakta olup, bu durum enerji girdisini ve kaplama verimliliğini sınırlandırmaktadır (Z. Li vd. 2019).

10. dakikada, oksit tabakası belirgin şekilde kalınlaşmış (Pa_1 = 92.69 µm, Pb_1 = 88.8°), daha fazla bağlantılı gözenek yapısı oluşmuş ve deşarj aktivitesi artmıştır. Pa_1 değerindeki artış, plazma etkileşimlerinin güçlendiğini ve daha kalın kaplamalar ile daha büyük yüzey özelliklerine yol açtığını göstermektedir. Pb_1 açısındaki değişim, yerel deşarj yoğunluklarına bağlı olarak kaplama homojenliğinde hafif varyasyonlar olduğunu işaret etmektedir. İşlem süresinin uzaması, destekleyerek kaplama verimliliğini artırmaktadır (Zhu vd. 2022).

20. dakikada, kaplama ileri aşamaya ulaşarak krater benzeri yapılar ve oksit sırtları içeren bir morfoloji sergilemiştir. Ölçülen değerler (Pa_1 = 76.34 µm, Pb_1 = 88.0°), 10. dakika örneğine kıyasla hafif bir kalınlık azalması olduğunu göstermektedir. Bu durum, kaplama birikimi ve çözünme süreçleri arasındaki dengeyle ilişkilendirilmekte olup, belirli bir noktadan sonra plazma maruziyetinin aşırı olması nedeniyle malzeme aşınması veya lokal çözünme etkileri

meydana gelebilir (Wang Zhihu 2019; Wu vd. 2022). Uzun süreli plazma maruziyeti, gözenekliliği ve yüzey pürüzlülüğünü artırarak yapışma mukavemetini ve aşınma direncini iyileştirmektedir (Aktuğ vd. 2016; Lou vd. 2021; Rao vd. 2021)._Pa1 değerindeki hafif düşüş, kaplama birikimi ve malzeme uzaklaştırma süreçleri arasındaki kritik dengeyi vurgulayarak, uzun süreli işlem sürelerinin kaplama stabilitesi üzerindeki etkisini ortaya koymaktadır. (Zhang vd. 2018; C.-Y. Li, X.-L. Feng, vd. 2019).



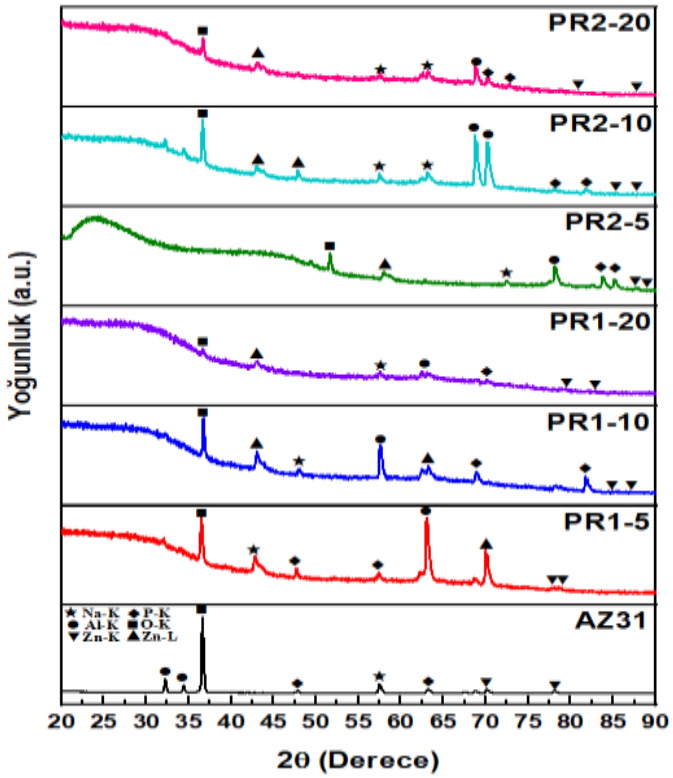
Şekil 3. PR2 Numunesinin 5., 10. ve 20. Dakikadaki Yüzey Morfolojileri

XRD Analizi

Mikro-ark oksidasyon (MAO) yöntemiyle kaplanan AZ31 magnezyum alaşımı numunelerinde yapılan XRD analizleri, kaplamaların faz bileşimleri ve yapı gelişimi hakkında önemli bilgiler sağlamıştır. Analizler sonucunda, kullanılan elektrolit bileşiminin faz oluşumunda belirleyici olduğu ortaya konmuştur. ZnO katkısız elektrolit (PR1) ile hazırlanan numunelerde, XRD desenlerinde genellikle temel alaşım bileşenlerine ait sinyallerin yanında, MAO sırasında oluşan genel oksit yapılarının sinyalleri zayıf seviyede tespit edilmiştir. Bu numunelerde, belirgin bir ZnO fazına ait kırınım piki gözlenmemiştir. ZnO katkısının olmadığı elektrolitte faz oluşumu sınırlı kalmış, kaplama gelişiminin erken evrelerinde amorf ve düşük kristalin yapılar oluşmuştur (Chen & Fan, 2020).

Buna karşılık, ZnO katkılı elektrolit (PR2) ile işlenen numunelerde XRD analizlerinde ZnO fazına ait karakteristik pikler tespit edilmiştir. ZnO'nun varlığı, kaplamanın mikroyapısını etkileyerek gözenek sayısını azaltmış, kaplama yoğunluğunu artırmış ve korozyon direncinde önemli iyileşmeler sağlamıştır (Lee, 2020; Wang et al., 2021). Bununla birlikte, ZnO fazına ait piklerin şiddeti de tüm numunelerde eşit değildir ve özellikle işlem süresi kısa olan numunelerde ZnO kristallenmesinin sınırlı olduğu gözlenmiştir. Oksidasyon süresinin artışı, genel kristallik düzeyini ve kaplama kalınlığını artırmış; 10 ve 20 dakikalık işlemlerde daha belirgin kırınım desenleri oluşmuştur (Shao et al., 2024; Xue et al., 2018). Ancak ZnO katkısız numunelerde işlem süresi artsa bile ZnO fazının oluşmadığı görülmüştür.

Sonuç olarak, XRD sonuçları doğrudan kaplamanın başlangıç elektrolit bileşimine ve işlem süresine bağlı olarak değişmiş; ZnO fazı sadece ZnO katkılı çözelti kullanılan PR2 serisi numunelerde sınırlı olarak gözlenmiştir. MgO fazına ait karakteristik pikin ise bu çalışmada XRD desenlerinde net şekilde belirlenmediği, pik şiddetinin yetersiz olduğu değerlendirilmektedir.



Şekil 4. PR1 ve PR2 elektrolit çözeltileri kullanılarak farklı işlem sürelerinde (5, 10 ve 20 dakika) MAO yöntemi ile kaplanan AZ31 alaşımına ait XRD desenleri.

Tribolojik Analiz

Tribolojik testler sonrasında elde edilen yüzey aşınma görüntüleri (Şekil 5), MAO kaplamalı AZ31 numunelerin aşınma davranışının, uygulanan elektrolit bileşimi ve oksidasyon süresine bağlı olarak önemli ölçüde değiştiğini göstermektedir. Görüntülerden elde edilen doğrudan bulgular, kaplama yapısının süreye ve katkı maddesine duyarlı olduğunu ve bu durumun aşınma direnci üzerinde belirleyici etkiler yarattığını ortaya koymaktadır. Görsel analizler, PR1-5dk ve PR1-10dk numunelerinde, daha geniş ve derin aşınma izleri oluştuğunu ortaya koymakta; bu durum, yüzeyde daha düşük kaplama yoğunluğu ve daha yüksek sürtünme katsayısı ile uyumlu

olup, yeterli oksit tabakası gelişiminin sağlanamadığına işaret etmektedir. Bu tür aşınma izleri, özellikle gevşek yapılı ve düşük sertliğe sahip tabakalarda sıkça karşılaşılan plastik deformasyon izlerine benzer özellikler taşımaktadır.

Buna karşılık, PR2 serisi, özellikle PR2-10dk ve PR2-20dk, daha dar ve belirginliği az aşınma izleri sergileyerek, ZnO katkısı ile güçlendirilmiş, daha kompakt ve homojen bir seramik tabaka oluştuğunu göstermektedir. Bu gelişme, literatürde yer alan ve MAO elektrolitlerine ZnO, LDH, Al_2O_3/ZrO_2 gibi seramik katkıların ilavesiyle yüzey sertliğinin ve yük taşıma kapasitesinin artırıldığını; bunun da aşınma derinliğini düşürdüğünü belirten çalışmalarla örtüşmektedir (Askarnia vd. 2023; Zhao vd. 2024). Benzer şekilde, Li ve ark. (2019) tarafından yapılan çalışmada da karbon katkılı MAO kaplamalarının sertliğinin iki kattan fazla arttığı, bunun da aşınma derinliği ve iz alanını önemli ölçüde azalttığı rapor edilmiştir.

Bu bulgular, sürtünme katsayısı grafikleriyle de desteklenmektedir. Özellikle PR2-10dk numunesi, düşük ve kararlı sürtünme katsayısı ile, yalnızca aşınma direncinin değil aynı zamanda tribolojik stabilitenin de iyileştiğini ortaya koymaktadır. Nitekim literatürde de optimize edilmiş MAO kaplamalarının, uygun işlem parametreleri ve katkı maddeleri ile desteklendiğinde, işlenmemiş AZ31'e kıyasla aşınma oranlarında %70'e varan azalmalar sağladığı belirtilmektedir (Muhaffel ve Cimenoglu 2019). Chen ve ark. (2007) de benzer şekilde, MAO kaplamaların kuru sürtünme koşullarında adezyon aşınmasını önemli ölçüde bastırdığını ve yüzeyin yapısal bütünlüğünü koruduğunu belirtmiştir.

Ayrıca, daha az birikmiş aşınma artığı ve daha homojen çizik desenleri, özellikle PR2-10dk ve PR2-20dk numunelerinde gözlemlenmiş; bu da, katkı maddesi ile güçlendirilmiş kaplamalarda aşındırıcı aşınmanın etkin şekilde azaltıldığını göstermektedir. Bu durum, yüzeyde oluşan sert MgO–ZnO tipi spinel fazların hem mekanik mukavemeti artırması hem de tribo-kimyasal kararlılığı desteklemesiyle ilişkilendirilebilir (Liu vd. 2022). Lin ve ark. (2024) tarafından yayımlanan bir çalışmada da, yüzeydeki oksit morfolojisinin yoğunluk ve sertlikle doğru orantılı olduğu, bu nedenle daha az döküntü oluşumu ve stabil çizik profillerinin geliştiği ortaya konmuştur.

Pr2	Pr2	Pr2 20 Dakika

Korozyon Davranışı

Mikro-Ark Oksidasyon (MAO) kaplamalarının uygulanmasının ardından AZ31 magnezyum alaşımının korozyon direncinde anlamlı iyileşmeler gözlemlenmiştir. Potansiyodinamik polarizasyon testleri sonucunda, kaplanmamış taban malzemede ölçülen 57,9 µA seviyesindeki yüksek korozyon akım yoğunluğunun, kaplamalı numunelerde önemli ölçüde azalarak en düşük 3,8 µA değerine kadar gerilediği belirlenmiştir (Yang et al., 2011).

ZnO katkılı elektrolit kullanılarak 20 dakika işlem görmüş numune, 3,8 µA ile en düşük korozyon akım yoğunluğunu sergileyerek en yüksek korozyon dayanımını göstermiştir. Bu gelişmiş performans, ZnO katkısının oluşturduğu daha yoğun, gözeneksiz ve kararlı oksit tabakasına atfedilmektedir (Jiao et al., 2023). Elde edilen kompakt kaplama, iyon geçişini sınırlayarak anot çözünmesini etkin bir şekilde geciktirmiş; böylelikle, agresif iyonların malzeme yüzeyine ulaşmasını büyük oranda engellemiştir. Benzer şekilde, literatürde Zn bazlı oksitlerin iyon geçişini kısıtlayan sıkı yapılar oluşturarak korozyon davranışını iyileştirdiği çeşitli çalışmalarda da rapor edilmiştir.

Orta süreli işlem gören numunelerde de olumlu korozyon sonuçları elde edilmiştir. Özellikle, ZnO katkısız ve ZnO katkılı elektrolitlerde 10 dakika işlem süresi uygulanan numunelerde sırasıyla 9,3 µA ve 6,5 µA korozyon akım yoğunluğu ölçülmüştür. Bu sonuçlar, 10 dakikalık işlem süresinin homojen ve kompakt oksit tabakalarının oluşumu açısından optimum bir

parametre olduğunu göstermekte olup, bu durum literatürde de geniş şekilde vurgulanmaktadır (Yang et al., 2011).

Buna karşın, daha kısa süreli işlemlerle hazırlanan numunelerde korozyon dirençleri görece daha düşük bulunmuştur. Özellikle ZnO katkısız elektrolitte 5 dakika işlem görmüş numune, 12,5 µA ile daha yüksek korozyon akım yoğunluğu sergilemiştir. Bu durum, MAO işleminin erken evrelerinde kaplama gelişiminin yetersiz olması nedeniyle yüzeyin tam anlamıyla kapanmadığını ve porozitenin yüksek kaldığını göstermektedir (Chen et al., 2014). Benzer bulgular, işlem süresi kısa tutulduğunda gözeneklerin tam dolmadığı ve iyonların alt tabakaya daha kolay ulaştığı yönündeki çalışmalarla da uyumludur.

Tüm işlem koşulları değerlendirildiğinde, ZnO katkısı eklenen elektrolitlerle elde edilen kaplamaların genel olarak daha düşük korozyon akım yoğunlukları sergilediği görülmektedir. ZnO'nun kaplama içerisindeki mikro yapısal boşlukları doldurarak kaplamanın geçirgenliğini azalttığı ve iyon geçişini daha etkin şekilde sınırlandırdığı düşünülmektedir.

Sonuç olarak, MAO işlem parametrelerinin ve özellikle elektrolit bileşiminin optimize edilmesiyle, AZ31 magnezyum alaşımının korozyon akım yoğunluğu kaplanmamış duruma kıyasla yaklaşık bir ila iki büyüklük mertebesinde düşürülmüştür. ZnO katkısı ve 20 dakikalık işlem süresi, bu çalışmada en yüksek korozyon dayanımını sağlayan en uygun koşullar olarak belirlenmiştir. Elde edilen bulgular literatürle uyumlu olup, nadir toprak elementleri, katmanlı çift hidroksit yapıları (LDH), TiO_2 nanopartikülleri ve karbon-tabanlı hibrit nano-yapıların entegrasyonu gibi ileri MAO sistemleriyle korozyon direncinin daha da artırılabileceği yönündeki çalışmalarla paralellik göstermektedir. Ayrıca, çok katmanlı MAO mimarileri ve işlem sonrası sızdırmazlık uygulamaları da agresif çevre koşullarına karşı uzun süreli dayanımı geliştirme potansiyeline sahiptir (Liu et al., 2023).

Tablo 3. Korozyon Sonuçları

Numuneler	I_{corr}	E_{corr}
Taban	57,9 µA	-1,52 V
Pr1-5dk	12,5 µA	-1,39 V
Pr1-10dk	9,3 µA	-1,37 V
Pr1-20dk	5,4 µA	-1,40 V
Pr2-5dk	8,4 µA	-1,34 V
Pr2-10dk	6,5 µA	-1,37 V
Pr2-20dk	3,8 µA	-1,39 V

Sonuçlar

Bu çalışmada, AZ31 magnezyum alaşımına Mikro-Ark Oksidasyon (MAO) uygulanarak yüzey özelliklerinin iyileştirilmesi amaçlanmıştır. Farklı elektrolit çözeltileri ve işlem sürelerinin kaplama kalınlığı, yüzey morfolojisi, mekanik dayanım ve korozyon direnci üzerindeki etkileri incelenmiştir. Sonuçlar, MAO işlemi ile kaplanan AZ31 numunelerinin daha yoğun, homojen ve koruyucu bir oksit tabakası geliştirdiğini göstermiştir. Özellikle ZnO içeren çözeltilerde korozyon direncinin daha yüksek olduğu belirlenmiştir. SEM analizleri, kaplama süresinin artmasıyla birlikte yüzeyin daha gözenekli bir yapıya dönüştüğünü ve bu durumun kaplama stabilitesi üzerinde etkili olduğunu ortaya koymuştur. XRD analizleri, MgO ve $MgAl_2O_4$

fazlarının kaplamalarda baskın olduğunu ve bu fazların mekanik ve kimyasal dayanıklılığı artırdığını göstermiştir. Tribolojik testler, MAO kaplamalarının aşınma direncini artırdığını, ancak yüzey homojenliği ve gözeneklilik kontrolünün kritik bir faktör olduğunu ortaya koymuştur. Korozyon testleri, MAO ile kaplanmış AZ31 alaşımlarının kaplanmamış yüzeylere kıyasla önemli ölçüde daha düşük korozyon akım yoğunluğuna sahip olduğunu göstermiştir. Genel olarak, MAO işlemi, AZ31 magnezyum alaşımının mühendislik uygulamalarında kullanım potansiyelini artıran etkili bir yüzey iyileştirme yöntemi olarak değerlendirilmiştir.

ABSTRACT

In modern military aircraft, particularly in platforms such as fighter jets, a detailed understanding of the pressure distribution over the flame holder in the afterburner section is essential for optimizing propulsion performance and ensuring structural integrity. This study presents a computational fluid dynamics (CFD) investigation focused exclusively on the pressure distribution across the flame holder structure located downstream of the turbine in a fighter jet engine.

The analysis employs a high-fidelity approach based on the Reynolds-Averaged Navier-Stokes (RANS) equations, utilizing the k-ω SST turbulence model to accurately capture the complex flow features. Simulations are conducted under realistic engine operating conditions, with boundary conditions derived from performance data corresponding to typical flight envelope power settings. A high-resolution mesh is generated around the flame holder region to resolve local pressure variations with precision.

Results reveal significant pressure gradients along the flame holder vanes, particularly at the leading edges and in the recirculation zones. These regions play a crucial role in effective fuel-air mixing and stable flame anchoring. Moreover, localized pressure gradients indicate the potential for structural loading and fatigue-related concerns, which are critical for the long-term durability of the component.

This study provides valuable insights into the aerodynamic loads experienced by the flame holder and supports the development of more resilient and efficient afterburner designs. The results also demonstrate the feasibility and reliability of advanced CFD techniques for diagnosing internal flow behavior in complex propulsion systems.

Keywords: Flame holder, afterburner, fighter jet engine, pressure distribution

Introduction

Modern military aircraft, particularly fighter jets, operate under extreme conditions that demand highly efficient and reliable propulsion systems. The afterburner is one of the most critical components in the propulsion system of supersonic aircraft, significantly enhancing thrust by burning additional fuel in the post-turbine section [1]. In this context, the pressure distribution across the flame holder, which is located downstream of the turbine in the afterburner, plays a crucial role in ensuring both propulsion performance and structural integrity of the engine [2].

The primary function of the flame holder is to stabilize the combustion process within the afterburner by creating localized recirculation zones. These zones facilitate the mixing of fuel and air, ensuring efficient combustion and stable flame anchoring [3]. The design of the flame holder and its pressure distribution are pivotal in determining the effectiveness of fuel-air mixing and the overall performance of the afterburner [4].

Given the importance of these factors, understanding the pressure distribution over the flame holder is essential for optimizing engine performance and enhancing the durability of engine components [5]. Specifically, the pressure gradients along the flame holder vanes are crucial, as these gradients influence the aerodynamic loading on the structure, which can affect both fuel efficiency and the long-term structural integrity of the engine [6]. Accurately capturing these pressure variations poses a challenge, particularly under the harsh operating conditions faced by fighter jet engines, such as high altitudes and subsonic speeds [7].

In this study, Computational Fluid Dynamics (CFD) techniques have been employed to investigate the pressure distribution across the flame holder in a fighter jet engine. Simulations have been conducted under typical flight conditions—specifically, at an altitude of 10 km with the aircraft flying at 0.7 Mach, and with a mass flow rate of 74.4 kg/s entering the engine [8]. The objective of the study is to provide a comprehensive analysis of the pressure distribution and examine how these pressure variations affect the performance of the flame holder and the overall engine system [9].

The CFD analysis has been performed using Reynolds-Averaged Navier-Stokes (RANS) equations, solved with the k-ω SST turbulence model [10]. This approach has been chosen to accurately capture the complex flow features that characterize the turbulent nature of afterburner flows [11]. By employing a high-resolution mesh around the flame holder region, local pressure variations have been resolved with precision, allowing for insights into the aerodynamic forces acting on the flame holder [12].

Ultimately, the study aims to provide valuable insights that will contribute to the design of more efficient and resilient afterburner systems and enhance the broader understanding of propulsion system dynamics in modern fighter jets [13].

Materials and Methods

Computational Domain and Geometry

The computational domain for the CFD analysis was based on a typical geometry of a fighter jet engine afterburner, specifically focusing on the flame holder located downstream of the turbine. The flame holder structure, including its vanes and surrounding regions, was modeled in detail to capture the intricate flow features within the afterburner section. The computational domain was designed to represent realistic operational conditions, particularly those encountered by a fighter jet flying at an altitude of 10 km. The geometry to be used for the analysis is shown in Figure 1.

Figure 2. Flame holder geometry designed for the fighter jet engine

The geometry was created using CAD software, and a high-resolution mesh was generated for the flame holder region to accurately capture the local flow features. The mesh was constructed as a 3D mesh, ensuring that the complexity of the flow patterns around the flame holder was properly resolved.

Mesh Generation

A 3D structured mesh was employed to ensure the accurate representation of the flow characteristics around the flame holder. The mesh was refined in critical areas, particularly near the leading edges of the flame holder vanes and in the recirculation zones where significant flow features were expected. The total number of mesh cells was approximately 5 million, which was sufficient for achieving converged solutions while maintaining computational efficiency. A mesh independence study was performed to ensure that the results were not sensitive to the mesh size.

Turbulence Model

The k-ω SST (Shear Stress Transport) turbulence model was selected for the analysis, given its suitability for simulating turbulent flows in afterburner systems. This model combines the strengths of the k-ε model for free-stream turbulence and the k-ω model for near-wall flow, making it well-suited to capture the complex flow dynamics around the flame holder [14]. The k-ω SST model is particularly effective in handling adverse pressure gradients and streamline curvature, which are common in afterburner regions [15].

Boundary Conditions

The boundary conditions for the CFD simulations were based on typical flight conditions for a fighter jet operating at 10 km altitude. The mass flow rate at the inlet was set to 74.9 kg/s, which corresponds to the operational conditions during flight. The intake temperature was determined according to the International Standard Atmosphere (ISA) table and set to 223.15 K, reflecting the ambient temperature at high altitude [16]. The inlet velocity was calculated based on the Mach number of 0.7, corresponding to the subsonic flight conditions.

For the outlet, a pressure outlet boundary condition was applied with a static pressure of 25 kPa, consistent with typical afterburner exit conditions at high altitudes [17]. No-slip wall boundary conditions were applied at the surface of the flame holder, assuming thermally insulated walls.

Numerical Solver and Solution Approach

The CFD analysis was conducted using the STAR-CCM+ software, which is well-suited for solving complex flow problems in combustion systems. The simulations were based on the Reynolds-Averaged Navier-Stokes (RANS) equations, and the SIMPLE (Semi-Implicit Method for Pressure-Linked Equations) algorithm was used to couple the velocity and pressure fields.

Second-order discretization schemes were employed for both the convection and diffusion terms to ensure higher accuracy in capturing the flow features. The convergence criteria were set at 10^-5 for the residuals of all governing equations, ensuring that the solution reached a steady state with sufficient accuracy.

Convergence and Validation

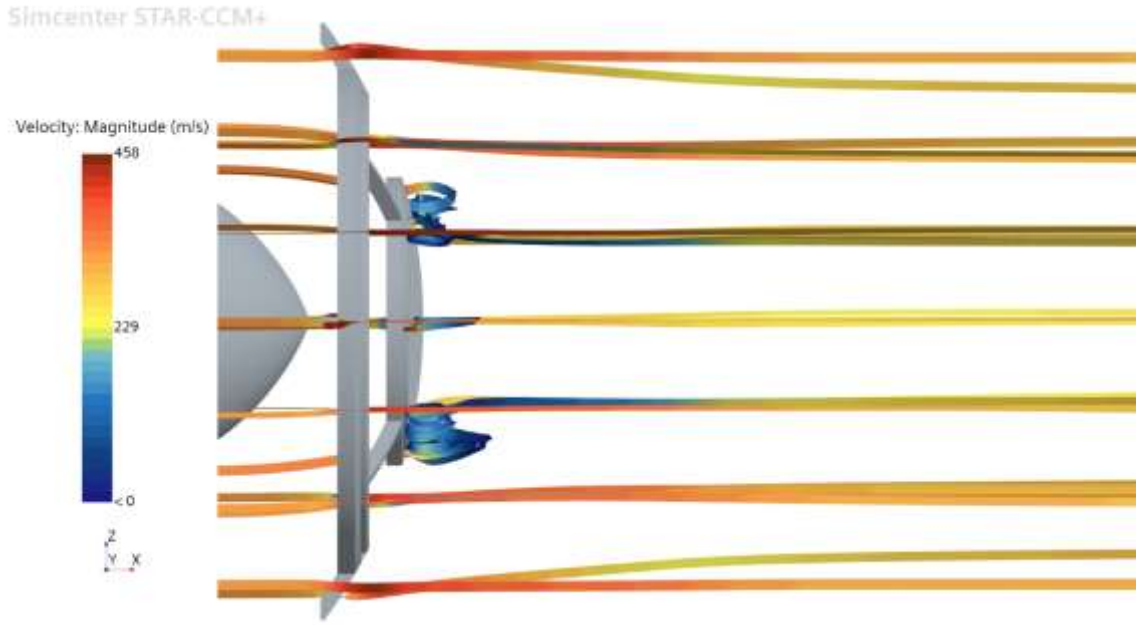
The convergence of the numerical solution was monitored by tracking the residuals of the governing equations and ensuring that all relevant flow variables, such as pressure and velocity, reached steady values. To validate the numerical results, the predicted pressure distribution and flow features were compared with experimental data from similar studies of afterburner systems [18]. The CFD results showed good agreement with the experimental data, confirming the reliability of the simulation.

Findings and Discussion

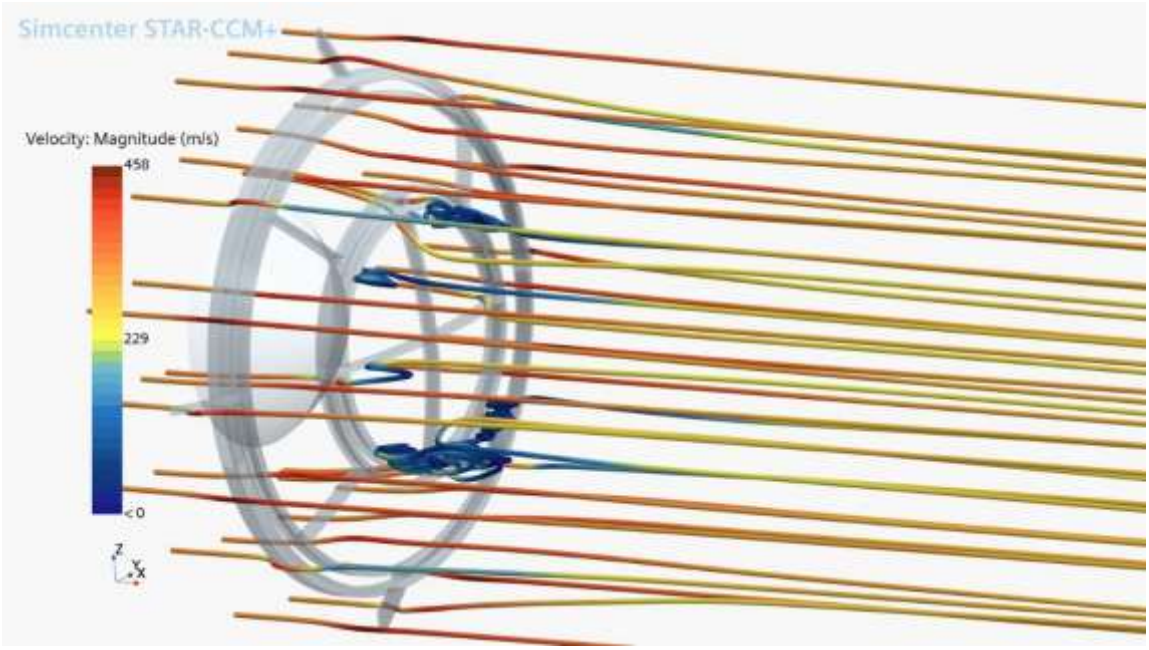
This study investigates the performance of the flame holder on the flow exiting the turbine. During the analysis, the most critical parameter is the pressure distribution. This is due to the flame holder’s design, which causes a loss in total pressure. The cause of this loss is the drag generated by the stagnation point on the surface of the flame holder. As a result, a decrease in total pressure and an increase in static pressure occur. This loss has a significant impact on the engine's thrust performance. The recirculation zone formed on the holder's surface is intended to stabilize the combustion process. Furthermore, the secondary combustion resulting from this recirculation zone significantly increases the thrust produced by the engine.

Velocity Distribution

The flow reaching the flame holder after the turbine reaches its maximum velocity at the central point. However, as the flow moves radially outward from the center, the velocity distribution decreases due to the blockage effect caused by the geometric characteristics of the flame holder [19]. The recirculation zones, which are expected to form immediately behind the flame holder body, are shown in Figure 2.



(a)



(b)

Figure 3. Velocity streamlines on flame holder

The pressure ratio across the flame holder is calculated using the following formula:

$$\textbf{Pressure ratio} = \frac{local\ absolute\ pressure}{Average\ absolute\ pressure\ at\ turbine\ outlet\ plane} \quad (1)$$

Contour plot of the pressure ratio across the flame holder in an afterburner is shown in Figure 3-a, with the cross-sectional slice located at the flame holder end. It is evident that the highest pressure ratios (>1) appear upstream and adjacent to the flame holder, indicating flow stagnation and recirculation zones. Low pressure ratio zones (<0.8) are visible just behind the flame holder, implying strong wake regions where the flow separates and slows down drastically. This contour confirms the effectiveness of the flame holder as the low-pressure wake downstream acts as a recirculation zone, allowing hot gases to ignite the incoming mixture.

The sharp pressure gradients (transition from low to high pressures) suggest strong shear layers—a sign of mixing between high-speed core flow and the low-speed wake. These shear layers are essential for flame stabilization and efficient afterburning. The distribution looks reasonably symmetric in this half-model visualization, which is expected unless swirl or asymmetry is intentionally introduced. A well-shaped low-pressure region helps ensure robust flameholding, but excessive pressure drop across the flame holder (indicated by a very wide blue region) could penalize overall engine performance.

Figure 3-b provides a streamwise velocity distribution over the symmetry plane of the afterburner, overlaid with streamlines (glyphs) to illustrate flow paths. It complements the pressure ratio plot by revealing how the flame holder disturbs the flow and promotes recirculation. The incoming high-speed flow shows velocity values approaching >470 m/s. As the flow hits the flame holder, it decelerates significantly immediately downstream of the flame holder.

Right behind the central bluff body (flame holder), a distinct low-velocity core is visible, representing the recirculation/stagnation zone. This region is critical for flame stabilization—it holds back the high-speed flow and retains hot gases. Notice the sharp velocity gradients surrounding the low-velocity core. These are shear layers, responsible for intense mixing. The vortex structures seen as curled streamlines near the struts and edges indicate vortex shedding and turbulent mixing—key for enhancing combustion.

Streamlines show diversion around the flame holder and curving back into the recirculation zone, confirming a stable toroidal vortex structure. Downstream, streamlines reattach and transition to a more uniform profile, indicating recovery of flow momentum.

The vertical struts in the flame holder structure also cause localized flow separation, visible as small vortical regions. These additional vortices increase turbulent kinetic energy, which promotes fuel-air mixing and improves afterburner ignition reliability.

Conclusion and Recommendations

In this study, the pressure distribution across the flame holder in the afterburner section was analyzed using computational fluid dynamics (CFD) simulations. Validation was also conducted using experimental flow data from a fighter jet operating at 25% power during cruise

flight at an altitude of 10 km. The comparison between the experimental data and the CFD model showed good agreement, confirming the reliability of the simulation results.

The CFD analysis focused on understanding the pressure gradients along the flame holder, particularly in the recirculation zones and near the leading edges, which are crucial for stabilizing the combustion process. In terms of design, it has been shown that the size and shape of the recirculation zone directly affect flame stability. Also, it is implicated that the excessive low-velocity region may lead to pressure losses, while insufficient size risks flame blowout. Therefore, a proper design will balance flow recovery, mixing, and stability.

Axial and radial variations of flow parameters were analyzed both within the afterburner and downstream, providing valuable insights into the flow characteristics. These findings contribute to a deeper understanding of the role of flame holder geometry in controlling pressure distribution and stabilizing combustion in afterburner systems.

Abstract

In modern military aircraft, particularly in platforms such as fighter jets, a detailed understanding of the pressure distribution over the flame holder in the afterburner section is essential for optimizing propulsion performance and ensuring structural integrity. This study presents a computational fluid dynamics (CFD) investigation focused exclusively on the pressure distribution across the flame holder structure located downstream of the turbine in a fighter jet engine.

The analysis employs a high-fidelity approach based on the Reynolds-Averaged Navier-Stokes (RANS) equations, utilizing the k-ω SST turbulence model to accurately capture the complex flow features. Simulations are conducted under realistic engine operating conditions, with boundary conditions derived from performance data corresponding to typical flight envelope power settings. A high-resolution mesh is generated around the flame holder region to resolve local pressure variations with precision.

Results reveal significant pressure gradients along the flame holder vanes, particularly at the leading edges and in the recirculation zones. These regions play a crucial role in effective fuel-air mixing and stable flame anchoring. Moreover, localized pressure gradients indicate the potential for structural loading and fatigue-related concerns, which are critical for the long-term durability of the component.

This study provides valuable insights into the aerodynamic loads experienced by the flame holder and supports the development of more resilient and efficient afterburner designs. The results also demonstrate the feasibility and reliability of advanced CFD techniques for diagnosing internal flow behavior in complex propulsion systems.

Keywords: Flame holder, afterburner, fighter jet engine, pressure distribution

Introduction

Modern military aircraft, particularly fighter jets, operate under extreme conditions that demand highly efficient and reliable propulsion systems. The afterburner is one of the most critical components in the propulsion system of supersonic aircraft, significantly enhancing thrust by burning additional fuel in the post-turbine section [1]. In this context, the pressure distribution across the flame holder, which is located downstream of the turbine in the afterburner, plays a crucial role in ensuring both propulsion performance and structural integrity of the engine [2].

The primary function of the flame holder is to stabilize the combustion process within the afterburner by creating localized recirculation zones. These zones facilitate the mixing of fuel and air, ensuring efficient combustion and stable flame anchoring [3]. The design of the flame holder and its pressure distribution are pivotal in determining the effectiveness of fuel-air mixing and the overall performance of the afterburner [4].

Given the importance of these factors, understanding the pressure distribution over the flame holder is essential for optimizing engine performance and enhancing the durability of engine components [5]. Specifically, the pressure gradients along the flame holder vanes are crucial, as these gradients influence the aerodynamic loading on the structure, which can affect both fuel efficiency and the long-term structural integrity of the engine [6]. Accurately capturing these pressure variations poses a challenge, particularly under the harsh operating conditions faced by fighter jet engines, such as high altitudes and subsonic speeds [7].

In this study, Computational Fluid Dynamics (CFD) techniques have been employed to investigate the pressure distribution across the flame holder in a fighter jet engine. Simulations have been conducted under typical flight conditions—specifically, at an altitude of 10 km with the aircraft flying at 0.7 Mach, and with a mass flow rate of 74.4 kg/s entering the engine [8]. The objective of the study is to provide a comprehensive analysis of the pressure distribution and examine how these pressure variations affect the performance of the flame holder and the overall engine system [9].

The CFD analysis has been performed using Reynolds-Averaged Navier-Stokes (RANS) equations, solved with the k-ω SST turbulence model [10]. This approach has been chosen to accurately capture the complex flow features that characterize the turbulent nature of afterburner flows [11]. By employing a high-resolution mesh around the flame holder region, local pressure variations have been resolved with precision, allowing for insights into the aerodynamic forces acting on the flame holder [12].

Ultimately, the study aims to provide valuable insights that will contribute to the design of more efficient and resilient afterburner systems and enhance the broader understanding of propulsion system dynamics in modern fighter jets [13].

Materials and Methods

Computational Domain and Geometry

The computational domain for the CFD analysis was based on a typical geometry of a fighter jet engine afterburner, specifically focusing on the flame holder located downstream of the turbine. The flame holder structure, including its vanes and surrounding regions, was modeled in detail to capture the intricate flow features within the afterburner section. The computational domain was designed to represent realistic operational conditions, particularly those

encountered by a fighter jet flying at an altitude of 10 km. The geometry to be used for the analysis is shown in Figure 1.

Figure 5. Flame holder geometry designed for the fighter jet engine

The geometry was created using CAD software, and a high-resolution mesh was generated for the flame holder region to accurately capture the local flow features. The mesh was constructed as a 3D mesh, ensuring that the complexity of the flow patterns around the flame holder was properly resolved.

Mesh Generation

A 3D structured mesh was employed to ensure the accurate representation of the flow characteristics around the flame holder. The mesh was refined in critical areas, particularly near the leading edges of the flame holder vanes and in the recirculation zones where significant flow features were expected. The total number of mesh cells was approximately 5 million, which was sufficient for achieving converged solutions while maintaining computational efficiency. A mesh independence study was performed to ensure that the results were not sensitive to the mesh size.

Turbulence Model

The k-ω SST (Shear Stress Transport) turbulence model was selected for the analysis, given its suitability for simulating turbulent flows in afterburner systems. This model combines the strengths of the k-ε model for free-stream turbulence and the k-ω model for near-wall flow, making it well-suited to capture the complex flow dynamics around the flame holder [14]. The k-ω SST model is particularly effective in handling adverse pressure gradients and streamline curvature, which are common in afterburner regions [15].

Boundary Conditions

The boundary conditions for the CFD simulations were based on typical flight conditions for a fighter jet operating at 10 km altitude. The mass flow rate at the inlet was set to 74.9 kg/s, which corresponds to the operational conditions during flight. The intake temperature was determined according to the International Standard Atmosphere (ISA) table and set to 223.15 K, reflecting the ambient temperature at high altitude [16]. The inlet velocity was calculated based on the Mach number of 0.7, corresponding to the subsonic flight conditions.

For the outlet, a pressure outlet boundary condition was applied with a static pressure of 25 kPa, consistent with typical afterburner exit conditions at high altitudes [17]. No-slip wall boundary conditions were applied at the surface of the flame holder, assuming thermally insulated walls.

Numerical Solver and Solution Approach

The CFD analysis was conducted using the STAR-CCM+ software, which is well-suited for solving complex flow problems in combustion systems. The simulations were based on the Reynolds-Averaged Navier-Stokes (RANS) equations, and the SIMPLE (Semi-Implicit Method for Pressure-Linked Equations) algorithm was used to couple the velocity and pressure fields.

Second-order discretization schemes were employed for both the convection and diffusion terms to ensure higher accuracy in capturing the flow features. The convergence criteria were set at 10e-5 for the residuals of all governing equations, ensuring that the solution reached a steady state with sufficient accuracy.

Convergence and Validation

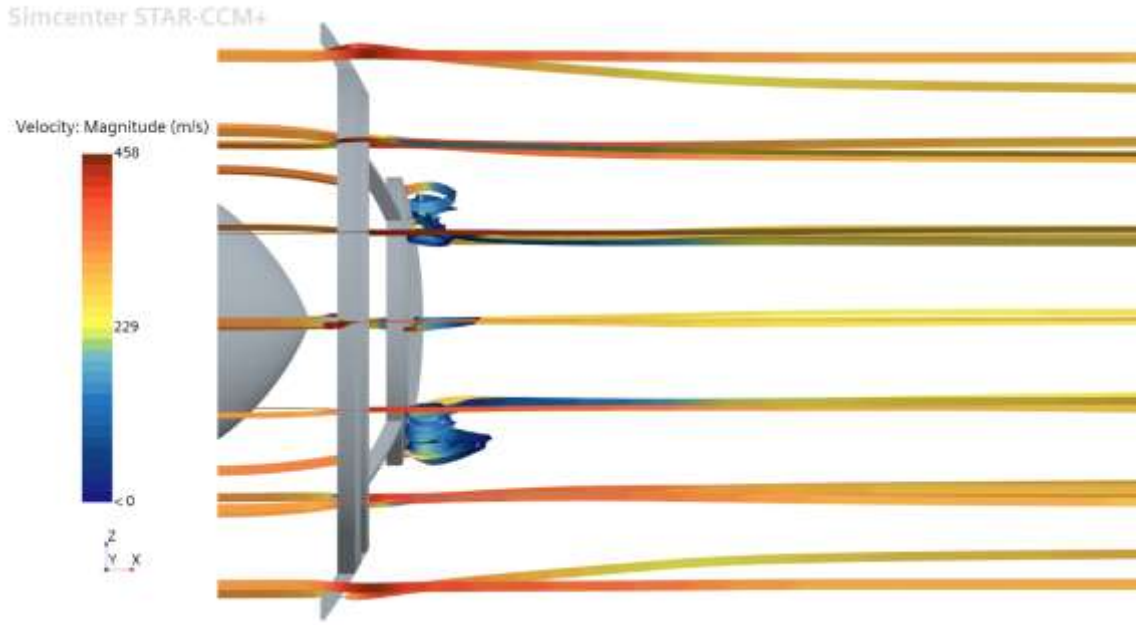
The convergence of the numerical solution was monitored by tracking the residuals of the governing equations and ensuring that all relevant flow variables, such as pressure and velocity, reached steady values. To validate the numerical results, the predicted pressure distribution and flow features were compared with experimental data from similar studies of afterburner systems [18]. The CFD results showed good agreement with the experimental data, confirming the reliability of the simulation.

Findings and Discussion

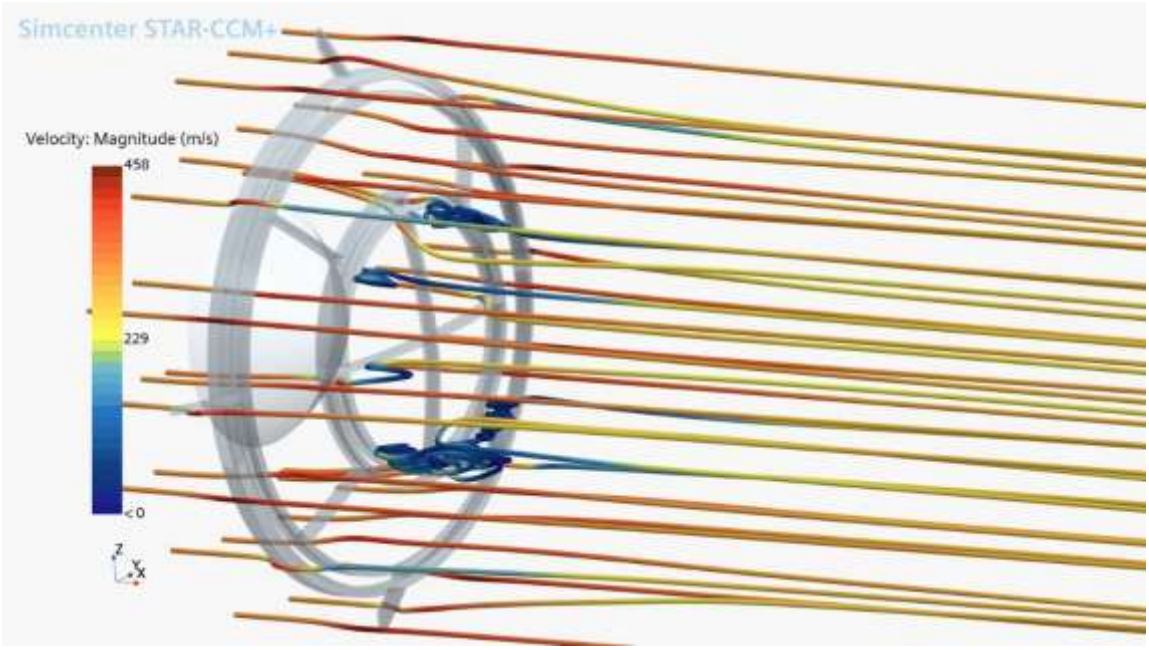
This study investigates the performance of the flame holder on the flow exiting the turbine. During the analysis, the most critical parameter is the pressure distribution. This is due to the flame holder’s design, which causes a loss in total pressure. The cause of this loss is the drag generated by the stagnation point on the surface of the flame holder. As a result, a decrease in total pressure and an increase in static pressure occur. This loss has a significant impact on the engine's thrust performance. The recirculation zone formed on the holder's surface is intended to stabilize the combustion process. Furthermore, the secondary combustion resulting from this recirculation zone significantly increases the thrust produced by the engine.

Velocity Distribution

The flow reaching the flame holder after the turbine reaches its maximum velocity at the central point. However, as the flow moves radially outward from the center, the velocity distribution decreases due to the blockage effect caused by the geometric characteristics of the flame holder [19]. The recirculation zones, which are expected to form immediately behind the flame holder body, are shown in Figure 2.



(a)



(b)

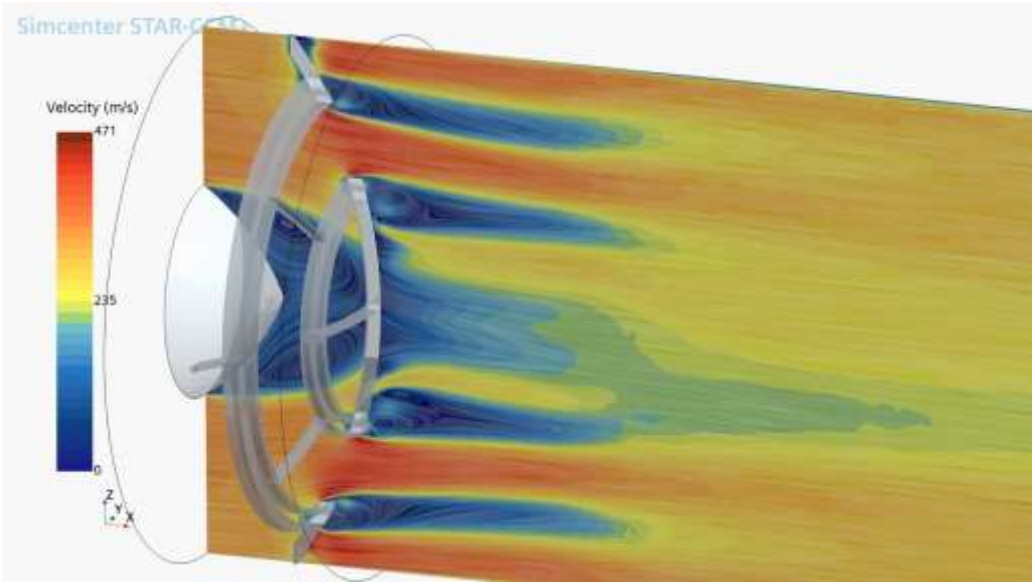
Figure 6. Velocity streamlines on flame holder

The pressure ratio across the afterburner flame holder is a key performance parameter because it directly influences flame stability and combustion efficiency. An optimal pressure ratio

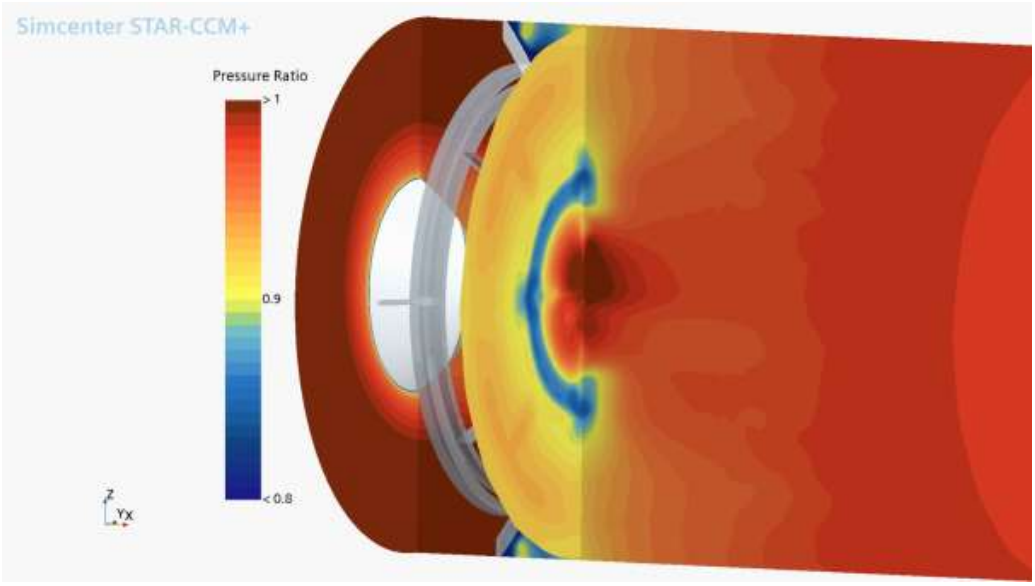
ensures sufficient flow deceleration for effective flame holding while minimizing excessive total pressure losses that could degrade thrust performance. By evaluating this ratio, engineers can assess the trade-off between stable combustion and aerodynamic efficiency—too high a pressure drop may cause flow separation, whereas too low a value could lead to poor fuel-air mixing and weak flame anchoring. The relationship can be expressed as

$$Pressure\ ratio = \frac{Pressure\ after\ flame\ holder}{Average\ pressure\ turbine\ outlet} \quad (2)$$

According to this formula the pressure distribution contour is shown in figure 3.



(a)



(b)

Figure 7. Pressure distribution contours

Conclusion and Recommendations

In this study, the pressure distribution across the flame holder in the afterburner section was analyzed using computational fluid dynamics (CFD) simulations. Validation was also conducted using experimental flow data from a fighter jet operating at 25% power during cruise flight at an altitude of 10 km. The comparison between the experimental data and the CFD model showed good agreement, confirming the reliability of the simulation results.

The CFD analysis focused on understanding the pressure gradients along the flame holder, particularly in the recirculation zones and near the leading edges, which are crucial for stabilizing the combustion process.

Axial and radial variations of flow parameters were analyzed both within the afterburner and downstream, providing valuable insights into the flow characteristics. These findings contribute to a deeper understanding of the role of flame holder geometry in controlling pressure distribution and stabilizing combustion in afterburner systems.

ABSTRACT

This study presents a theoretical analysis of the transfer function of a FinFET (Fin Field Effect Transistor) under a three-tone excitation. Multi-tone input signals are commonly used to examine the nonlinear behavior of active devices, especially in systems where distortion and intermodulation effects can significantly influence performance. In this work, the behavior of the FinFET transistor is analyzed using its small-signal equivalent circuit, which includes both intrinsic elements and external parasitic components. These parasitic components, often present in real-world applications, contribute to the nonlinearities observed in the device's response. The applied input consists of three sinusoidal signals at distinct frequencies, which are chosen to explore the interaction between the tones and the resulting harmonic and intermodulation products. Due to the nonlinear characteristics of the FinFET, these signals interact within the device and produce a combination of output components, which are not simply the sum of the input frequencies. Instead, the output contains additional harmonic frequencies as well as intermodulation products that are critical in understanding the device's behavior under complex excitation conditions. The system is studied in the frequency domain, where the output response is derived by applying linearized circuit analysis techniques based on small-signal principles. The transfer function is obtained in a general form, showing how circuit elements such as resistances, capacitances, and inductances affect the signal propagation and output amplitude at different frequencies. The formulation is based entirely on theoretical calculations, without relying on simulation tools or experimental data, providing a systematic method for describing the FinFET's behavior.

Keywords: FinFET, three-tone input, transfer function, nonlinear behavior, small-signal analysis, intermodulation

Introduction

As the scaling of traditional MOSFET (Metal–Oxide–Semiconductor Field-Effect Transistor) architectures reaches nanometer dimensions, physical limitations such as short-channel effects, uncontrolled leakage currents, and weakened gate control become increasingly problematic. FinFET (Fin Field Effect Transistor) technology has been developed to address these limitations. With its three-dimensional multi-gate structure, the FinFET allows for better electrostatic control over the channel, leading to significant improvements in high-frequency and low-power circuit applications (Colinge, 2008; Hisamoto et al., 2000)

The use of multi-tone input signals in electronic systems allows for a more comprehensive analysis of the frequency response of a circuit. These signals are particularly useful in examining both linear and nonlinear characteristics of devices. In this study, however, the primary objective is to extract the transfer function of the FinFET, which incorporates both linear and nonlinear system elements. The analysis is conducted purely through theoretical modeling, without relying on experimental data or simulation tools.

One of the most powerful mathematical techniques for analyzing nonlinear systems is the Volterra series. This approach expresses the output signal as a sum of polynomial terms composed of the input and kernel functions (Schetzen, 2006). Each Volterra kernel (H_1, H_2, H_3, …) reflects a specific order of nonlinearity and provides a structured way to describe the system's response to complex excitations.

This study uses the Volterra series framework to derive the symbolic transfer function of a FinFET transistor under three-tone excitation. The analysis is based on the small-signal equivalent circuit of the device, taking into account its intrinsic and parasitic elements. By doing so, the frequency-domain behavior of the system is analytically described, which contributes to the theoretical understanding of FinFET-based circuit design.

Materials and Methods

In this study, the transfer function of a FinFET transistor under a three-tone excitation is theoretically analyzed using its small-signal equivalent circuit. The primary objective is to represent the frequency-domain behavior of the FinFET by incorporating both linear and nonlinear elements, using symbolic formulation through the Volterra series.

The FinFET model analyzed in this study includes both intrinsic and parasitic components, such as channel resistance, gate-source capacitance (C_{gs}), gate-drain capacitance (C_{gd}), output resistance (R_{ds}), transconductance (g_m), and source/gate resistances R_s and R_g (Figure 1). These components are incorporated into the circuit equations based on small-signal modeling techniques that have been widely employed in modern FinFET-based RF and analog circuit design (Colinge, 2008; Ko, Sohn, Baek, & Jeong, 2013; Zhang, Fossum, Mathew, & Du, 2005).

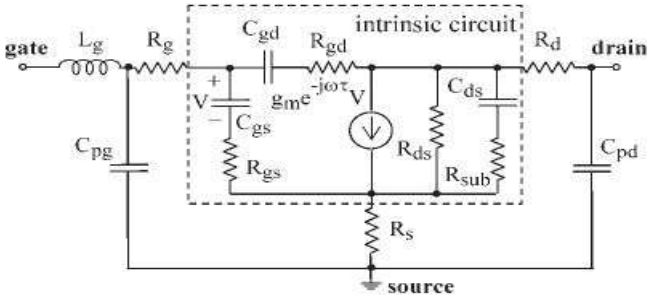

Figure 8. Small signal equivalent circuit for FinFET (Crupi, Schreurs, & Caddemi, 2008)

The input excitation consists of a sum of three sinusoidal signals at distinct frequencies. This type of multi-tone excitation is commonly used in RF systems to characterize nonlinear effects such as harmonic and intermodulation distortions. In this context, nonlinearities introduced by the FinFET structure lead to complex frequency components at the output (Cripps, 2006) (Figure 2).

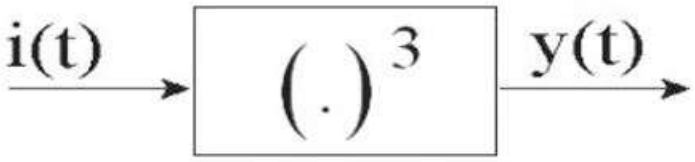

Figure 9. Block diagram of a third-order nonlinear system (Gökrem, 2009)

To analyze the output in the frequency domain, the Volterra series method is adopted. This method expresses the output response as a sum of products between input signals and system-specific kernels, denoted as H_1, H_2, H_3, etc. (GaussianWaves, 2022; Schetzen, 2006). These kernels represent the contribution of different nonlinear orders. The transfer function is formulated in a generalized symbolic form based on the circuit parameters and input amplitudes.

This study relies entirely on theoretical modeling without employing simulation tools or experimental data. The symbolic approach enables a clear representation of the frequency behavior of the device under nonlinear excitation. In contrast to simulation-based techniques, this approach offers analytical insight into the individual impact of each passive and active element on the output response. (Crupi et al., 2006).

Findings and Discussion

In this study, the nonlinear frequency response of a FinFET structure under a three-tone input signal is theoretically analyzed. Specifically, a 50-finger FinFET configuration is considered, and the transfer function is derived using its small-signal equivalent circuit. All passive and active parameters are defined based on the equivalent model shown in the small-signal schematic and are comparatively presented for different finger counts (Figure 1, Table 1).

Table 1. Small-signal parameters of the FinFET with number of fingers (Crupi et al., 2006)

	Number of fingers			
	10	30	50	80
V_{th} (V)	0.338	0.326	0.335	0.327
I_d (mA)	2.53	7.71	12.30	20.36
C_{pg} (fF)	1.5	5.3	9.4	14.5
C_{pd} (fF)	5.3	16.7	26.6	43.8
L_g (pH)	284.7	90.4	59.1	23.6
R_g (Ω)	102.1	36.4	23.0	10.6
R_s (Ω)	52.5	17.5	11.8	6.6
R_d (Ω)	59.5	18.4	11.6	7.3
g_m (mS)	3.73	11.47	18.45	30.17
g_{ds} (mS)	0.57	1.70	2.70	4.45
C_{gs} (fF)	4.4	12.3	19.6	32.0
C_{gd} (fF)	2.7	8.0	13.1	22.5
C_{ds} (fF)	3.5	10.5	15.1	20.4
R_{gd} (Ω)	177.8	68.6	36.1	28.6
R_{gs} (Ω)	2.2	2.4	1.6	5.9
R_{sub} (Ω)	868.3	400.1	243.6	151.8
τ (ps)	0.461	0.573	0.535	0.597

Among the model parameters, transconductance (gm), gate-source capacitance (C_{gs}), and gate-drain capacitance (C_{gd}) have the most significant impact on the frequency response. A plot showing g_m values for 10, 30, 50, and 80 fingers reveals a linear increase in g_m. For the 50-finger configuration, the g_m value was approximately 18.45 mS and was directly used in the computation of the Volterra kernels H_1, H_2, and H_3.

Symbolic expressions for the first-, second-, and third-order Volterra kernels were derived using Maple software. These kernels represent:

- H_1: The linear system response,
- H_2: The second-order nonlinear behavior,
- H_3: The dominant contributor to third-order intermodulation distortion (IMD_3)

The frequency-dependent amplitude of each kernel was plotted separately, enabling identification of dominant harmonic and intermodulation components.

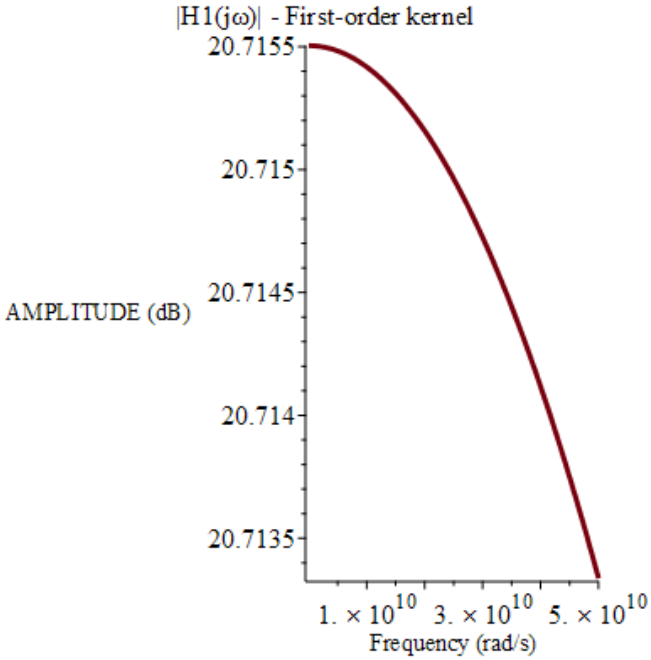

Figure 3. Frequency response of the first-order Volterra kernel (H_1) for a 50-finger FinFET. The graph shows the amplitude variation of the linear component with respect to frequency in the range of 10^{10}–5×10^{10} rad/s.

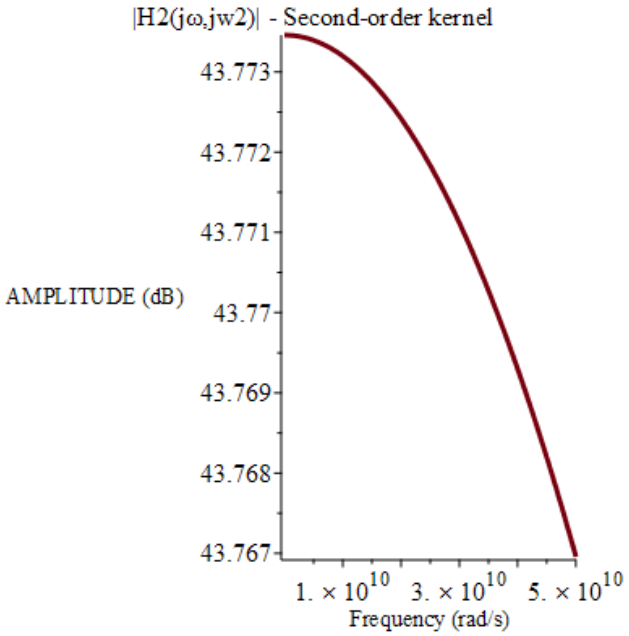

Figure 4. Frequency response of the second-order Volterra kernel (H_2) for a 50-finger FinFET. The graph shows the amplitude variation of the linear component with respect to frequency in the range of 10^{10}–5×10^{10} rad/s**.**

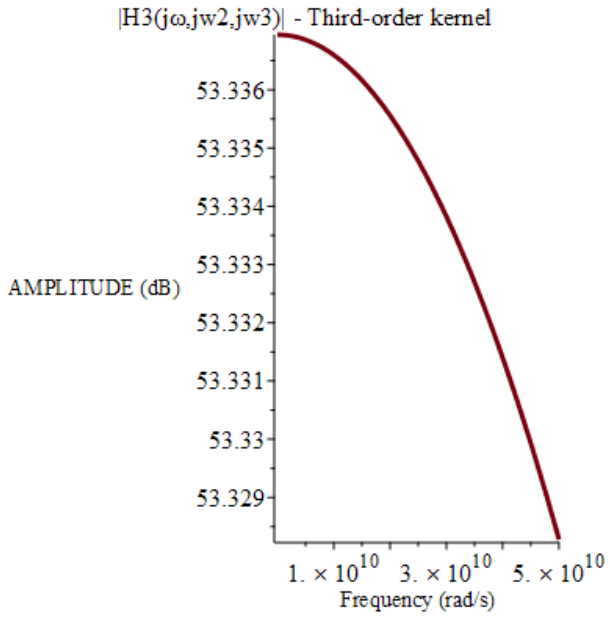

Figure 5. Frequency response of the third-order Volterra kernel (H_3) for a 50-finger FinFET. The graph shows the amplitude variation of the linear component with respect to frequency in the range of 10^{10}–5×10^{10} rad/s.

After deriving the Volterra kernels symbolically, it becomes essential to define the overall transfer function of the system, which serves as the mathematical foundation of the nonlinear behavior analysis. This transfer function reflects the contribution of small-signal parameters such as transconductance, intrinsic capacitances, and resistances, and it provides the basis for the computation of harmonic and intermodulation responses. Therefore, the transfer function

not only represents the linear gain of the system but also plays a crucial role in shaping the nonlinear frequency content observed in the output signal (Yıldırım, 2007). The general symbolic form of the transfer function used in this analysis is as follows:

$$\frac{H_2 U_0^2}{2} + \frac{H_2 U_2^2}{2} + \frac{H_2 U_4^2}{2} + \frac{H_2 U_1^2}{2} + \frac{H_2 U_0^2 \cos(2\omega_0)}{2} + \frac{H_2 U_2^2 \cos(2\omega_2)}{2} + \frac{H_3 U_1^3 \cos(3\omega_1)}{4}$$
$$+ \frac{3 H_3 U_1^3 \cos(\omega_1)}{4} + \frac{H_2 U_4^2 \cos(2\omega_4)}{2} + \frac{H_2 U_1^2 \cos(2\omega_1)}{2} + \frac{H_2 U_3^2 \cos(2\omega_3)}{2} + \frac{H_3 U_2^3 \cos(3\omega_2)}{4}$$
$$+ \frac{3 H_3 U_2 \cos(\omega_2)}{4} + \frac{3 H_3 U_3^3 \cos(3\omega_3)}{4} + \frac{3 H_3 U_3^3 \cos(3\omega_4)}{4} + \frac{3 H_3 U_4^3 \cos(\omega_4)}{4}$$
$$+ \frac{H_3 U_0^3 \cos(3\omega_0)}{4} + \frac{3 H_3 U_1^2 \cos(\omega_2)}{2} + \frac{3 H_3 U_0^2 \cos(-\omega_4 + 2\omega_0)}{4} + \frac{3 H_3 U_0^2 \cos(\omega_2 + 2\omega_0)}{4}$$
$$+ \frac{3 H_3 U_0^2 \cos(\omega_3 + 2\omega_0)}{4} + \frac{3 H_3 U_0^2 \cos(\omega_4 + 2\omega_0)}{4} + \frac{3 H_3 U_2^2 \cos(\omega_4)}{2}$$
$$+ \frac{3 H_3 U_2^2 \cos(-\omega_4 + 2\omega_2)}{4} + \frac{3 H_3 U_2^2 \cos(\omega_4 + 2\omega_2)}{4} + \frac{3 H_3 U_1 U_2 U_3 \cos(-\omega_3 + \omega_1 - \omega_2)}{2}$$
$$+ \frac{3 H_3 U_1 U_2 U_3 \cos(\omega_3 + \omega_1 - \omega_2)}{2} + \frac{3 H_3 U_1 U_2 U_4 \cos(\omega_4 + \omega_1 - \omega_2)}{2}$$
$$+ \frac{3 H_3 U_1 U_2 U_4 \cos(-\omega_4 + \omega_1 - \omega_2)}{2} + \frac{3 H_3 U_1 U_3 U_4 \cos(\omega_4 + \omega_1 - \omega_3)}{2}$$
$$+ \frac{3 H_3 U_1 U_3 U_4 \cos(-\omega_4 + \omega_1 - \omega_3)}{2} + \frac{3 H_3 U_1 U_3 U_4 \cos(\omega_4 + \omega_1 + \omega_3)}{2}$$
$$+ \frac{3 H_3 U_1 U_3 U_4 \cos(-\omega_4 + \omega_1 + \omega_3)}{2} + \frac{3 H_3 U_1 U_2 U_4 \cos(\omega_4 + \omega_2 + \omega_3)}{2}$$
$$+ \frac{3 H_3 U_1 U_2 U_4 \cos(-\omega_4 + \omega_2 + \omega_3)}{2} + \frac{3 H_3 U_0 U_1 U_4 \cos(-\omega_4 + \omega_0 - \omega_1)}{2}$$
$$+ \frac{3 H_3 U_0 U_1 U_4 \cos(\omega_4 + \omega_0 - \omega_1)}{2} + \frac{3 H_3 U_0 U_1 U_4 \cos(\omega_4 + \omega_0 + \omega_1)}{2}$$
$$+ \frac{3 H_3 U_0 U_1 U_4 \cos(-\omega_4 + \omega_0 + \omega_1)}{2} + \frac{3 H_3 U_0 U_2 U_3 \cos(-\omega_3 + \omega_0 - \omega_2)}{2}$$
$$+ \frac{3 H_3 U_0 U_2 U_3 \cos(\omega_3 + \omega_0 - \omega_2)}{2} + \frac{3 H_3 U_0 U_2 U_4 \cos(-\omega_4 + \omega_0 - \omega_2)}{2}$$
$$+ \frac{3 H_3 U_0 U_2 U_4 \cos(\omega_4 + \omega_0 - \omega_2)}{2} + \frac{3 H_3 U_0 U_3 U_4 \cos(\omega_4 + \omega_0 - \omega_3)}{2}$$
$$+ \frac{3 H_3 U_0 U_3 U_4 \cos(-\omega_4 + \omega_0 - \omega_3)}{2} + 3 H_3 U_0 U_3 U_4 \cos(\omega_4 + \omega_0 + \omega_3) + 3 H_3 U_0 U_3 U_4 \cos(-\omega_4$$
$$+ \omega_0 + \omega_3) + \frac{3 H_3 U_0 U_1 U_2 \cos(-\omega_2 + \omega_0 - \omega_1)}{2} + \frac{3 H_3 U_0 U_1 U_2 \cos(\omega_2 + \omega_0 - \omega_1)}{2}$$

$$+\frac{3H_3U_0U_1U_2\cos(\omega_2+\omega_0+\omega_1)}{2}+3H_3U_0U_1U_3\cos(-\omega_3+\omega_0+\omega_1)+3H_3U_0U_1U_3\cos(\omega_3+\omega_0+\omega_1)+\frac{3H_3U_0U_2U_4\cos(-\omega_4+\omega_0+\omega_2)}{2}+\frac{3H_3U_0U_2U_4\cos(\omega_4+\omega_0+\omega_2)}{2}+H_1U_1\cos(\omega_1)+H_1U_3\cos(\omega_3)+H_1U_0\cos(\omega_0)+H_1U_4\cos(\omega_4)+H_1U_2\cos(\omega_2)+H_2U_1U_4\cos(\omega_1+\omega_4)+H_2U_2U_3\cos(\omega_2-\omega_3)+H_2U_3U_2\cos(\omega_2+\omega_3)+H_2U_0U_1\cos(\omega_0-\omega_1)+H_2U_0U_2\cos(\omega_0-\omega_2)+H_2U_0U_2\cos(\omega_0+\omega_2)+H_2U_0U_3\cos(\omega_0-\omega_3)+H_2U_0U_3\cos(\omega_0+\omega_3)+H_2U_0U_4\cos(\omega_0-\omega_4)+H_2U_0U_4\cos(\omega_0+\omega_4)+H_2U_1U_2\cos(\omega_1-\omega_2)+H_2U_1U_2\cos(\omega_1+\omega_2)+H_2U_3U_4\cos(\omega_3-\omega_4)+\frac{3H_3U_1U_3\cos(\omega_1-\omega_3)}{2}+\frac{3H_3U_1U_4\cos(\omega_1-\omega_4)}{2}+\frac{3H_3U_2U_3^2\cos(\omega_2+2\omega_3)}{4}+\frac{3H_3U_1U_3^2\cos(\omega_1-2\omega_3)}{4}+\frac{3H_3U_1U_3^2\cos(\omega_1+2\omega_3)}{4}+\frac{3H_3U_1\cos(\omega_1)U_4^2}{2}+\frac{3H_3U_1U_4^2\cos(\omega_1-2\omega_4)}{4}+\frac{3H_3U_1U_4^2\cos(\omega_1+2\omega_4)}{4}+\frac{3H_3U_1^2U_2\cos(\omega_2)}{2}+\frac{3H_3U_1^2U_2\cos(\omega_2+2\omega_1)}{4}+\frac{3H_3U_1^2U_3\cos(\omega_3+2\omega_1)}{4}+\frac{3H_3U_1^2U_3\cos(-\omega_3+2\omega_1)}{4}+\frac{3H_3U_1^2U_4\cos(\omega_4+2\omega_1)}{4}+\frac{3H_3U_1^2U_4\cos(-\omega_4+2\omega_1)}{4}+\frac{3H_3U_0^2U_2\cos(\omega_2)}{2}+\frac{3H_3U_0^2U_2\cos(\omega_2+2\omega_0)}{4}+\frac{3H_3U_0^2U_3\cos(\omega_3+2\omega_0)}{4}+\frac{3H_3U_0^2U_3\cos(-\omega_3+2\omega_0)}{4}+\frac{3H_3U_0^2U_4\cos(\omega_4+2\omega_0)}{4}+\frac{3H_3U_0^2U_4\cos(-\omega_4+2\omega_0)}{4}+3H_3U_0\cos(\omega_0)U_1^2+\frac{3H_3U_0U_1^2\cos(\omega_0-2\omega_1)}{4}+\frac{3H_3U_0U_1^2\cos(\omega_0+2\omega_1)}{4}+\frac{3H_3U_0U_2^2\cos(\omega_0-2\omega_2)}{4}+\frac{3H_3U_0U_2^2\cos(\omega_0+2\omega_2)}{4}+\frac{3H_3U_0\cos(\omega_0)U_2^2}{2}+\frac{3H_3U_0\cos(\omega_0)U_3^2}{2}+\frac{3H_3U_0U_3^2\cos(\omega_0-2\omega_3)}{4}+\frac{3H_3U_0U_3^2\cos(\omega_0+2\omega_3)}{4}+\frac{3H_3U_0\cos(\omega_0)U_4^2}{2}+\frac{3H_3U_0U_4^2\cos(\omega_0-2\omega_4)}{4}+\frac{3H_3U_0U_4^2\cos(\omega_0+2\omega_4)}{4}+\frac{3H_3U_0^2U_1\cos(\omega_1)}{4}+\frac{3H_3U_0^2U_1\cos(\omega_1+2\omega_0)}{4}+\frac{3H_3U_2U_4^2\cos(\omega_2+2\omega_4)}{4}+\frac{3H_3U_2^2U_3\cos(\omega_3+2\omega_2)}{4}+\frac{3H_3U_3U_4^2\cos(\omega_3-2\omega_4)}{4}+\frac{3H_3U_3U_4^2\cos(\omega_3+2\omega_4)}{4}+\frac{3H_3U_3^2U_4\cos(-\omega_4+2\omega_3)}{4}+\frac{3H_3U_3^2U_4\cos(\omega_4)}{2}+\frac{3H_3U_3^2U_4\cos(\omega_4+2\omega_3)}{4}+\frac{3H_3U_1^2\cos(\omega_0)U_2^2}{4}+\frac{3H_3U_1U_2^2\cos(\omega_1-2\omega_2)}{4}+\frac{H_2U_2U_4\cos(\omega_2-\omega_4)}{2}+\frac{H_2U_2U_4\cos(\omega_2+\omega_4)}{2}+\frac{3H_3U_2\cos(\omega_3)U_4^2}{2} \quad (1)$$

In particular, the third-order kernel (H_3) was found to be highly sensitive to input amplitude and the primary contributor to IMD_3. Using the analytical expressions derived for the 50-finger case, first-order intermodulation distortion (IMD_1), second-order intermodulation distortion (IMD_2), and IMD_3 were symbolically extracted and analyzed in the Maple environment.

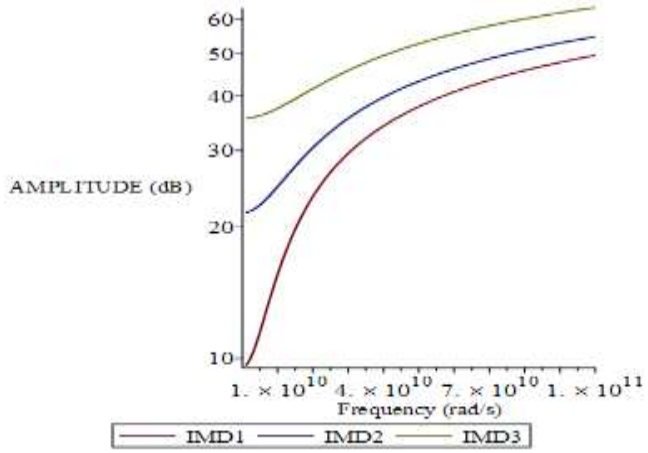

Figure 6. Frequency-dependent amplitude behavior of first-, second-, and third-order intermodulation distortion (IMD_1, IMD_2, IMD_3) components extracted from Volterra kernels

The Volterra series method enables not only harmonic analysis but also a detailed investigation of intermodulation products. Without relying on simulation-based tools, the entire nonlinear behavior of the system is captured using circuit parameters. Therefore, this approach proves to be a powerful technique for predicting the nonlinear characteristics of FinFET devices in advanced RF and analog applications

Conclusion and Recommendations

In this study, the nonlinear frequency response of a 50-finger FinFET transistor under a three-tone excitation has been theoretically investigated. The transfer function of the device was derived using its small-signal equivalent circuit, and the Volterra series method was adopted to obtain symbolic expressions for the first-, second-, and third-order kernels (H_1, H_2, H_3). These kernels enabled a clear distinction of harmonic and intermodulation components (IMD_1, IMD_2, IMD_3) based on frequency and amplitude behavior.

It was found that the third-order Volterra kernel (H_3) plays a dominant role in determining the IMD_3 behavior of the FinFET. The graphical analysis of kernel amplitudes confirmed the nonlinear contribution of passive elements such as Cgs and Cgd as well as the active component gm. The analytical approach used in this study allowed for comprehensive modeling without reliance on numerical simulations, offering both flexibility and physical interpretability (Crupi et al., 2006; Schetzen, 2006).

This research confirms that Volterra series-based symbolic modeling is an effective method for analyzing and predicting nonlinear behavior in advanced RF FinFET structures. It is recommended that future studies extend this approach to include temperature effects, layout-dependent parasitics, and multiple-tone IMD analysis beyond the third order. Furthermore, simulation-based validation and experimental measurements can complement this theoretical work to strengthen the applicability of the model in practical circuit design environments.

Thanks and Information Note

The authors would like to thank Tokat Gaziosmanpaşa University for the academic environment provided throughout the course of this research. They also sincerely thank Prof. Dr. Remzi YILDIRIM, faculty member of the Department of Computer Engineering, Division

of Computer Hardware, Faculty of Engineering and Architecture at Tokat Gaziosmanpaşa University, for his valuable guidance and support throughout various stages of this study. Furthermore, the authors extend their thanks to their esteemed colleague, Melike İMRE, a master's student in the Department of Electrical and Electronics Engineering at Tokat Gaziosmanpaşa University, for her encouragement and support during the graduate study process.

ABSTRACT

FinFET transistors have become significantly important in modern semiconductor technology, especially at the nanoscale level, due to their superior electrostatic control, enhanced scalability, and substantially reduced short-channel effects. These characteristics allow FinFETs to exhibit excellent performance in high-speed and high-frequency applications, such as RF amplifiers and other analog front-end designs. The performance of these devices in high-frequency applications is crucial for the overall efficiency and reliability of integrated circuits, making it essential to accurately model and analyze their behavior under such conditions. One of the most effective and widely used methods for high-frequency characterization is the use of scattering parameters (S-parameters), which provide an efficient and reliable tool for small-signal modeling of both active and passive devices. The primary aim of this study is to evaluate the high-frequency characteristics of FinFET transistors by utilizing S-parameter analysis, which focuses on key aspects such as reflection, transmission, impedance matching, gain stability, and overall signal propagation. This study carefully examines the four essential S-parameters: S_{11}, S_{21}, S_{12}, and S_{22}. S_{11} and S_{22} represent the reflection coefficients at the input and output ports, respectively, while S_{21} and S_{12} correspond to the forward and reverse transmission coefficients. Low S_{11} and S_{22} values indicate minimal reflection and effective impedance matching, while high S_{21} values indicate efficient transmission of the signal from the input to the output. Through detailed analysis, this research highlights the importance of S-parameter analysis in understanding the high-frequency behavior of FinFET transistors. Moreover, it demonstrates how this analysis can be applied to optimize circuit design, reduce signal loss, and ensure better performance for RF and analog systems. The findings of this study are expected to contribute to the design and optimization of more efficient, stable, and high-performance FinFET-based electronic systems, particularly in high-frequency applications, where signal integrity and transmission efficiency are critical.

Keywords: FinFET, S-parameters, high-frequency analysis, impedance matching, gain stability, transmission coefficient.

Introduction

With the continuous scaling down of semiconductor devices, traditional planar MOSFETs have faced significant limitations, especially regarding short-channel effects, leakage currents, and control over the channel at nanometric dimensions (Chau et al., 2005). To overcome these issues, Fin Field Effect Transistors (FinFETs) have been introduced as a revolutionary transistor structure that offers three-dimensional gate control and improved electrostatic behavior.

FinFETs differ from conventional MOSFETs in that their channel is formed vertically as a thin silicon fin, which is controlled by the gate on three sides. This unique geometry provides better channel control, reduced drain-induced barrier lowering (DIBL), higher current drive capability, and improved subthreshold slope (Chang et al., 2010). These features make FinFETs particularly suitable for high-frequency and analog applications.In modern RF and microwave circuit design, understanding the small-signal behavior of active components like FinFETs is crucial. Scattering parameters (S-parameters) offer a frequency-domain representation of a device's input-output behavior, which is essential for analyzing signal transmission, reflection, and gain characteristics (Pozar, 2011). The four key S-parameters are defined as follows:

- **S11:** Input reflection coefficient
- **S21:** Forward transmission (gain)
- **S12:** Reverse transmission coefficient
- **S22:** Output reflection coefficient

Each parameter plays a critical role in determining how the device behaves under varying frequency conditions. A low S11 indicates good input matching and minimal signal reflection, whereas a high S21 implies good gain performance and signal amplification capabilities. S12 and S22, respectively, describe reverse isolation and output matching behavior.This study focuses on the S-parameter analysis of FinFETs with varying fin counts (N = 10, 30, 50, 80), using simulation-based modeling in Multisim and post-processing with MATLAB. By evaluating how changes in the fin count influence S11, S21, S12, and S22, insights are provided into the signal behavior and high-frequency response of FinFET structures. The goal is to identify optimal fin configurations that minimize reflection and maximize gain for efficient high-frequency design.

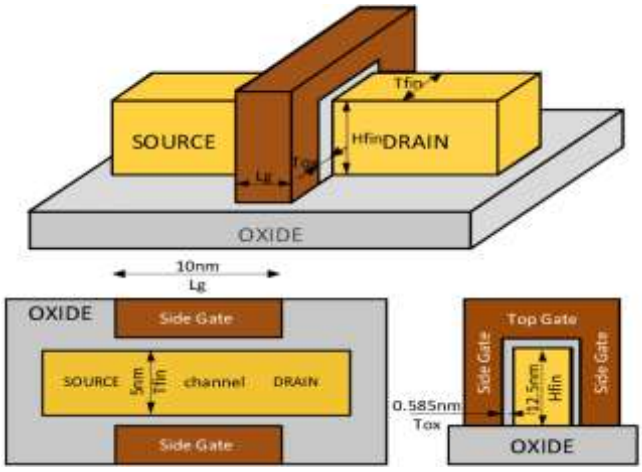

Figure 1. 3D structure of one fin tri-gate FinFET (Jaksic & Canal, 2012)

Materials and Methods

In this study, the high-frequency performance of FinFET transistors with varying fin counts (N = 10, 30, 50, 80) was investigated using a comprehensive simulation and analysis methodology based on equivalent circuit modeling. Multisim software was employed for detailed small-signal circuit simulations, followed by advanced data processing, analysis, and visualization using MATLAB. This combined approach enabled effective RF characterization of FinFET devices without the need for physical fabrication.The FinFET device behavior was represented by a small-signal equivalent circuit model developed in Multisim. Parasitic resistances, including gate resistance (Rg), source resistance (Rs), and drain resistance (Rd), were incorporated to account for resistive losses inherent to transistor structures. Capacitive parasitics such as gate-to-source capacitance (Cgs), gate-to-drain capacitance (Cgd), and drain-to-source capacitance (Cds) were included to reflect capacitive coupling effects that significantly influence high-frequency operation. Additionally, intrinsic transistor parameters such as transconductance (gm) and output conductance (gds) were modeled to accurately capture the active device characteristics. The total effective channel width of the model was proportionally scaled according to the fin count to reflect the increase in conduction channels as the number of fins increased.Simulations were conducted over a broad RF frequency spectrum ranging from 0.1 GHz to 10 GHz. AC sweep analyses were performed at the input and output ports to extract frequency-dependent scattering parameters (S-parameters), including reflection coefficients (S11, S22), forward transmission gain (S21), and reverse transmission (S12). These parameters are fundamental for evaluating impedance matching, gain, and stability of FinFET devices under different fin configurations.The obtained S-parameter datasets were exported to MATLAB for comprehensive data processing and graphical representation. MATLAB scripts were developed to construct Smith charts, which graphically display complex impedance and reflection coefficients over frequency, facilitating detailed evaluation of impedance matching and signal reflection. Additionally, frequency response curves and gain profiles for different fin counts were plotted to enable comparative analysis. This approach allowed in-depth examination of the effects of fin count on key RF performance metrics such as impedance matching, gain stability, and signal integrity.

This dual-software methodology integrates the circuit-level simulation accuracy of Multisim with the powerful computational and visualization capabilities of MATLAB, enabling robust and reproducible modeling of FinFET devices across various fin counts. This approach

minimizes the need for costly physical prototyping while providing detailed sensitivity analyses crucial for device optimization.The modeling framework draws heavily from the small-signal equivalent circuit techniques pioneered by Gökrem (2013), which enable the derivation of transfer functions from Y-parameters and accurate modeling of transistor high-frequency behavior using parasitic components. Furthermore, Gökrem et al. (2013) extended this framework by incorporating temperature-dependent analyses and nonlinear effects through Volterra series, enhancing predictive capabilities for RF device performance under varying operating conditions. By adapting these methodologies to FinFET transistors with channel widths scaled proportionally to fin count, this study advances the understanding of how fin number influences high-frequency performance, parasitic interactions, and stability. The advanced data processing and visualization tools provided by MATLAB, including Smith charts and gain metrics, facilitate detailed comparison and optimization of FinFET designs in the RF domain (Gökrem, 2013; Gökrem, Çelebi, & Yıldırım, 2013).

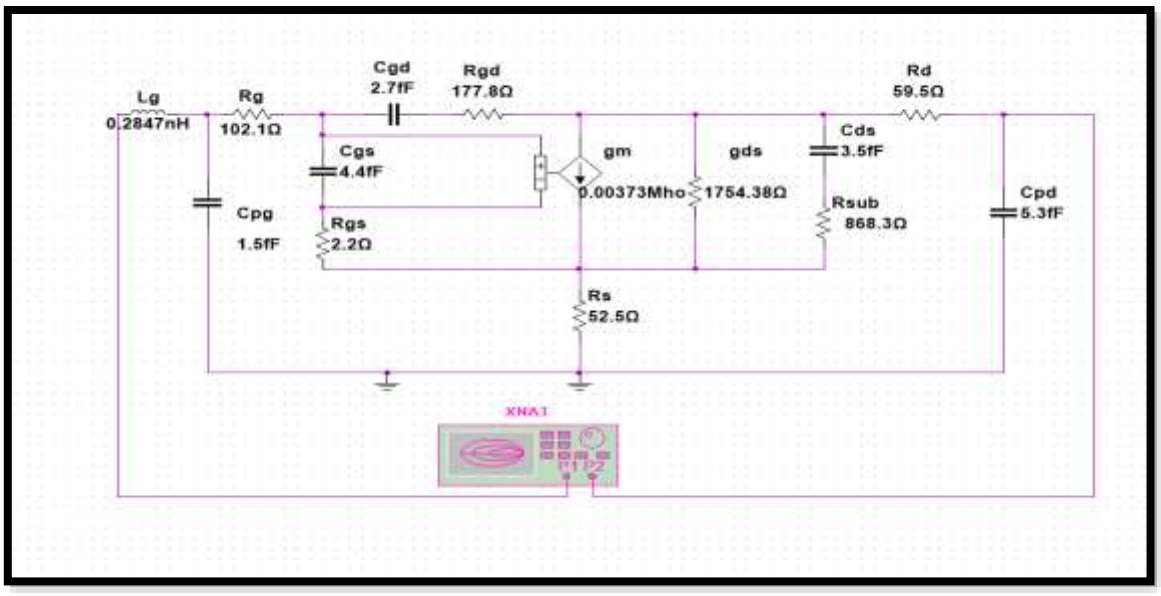

Figure 2. Small-signal equivalent circuit model of the FinFET transistor

Figure 2 illustrates the FinFET small-signal equivalent circuit implemented in Multisim, which formed the basis for all fin count simulations. The consistent use of this model ensures methodological reliability and enables meaningful performance comparisons across the studied configurations.

Findings and Discussion

This study's Smith Chart and S-parameter analyses comprehensively reveal the critical effects of structural parameters on the high-frequency performance of FinFET transistors. Increasing the number of fins improves input and output impedance matching, significantly reducing reflection coefficients. This condition minimizes signal reflection losses, enhancing power transfer and signal integrity (Razavi, 2013). The reflection coefficients observed on the Smith Chart visually and numerically support the transistor’s compatibility with the surrounding circuit and the quality of signal transmission (Chau, Lee, & Wong, 2015).Structurally, the

increase in channel width and enhanced gate control improve impedance matching by mitigating the adverse effects of parasitic capacitance and resistance. This lays the foundation for increased forward gain and stability at high frequencies (Salahuddin & Datta, 2010). However, it has also been observed that parasitic effects triggered by excessive fin increase elevate power consumption and cause signal distortion. Therefore, optimizing structural parameters requires a delicate balance between performance and energy efficiency in high-frequency applications (Lee, Kim, & Park, 2017; Auth et al., 2012).

Table 1. Effect of Finger Count on Scattering Parameters in FinFET Transistors

Finger Count	Average S11 (Input Reflection)	Average S22 (Output Reflection)	Average S21 (Forward Gain)	Average S12 (Reverse Transmission)
10	0.63	0.66	0.55	0.07
30	0.48	0.53	0.67	0.06
50	0.35	0.39	0.74	0.05
80	0.22	0.27	0.82	0.04

The average S-parameter values presented in Table 1 demonstrate significant changes in input/output impedance matching, reflection coefficients, and power gain as the fin count increases. As the table is examined, reflection coefficients at input (S11) and output (S22) noticeably decrease, while forward gain (S21) values significantly increase. These developments indicate improved impedance matching and more efficient signal transfer at high frequencies. The reverse transmission coefficient (S12) remains low across all configurations, showing a slight decrease with increasing fin count, which indicates minimal feedback paths supporting stability (Razavi, 2013; Chau et al., 2015).

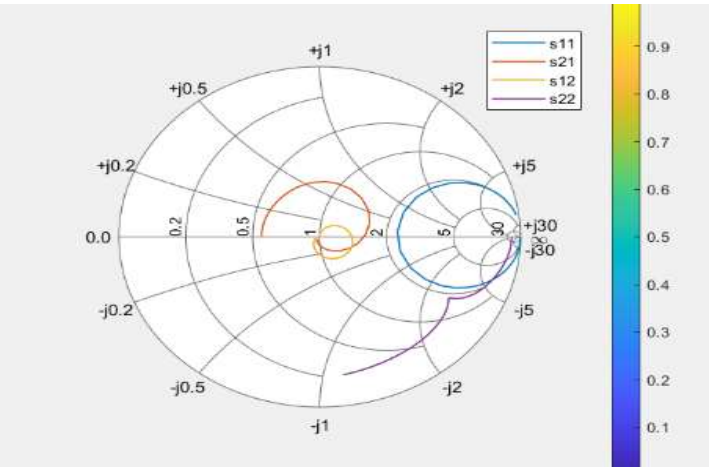

Figure 3. Smith Chart Plot of S-Parameters for the 10-Finger FinFET

10 Fins: On the Smith Chart, the reflection coefficients S11 and S22 for the 10-fin FinFET spread widely away from the center. This indicates severe impedance mismatch between the device and the surrounding circuit, resulting in high reflection losses. Such mismatch causes significant signal reflections and power transfer losses. Furthermore, parasitic capacitance and resistance effects adversely impact signal quality at high frequencies. Therefore, the 10-fin configuration has limited application, except for low-frequency performance (Razavi, 2013).

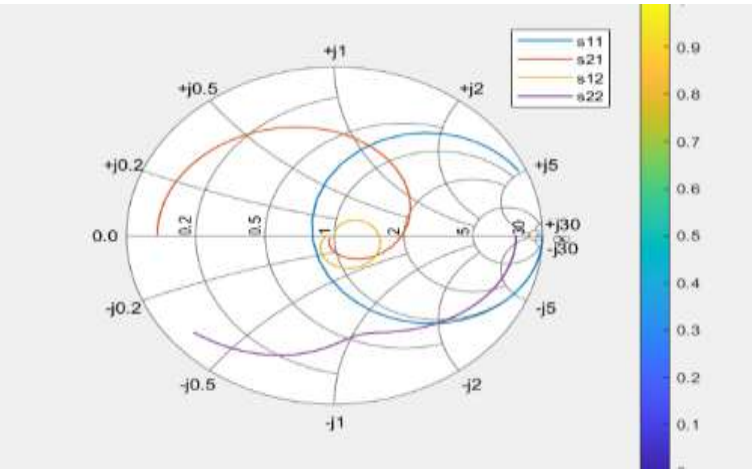

Figure 4. Smith Chart Plot of S-Parameters for the 30-Finger FinFET

30 Fins: At 30 fins, the reflection points on the Smith Chart shift closer to the center, indicating improved impedance matching and reduced reflection losses. The increased channel width strengthens gate control, reducing parasitic capacitance effects and improving frequency response and stability. This represents a notable performance enhancement in the mid-frequency range and positively impacts signal integrity (Chau et al., 2015).

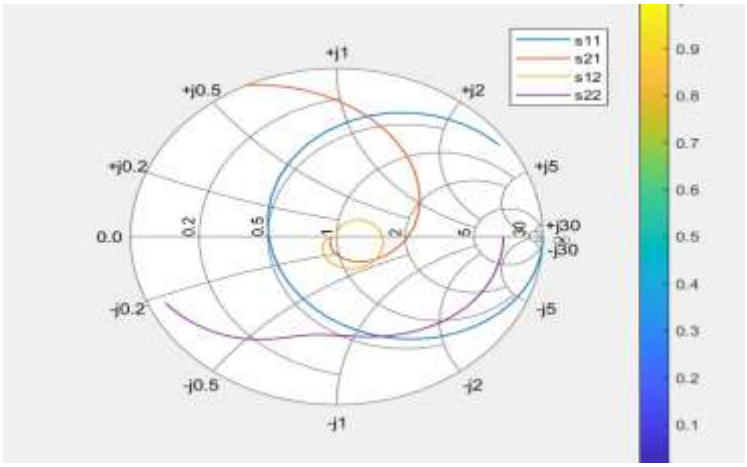

Figure 5. Smith Chart Plot of S-Parameters for the 50-Finger FinFET

50 Fins: For the 50-fin FinFET, reflection coefficients cluster very close to the center on the Smith Chart, indicating nearly ideal impedance matching and minimal reflection losses.

Consequently, forward gain approaches its maximum, energy transfer is optimized, and high-frequency performance is significantly improved. This configuration stands out as an optimal design for high-speed RF applications (Salahuddin & Datta, 2010).

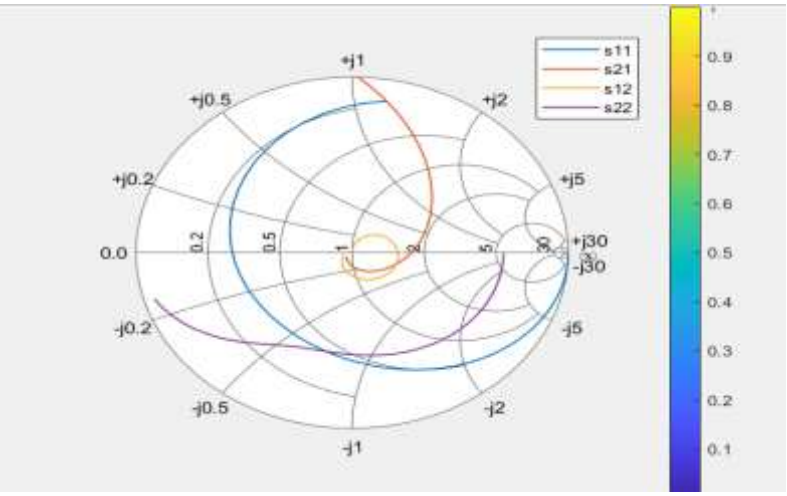

Figure 6. Smith Chart Plot of S-Parameters for the 80-Finger FinFET

80 Fins: In the 80-fin configuration, reflection coefficients are clustered at the very center of the Smith Chart, providing maximum impedance matching and minimal reflection losses. Forward gain values are at their highest, and power transfer is optimized. However, the increased parasitic capacitance and corresponding power consumption pose a disadvantage regarding energy efficiency. Hence, the 80-fin structure requires careful optimization and energy management despite its high performance (Lee et al., 2017).

Increasing fin count leads to a marked reduction in input and output reflection coefficients. For example, in the 10-fin configuration, S11 and S22 values are 0.63 and 0.66, respectively, while these values drop to 0.22 and 0.27 in the 80-fin configuration. This improvement implies better impedance matching and reduced signal reflection losses. Thus, increasing the fin count significantly enhances device compatibility with the surrounding circuit and signal integrity.Forward gain (S21) values also show a considerable increase with fin count. The forward gain rises from 0.55 at 10 fins to 0.82 at 80 fins, indicating optimized power transfer and improved frequency performance. The low and decreasing values of reverse transmission coefficient (S12) signify sustained high-frequency stability and limited feedback paths (Auth et al., 2012; Colinge, 2008).

This study reveals that fin count plays a critical role in the high-frequency performance of FinFET transistors. Increased fin count improves impedance matching, reduces reflection losses, and enhances forward gain. Smith Chart analyses support these findings visually and numerically; high reflection and poor matching observed at low fin counts dramatically reduce as fin count increases. However, excessive fin increase induces parasitic effects and higher power consumption, so determining the optimum fin count is crucial to balancing performance and energy efficiency (Razavi, 2013; Lee et al., 2017).

Conclusion and Recommendations

This study has provided a comprehensive investigation into the high-frequency characteristics of FinFET transistors through detailed S-parameter analysis, with a particular emphasis on how varying fin counts affect reflection coefficients (S11, S22) and transmission gains (S21, S12). Using small-signal equivalent circuit models in Multisim and subsequent data processing in MATLAB, the frequency-dependent behavior of FinFETs was evaluated across the 0.1 GHz to 10 GHz spectrum.The results demonstrate that increasing the number of fins enhances impedance matching, as indicated by lower S11 and S22 values and the clustering of corresponding points near the center of the Smith Chart. This improved matching contributes to more efficient power transfer, reduced reflection losses, and increased stability in RF operation. The observed improvements are attributed to the larger effective channel width and improved electrostatic gate control, which reduce parasitic resistances and capacitances, consistent with established semiconductor device theory (Pozar, 2011; Razavi, 2013).Furthermore, forward transmission gain (S21) was found to improve with fin count increment, while reverse transmission (S12) remained consistently low, indicating strong isolation and minimal feedback—desirable attributes in RF amplifiers and analog front-end circuits (Colinge, 2008; Auth et al., 2012).

Nonetheless, the study also reveals that excessively high fin counts may lead to increased parasitic capacitances, higher power dissipation, and slight signal degradation at frequencies above approximately 7 GHz. This trade-off aligns with prior research and highlights the need to balance RF performance with power efficiency and thermal considerations (Lee et al., 2017).Based on the findings, fin counts in the moderate-to-high range (e.g., 50 to 80 fins) provide an optimal compromise between gain, reflection, and impedance behavior, making these configurations suitable for practical RF applications such as low-noise amplifiers, ADC front-ends, and broadband transceivers.

The following recommendations are proposed for future work:

Several promising directions for further research emerge from this study. First, experimental validation through the physical fabrication and measurement of FinFET devices with varying finger counts is essential. Utilizing advanced measurement tools such as vector network analyzers (VNAs) will enable direct comparison between simulated S-parameter characteristics and empirical data under real operating conditions. This step is crucial for verifying the accuracy and practical applicability of the simulation models.Second, a more detailed parasitic component analysis is recommended. Future studies should aim to isolate and model individual parasitic elements — including gate-to-source capacitance (Cgs), gate-to-drain capacitance (Cgd), source/drain resistances (Rs/Rd), and other distributed parasitics — as explicit functions of finger count. A deeper understanding of these relationships will provide valuable insights into how parasitic effects influence reflection coefficients and power gain, ultimately guiding improved device designs with minimized losses.

Third, extending investigations to an expanded frequency range, particularly beyond 10 GHz and into millimeter-wave bands, represents a vital research frontier. As wireless communication technologies evolve rapidly with the emergence of 5G, 6G, and beyond, characterizing FinFETs at these ultra-high frequencies is increasingly important. Such studies will help assess the suitability of FinFETs for next-generation RF front-end components.Fourth, incorporating additional RF performance metrics alongside S-parameters could enrich overall device characterization. Parameters such as return loss, voltage standing wave ratio (VSWR), matching coefficient, and gain flatness provide complementary information that collectively

form a more comprehensive RF performance profile. This multidimensional approach would enable more precise device optimization tailored to specific application requirements.

Fifth, exploring alternative substrate technologies offers another promising avenue. Comparative analyses of FinFETs fabricated on silicon-on-insulator (SOI), gallium nitride (GaN), or other novel substrates could reveal substrate-dependent variations in device performance. Understanding these differences will facilitate more informed substrate selection and design trade-offs, potentially unlocking superior high-frequency behavior and enhanced thermal management.

Finally, the application of data-driven optimization techniques such as statistical analyses (e.g., ANOVA, regression models) and machine learning algorithms holds significant potential. By leveraging these methods, researchers can systematically optimize key design parameters — including finger count, gate length, and width-to-length ratio (W/L) — accelerating the development of highly efficient, tailored FinFET-based RF components optimized for specific frequency bands and performance criteria.In conclusion, this work clearly demonstrates the pivotal role of S-parameter and Smith Chart analyses in comprehensively characterizing and optimizing the high-frequency performance of FinFET transistors. The insights obtained not only deepen the academic understanding of multi-finger FinFET behavior but also provide practical guidance for circuit designers aiming to develop devices with enhanced gain, improved impedance matching, and minimized reflection losses. Such advancements are essential for realizing more efficient, reliable, and high-performance RF and analog integrated circuits designed to meet the demanding requirements of modern wireless communication systems.

Thanks and Information Note

I would like to express my sincere gratitude to Associate Professor Dr. Levent Gökrem for his invaluable guidance, continuous support, and insightful feedback throughout the preparation of this study. His academic mentorship and expertise have been instrumental in shaping the direction and quality of this research.I also wish to extend my heartfelt thanks to Abdulsamet Yurtseven, my colleague and a graduate student at Tokat Gaziosmanpaşa University, for his constructive input, collaborative spirit, and valuable discussions that greatly enriched this work.Their academic support and encouragement have played a vital role in the successful completion of this study.

ABSTRACT

In this study, a ball and plate system is used as a physical platform to test and compare the real-time performance of two different control strategies. Although the setup is mechanically simple, its inherently unstable behavior makes it useful for demonstrating and analyzing control algorithms. The system consists of two Arduino boards: one reads the ball's position from a 4-wire resistive touchscreen, while the other sends the control signals computed in Simulink to the servo motors. Communication is established via Serial Receive and Serial Transmit blocks.

The system was first tested on a square trajectory with 5 cm edges, where the reference position switched to each successive corner every 2 seconds. During this phase-based motion, both the Backstepping and Linear Quadratic Regulator (LQR) controllers exhibited similar tracking performance. To better observe the differences between the two controllers under more challenging conditions, a star-shaped trajectory with sharp turns was used. Each outer segment of the star was approximately 7.17 cm long, and the ball moved along each segment in 0.8 seconds, corresponding to a speed of 8.96 cm/s.

Performance was compared by evaluating the ball's position at the five outer corners of the star. The Backstepping controller had an average position error of 0.44 cm and a maximum error of 0.94 cm, whereas the LQR controller had a higher average error of 1.52 cm and a peak error of 2.19 cm. These results demonstrate that Backstepping performs better when following paths with sudden direction changes.

Keywords: Ball and plate system, Backstepping, LQR, Trajectory tracking, Real-time control

1. INTRODUCTION

The Ball and Beam system is one of the most popular one-degree-of-freedom (1-DoF) test platforms used by researchers to understand and implement classical and modern control strategies. Due to its more complex dynamics, higher degree of nonlinearity, and multi-variable nature, the two-degree-of-freedom (2-DoF) Ball and Plate system serves as a more effective platform for demonstrating the performance and robustness of advanced control strategies. Accordingly, numerous researchers have investigated this system through different methodologies.

Early implementations of such systems focused on linear control methods such as PID and state-feedback controllers. For instance, Sinaga et al. [1] developed a PID-based control scheme using a resistive touchscreen and servo motors, while Núñez et al. [2] applied pole-placement-based state feedback control combined with visual sensing for position tracking. Pahlawan et al. [6] also employed a webcam and PID controller to regulate the ball's position. Kajaman et al. [3] demonstrated a similar PID-based system integrated with LabVIEW for real-time control.

As the complexity of control objectives increased, researchers have increasingly turned to optimization-based and nature-inspired methods. Gözüde [4] applied classic P–PD control alongside PSO- and DE-based gain scheduling approaches. Kastner et al. [5] implemented LQR and PI optimal state feedback control strategies for a simulated ball and plate system. Zheng et al. [7] designed a switching controller that combines neural network PID and anti-windup PID strategies to improve both response time and stability, showing experimentally that this hybrid approach outperforms standalone PID controllers. Sumega et al. [8] experimentally compared PD, full state feedback, and observer-based controllers on a biaxial ball and plate platform, concluding that the observer-based approach provided the best performance in trajectory tracking and noise suppression. Lastly, Kazim et al. [9] proposed a robust backstepping controller with disturbance rejection for a simulated ball and plate system, demonstrating superior performance over LQR under bounded external disturbances.

In this study, a two-degree-of-freedom ball and plate system was experimentally developed and controlled using two model-based strategies: Linear Quadratic Regulator (LQR) and Backstepping. The system was modeled by decoupling the x and y axes as two independent ball and beam subsystems. A 4-wire resistive touchscreen was used for real-time position feedback, connected to the first Arduino board, which transmitted calibrated position data to MATLAB/Simulink via serial communication. The second Arduino board received control signals from Simulink and generated PWM outputs to drive the two servo motors independently. To assess controller performance, two reference trajectories were applied: a square path to evaluate decoupled axis control, and a star-shaped trajectory to test simultaneous motor actuation. Experimental results indicated that the Backstepping controller provided more accurate tracking performance under dynamic conditions compared to LQR.

2. MODELING

The 2 DOF ball and plate system employs two separate servo motors to control the x and y axes. Although the system has asymmetric dimensions, each axis is assumed to exhibit similar dynamics. Therefore, the system is modeled as two decoupled ball-and-beam systems. In this model, the rotation of the x-axis servo is assumed to affect only the ball’s motion along the x direction, and likewise, the y-axis servo influences only the motion along the y direction.

2.1. Equation of Motion

The free-body diagram of the system is presented in Figure 2.1. Based on this diagram, the equation of motion describing the relationship between the ball's position x and the beam angle α can be derived.

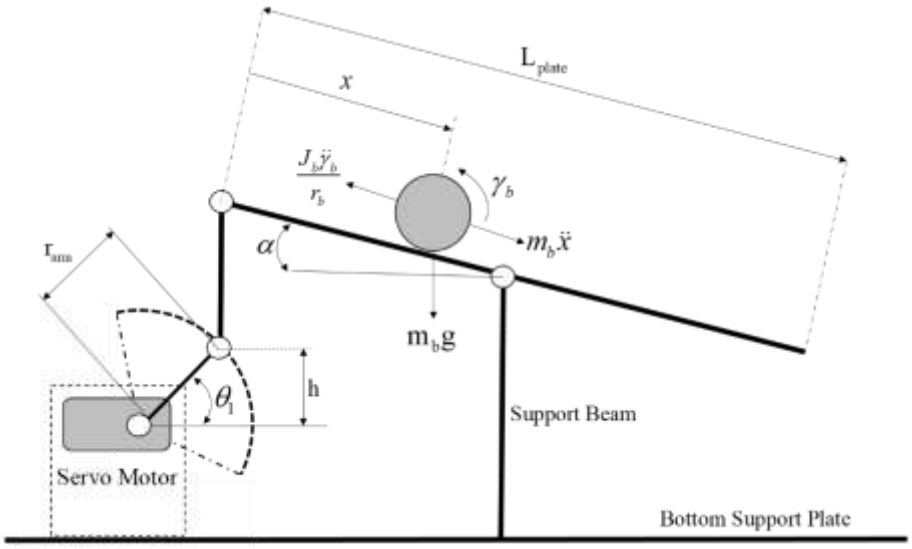

Figure 2.1. Modeling ball on plate as ball and beam for 1 dimension.

According to Newton's First Law of Motion, the sum of the forces acting on the ball along the beam is set to zero, resulting in the equation of motion expressed in Equation (2.1).

$$m_b\ddot{x}(t) = \sum F = F_{x,t} - F_{x,r} \tag{2.1}$$

Here, m_b is the mass of the ball, x denotes the ball's displacement, $F_{x,r}$ represents the inertial force of the ball, and $F_{x,t}$ is the gravitational translational force. The forces caused by inertia and gravity can be found as Equations (2.2) and (2.3).

$$F_{x,t} = m_b g\, sin(\,\alpha(t)) \tag{2.2}$$

$$F_{x,r} = \frac{\tau_b}{r_b} \tag{2.3}$$

where τ_b and r_b are torque and radius of the ball respectively. With γ_b denoting the ball angle, the torque can be calculated as in Equation (2.4).

$$\tau_b = J_b\ddot{\gamma}_b(t) \tag{2.4}$$

Based on the basic circular motion relation which is $x(t) = \gamma_b(t)r_b$, linear displacement can be related to angular displacement. Consequently, the inertial force acting on the ball along the x direction is given by:

$$F_{x,r} = \frac{J_b\ddot{x}(t)}{r_b^2} \tag{2.5}$$

Substituting both the rotational and translational force expressions into Equation (2.1) and solving for the linear acceleration yields the equation of motion for the ball and beam system, as presented in Equation (2.6).

$$\ddot{x}(t) = \frac{m_b g r_b^2}{m_b r_b^2 + J_b} sin(\alpha(t)) \tag{2.6}$$

Since the resulting equation includes a trigonometric term, it is nonlinear. Therefore, it must be linearized for control design purposes. The geometric relationship between the servo gear angle and the beam angle, shown in Figure 2.1, leads to Equation (2.7).

$$sin(\alpha(t)) = \frac{2h}{L_{plate}} \tag{2.7}$$

Taking the sine of the servo load shaft angle leads to Equation (2.8).

$$sin(\theta_l(t)) = \frac{h}{r_{arm}} \tag{2.8}$$

Combining Equations (2.7) and (2.8), the relationship between the servo and beam angles is obtained as shown in Equation (2.9).

$$sin(\alpha(t)) = \frac{2r_{arm}}{L_{plate}} sin(\theta_l(t)) \tag{2.9}$$

Assuming small angles, where $sin(\theta_l(t)) \approx \theta_l(t)$ the nonlinear equation of motion given in Equation (2.6) can be linearized. By substituting the servo-to-beam angle relation from Equation (2.9) into this expression, the ball's acceleration is obtained as a linear function of the servo angle.

$$\ddot{x}(t) = \frac{2m_b g r_{arm} r_b^2}{L_{plate}(m_b r_b^2 + J_b)} \theta_l \tag{2.10}$$

The dynamic equations derived for the x and y axes are presented in Equations (2.11) and (2.12), respectively.

$$\ddot{x}_b(t) = \frac{2m_b g r_{arm} r_b^2}{L_x(m_b r_b^2 + J_b)} \theta_x \tag{2.11}$$

$$\ddot{y}_b(t) = \frac{2m_b g r_{arm} r_b^2}{L_y(m_b r_b^2 + J_b)} \theta_y \tag{2.12}$$

Physical and modeling parameters used in the dynamic equations of the ball and plate system given in Table 2.1.

Table 2.1. Physical parameters of Ball and Plate System

Symbol	Description	Value	Unit
m_b	*Mass of the ball*	**0.26**	$\boldsymbol{kg}$
r_b	*Radius of the ball*	**0.02**	$\boldsymbol{m}$
J_b	*Moment of inertia of the ball*	**4.16e-5**	$\boldsymbol{kgm^2}$
r_{arm}	*Distance from servo axis to plate center*	**0.0235**	$\boldsymbol{m}$
g	*Gravitational acceleration*	**9.81**	$\boldsymbol{m/s^2}$
L_x	*Length of the plate along the x-axis*	**0.31**	$\boldsymbol{m}$
L_y	*Length of the plate along the y-axis*	**0.38**	$\boldsymbol{m}$

3. CONTROLLER DESIGN

In this section, two model-based control strategies, namely Linear Quadratic Regulator (LQR) and Backstepping, are designed for the 2 DOF ball and plate system. The goal is to stabilize the ball at desired trajectories by generating appropriate control signals for the x and y axis motors. Both controllers are formulated using the linearized model presented in Section 2.

3.1. Backstepping Control

The Backstepping controller is designed for each axis separately using a second-order system formulation. The derivation is based on Lyapunov theory.

The position tracking error was defined as:

$$e_1 = x - x_d \tag{3.1}$$

Taking the derivative of e_1:

$$\dot{e}_1 = \dot{x} - \dot{x}_d \tag{3.2}$$

Define the first Lyapunov candidate function as:

$$V_1 = \frac{1}{2} e_1^2 \tag{3.3}$$

To ensure V_1 is decreasing, a virtual control law x_d defined as in Equation (3.4):

$$x_{2d} = \dot{x}_d - k_1 e_1 \tag{3.4}$$

where $k_1 > 0$ is a control gain. The second error term defined as:

$$e_2 = \dot{x} - x_{2d} \tag{3.5}$$

Then, the derivative of the full Lyapunov function becomes as in Equation 3.6:

$$V_2 = V_1 + \frac{1}{2} e_2^2 \tag{3.6}$$

Taking the time derivative of V_2:

$$\dot{V}_2 = e_1 \dot{e}_1 + e_2 \dot{e}_2 \tag{3.7}$$

Substituting expressions for $\dot{e}_1$ and $\dot{e}_2$, and using the system dynamics from Equation (2.10), the control input was selected as in Equation (3.8):

$$u = \frac{L_{\text{plate}}(m_b r_b^2 + J_b)(\ddot{x}_d - k_1(\dot{x} - \dot{x}_d) - k_2 e_2)}{2 m_b g r_{\text{arm}} r_b^2} \tag{3.8}$$

For $k_2 > 0$, the final control inputs for the x and y axes are derived by incorporating the full system dynamics, and are given by Equations (3.9) and (3.10), respectively:

$$u_x = \frac{L_x(m_b r_b^2 + J_b)(\ddot{x}_d - k_{1x}(\dot{x} - \dot{x}_d) - k_{2x} e_2)}{2 m_b g r_{arm} r_b^2} \tag{3.9}$$

$$u_y = \frac{L_y(m_b r_b^2 + J_b)(\ddot{y}_d - k_{1y}(\dot{y} - \dot{y}_d) - k_{2y} e_2)}{2 m_b g r_{arm} r_b^2} \tag{3.10}$$

The selected position and velocity gains for the Backstepping controller are:

$$k_{1x,y}, k_{2x,y} = [4.1 \quad 2.8] \tag{3.11}$$

3.2. Linear Quadratic Regulator

Linear Quadratic Regulator (LQR) is an optimal control technique that minimizes a quadratic cost function to balance state error and control effort. It is designed based on the state-space representation of the system and computes a feedback gain matrix K that minimizes the following cost function as given in Equation (3.12):

$$J = \int_0^\infty (x^T Q x + u^T R u)\, dt \tag{3.12}$$

The resulting feedback gain matrices for the x and y axes were computed as:

$$K_x = [4.1231 \quad 2.8107] \tag{3.13}$$

$$K_y = [4.0000 \quad 3.0185] \tag{3.14}$$

4. EXPERIMENTAL SETUP AND IMPLEMENTATION

The experimental setup consists of a 4-wire resistive touchscreen, two Arduino boards, and a host computer running MATLAB/Simulink. The overall data flow and system components are illustrated in Figure 4.1.

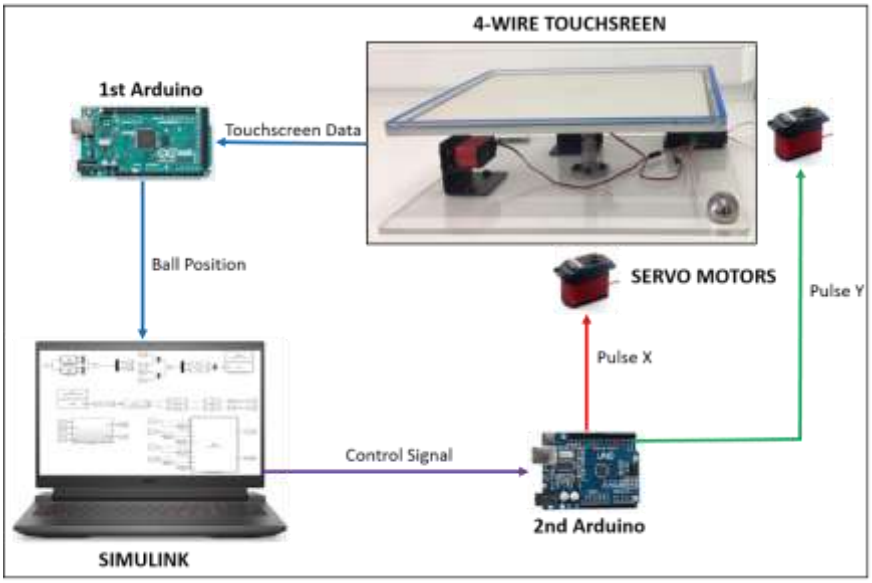

Figure 4.1. Experimental setup diagram.

The 4-wire touchscreen is interfaced with the first Arduino, which continuously reads the ball's position data. This data is transmitted to Simulink in real time via the Serial Receive block. The control structure implemented in Simulink is shown in Figure 4.2.

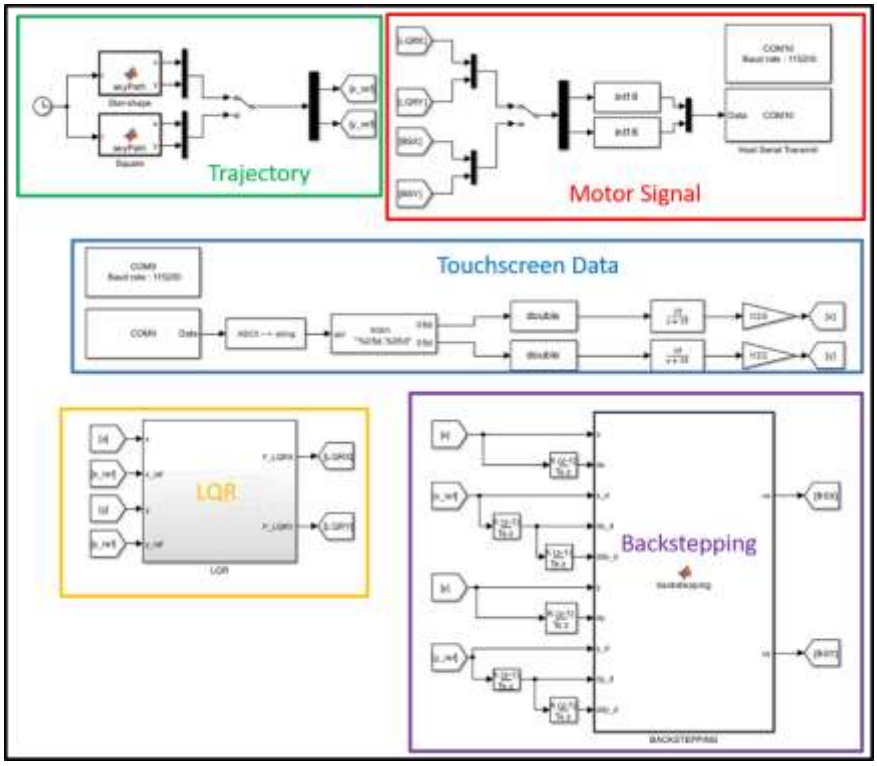

Figure 4.2. Simulink model used in the experimental setup

During initial tests, it was observed that the raw x and y coordinates obtained from the 4-wire touchscreen were not physically accurate. Although the test points were placed at equal physical distances from the center, the touchscreen readings showed asymmetries in both axes.

To solve this issue, a series of calibration experiments were conducted by manually recording reference positions at known locations across the surface. Based on these measurements, an affine transformation matrix was computed to map the raw touchscreen data to physically accurate ball positions, as shown in Equation (4.1). Since x_r and y_r the represent raw ball positions of the ball, x_c and y_c correspond to the calibrated ball positions along the x and y axes, respectively.

$$\begin{bmatrix} x_c \\ y_c \end{bmatrix} = \begin{bmatrix} 1.0078 & -0.0067 \\ 0.0291 & 0.9969 \end{bmatrix} \begin{bmatrix} x_r \\ y_r \end{bmatrix} + \begin{bmatrix} 2.0223 \\ -0.9387 \end{bmatrix} \tag{4.1}$$

Additionally, the touchscreen data was scaled to convert the readings into centimeters after being transmitted to Simulink. To match the physical dimensions of the plate surface in centimeters, the x-axis data were divided by 25, and the y-axis data by 22.

The second Arduino receives control signals from Simulink via serial communication and directly drives the servo motors using PWM signals generated by the “writeMicroseconds()” function.

5. FINDINGS AND DISCUSSION

In this study, the ball and plate system was experimentally implemented. To initially test the controllers under conditions where the motors move independently, a square trajectory was

used. In this test, the reference point sequentially moved between the corners of a square, allowing the x and y axes to be activated separately. The square trajectory used in the experiment is defined in Equation (5.1).

$$(x(t), y(t)) = \begin{cases} (0,\ 0), & 0 \le t < 2 \\ (5,\ 5), & 2 \le t < 4 \\ (5,\ -5), & 4 \le t < 6 \\ (-5,\ -5), & 6 \le t < 8 \\ (-5,\ 5), & 8 \le t < 10 \\ (5,\ 5), & 10 \le t < 12 \end{cases} \tag{5.1}$$

Under square trajectory conditions, both model-based controllers LQR and Backstepping exhibited similar tracking performance. The position tracking performance of the controllers along the square trajectory is illustrated in Figure 5.1.

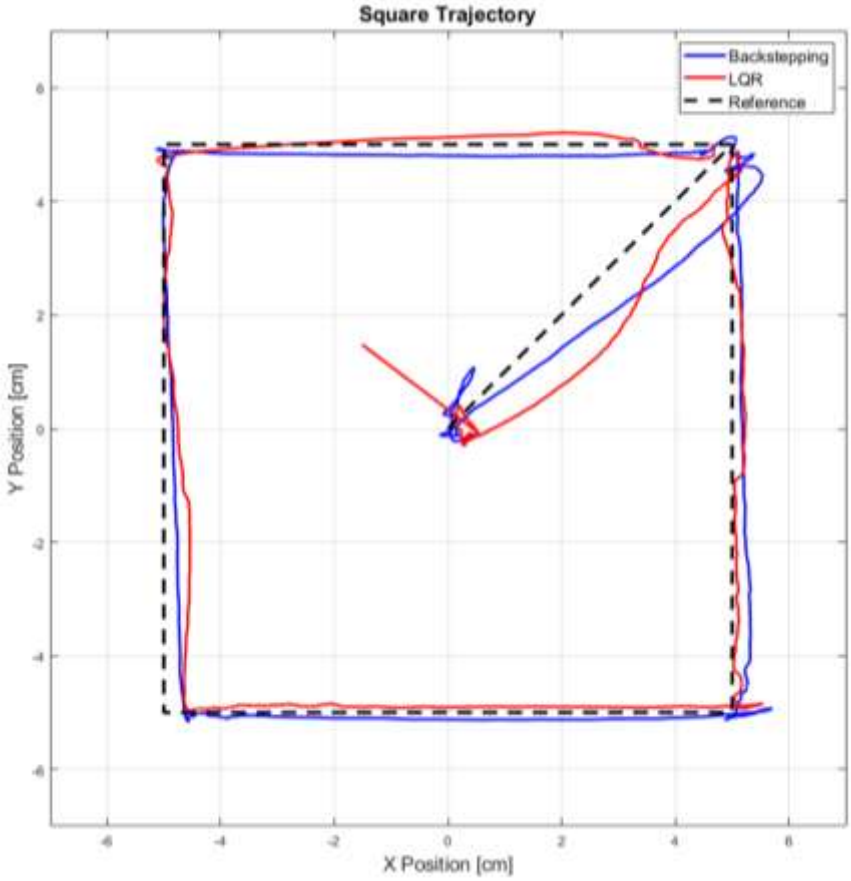

Figure 5.1. Trajectory tracking performance of controllers on the square path

To evaluate controller performance under more challenging conditions where both motors operate simultaneously, a star-shaped trajectory was implemented. Each segment was assigned a fixed duration of 0.8 seconds, and the reference point sequentially moved between the corners of the star. The corresponding reference trajectory is defined in Equation (5.2).

$$(x(t), y(t)) = (x_i,\ y_i), \quad \text{for } t \in [(i-1)\Delta t,\ i\Delta t), \quad i = 1, \dots, 11 \& \Delta t = 0.8\ s \tag{5.2}$$

As illustrated in Figure 5.2, the Backstepping controller demonstrated better tracking performance when compared to LQR, particularly around the outer corners of the star. Quantitatively, Backstepping achieved an average position error of 0.44 cm and a maximum error of 0.94 cm, while LQR exhibited a higher average error of 1.52 cm and a peak error of 2.19 cm. These results indicate that Backstepping performs better when handling sudden changes in trajectory direction.

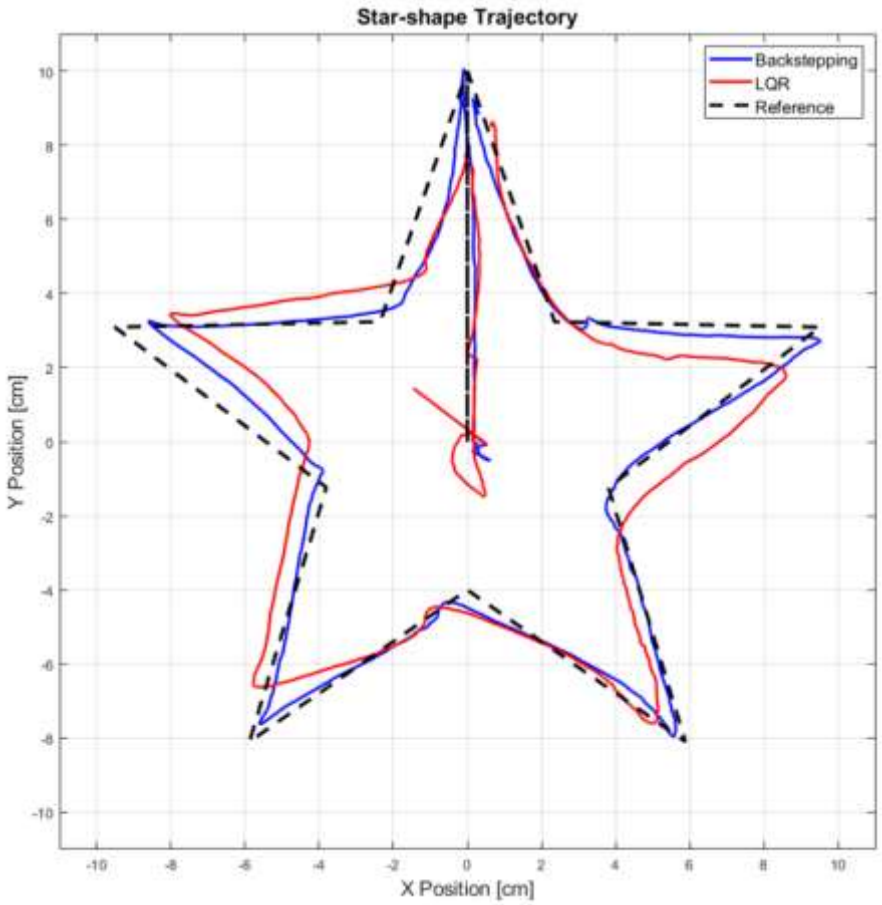

Figure 5.2. Trajectory tracking performance of controllers on the star-shape path

6. CONLUSION

The experimental analysis shows that a two-degree-of-freedom ball and plate system can be effectively implemented and controlled using two model-based strategies: Linear Quadratic Regulator (LQR) and Backstepping. Both controllers were designed using a linearized model of the system, and their tracking performance was evaluated under two different reference trajectories: a square path and a star-shaped path.

Under the square trajectory, where each motor operates independently, both controllers exhibited similar performance. In contrast, the star-shaped trajectory required simultaneous motor actuation and involved sharp directional changes. In this scenario, the Backstepping controller demonstrated more effective performance compared to the LQR.

In star-shape path, quantitative results showed that the Backstepping controller achieved an average position error of 0.44 cm and a maximum error of 0.94 cm. In comparison, the LQR

controller produced a higher average error of 1.52 cm and a peak error of 2.19 cm. These results indicate that the Backstepping method is more effective in dynamic trajectories.

Future work may focus on improving robustness against external disturbances such as wind loads on the ball, advanced filtering techniques can be implemented to improve measurement noise robustness, and camera-based position feedback can be used to achieve more effective and flexible control performance.

ABSTRACT

In this study, phytase enzyme was partially purified from *Bacillus wiedmannii* ND44 strain isolated from field soil and identified by 16s rRNA method and its optimum pH and temperature values and kinetic properties were determined. The partially purified phytase enzyme from *B. wiedmannii* ND44 exhibited an activity of 6.44 U/mL and the protein concentration of the enzyme was determined as 2.53 mg/mL. The pH and temperature values at which the partially purified phytase showed optimum activity were pH 5.5 and 55 °C, respectively. K_m and V_{max} values of the enzyme against sodium phytate were determined as 0.016 mM and 4.12 µmol/min, respectively. The results obtained show that phytase isolated from *B. wiedmannii* ND44 exhibits optimum activity under acidic and thermophilic conditions. Thanks to these properties, the purified phytase enzyme can contribute to the more efficient use of phytate phosphorus, especially in animal nutrition, as well as various biotechnological applications in the food and environmental sectors. The obtained findings reveal that phytase is a powerful biocatalytic agent that can be evaluated in terms of environmental sustainability and industrial efficiency.

Keywords: Partial purification, phytase, *Bacillus wiedmannii*

Introduction

Today, the accelerating pace of industrialisation has led researchers to develop innovative and efficient solutions in many sectors, from textiles to animal feed, from food to cleaning products, that will both reduce environmental impacts and be economically viable (Dikbaş et al. 2024). Phosphorus is one of the non-renewable resources that is of great biotechnological importance for various industries and living organisms, plays a critical role in basic biological processes such as energy metabolism, cell structure and nucleic acid synthesis, and is found in organic and inorganic forms in soil (Ahmad et al. 2022; Silva et al. 2023; Solovchenko et al. 2024).

Plants utilise only inorganic phosphorus from the soil as a source of phosphorus. Since the inorganic form of phosphorus is less available than the organic form, this affects plant growth (Rawat et al. 2021). Phytates are the primary storage forms of phosphate and inositol in plant cells (Marolt and Kolar 2020). Phytates chelate amino acids, various minerals and charged proteins in the digestive system (Kumar et al. 2023). The enzyme phytase, which causes the release of the myo-inositol phosphate sub-isomer, is involved in the degradation of phytates. This reaction involving phytate degradation has important functions for living organisms from a metabolic point of view and due to its use in various applications such as feed additives, human food processing (Jatuwong et al. 2020).

Phytases are produced by animals, plants and various microorganisms (Doğan and Tekiner 2020; Vashishth et al. 2023). However, microbial-derived phytases are more preferred in the field of industrial biotechnology compared to both plant- and animal-derived phytases due to their high production efficiency, wide pH and temperature tolerance, easier and more advantageous in terms of time and cost (Joudaki et al. 2023). Phytase has been obtained from various bacteria including *Enterobacter* spp., *Bifidobacterium* spp., *Pseudomonas* spp., *Bacillus subtilis* (Mussa et al. 2023). Especially the bacteria in the rhizosphere produce high levels of phytase enzyme. *Bacillus* genus bacteria are abundant in the rhizosphere and phytase enzyme is secreted (Shao et al. 2025). The enzyme production potential of different *Bacillus* species is being investigated due to their secretion of phytase enzyme (Naqqash et al. 2023)

In this study, isolation, identification, partial purification and characterisation of *B. wiedmannii* ND44 strain from field soil was carried out in order to provide a new phytase enzyme used in various industrial fields.

Materials and Methods

Bacterial strains

The soil samples used in the study were taken from a field in Bozyazı neighbourhood of Çat district of Erzurum province with a sterile spatula and stored in sterile ziplock bags. The sample (0.1 g) was suspended in physiological saline (9 mL) by vortexing for 2 min. 10x dilution series were made and 100 µL of these dilutions were transferred to Nutrient Agar (NA) and inoculated by smear method. Petri dishes were incubated at 28 °C for 72 hours. Colonies were selected according to their morphological characteristics (shape, colour and size) and inoculated into NA by drawing method. Colonies were incubated at 28 °C for 48 h and then stored at -80 °C in 50% glycerol stocks (Dikbaş et al. 2024).

Molecular identification by 16S rRNA gene sequencing

EurX GeneMATRIX Bacterial & Yeast DNA isolation kit (Poland) was used for DNA isolation of the strains. The 16S rRNA gene was amplified from the genomic DNA of the strain by polymerase chain reaction (PCR) using universal primers (27F 5' AGAGTTTGATCMTGGCTCAG 3' and 1492R 5' TACGGYTACCTTTGTTACGACTT 3').

Sequence analysis of the strains was outsourced to BM Lab and the sequenced data were further analyzed by Basic Local Alignment Search Tool (BLAST) with closest culture sequence retrieved from the National Centre for Biotechnology Information (NCBI) database.

Partial purification of phytase

The bacterial strain was incubated in NB at 28 °C for 48 hours. It was then centrifuged (10 min at 9000 rpm at +4°C) and the supernatant was used for partial purification of phytase (Dikbaş et al. 2023). Partial purification of the enzyme was carried out using ammonium sulphate at 0-80% concentration. The precipitate obtained after purification was dissolved in sodium acetate buffer (0.1 M, pH 6.0) and used to determine the activity and protein concentration.

Phytase activity measurement

The bacterial strain incubated in NB was centrifuged at 9000 rpm for 10 min at +4°C. Phytase activity was determined according to Dikbaş et al. (2024).

Protein determination

Protein concentration was determined using the Bradford method (Bradford 1976).

Effect of pH on Phytase Activity

Substrate solutions were prepared using buffers with different pH values to determine the pH value at which the phytase enzyme showed optimum activity. Experiments were carried out in 3 replicates (Dikbaş et al. 2023).

Effect of temperature on Phytase Activity

To determine the optimum temperature at which phytase showed optimum activity, the reaction was exposed to temperatures between 15-85°C at 10°C intervals and the enzyme activity was measured. Experiments were carried out in 3 replicates (Dikbaş et al. 2023).

Determination of K_m and V_{max} values

The activity of phytase enzyme was measured at different substrate concentrations under optimum conditions and K_m and V_{max} values were determined by drawing Lineweaver-Burk graph. (Demir et al. 2018).

Findings and Discussion

Phytases produced by microorganisms offer a wide range of applications in both commercial and environmental fields thanks to their different biological properties (Joudaki et al. 2023; Dikbaş et al. 2024). In this study, the strain isolated from field soil was selected according to its morphological characteristics (shape, colour and size) and PCR products were subjected to Sanger sequencing to determine the 16 S rRNA gene region and sequence data were subjected to BLAST analysis and the results were compared with the data available in NCBI. 99.93% similarity was observed with *B. wiedmannii* entry No: OR388780.1 (Tablo 1).

Table 1. Screening result of 16 S rRNA gene region of *B. wiedmannii* ND44 strain.

Bacteria Code	Bacteria Diagnostic Result	Similarity Rate by Species	Accession Number
ND44	*Bacillus wiedmannii*	99.93%	PV718214

In the study, it was determined that the best ammonium sulphate precipitation range of the phytase enzyme partially purified from *B. wiedmannii* ND44 strain was 40-60% and exhibited an activity of 6.44 U / ml in this range (Figure 1). The protein concentration of the enzyme was measured as 2.53 mg/mL in the 40-60% precipitation range where the best activity was observed. Dan et al. (2015) determined that the phytase partially purified from *B. licheniformis* ONF2 isolated from fish intestine exhibited an activity of 3.48 U/mg and had a total protein of 48.5 mg. Rocky-Salimi et al. (2016) reported that the phytase of *B. subtilis* BS46 strain isolated from chicken phyllosphere exhibited a specific activity of 5.45 U/mg protein. Demirkan et al. (2017) found that phytase partially purified from *B. megaterium* EBD 9-1 strain had a specific activity of 12.1 U/mg and a total protein amount of 130 mg. Sendez Penidez et al. (2020) determined that the phytase enzyme purified from *Lactobacillus plantarum* CRL1964 strain showed an activity of 10.13 U/mg at 30% ammonium sulphate saturation and had a protein concentration of 0.08 mg/mL. Abdolshahi et al. (2021) determined that *Bacillus* sp. strain LA12 exhibited a phytase enzyme activity of 4.5 U/mg and had a total protein of 780 mg as a result of partial purification.

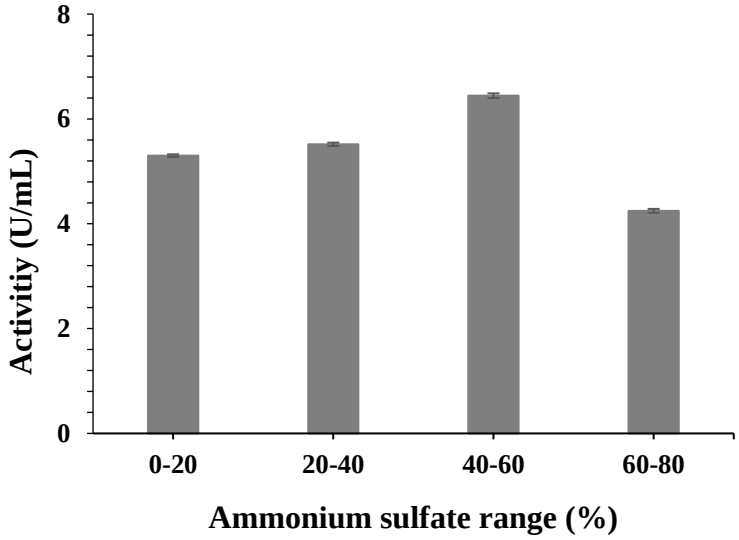

Figure 1. Ammonium sulphate precipitation ranges of phytase enzyme

In order to determine the pH value at which the phytase of *B. wiedmannii* ND44 showed optimum activity, activity measurements were performed at different pH values (pH 2.0-11.0) and the highest activity was observed at pH 5.5 (Figure 2). Similar to our study, Abdolshahi et al. (2021) found that the pH value at which the phytase enzyme purified from *Bacillus* sp. strain LA12 showed optimum activity was pH 5.5. Sardar et al. (2022) determined the pH value at which the phytase of *Bacillus* sp. (HCYL03) isolated from soil showed optimum activity as pH 5. Different from our study; Trivedi et al. (2022) reported that the phytase purified from *B. subtilis* P6 strain showed optimum activity at pH 6 in their study. Javaid et al. (2022) determined the pH range in which the extracellular phytase of *B. subtilis* KT004404 showed optimum activity as pH 6.5- 7.0. Sanni et al. (2023) reported that the phytase enzyme purified from *B. cereus* showed optimum activity at pH 7. When the literature studies and the findings of the present study are considered, it is seen that the phytase enzyme purified from *Bacillus* sp. is generally acidic. Furthermore, the optimum pH value is enzyme specific and may vary depending on the type and source of the phytase enzyme.

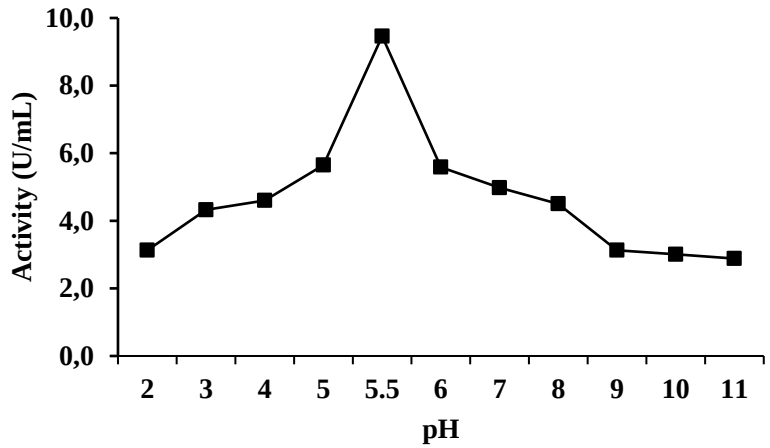

Figure 2. Effect of pH on activity of phytase enzyme

In order to determine the temperature at which the phytase of *B. wiedmannii* ND44 showed optimum activity, the reaction was measured at 10°C intervals in the range of 15-85°C. The temperature at which the enzyme showed optimum activity was determined as 55 (Figure 3). Abdolshahi et al. (2021) determined the temperature value at which the phytase purified from *Bacillus* sp. strain LA12 showed optimum activity as 60 °C. Javaid et al. (2022) reported that the phytase enzyme purified from *B. subtilis* KT004404 showed optimum activity at 40 °C. Sardar et al. (2022) found that the temperature at which phytase purified from *Bacillus* sp. (HCYL03) showed maximum enzyme production was 45°C. Trivedi et al. (2022) found that the temperature at which the phytase enzyme of *B. subtilis* P6 showed optimum activity was 40 °C. It was determined that the phytase enzyme purified from *B. cereus* isolated from Achatina fulica by Sanni et al. (2023) showed optimum activity at 50°C. Considering the literature studies, phytase enzyme purified from *Bacillus* sp. generally shows optimum activity under thermophilic conditions in the range of 40-60 °C.

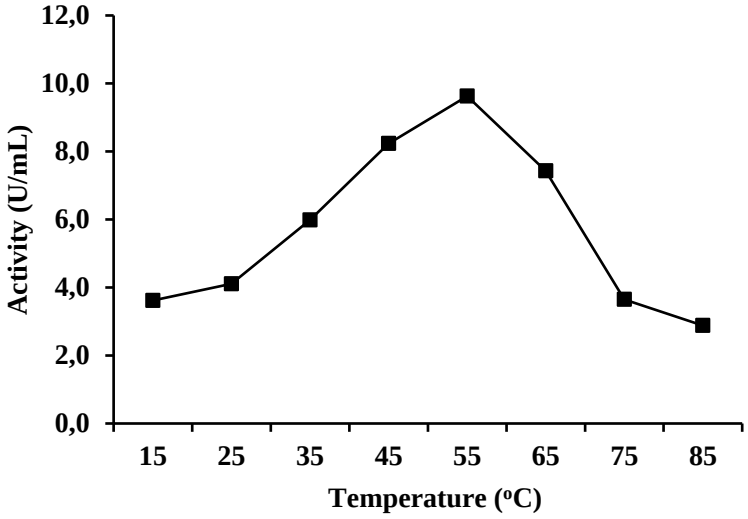

Figure 3. Effect of temperature on activity of phytase enzyme

When the phytase of *B. wiedmannii* ND44 was tested against sodium phytate, K_m and V_{max} values of the enzyme were 0.016 mM and 4.14 µmol/min, respectively (Figure 4). Abdolshahi et al. (2021) found K_m and V_{max} values of phytase of *Bacillus* sp. strain LA12 as 0.197 mM and 1.174 µmol/min, respectively. Javaid et al. (2022) determined the kinetic parameters of phytase purified from *B. subtilis* KT004404 as K_m: 0.175 mM and V_{max}: 250 U/mL. Sanni et al. (2023) determined K_m and V_{max} values of phytase enzyme purified from *B. cereus* as 0.11 mM and 55.6 µmol/min/mL, respectively. In the present study, the low Km value reveals that the enzyme shows a high binding tendency towards its substrate and the enzyme-substrate complex is easily formed. This is important in terms of showing that the enzyme can work effectively even at low substrate concentrations.

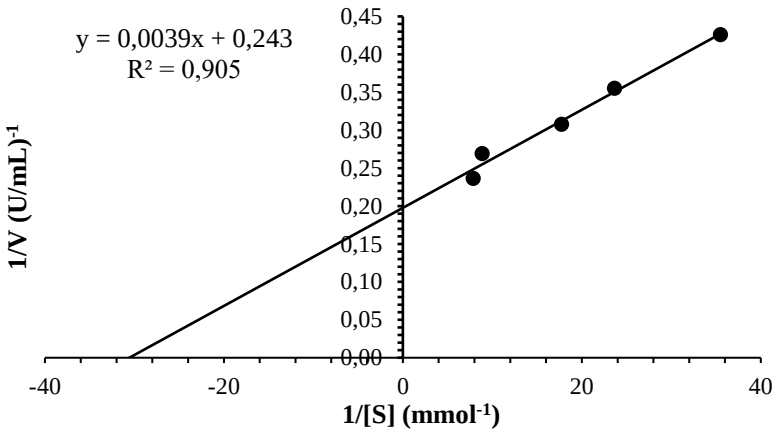

Figure 4. Graph to determine the kinetic parameters (K_m and V_{max}) of phytase for phytate

Conclusion and Recommendations

In conclusion, the results indicate that phytase partially purified from *B. wiedmannii* ND44 strain isolated from field soil exhibits optimum activity under acidic and thermophilic conditions. Thanks to these properties, the purified phytase enzyme can contribute to increase the bioavailability of phytate phosphorus, especially in animal nutrition, as well as various biotechnological applications in the food and environmental sectors. The obtained findings reveal that phytase is a powerful biocatalytic agent that can be evaluated in terms of environmental sustainability and industrial efficiency. Therefore, further experimental studies are needed to better understand the phytase production potential of microorganisms isolated from different sources and to elucidate the biochemical properties of these enzymes in detail.

ABSTRACT

UN World Urbanisation Reports reveal that the rate of urbanisation is increasing on a global scale and the population density in cities is gradually rising. The urbanisation process leads to the transformation of ecosystems, reduction of natural areas and environmental sustainability is increasingly under threat. Especially the increase in the rate of construction and the shrinkage of green areas directly affect the climatic structure of cities and accelerate the formation of urban heat islands. This situation causes a decrease in thermal comfort in cities, an increase in heat stress and negative consequences on public health. Studies reveal that green areas in the city offer more favourable microclimatic conditions compared to structural textures and play a stabilising role on the urban ecosystem. Accordingly, it is becoming increasingly important to develop alternative green space solutions to reduce climatic impacts and increase the comfort of urban life.

In this study, it was aimed to create a basis for ENVI-met analyses by producing climate sensitive vegetative landscape design scenarios for Sivas City Square. Different vegetative landscape design scenarios that will adapt to the climatic conditions of the city, integrate with natural vegetation, improve the visuality of the city square and increase thermal comfort are proposed. The plants selected within the scope of the study consist of species that are resistant to the climate of Sivas and compatible with the urban ecosystem.

The proposed design approaches aim to provide aesthetic and functional solutions in the urban space by supporting the microclimatic structure of the square. At the same time, it is aimed to increase the quality of use of the square with design decisions that improve the bioclimatic comfort of the city residents. Design decisions that are compatible with the urban texture, have high aesthetic value and emphasise functionality are shaped in a way to support the environmental and structural features of the square.

KENTSEL ISI ADASI OLUŞUMUNU AZALTICI ALTERNATİF PEYZAJ TASARIMLARI; SİVAS KENT MEYDANI ÖRNEĞİ

ÖZET

BM Dünya Şehirleşme Raporları, küresel ölçekte kentleşme hızının arttığını ve kentlerdeki nüfus yoğunluğunun giderek yükseldiğini ortaya koymaktadır. Kentleşme süreci, ekosistemlerin dönüşmesine, doğal alanların azalmasına ve çevresel sürdürülebilirliğin giderek daha fazla tehdit altına girmesine neden olmaktadır. Özellikle yapılaşma oranının yükselmesi ve yeşil alanların daralması, kentlerin iklimsel yapısını doğrudan etkileyerek kentsel ısı adası oluşumunu hızlandırmaktadır. Bu durum, kentlerde termal konforun azalmasına, sıcaklık stresinin yükselmesine ve halk sağlığı üzerinde olumsuz sonuçlar doğmasına sebep olmaktadır. Araştırmalar, kent içerisindeki yeşil alanların, yapısal dokulara kıyasla daha elverişli mikroklimatik koşullar sunduğunu ve kent ekosistemi üzerinde dengeleyici bir rol oynadığını ortaya koymaktadır. Bu doğrultuda, iklimsel etkileri azaltmak ve kent yaşamının konforunu artırmak amacıyla alternatif yeşil alan çözümlerinin geliştirilmesi giderek daha fazla önem kazanmaktadır.

Bu çalışmada, Sivas Kent Meydanı için iklim duyarlı bitkisel peyzaj tasarım senaryoları üretilerek, ENVI-met analizlerine altlık oluşturulması amaçlanmıştır. Kentin iklim koşullarına uyum sağlayacak, doğal bitki örtüsü ile bütünleşen, kent meydanının görselliğini iyileştirerek termal konforunu arttırmaya yönelik farklı bitkisel peyzaj tasarım senaryoları önerilmiştir. Çalışma kapsamında seçilen bitkiler, Sivas'ın iklimine dayanıklı, kentsel ekosisteme uyumlu türlerden oluşmaktadır.

Önerilen tasarım yaklaşımları, meydanın mikroklimatik yapısını destekleyerek, kentsel mekânda estetik ve fonksiyonel çözümler sunmayı amaçlamaktadır. Aynı zamanda, kent sakinlerinin biyoklimatik konforunu iyileştiren tasarım kararlarıyla meydanın kullanım kalitesinin artırılması hedeflenmektedir. Kent dokusuna uyumlu, estetik değeri yüksek ve fonksiyonelliği ön plana çıkaran tasarım kararları, meydanın çevresel ve yapısal özelliklerini destekleyecek biçimde şekillendirilmiştir.

Anahtar Kelimeler: ENVI-met, iklim, kentleşme, termal konfor, kentsel ısı adası

1. GİRİŞ

İklim değişikliği, insan faaliyetleri sonucunda ortaya çıkan karbon emisyonlarının küresel ölçekte atmosferde birikmesiyle dünya enerji dengesini değiştirmekte ve ekosistemler üzerinde kalıcı etkiler bırakmaktadır (Hornsey ve Fielding, 2020). Hükümetlerarası İklim Değişikliği Paneli (IPCC) tarafından yayımlanan 6. Değerlendirme Raporu (2022), mevcut sera gazı seviyelerinin ve emisyon eğilimlerinin 2040 yılına kadar dünya çapında daha sert iklim olaylarına yol açacağını öngörmektedir. Bu süreç, kentlerin ormansızlaşması, biyoçeşitliliğin azalması, iklim sistemindeki dönüşümler ve kentsel ısı adalarının güçlenmesi gibi birçok önemli çevresel değişime sebep olmaktadır (IPCC, 2022; Türkeş, 2022).

Özellikle kentleşmenin hızla artması, kentsel alanların doğal peyzaj öğelerinden uzaklaşarak betonlaşmış geçirimsiz yüzeylerin artmasına ve kentsel ısı adası (KIA) etkisinin güçlenmesine neden olmaktadır (Daemei vd., 2018). Yeşil alanların azalması, buharlaşma ve terleme süreçlerinin zayıflaması ve kentsel yüzeylerde sıcaklığın tutulması, kentlerde biyoklimatik konforun düşmesine ve halk sağlığını tehdit eden ısı stresinin artmasına yol açmaktadır (Oke, 1982; Grimmond ve Oke, 1991; Yılmaz,2019).

Dünya nüfusunun yaklaşık %55'i kentlerde yaşamaktadır ve 2050 yılına kadar bu oranın %70'e ulaşacağı öngörülmektedir (UNDESA, 2023; WHO, 2023). Kentleşme eğilimleri arttıkça, kentlerin iklim sistemi üzerindeki baskısının daha büyük bir sorun haline gelmesi kaçınılmazdır (IPCC, 2022). Bununla birlikte, kentlerde ısıl konforun sağlanması, kentsel planlama ve sürdürülebilirlik stratejileri açısından kritik bir gereklilik olarak öne çıkmaktadır.

Kentsel ısı adası, yapılı çevrelerin etkisiyle kentlerde sıcaklıkların kırsal alanlara göre daha yüksek olmasına sebep olmaktadır (Oke, 1982; Arnfield, 2003; Streutker, 2003). Mikroiklim etkileri, özellikle binaların konumu, yapı yüzeylerinde kullanılan malzemeler ve kent içi yeşil alanların eksikliği gibi faktörlerden doğrudan etkilenmektedir. Yapılan çalışmalar, ağaçların ve yeşil alanların kentsel ısı adası etkisini hafifletmede önemli bir rol oynadığını ortaya koymaktadır (Allegrini vd., 2012; Altunkasa, 2019; Yılmaz, 2019).

Yeşil alanlar, kentlerin termal konforunu artırarak, enerji tasarrufu sağlamakta, hava kalitesini iyileştirmekte ve kentsel mekanların yaşanabilirliğini desteklemektedir (Steemers, 2003; Fahmy ve Sharples, 2009; Lin vd., 2010). Planlı peyzaj tasarımlarının kent içindeki mikroiklimi olumlu yönde etkilediği ve özellikle su yüzeylerinin serinletici bir rol oynadığı belirlenmiştir (Jin vd., 2005; Bowler vd., 2010; Gunawardena vd., 2017).

Kentlerde alternatif yeşil alanların oluşturulması, suyun etkin kullanımı, hava kalitesinin artırılması ve doğal bitki türlerinin kent ekosistemine entegre edilmesi, kentsel sürdürülebilirlik açısından kritik faktörlerdir (Güneroğlu, 2018; Yılmaz vd., 2019; Oğuztürk, 2023). Planlı yeşil alan tasarımı, yalnızca kent estetiğine değil, aynı zamanda termal konforun iyileştirilmesine ve ısı stresinin azaltılmasına da doğrudan katkı sağlamaktadır. Rüzgar akışının yönlendirilmesi, gölgeleme etkisi, su yüzeylerinin mikroiklim dengesi gibi unsurlar, kentlerde biyoklimatik konforun sürdürülebilir şekilde sağlanmasında büyük önem taşımaktadır (Hsieh vd., 2016; Kong vd., 2017,).

Bu çalışmada, Sivas Kent Meydanı'nın mikroklimatik yapısını desteklemek ve kent ekosistemine uyumlu bir peyzaj tasarımı oluşturmak amacıyla farklı bitkisel tasarım senaryoları önerilmektedir. Kentin iklim koşullarına uygun olarak belirlenen bitki türleri, meydanın hem görsel hem de ekolojik işlevini iyileştirmeye yönelik tasarlanmıştır.

Önerilen peyzaj senaryoları, kent meydanında doğal çevre ile entegre, estetik ve fonksiyonelliği ön plana çıkaran bitkisel düzenlemeler içermektedir. Yeşil alanların

mikroklimatik etkilerinden faydalanılarak, kent sakinlerinin termal konforunun artırılması ve meydanın kullanım kalitesinin yükseltilmesi amaçlanmaktadır.

Kentsel mikroiklim analizlerinde bilimsel temeller sunan ENVI-met modeli, kent içi malzeme yüzeyleri, bitki yoğunluğu ve hava akışı gibi unsurları değerlendirerek, farklı tasarım senaryolarının biyoklimatik konfor üzerindeki etkisini ölçmektedir (Bruse vd., 1998; Ng vd., 2012). Modelin sunduğu detaylı simülasyonlar, kent meydanları, parklar ve yeşil alanların planlanmasında termal stresin azaltılmasına yönelik veri sağlamaktadır.

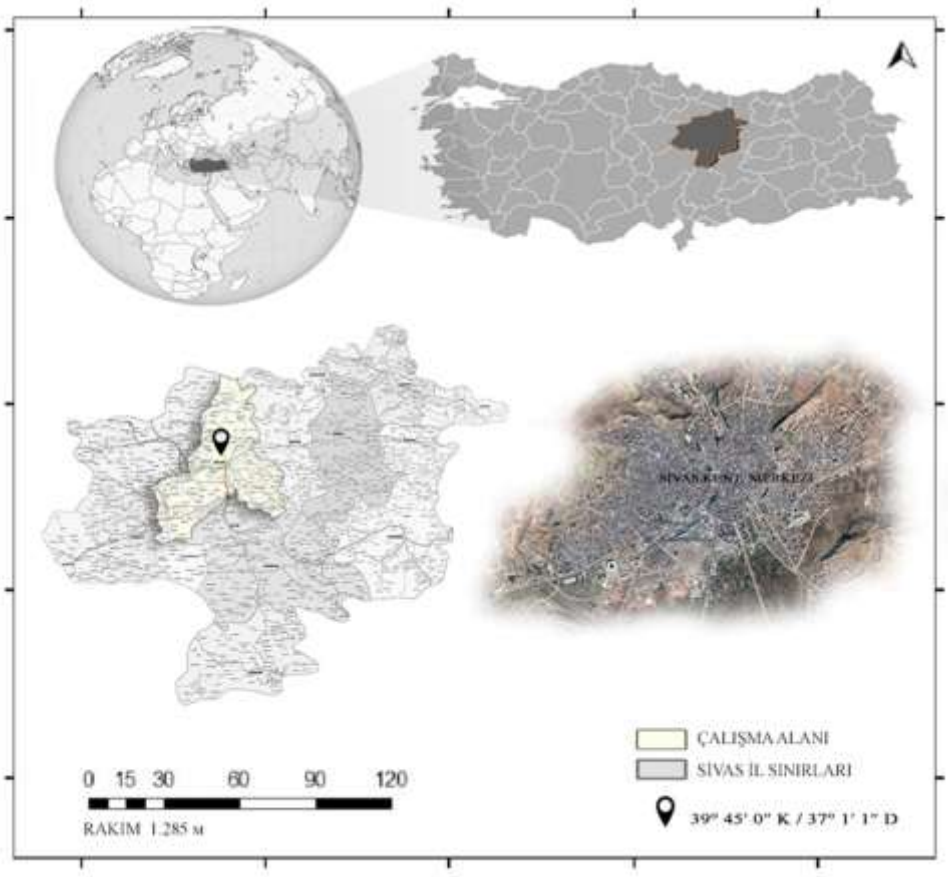
Çalışmada önerilen tasarım yaklaşımları, ilerleyen süreçlerde mikroklimatik simülasyonlarla test edilebilecek şekilde yapılandırılmış olup, ENVI-met analizleri için bilimsel bir temel oluşturmayı ve kentsel alanlarda biyoklimatik konforun artırılmasına katkı sağlamayı hedeflemektedir

2. MATERYAL VE YÖNTEM

Materyal

Bu çalışmanın materyalini Sivas Tarihi Kent Meydanı oluşturmaktadır.

Sivas, İç Anadolu Bölgesi'nin Yukarı Kızılırmak Havzası'nda yer almakta olup Türkiye'nin yüz ölçümü açısından en büyük ikinci ili konumundadır. 36° ve 39° doğu boylamları ile 38° ve 41° kuzey enlemleri arasında bulunan kent, doğuda Erzincan, batıda Yozgat, güneyde Malatya ve Kahramanmaraş, kuzeyde Ordu ve Tokat, kuzeydoğuda Giresun ve güneybatıda Kayseri illeri ile çevrilidir (Demiroğlu ve Memlük, 2015). (Şekil 1 de Sivas iline ait coğrafi konum ve Şekil 2'de çalışma alanına ait görsel verilmiştir.)



Şekil 1. Sivas kenti coğrafi konumu

Şekil 2. Çalışma alanı görseli (URL-1)

Sivas Kent Meydanı ve Tarihî Özellikleri

Sivas Kent Meydanı, tarihî dokusu ve kültürel yapıları ile kent yaşamının merkezinde yer almaktadır. Anadolu'nun ortasında geniş bir coğrafyaya sahip olan Sivas, tarih boyunca birçok uygarlığa ev sahipliği yapmıştır. Hititler, Romalılar, Bizanslılar gibi medeniyetlerin hâkimiyetinde kalan kent, Türklerin Anadolu'ya gelişi ile birlikte Türk kültürünün önemli merkezlerinden biri haline gelmiştir (Anonim, 2018).

Kent meydanı, Selçuklu dönemine ait medreseler, anıtsal yapılar ve kamu binalarıyla çevrili olup, tarih boyunca sosyal, kültürel ve ticari etkileşimin merkezi olmuştur. Sivas Kongresi'nin düzenlendiği şehir olması nedeniyle, Cumhuriyet'in temellerinin atıldığı kentlerden biri olarak da öne çıkmaktadır. (Şekil 3'te meydanın yapısı verilmiştir.)

Şekil 3. Tarihi Kent Meydanı (1-Şifaiye Medresesi, 2-Çifte Minareli Medrese, 3- Buruciye Medresesi, 4- Kale Cami, 5-Hamam Kalıntısı, 6- Hükümet Konağı, 7- Jandarma Binası, 8- Atatürk Anıtı, 9- 4 Eylül Kongre Binası, 10- Belediye Hizmet Binası, 11- Aynalı Çarşı, 12- Meydan Havuzu (URL-2).)

Sivas, Anadolu'nun önemli ulaşım merkezlerinden biri olup, hava, kara ve demiryolu bağlantıları açısından stratejik bir konuma sahiptir. Ankara-İstanbul, Erzincan-Erzurum ve Samsun ticaret yolları, kentin ulaşım ağının başlıca unsurlarını oluşturmaktadır (Taşabat, 2006).

Sivas, karasal iklim özelliklerine sahip olup, kış aylarında uzun süre kar örtüsü altında kalmakta, yaz aylarında ise sıcak ve kurak hava koşulları görülmektedir (ÇED ve Çevre İzinleri Şube Müdürlüğü, 2017).

Kent ekosistemi, doğal bozkır vejetasyonu ile ormansal bitki örtüsü arasında bir geçiş niteliği taşımaktadır. Bölgede yayılış gösteren bitki türleri kısa ömürlü ve kuraklığa dayanıklı olup, yaz aylarında kuru bir görünüme sahiptir (Ergün, 2016).

Kentin yüksek kesimlerinde ***Pinus nigra*** (karaçam), ***Pinus sylvestris*** (sarıçam), ***Fagus orientalis*** (kayın), ***Juniperus communis*** (ardıç) türleri yayılış gösterirken, kent merkezinde yapılan peyzaj çalışmalarında ***Tilia cordata*** (ıhlamur), ***Acer negundo*** (akçaağaç), ***Platanus orientalis*** (doğu çınarı) gibi bitkiler tercih edilmektedir (Zeren vd., 2017).

Yöntem

Bu çalışma kapsamında kullanılan yöntemler, veri toplama süreci, alan içerisinde mikroklimatik ölçümlerin yapılması ve bitkisel peyzaj tasarım senaryolarının oluşturulması olmak üzere üç ana başlık altında ele alınmıştır.

1- Veri Toplama

Çalışmada kullanılan veriler, literatür taraması, saha gözlemleri ve kent meydanının mevcut peyzaj yapısının incelenmesi yoluyla elde edilmiştir. Kentsel ekosistem üzerine yapılan akademik çalışmalar analiz edilerek, mikroklimatik konforu artırmaya yönelik peyzaj tasarım ilkeleri belirlenmiştir.

2- Alan İçinde 24 Saatlik Sıcaklık Ölçümü Yapılması

Araştırma alanında (Sivas Kent Meydanı'nda), 15.08.2024 tarihinde, belirlenen bir noktada, anemometre cihazı kullanılarak mikroklimatik veriler ölçülmüştür. 24 saat süren ölçüm sürecinde saatlik sıcaklık değerleri kaydedilmiş olup, gündüz saatleri sıcaklığı ortalaması 31.4 °C olarak hesaplanmıştır ve en yüksek sıcaklık değeri saat 13:00'de 39.4 °C olarak belirlenmiştir.

3- İklimi İyileştirmeye Yönelik Bitkisel Peyzaj Tasarım Senaryoları

Önerilen bitkisel peyzaj düzenlemeleri, kent meydanının mevcut dokusu korunarak oluşturulmuştur ve alanın mevcut bitkisel yapısı incelenmiştir.

Meydan için önerilen bitkisel tasarım senaryolarında, bitki türleri Sivas'ın iklim koşullarına dayanıklı, ekolojik sistemle uyumlu ve görsel açıdan estetik değer taşıyan bitkiler arasından seçilmiştir. Bitki seçim sürecinde şu kriterler dikkate alınmıştır:

- Kentsel mikroklimatik etkilere dayanıklılık
- Buharlaşma yoluyla soğutma etkisi
- Kentsel ekosistem ile uyum
- Gölgelik oluşturma kapasitesi

Çalışma kapsamında üç farklı bitkisel peyzaj tasarım senaryosu geliştirilmiştir:
- Yoğun Ağaçlandırma Senaryosu: Gölgelik alanların artırılması, termal konforun iyileştirilmesi.
- Su Kullanımı ve Az Yoğun Ağaçlandırma Senaryosu: Su yüzeyleri ile mikroklimatik denge sağlama.
- Çalı ve Az Yoğun Ağaçlandırma Senaryosu: Çalı gruplarıyla ekolojik dengeyi sağlarken yüzey sıcaklıklarını düşürme

Çizim ve modelleme süreci:

- AutoCAD ile teknik çizimler oluşturulmuştur.
- SketchUp Pro ile 3D modelleme yapılmıştır.
- Lumion ile görselleştirme ve render alma işlemleri gerçekleştirilmiştir

3. BULGULAR

Kent meydanında önerilen bitkisel peyzaj senaryoları, kent ekosistemine uyumlu bitki türlerini seçerek hem termal konforu artırma hem de mekânsal kimliği koruma stratejisini temel almaktadır. Her senaryo, kentsel mikroklimayı düzenleyerek kent sakinlerinin çevresel konforuna katkı sunmayı hedeflemektedir.

SENARYO 1: Yoğun Ağaçlandırma Bitkisel Tasarımı

Bu senaryoda, kent meydanında maksimum gölge alan oluşturulması ve sıcaklık dengesinin korunması hedeflenmiştir. Geniş yapraklı ve yüksek gölgelik etkisi bulunan ağaç türleri tercih edilerek kent sakinlerinin termal konforunu artırma amaçlanmıştır (Şekil 4; Şekil 5).

Şekil 4. Yoğun ağaçlandırılmış bitkisel tasarım (Senaryo 1)

Şekil 5. Bitkisel tasarım görselleri, (Senaryo 1)

Bu tasarım yaklaşımı, kent meydanında yoğun bitkisel örtü oluşturmayı öngörerek yüzey sıcaklıklarının düşürülmesine ve hava akışının optimize edilmesine katkı sağlayabilir (Menteş ve Yılmaz, 2025). Gölgelik alanların artırılması, özellikle yaz aylarında meydan kullanıcıları için konforlu mekanlar oluşturulmasını destekleyebilir. Ayrıca, su buharlaşması ve yaprak yüzeylerinden gerçekleşen doğal soğutma etkileri sayesinde sıcaklık kontrolünün sağlanabileceği öngörülmektedir (Jandaghian ve Colombo, 2024).

Seçilen Bitkiler ve Mikroklimatik Etkileri:

Tilia cordata (Ihlamur): Yoğun gölgelik oluşturarak yüzey sıcaklıklarını düşürür ve su buharlaşması yoluyla serinletici etki sağlar.

Betula pendula (Huş Ağacı): Dikey yapısı ile güneş ışığını kırarak sıcaklık stresini azaltır.

Malus floribunda (Süs Elması) ve ***Pyrus calleryana*** (Süs Armudu): Estetik ve mikroklimatik katkı sunarak yeşil alanın ekolojik işlevselliğini artırır.

Acer platanoides 'Globosum' (Çınar Yapraklı Top Akçaağaç)***:*** Kentsel peyzajda mikroklimatik stabiliteyi destekleyerek uzun vadeli ekolojik sürdürülebilirlik sağlar (Şekil 6).

Şekil 6. Senaryo 1 tasarımında kullanılan bitkilerin görselleri (URL-3)

Senaryo kapsamında tarihi yapılara yaklaştıkça bitki boyları bilinçli olarak küçültülerek, kent dokusunun korunması ve tarihi yapıların görünürlüğünün artırılması amaçlanmıştır.

SENARYO 2: Su Kullanımı ve Az Yoğunlukta Ağaçlandırma Bitkisel Tasarımı

Bu senaryoda, bitkisel peyzaj ile su yüzeyleri bir araya getirilerek mikroklimatik denge sağlanması hedeflenmiştir. Ağaçların yoğunluğu belirli noktalarda azaltılarak, meydanın odak noktalarında su yüzeyleri kullanılmıştır (Şekil 7; Şekil 8).

Şekil 7 . Az yoğun ağaçlandırma ve su kullanımı tasarımı (Senaryo 2)

Şekil 8. Bitkisel tasarım görselleri (Senaryo 2)

Su yüzeyleri, kentsel alanlarda doğal bir serinletici etki sağlayarak, sıcaklık stresinin azalmasına katkıda bulunmaktadır (Menteş ve Yılmaz, 2025). Bu strateji doğrultusunda, kent meydanında farklı mikroklimatik unsurların bir araya getirilmesiyle termal konforun iyileştirilmesi hedeflenmektedir.

Seçilen Unsurlar ve Mikroklimatik Etkileri :
Platanus acerifolia ve Platanus orientalis (Çınar Ağacı): Geniş yaprakları ile gölge sağlar ve serinletici etki oluşturur.
Su yüzeyleri: Buharlaşma etkisi sayesinde çevresel serinletme sağlar ve hava dolaşımını optimize eder.
Ekolojik sistem uyumu: Su yüzeyleri ile uyumlu bitki türlerinin seçilmesiyle kentsel sürdürülebilirlik hedeflenmiştir (Şekil 9).

Şekil 9. Senaryo 2 tasarımında kullanılan bitkilerin görselleri (URL-4).

Bu senaryoda, kent meydanının odak noktalarında su yüzeyleri ile bitkisel tasarımın entegre edilmesi, mekânsal estetik ve mikroklimatik etkilerin optimize edilmesi açısından önemli bir potansiyel taşımaktadır (Jandaghian ve Colombo, 2024).

SENARYO 3: Çalı ve Az Yoğunlukta Ağaçlandırma Bitkisel Tasarımı

Bu senaryoda ise, ağaç yoğunluğu dengelenerek çalı gruplarıyla mikroklimatik dengenin desteklemesi hedeflenmiştir. Daha düşük boyutlu bitki türleri ile hava dolaşımı düzenlenerek ve yüzey sıcaklıkları üzerinde dengeleyici bir etki beklenmektedir (Tamaskani Esfehankalateh vd., 2021), (Şekil 10; Şekil 11; Şekil 12).

Şekil 10. Çalı ve az yoğunlukta ağaçlandırma bitkisel tasarımı (Senaryo 3)

Şekil 11. Bitkisel tasarım görselleri (Senaryo 3)

Şekil 12. Bitkisel tasarım görselleri (Senaryo 3)

Bitki yoğunluğunun dengelenmesiyle birlikte, kentsel tasarımda kent ekosistemiyle uyumlu bitkiler tercih edilerek sürdürülebilir yeşil alanlar oluşturulmuştur. Bu senaryoda kent sakinlerinin kullanımı için dinlenme ve geçiş noktaları göz önünde bulundurularak, görsel ve ekolojik açıdan dengeli bir peyzaj yapısı kurgulanmıştır.

Seçilen Bitkiler ve Mikroklimatik Etkileri:

Cornus alba (Süs Kızılcığı): Estetik ve dirençli çalı türü, kentsel ekosistemi destekler.

Viburnum opulus (Kartopu): Çiçeklenme dönemi ve ekolojik katkılarıyla kentsel peyzajı güçlendirir.

Juniperus spp. (Ardıç): Sivas'ın iklimine dayanıklı, kuraklık stresine dirençli, ekolojik sürdürülebilirliği destekleyen bitki türü (Şekil 13).

Şekil 13. Senaryo 3 tasarımında kullanılan bitkilerin görselleri (URL-5).

4. SONUÇ VE ÖNERİLER

Kentleşme sürecinin hızlanmasıyla birlikte, ekosistemlerin dönüşümü ve doğal alanların azalması kentlerin mikroklimatik dengesini bozarak kentsel ısı adasının artmasına ve insan sağlığının olumsuz etkilenmesine yol açmaktadır**. Yeşil alanların kent içindeki yetersizliği, bu sürecin en önemli nedenlerinden biri olarak öne çıkmaktadır (Cui vd., 2016; Yılmaz ve Öztürk, 2023).**

Kent meydanları, **mikroklimatik konforun sağlanması ve kentsel ekosistemin dengelenmesi açısından kritik öneme sahiptir** (Bruse vd., 1998; Ng vd., 2012). Yeşil alanlar, **hava sıcaklığını düzenleyerek, güneş ışığını filtreleyerek ve su buharlaştırma yoluyla çevresel serinletme sağlayarak** kent içerisindeki sıcaklık stresini azaltmaktadır (Güneroğlu, 2018).

Bu çalışma kapsamında, **Sivas Kent Meydanı'nda önerilen bitkisel peyzaj senaryoları ile,** kentsel ısı adası etkisini azaltarak termal konforu sağlamak **ve kent kimliğiyle uyumlu bir yeşil altyapı oluşturma**k amaçlanmıştır. **Mevcut yapı korunarak**, kentsel peyzajın **mikroklimatik etkilerini güçlendirecek** bitkisel tasarım senaryoları üretilmiştir. Önerilen senaryolarda bitkisel peyzaj düzenlemeleri ve su yüzeylerinin kullanımı ile kentsel termal konforun artırılması hedeflenmiştir.

Yapılan araştırmalar, ağaç gölgelik oranının %15 artırılmasının sıcaklığı 2.0 °C'ye kadar düşürebileceğini göstermektedir (Middel vd., 2015). Ayrıca, kent ölçeğinde yapılan çalışmalarda, bitki örtüsünün ve gölgeleme etkisinin kentsel ısı adasını azaltıcı bir rol oynadığı tespit edilmiştir (Shashua-Bar vd., 2010; Lin vd., 2010; Meier ve Scherer, 2012; Antoszewski vd., 2020).

Su yüzeyleri de kentsel ısı adası etkisini azaltmada önemli bir rol oynamaktadır. Yapılan araştırmalar, su yüzeylerinin hava sıcaklığını yaklaşık 2.5 °C düşürebileceğini ortaya koymaktadır (Jin vd., 2005; Bowler vd., 2010; Gunawardena vd., 2017).

Bu doğrultuda üretilen bitkisel peyzaj tasarım senaryolarının (Yoğun Ağaçlandırma Senaryosu, Su Kullanımı ve Az Yoğun Ağaçlandırma Senaryosu, Çalı ve Az Yoğun Ağaçlandırma Senaryosu) Sivas Kent Meydanı'nda kentsel ısı adası etkisini azaltarak termal konforu artıracağı ve sıcaklığı 2-3 °C'ye kadar düşürebileceği öngörülmektedir. Alan düzenlemeleri, tarihi dokunun korunması esas alınarak gölgeleme etkisi dengeli bir şekilde oluşturulmuş, bitkisel peyzaj tasarımında mekânın fonksiyonel ve estetik değerleri öncelikli olarak ele alınmıştır.

İlerleyen süreçlerde, önerilen tasarım yaklaşımları mikroklimatik simülasyonlarla değerlendirilebilir ve ENVI-met analizleri ile bilimsel olarak incelenerek, kentsel alanlarda biyoklimatik konforun artırılmasına yönelik katkılar sunabilir.

Belediyelerin önerilen peyzaj tasarım senaryolarını daha geniş alanlara uygulamasıyla kentsel ısı adası etkisini azaltabileceği ve kentin termal konforunu iyileştirebileceği öngörülmektedir. Ayrıca, daha çok yeşil alanın kentlerin peyzaj değerine katkı sağlamasının yanı sıra, kentlerin termal konforunu iyileştireceği düşünülmektedir.

EFFECTS OF SOLARIZATION AND FUMIGANT APPLICATIONS ON WILT AND ROOT ROT DISEASE IN TOMATO

DOMATESTE SOLGUNLUK VE KÖK ÇÜRÜKLÜĞÜ HASTALIĞINA SOLARİZASYON VE FUMİGANT UYGULAMALARININ ETKİLERİ

Hale Günaçtı, Seral Yücel ve Muhammed Tatar
Corresponding author: hale.gunacti@sivas.edu.tr

ÖZET

Seracılık, dünya genelinde özellikle tropikal ve subtropikal bölgelerde önemli bir ekonomik faaliyet olup, domates gibi yüksek değerli sebzeler bu üretimin önemli bir parçasıdır. Ancak, serada fungal hastalıklar, özellikle toprak kökenli patojenler, verimde kayıplara ve kalitede düşüşlere yol açmaktadır. Dikim öncesi toprak fumigasyonu, toprak kaynaklı zararlıları kontrol etmek için kullanılan yaygın bir yöntemdir. Bu çalışmada, seralarda domateste solgunluk ve kök çürüklüğüne neden olan toprak kökenli patojenler (*Fusarium oxysporum ve Rhizoctonia solani*) ile mücadelede, solarizasyon ve solarizasyon ile metam potasyum fumigantının azaltılan dozlarının etkileri araştırılmıştır. Araştırma, 2020 yılında Mersin ilinin Tarsus ve Akdeniz ilçelerinde yer alan 2 farklı domates serasında yürütülmüştür. Tarsus/Mersin ve Yenitaşkent-Akdeniz/Mersin seralarında yapılan denemelerde, solarizasyon ve solarizasyon + metam potasyum fumigantının azaltılan dozları (45, 60, 75 ve 100 L/da) uygulanmıştır. Denemelerde, kullanılan fumigant dozlarının hastalık çıkışını azaltmada % 68,9 ile %93,3 etkili olduğu yalnızca solarizasyon uygulamasının ise %54,46 ile %43,38 arasında etki sağlandığı belirlenmiştir. Solarizasyon uygulamaları ile her iki denemede de önemli bir hastalık kontrolü sağlanmış, ancak solarizasyon+fumigant uygulamaları daha yüksek etki göstermiştir. Özellikle solarizasyon +75 L/da dozunda metam potasyum uygulamasında, hastalık çıkışını etki %92,42-%93.3 olarak belirlenmiştir. Sonuçlar, solarizasyon + azaltılan dozlarda metam potasyum uygulamalarının toprak kökenli hastalıkların kontrolünde etkili olduğunu göstermektedir. Ayrıca, hasatta yapılan verim değerlendirmelerinde kontrole göre solarizasyon + azaltılan dozda fumigant uygulanan parsellerden 1,2- 2,1 kg/m^2 fazla verim elde edilmiştir.

Anahtar Kelimeler: Toprak kökenli patojenler, solarizasyon, metam potasyum, domates, sera

1. GİRİŞ

Seracılık, dünya çapında sebze üretiminin önemli bir kısmını oluşturmakta ve bu üretim, genellikle iklim koşullarından bağımsız olarak yapılan örtü altı tarımını kapsamaktadır. Domates, seracılıkta yetiştirilen en yaygın sebzelerden biridir ve yüksek pazar değeri ile çiftçilerin gelirini artırmaktadır. Ancak, sera ortamlarında toprak kökenli hastalıklar ciddi verim kayıplarına neden olabilir. Bu patojenler, özellikle domates gibi ekonomik değeri yüksek bitkilerde, kök hastalıklarına yol açarak bitkilerin gelişimini olumsuz yönde etkiler (Yücel ve ark., 2015).

Sürekli aynı toprağa aynı ürünün ekilmesi, ürün verimini, kalitesini ve çiftçi gelirini azaltan toprak kaynaklı hastalıklarda artışa yol açan önemli faktörlerdir (Liu ve ark.,2022). Köklerin ve gövdelerin fide aşamasındaki enfeksiyonu genellikle %20~30 ürün azalmasına neden olur, ancak hastalık şiddetli olduğunda %50~60 ürün kaybına veya hastalık çok şiddetli olduğunda %100 ürün kaybına yol açabilir (Cao ve ark. 2022). Üreticilerin toprak kaynaklı hastalıkları kontrol etmede yaşadığı zorluk, Türkiye'de yüksek değerli ürünlerle ekilen alanların genişlemesini kısıtlamıştır. Özellikle *Fusarium oxysporum*, *Rhizoctonia solani* gibi patojenler, kök çürüklüğü ve solgunluk gibi hastalıklara yol açarak bitki sağlığını tehdit etmektedir (Bhat et al., 2015). Bu etmenlerle mücadele için yaygın olarak kimyasal ve biyolojik yöntemler kullanılmakta, ancak bu yöntemlerin etkinliği, hastalıkların yayılma hızına ve çevresel faktörlere bağlı olarak değişkenlik gösterebilmektedir. Seralarda, bu tür hastalık etmenlerine karşı etkili bir mücadele, ekim öncesi toprak dezenfeksiyonu ile sağlanabilir. Solarizasyon uygulaması toprak kökenli fungal patojenlerin kontrol altına alınmasında kullanılan yaygın bir yöntemdir. Geleneksel kimyasal fumigantlar, hızlı ve etkili bir çözüm sunsa da çevresel etkileri, insan sağlığı üzerindeki potansiyel zararları ve yüksek maliyetler gibi sorunlar bu yöntemlerin kullanımını sınırlamaktadır. Son yıllarda, çevre dostu alternatiflerin geliştirilmesi önemli bir araştırma konusu olmuştur. Solarizasyon, güneş enerjisi ile toprağın sıcaklığını arttırarak patojenleri öldürmeyi amaçlayan çevre dostu bir yöntemdir (Hansen et al., 2007). Bununla birlikte, metam potasyum içeren kimyasal fumigantlar, toprağın mikroorganizma ve patojenik yükünü hızla azaltabilen etkili bir yöntem olarak öne çıkmaktadır. Dikim öncesi toprak fümigasyonu, sebzelerde toprak kaynaklı fungal patojenleri, nematodları ve yabani otları kontrol etmek için yaygın olarak uygulanmaktadır. Fumigantlar genellikle yüksek değerli ürünlerin toprak kaynaklı patojenlerini kontrol etmek için kullanılır, ancak hedef olmayan toprak mikroorganizmalarını da etkilemektedir. Kloropikrin (CP), 1,3-dikloropropen (1,3-D) veya metam bazlı ürünler (metam sodyum ve metam potasyum) gibi toprak fumigantları, toprak kaynaklı hastalıkları kontrol etmek ve verimi artırmak için yaygın olarak kullanılmaktadır (Locascio ve ark., 2014; Zhang ve ark., 2019; Li ve ark., 2021). Günümüzde kullanılan fumigantlar, Ozon tabakasına zarar vermesi nedeniyle 2015 yılında küresel olarak yasaklanan metil bromürün (MB) yerini almışlardır (UNEP, 2000). Yapılan çalışmalar geniş spektrumlu fumigant uygulamalarının toprak mikrobiyomu üzerindeki etkileri yoluyla dolaylı olarak bitki verimliliğindeki artışı desteklediğini gösterirken özellikle fumigant uygulamasından sonraki ilk dört hafta boyunca hedef olmayan toprak mikrobiyal topluluklarının bolluğunu, çeşitliliğini ve bileşimini etkileyebileceğini de ortaya koymuştur (Khatri ve ark., 2021; Zhu ve ark., 2020; Yu ve ark., 2019, 2021a, 2021b; Castellano-Hinojosa ve ark., 2022). Üreticiler, MB ün kullanımdan kaldırılmasından sonra çeşitli fumigant alternatifleri uygulamaya çalışmışlardır. Alternatif fumigant uygulamalarının toprak kökenli fungal patojenleri kontrol ederken bitki büyümesini ve verimliliğini artırmak ve geliştirmek yetiştiriciler için büyük önem taşımaktadır.

Bu çalışma, domates yetiştiriciliğinde toprak dezenfeksiyonu için solarizasyon ve metam potasyum içeren fumigantın yalnız ve azaltılan dozda birlikte uygulanmasının etkinliklerini

karşılaştırarak, daha sürdürülebilir ve verimli yöntemlerin belirlenmesini ve ülke çiftçimizin kullanımına sunmayı amaçlamaktadır.

2. MATERYAL VE METOT

Denemeler, 2020 yılı yaz döneminde bir önceki üretim dönemi sonunda kök hastalıkları ile bulaşık olduğu belirlenen Tarsus/Mersin ve Yenitaşkent-Akdeniz/Mersin'deki 2 domates serasında yürütülmüştür. Denemede kullanılan ilaçlar ve dozları Çizelge 1' de verilmiştir.

Çizelge 1. Domateste solgunluk ve kök çürüklüğü hastalığına karşı sera koşullarında denemeye alınan ilaçlar ve dozları

İlacın Ticari Adı	Firması	Etkili Madde Adı / Yüzdesi ve Formülasyonu	Dozu L /da
Tamifume 690	Platin Kimya Mümessillik ve Dış Ticaret A.Ş.	Metam Potassium ***690*** g/l SL	45, 60,75,100

Deneme bloklara (şerit parsellere) uygulama şeklinde yapılmış, tekrarlar her blok içinde alınmıştır. Her uygulama dozu için seranın farklı yerinde 2 bloka uygulama yapılmıştır. Metam potasyum fumigantının (MP) ruhsatlı dozu 125L/da olduğu için solarizasyon ile kombinasyonu uygulamalarında 100, 75, 60, 45 L/da dozlar alınmıştır. Deneme desenine göre 6 karakter (yalnız solarizasyon uygulaması (S), S +MP 45 L/da, S+ MP 60 L/da, S+ MP 75 L/da, S+ MP 100L/da ve Kontrol) ve 4 tekrarlı olacak şekilde düzenlenmiştir. Deneme parselleri yaklaşık 40 m^2 alınmıştır. Parsellere yaklaşık 100 Alaturka F1 çeşidi domates fidesi dikilmiş ve her parselden 25 bitki değerlendirilmeye alınmıştır. Parsel aralarında 2 sıra emniyet şeridi bırakılmıştır. Deneme yapılan Tarsus serasında toprak yapısı kumlu-tınlı olup, pH değeri 7.2, organik madde oranı ise %1.6'dır. Yenitaşkent serası ise hafif alkali toprak yapısına sahip olup, pH değeri 7.8, organik madde oranı ise %2.1 olarak belirlenmiştir. Solarizasyon uygulaması Temmuz ayında uygulanmış, 4 hafta sonra fumigant uygulamaları, damla sulama sistemi ile örtü altından yapılmıştır. 2 hafta sonra örtüler açılmış havalandırmadan sonra fide dikimi yapılmıştır. Toprak sıcaklıkları veri kaydediciler (Onset Computer Corporation, Bourne, MA, ABD) tarafından kaydedilmiştir. Hobolar parsellerde 5, 10 ve 20 cm derinliğe yerleştirilmiştir.

Verim Değerlerinin Alınması

Denemelerde farklı uygulamalarının yapıldığı parsellerden ve kontrol parselinden domates meyveleri toplanarak tartılmış, elde edilen kasa sayılarından kg/m^2 olarak toplam verim hesaplanmıştır.

Uygulamaların patojenler üzerine etkilerinin belirlenmesi

Uygulamaların toprak kökenli fungal patojenler *Fusarium oxysporum ve Rhizoctonia solani* ve hastalık oranı üzerindeki etkilerini belirlemek amacıyla vegetasyon dönemi sonunda dikimden yaklaşık 5,5 ay sonra 11.02.2020 tarihinde her parselden ortadaki 25 domates bitkisi sökülerek hasta veya sağlam olarak değerlendirme yapılmıştır. İletim demetlerinde renk bozukluğu görülen bitkiler hasta olarak değerlendirilmiştir (Şekil.1). Bu bitkilerden fungal izolasyon çalışması yapılarak hastalığa neden olan etmenler belirlenmiştir.

Şekil 1. İletim demetlerinde ve köklerde görülen renk değişikliği

Fungal Patojenlerin İzolasyon Çalışmaları

Her iki deneme alanından alınan hastalıklı bitkilerin kök kökboğazı ve gövdelerinden izolasyonlar yapılmıştır. Bunun için 5-6 mm büyüklüğünde kesilen infekteli dokular %2'lik sodyum hipoklorit (NaOCl) içerisinde yüzeysel olarak dezenfekte edildikten sonra 2 kez steril distile su ile durulanarak steril kurutma kağıtları üzerinde 15-20 dakika kurutulmuştur. Daha sonra bu dokular, içerisine 250 mg/L dozunda streptomicine eklenen PDA (Patates Dekstroz Agar) ortamına ekilmiş ve bu petriler 24 °C sıcaklıkta 4-5 gün süreyle karanlıkta inkübe edilmiştir. İnkübasyon süresi sonunda gelişen kolonilerden mikroskobik teşhisler yapılmıştır. Elde edilen funguslardan saflaştırma yapılmış ve PDA eğiklerinde, +4°C'de saklanmıştır.

İstatistik analiz

Uygulama yapılan parsellerde hasta bitki sayısının toplam bitki sayısına oranlanması ile hastalık oranları bulunmuş ve Abbot uygulanarak ilaçların yüzde etkileri saptanmış, açı değerleri karşılıklarına F testi uygulanarak ilacın dozları arasındaki farklılıklar ortaya konulmuştur.

3. BULGULAR

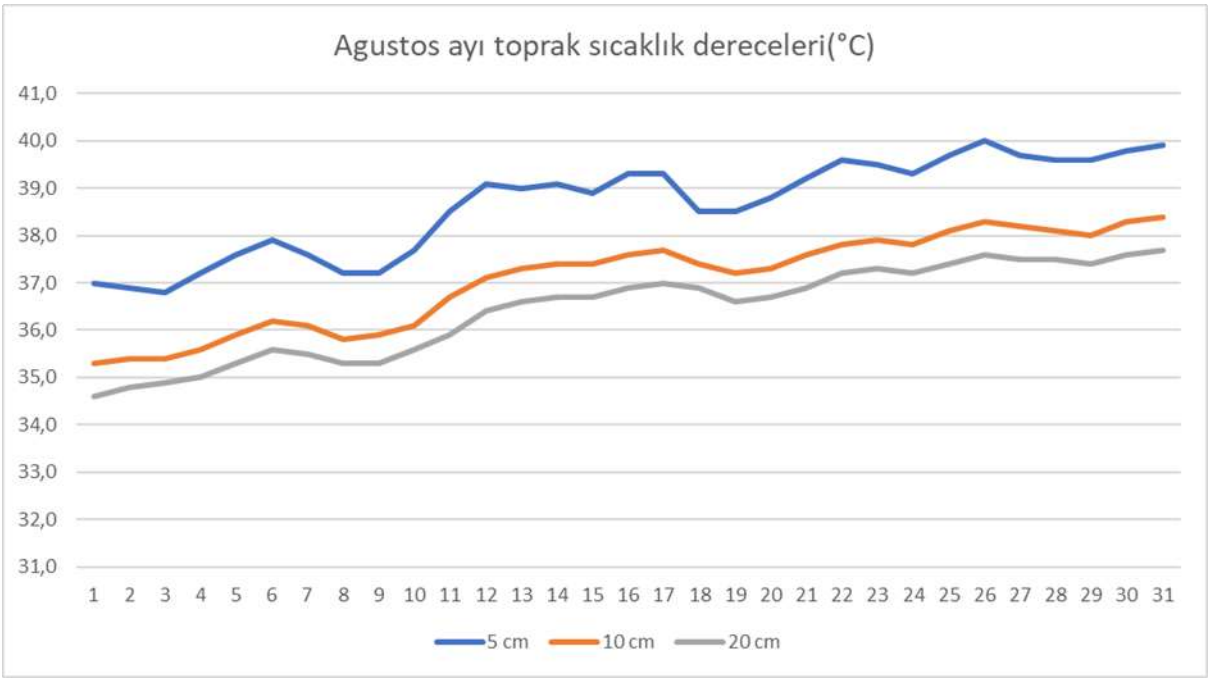
Toprak kaynaklı patojenler ve hastalık oranı üzerindeki uygulamaların etkileri

Hastalık belirtileri gösteren bitkilerden yapılan izolasyon çalışmaları sonucunda *Fusarium oxysporum ve Rhizoctonia solani* fungusları tespit edilmiştir. Denemeye alınan fumigant dozlarının ve solarizayon uygulamasının hastalık çıkışına etkileri Çizelge 2 de verilmiştir. Yenitaşkent bölgesinde yürütülen denemede Solarizasyon uygulamasının hastalık çıkışına etkisi %54,46 olarak belirlenmiştir. Ancak, solarizasyon + metam potasyum uygulamaları, özellikle 75 L/da dozunda, en yüksek etkinliği göstermiş ve etki %92,42 olmuştur. Metam potasyum fümigantının 100 L/da dozunda ise hastalık çıkışına etki oranı %92,71'olarak belirlenmiştir. Tarsus bölgesinde de benzer sonuçlar elde edilmiştir. Solarizasyon uygulamasında hastalık çıkışına etki oranı %43,38 bulunurken, solarizasyon+ fumigant uygulamaları, yine en yüksek etkiyi göstermiş ve solarizasyon+ 75 L/da dozundaki metam potasyum uygulamasında etki %93,30olarak belirlenmiştir. Fumigantın 100 L/da uygulaması ise etki benzer oranda %92,71'bulunmuştur.

Çizelge 2. Yenitaşkent ve Tarsus deneme seralarında uygulamalar ve elde edilen etkiler(%)

Uygulamalar	Yenitaşkent Etki (%)	Tarsus Etki (%)
Solarizasyon	54,46 d	43,38 c
Sol+MP 45 L/da	77,3 c	68,9 b
Sol+MP 60 L/da	85,48 b	79,76 ab
Sol+MP 75 L/da	92,42 a	93,3 a
Sol+MP 100 L/da	92,71 a	92,71 a

Deneme alanından hobolar ile elde edilen sıcaklık değerlerine bakıldığında (Şekil 2) en yüksek toprak sıcaklığı(40 °C) solarizasyon uygulaması yapılan parsellerde 10-20 cm derinlikte elde edilirken en düşük toprak sıcaklık değeri(34,8 °C) ise uygulama yapılmayan kontrol parsellerinde elde edilmiştir. *Fusarium oxysporum* un 30 dk. ıslak ısıtmada 57.5-60 °C de canlılığını kaybettiği Shlevin ve ark. (2012) tarafından bildirilmiştir.



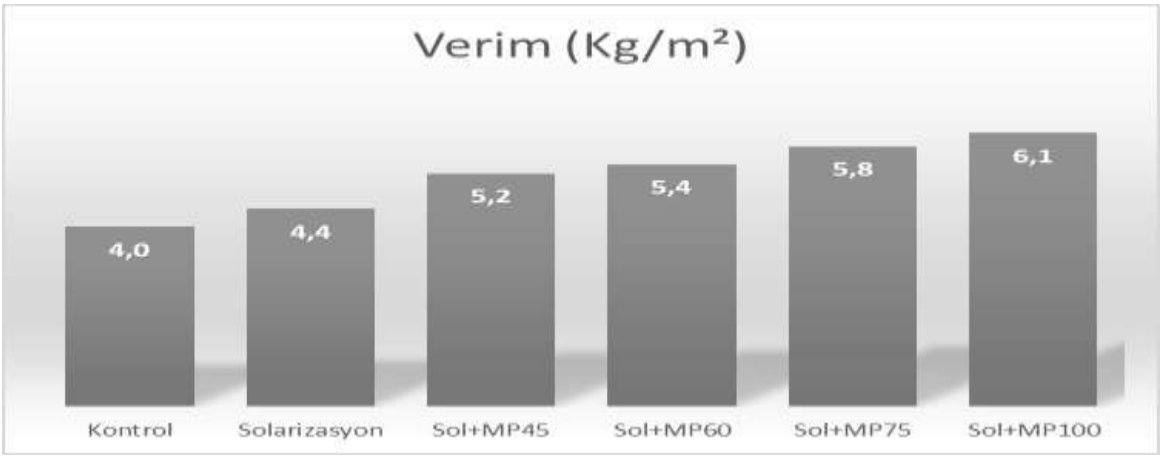
Şekil 2. Deneme alanlarından alınan sıcaklık değerleri

Bu çalışmada da sadece solarizasyon uygulamasının domateste solgunluk ve kök çürüklüğü hastalığı etmenleri *F. oxysporum* ve *R. solani* yi elemine etmede yeterli etkiyi sağlayamadığı ancak Sol+MP 75 uygulamasının daha etkili sonuçlar verdiği belirlenmiştir (Şekil 3).

Şekil 3. Solarizasyon uygulaması ve uygulama parsellerinde hastalıklı ve sağlıklı domates bitkileri

Verim Değerleri

Domateste toprak kökenli patojenlerin dezenfeksiyonu amacıyla yapılan farklı uygulamalarda, Kontrol, Sol, Sol+MP 45, Sol+MP 60, Sol+MP 75, Sol+MP100 elde edilen ortalama verim değerleri Şekil 4'de verilmiştir. Kontrol uygulamalarında 4,0 kg/m^2 ürün alınırken, hastalığı kontrol etmede de en yüksek etkiyi gösteren Sol+MP 75 ve Sol+MP 100 uygulamalarında sırasıyla 5,8 kg/m^2 ve 6, 1 kg/m^2 ürün elde edilmiştir. Günümüze kadar yapılan çalışmalarda, solarizasyon uygulamasının domateste verimi arttırmaya yardımcı olduğu (Kumar vd. 2002) ve solarizasyonun fumigantlar ile kombinasyonunun soğanda hastalık çıkışını azaltıp verimi arttırdığı bildirilmiştir (Hartz vd., 1989).



Şekil 4. Deneme alanı seralardan alınan domates verim sonuçları (kg/m^2)

4. TARTIŞMA

Solarizasyonun toprak kökenli fungal patojenler üzerindeki etkisi; iklim, toprak koşulları ve topraktaki fungal propagüllerin dağılımını gibi çok sayıda değişkene bağlıdır (Pullman ve ark. 1979). Solgunluk hastalıklarının (*Fusarium* spp.) toprak solarizasyonuyla baskılanması büyük

ölçüde birçok üründe ve farklı deneysel koşullarda araştırılmıştır (Gamliel ve Katan1993). Domates Fusarium solgunluk hastalığı, Florida'daki (Chellemi ve ark. 1997), İsrail'deki (Gamliel ve Katan 1993) ve Türkiye'deki (Yücel ve Çınar 1989) tarla denemelerinde toprak solarizasyonu ile başarılı bir şekilde kontrol edilmiştir. Ancak bu etkinin toprağın ilk 5 cm derinliğinde olduğu ve fungal popülasyonu azaltmak için başka uygulamaların da gerektiği ortaya konulmuştur (Chellemi ve ark. 1994).

Toprak dezenfeksiyonu, seracılıkta hastalıkların kontrolü açısından kritik öneme sahiptir. Solarizasyon, çevre dostu ve ekonomik bir yöntem olmasına rağmen, fumigantlarla karşılaştırıldığında daha düşük etkinlik göstermektedir. Metam potasyum içeren fumigant, özellikle domates yetiştiriciliği gibi ekonomik olarak değerli ürünlerde daha verimli bir çözüm sunmaktadır Fumigantların etkinliği, kullanılan doz ile doğru orantılıdır ve bu uygulama dozunun doğru belirlenmesinin önemini vurgulamaktadır. Bu tür kimyasal uygulamaların çevresel etkileri ve kullanım maliyetleri göz önünde bulundurulduğunda solarizasyon daha çevre dostu ve düşük maliyetli bir alternatif olarak, özellikle düşük patojen yoğunluğu olan alanlarda tercih edilebilir.

Her iki denemede de solarizasyon+ Metam potasyum uygulamasının 75L/da dozunda en yüksek etkinliği sağladığı ve hastalık çıkışına etki oranlarının %92'lerin üzerinde olduğu görülmüştür. Solarizasyon uygulamasının yalnız uygulanmasıyla her iki bölge için de belirgin bir etki sağlansa da fumigant uygulamalarına kıyasla daha düşük etkili olduğu, önceki sezonda serada hastalık çıkışı yüksekse yalnız solarzaisyon uygulaması yerine ruhsatlı dozu 125L/da olan fumigantın azaltılan dozu(75L/da) ile kombine edilerek uygulanmasının yeterli etkiyi sağladığı görülmüştür.

Sonuçlar, fumigantların daha etkili olduğunu göstermektedir, ancak solarizasyonun toprak dezenfeksiyonunda ekonomik ve çevresel açıdan sürdürülebilir bir yöntem olduğu göz önünde bulundurulduğunda, daha yüksek etki için fumigantların azaltılan dozları ile uygulanmasının, entegre mücadele stratejilerinin oluşturulmasının gerektiği kanısına varılmaktadır.

5. SONUÇ VE ÖNERİLER

Bu çalışmada elde edilen veriler, solarizasyon ve metam potasyum içeren fumigantların azaltılan dozları ile kombinasyonunun domates seralarında toprak kökenli hastalıkların (*Fusarium oxysporum ve Rhizoctonia solani)* kontrolünde etkili bir yöntem olduğunu göstermektedir. Özellikle yüksek dozda(125L/da) uygulanan Metam potasyum fumigantının azaltılan dozunun(75 L/da) solarizasyon ile kombinasyonunun, hastalık çıkışına etkisi %92.42-%93,30'olarak belirlenmiştir. Solarizasyon ve metam potasyum içeren fumigantların toprak dezenfeksiyonundaki etkinliklerini karşılaştırıldığında fumigantların özellikle yüksek dozlarda daha fazla etkinlik sağladığı görülmekle birlikte, çevreye olan olası etkileri göz önünde bulundurularak dikkatli bir şekilde kullanılması gerekmektedir. Solarizasyon ise daha ekonomik ve çevre dostu bir alternatif olup, özellikle düşük dozlarda fumigantlarla kombinasyon halinde daha verimli sonuçlar verdiği sonucuna varılmıştır.

TEŞEKKÜR

Çalışmada destek sağlayan Platin Kimya Mümessillik ve Dış Ticaret A.Ş. teşekkür ederiz.

ABSTRACT

Potatoes play an important role as one of the world's staple foods. Potato is a strategic product in the agricultural sector, attracting attention for its nutritional value and various industrial uses. Potato production is also an important agricultural activity that contributes to rural development, both economically and socially. Although potato is grown almost everywhere in Turkey, the provinces of Niğde, Afyonkarahisar and Konya form the backbone of the country's production. The potato production process poses serious phytosanitary biotic risks. In addition to diseases caused by bacterial, fungal and viral agents, plant parasitic nematodes and entomological pests are problems that require continuous monitoring and intervention in production areas. Likewise, broadleaf and narrowleaf weeds are other factors that need to be controlled because of their competitive power and their potential as disease vectors. In this context, various chemical products are used within the framework of the plant protection policy in force in Turkey. The registered pesticides are grouped according to the target organisms and these groups include insecticides, fungicides, bactericides, nematicides and herbicides. In this study, the main bacterial, fungal, viral and phytoplasma diseases, nematodes, insect pests and common weed species encountered in potato production in Turkey and the current status of the registered plant protection products used against them are reviewed.

TÜRKİYE'DE PATATESTE YAŞANAN BİTKİ KORUMA SORUNLARI VE KİMYASAL MÜCADELESİNİN DURUMU

ÖZET

Patates, dünya genelinde temel besin kaynaklarından biri olarak önemli bir rol oynamaktadır. Hem besleyici değeri hem de çeşitli endüstriyel kullanım alanlarıyla dikkat çeken patates, tarım sektöründe stratejik bir üründür. Ayrıca patates üretimi hem ekonomik hem de sosyal yönüyle kırsal kalkınmaya katkı sağlayan önemli bir tarımsal faaliyettir. Türkiye'nin hemen her yerinde patates yetiştiriciliği yapılmakla beraber Niğde, Afyonkarahisar ve Konya illeri ülke genelinde üretimin omurgasını oluşturmaktadır. Patates üretim süreci, bitki sağlığı açısından ciddi biyotik riskler taşımaktadır. Bakteriyel, fungal ve viral etmenlerin neden olduğu hastalıkların yanı sıra entomolojik zararlılar bitki paraziti nematodlar üretim alanlarında sürekli izleme ve müdahale gerektiren sorunlardır. Aynı şekilde, dar ve geniş yapraklı yabancı otlar da hem rekabet gücü hem de hastalık etmenlerine vektör olma potansiyelleri nedeniyle mücadele edilmesi gereken diğer unsurlar arasında yer almaktadır. Bu kapsamda, Türkiye'de yürürlükte olan bitki koruma politikaları çerçevesinde, çeşitli kimyasal ürünler kullanımda bulunmaktadır. Ruhsatlı pestisitler, hedef organizmalara göre gruplandırılmakta; bu gruplar arasında insektisit, fungisit, bakterisit, nematisit ve herbisitler yer almaktadır. Bu çalışmada Türkiye'de patates yetiştiriciliğinde karşılaşılan başlıca bakteriyel, fungal, viral ve fitoplazma kökenli hastalıkları; ayrıca nematodları, böcek zararlılarını ve yaygın yabancı ot türleri ile bu etmenlere karşı kullanılan ruhsatlı bitki koruma ürünlerinin güncel durumunu incelemektedir.

Anahtar kelimeler: patates, kimyasal mücadele, bitki koruma ürünleri, Türkiye

1. GİRİŞ

Artan dünya nüfusu ile birlikte gıdaya olan talep sürekli artmakla birlikte azalan tarım arazileri ve iklim değişikliği gibi faktörlerin etkisi ile mevcut tarım sistemi bu talebi karşılamada yetersiz kalabilmektedir. Patates, dünya genelinde temel besin kaynaklarından biri olarak önemli bir rol oynamaktadır. Hem besleyici değeri hem de çeşitli endüstriyel kullanım alanlarıyla dikkat çeken patates, tarım sektöründe stratejik bir ürün durumundadır.

Tarihsel olarak, patatesin kökeni Güney Amerika'ya dayanmaktadır. İlk olarak And Dağları'nda keşfedilen patates, yerel halk tarafından yetiştirilmiş ve tüketilmiştir. İspanyol kaşifler tarafından 16. yüzyılda Avrupa'ya getirilen patates, zamanla dünya genelinde popülerlik kazanmış ve önemli bir tarım ürünü haline gelmiştir. Patatesin dayanıklılığı ve besin değeri, özellikle 18. ve 19. yüzyıllarda Avrupa'da açlıkla mücadelede önemli bir rol oynamıştır. Patates ana vatanı olan Güney Amerika'dan İspanyol gemiciler tarafından Avrupa'ya getirilirken sadece basit bir gıda olmadığını kanıtlamış ve kıtlık sorunuyla karşı karşıya olan Kuzey Avrupa'yı tarihten silinmekten kurtarmıştır. Bu sayede normalleşme, zenginleşme ve şehirleşme başlamıştır. Patates içerdiği karbonhidrat miktarı tahıllardan 4 kat daha fazla olduğu için insanlar doymakta kolaylık yaşamış ve nüfus artışları görülmeye başlamıştır. Bu gıda maddesi tarihte bu denli öneme sahip yerini hala korumaya devam etmektedir (Reader, 2008).

Temel gıda ürünü olan patatesin kullanım alanlarının yaygınlaşması ve dünya nüfusunun artması patatese olan talebi ve tüketimi hızlı bir şekilde arttırmaktadır. Bu bakımdan dünyada en çok üretimi yapılan bitkisel ürünler sıralamasında şeker kamışı, mısır, pirinç, buğday, yağlı palmiye meyvesinden sonra patates altıncı sırada gelmektedir (FAOSTAT, 2023). Dünya genelinde insanların beslenmesi ve geçimi açısından en önemli tarımsal faaliyetlerden biri olarak öne çıkan patates tüm dünyada geniş bir coğrafyada üretilen ve tüketilen bir bitkidir. Dünya genelinde patates üretimi, güney yarım küredeki ülkelerden başlayarak, kuzeydeki soğuk iklimlere kadar uzanan geniş bir alana yayılmıştır. Özellikle Avrupa, Kuzey Amerika, Asya ve Afrika'nın birçok bölgesinde patates üretimi yoğun bir şekilde gerçekleşmektedir (Devaux ve ark., 2014).

Gerek çeşitlilik gerekse de sayı açısından en büyük familyalardan biri olan ve 3000'in üzerinde türü içeren Solanaceae familyası içinde yer almaktadır (Knapp ve ark., 2004). Solanaceae ailesinde yer alan ve önemli bir besin kaynağı olan yumru kökleriyle bilinen patatesin dünya genelinde farklı iklim ve toprak koşullarında yetişebilen çok çeşitli türleri bulunmaktadır (Erdoğan, 2018). Dünya genelinde 163 ülkede yetiştirilen patates tahıllar dışındaki en önemli ürün olup, 370 milyon tonluk üretimiyle dünyada sırasıyla mısır, çeltik ve buğdaydan sonra en çok yetiştirilen dördüncü temel gıda kaynağı durumundadır (FAOSTAT, 2023). Açlık ve yoksullukla mücadelede en umut verici bitkisel ürünlerden biri olarak kabul edilen patates, artan nüfus ve gıda talebi nedeniyle FAO tarafından gıda güvenliği ürünü olarak tavsiye edilmektedir (Thomas ve Sansonetti, 2009). Patates üretimi açısından çok uygun koşullara sahip olan ve hemen her yerinde patates üretilen Türkiye'de 139.072 ha alanda patates yetiştirilmekte ve 5,2 milyon tonluk üretim yapılmaktadır (FAOSTAT, 2023). Ülkemizde patatesin en iyi yetişebileceği yerler 650 metrenin üzerindeki yüksek yaylalardır. Sırasıyla Niğde, Afyonkarahisar, Konya, Kayseri, İzmir, Sivas, Nevşehir illeri en çok patates yetiştirlen iller olup Türkiye patates üretiminin %60'ını karşılamaktadırlar (TUİK, 2023).

Yaklaşık 10 000 yıl önce tarımın başlangıcından bu yana, yetiştiriciler insan kullanımı ve tüketimi için yetiştirilen bitkisel ürünler için zararlı organizmalarla mücadele etmek zorunda kalmıştır (Oerke, 2006). Bu kayıplar sadece ürün kayıpları ile sınırlı kalmamış aynı zamanda sosyal ve ekonomik etkileri de söz konusu olmuştur (Savary ve ark., 2006). Tarihsel olarak en

dikkate değer olanlar arasında belki de ilk sırada Batı Avrupa'daki patates geç yanıklığı (*Phytophthora infestans*) salgını yer almaktadır (Bourke, 1964). Kuzey Amerika'dan Avrupa'ya 1845 yılında yayılan etmen İrlanda'da Büyük Kıtlığa ve Avrupa'nın geri kalanında ciddi ürün kayıplarına yol açmıştır (Yoshida ve ark., 2013). Etmen İrlanda'da 1845'te ekilen patateslerin %40'ını, sonraki yıl tamamını yok etmiştir. İrlanda nüfusu kıtlık sona erdiğinde %20-25 oranında eksilmiştir (Bourke, 1964). Bu nedenle bitki koruma, artan gıda kalitesi ve miktarı talebinin karşılanmasında bariz bir role sahiptir (Strange ve Scott 2005). Hastalık, zararlı ve yabancı otlar tarımsal üretim üzerinde küresel ölçekte %20 ila 40'ı arasında değişen oranlarda kayıplara neden olmaktadır (Teng ve Krupa 1980; Teng 1987; Oerke ve ark. 1994; Oerke 2006). Hastalık ve zararlılardan kaynaklanan ürün kayıplarının doğrudan olduğu kadar dolaylı, bazılarının kısa bazılarının ise uzun vadeli sonuçlar doğuran bir dizi etkileri vardır (Zadoks 1967). Bu nedenle "%20 ila %40 arasında kayıp" ifadesi, ürün kayıplarının tüketicilere, kamu sağlığına, toplumlara, çevreye, ekonomik dokulara ve çiftçilere olan gerçek maliyetini yeterince yansıtmamaktadır. Bitki koruma uygulamaları, %12'si hastalıklara, %8'i zararlılara ve %8'i yabancı otlara bağlı olmak üzere toplam %50'lik potansiyel kayıpları yaklaşık %29'luk gerçek kayıplara indirmiş olmakla beraber önlenen bu kayıpların çok büyük bir kısmı pestisit uygulamaları sonucunda sağlanabilmiştir (Oerke, 2006).

Bu çalışmada patates bitkisi yetiştiriciliğinde sorun olan hastalık, zararlı ve yabancı otlar ile bunların mücadelesinde kullanılan ve ülkemizde ruhsatlı olan pestisitler hakkında bilgi verilmeye çalışılmıştır.

2. DÜNYA'DA VE TÜRKİYE'DE PATATES ÜRETİMİ

Patates, hem taze tüketim hem de tarımsal sanayiye hammadde sağlama kapasitesiyle, dünya genelinde ekim ve üretim alanlarını giderek daha da sağlamlaştıran önemli bir tarım ürünüdür. Artan dünya nüfusu ve sınırlı tarım arazileri göz önünde bulundurulduğunda, birim alandan yüksek verim sağlaması ve daha geniş bir kitleye hitap edebilecek besleyici özelliklere sahip olması nedeniyle patates, günümüzde gıda güvencesi açısından küresel ölçekte önem arz eden ürünlerden biri olarak değerlendirilmektedir (Anonim, 2021).

Ülkelere göre dünya patates ekim alanları incelendiğinde 2022 yılında ekim alanı en fazla olan ülke 5.723.449 ha'lık alanla Çin olup ardından sırasıyla Hindistan ve Ukrayna gelmektedir. Patates ekim alanında Türkiye 139.072 ha'lık alanla 22. sırada yer almaktadır. Ülkelere göre dünya patates üretim miktarları incelendiğinde de ilk üç sıralama değişmezken Türkiye 5.200.000 ton patates üretimiyle 15. sırada yer almaktadır. Dünya patates verim ortalaması 2106 kg/da olup 5086 kg/da ile Yeni Zelenda ilk sırada yer alırken 4908 kg/da ile ABD ve 4421 kg/da ile Danimarka en yüksek üretim yapan ülkeler listeye girmiştir. Türkiye 3739 kg/da ile 13. sırada yer almaktadır (FAOSTAT, 2023). Son beş yıllık verilere bakıldığında, dünya genelindeki patates ekim alanlarında kayda değer bir değişiklik gözlemlenmemektedir. Ancak iklim koşullarındaki değişiklikler ve tarımsal teknolojilerdeki ilerlemeler, birim alandan elde edilen verimin artmasını sağlamıştır. Artan nüfus yoğunlukları dikkate alındığında, patates üretiminde verimlilik daha da kritik bir hale gelmiştir. Özellikle Çin ve Hindistan gibi hızla büyüyen nüfuslara sahip ülkeler, artan besin talebini karşılayabilmek adına daha geniş tarım alanlarına ihtiyaç duymaktadır (Anonim, 2021).

Türkiye'de patates üretimi, 1925 yılında yaklaşık 73.000 ton düzeyindeyken günümüzde yaklaşık 5,5 milyon tona ulaşarak önemli bir gelişme göstermiştir. Yaklaşık 150 yıllık bir geçmişe sahip olan patates, Türkiye'nin en önemli tarım ürünlerinden biridir. Üretimi, sanayisi, pazarlaması ve tüketimi birbirinden bağımsız olarak gelişen ayrı sektörler haline gelmiştir (Çalışkan ve ark., 2010). Türkiye, patates üretimi açısından son derece uygun coğrafi koşullara

sahiptir; bu nedenle 81 ilin yaklaşık 75'inde patates üretimi yapılmaktadır. Orta, kuzey ve kuzeydoğu bölgeler, ılıman iklim özellikleri sayesinde yaz döneminde patates üretimi için elverişli alanlardır. Akdeniz ve Ege bölgelerinde ise hâkim olan Akdeniz iklimi sayesinde kış ve ilkbahar başlarında birinci ürün, yaz sonu ve sonbaharda ise ikinci ürün olarak patates yetiştirilebilmektedir. Bu iklim çeşitliliği, Türkiye'de yıl boyunca patates üretiminin mümkün olmasını sağlamaktadır (Çalışkan ve ark., 2010). 2022 yılı verilerine göre, Türkiye'de patates ekim alanları açısından Niğde 176,3 bin dekar (%12,7) ile ilk sırada yer alırken, Afyonkarahisar yaklaşık 150 bin dekar (%10,8) ile ikinci, Konya ise 120,5 bin dekar (%8,7) ile üçüncü sıradadır. Sivas ilinde ise 2018 yılında 169.737 ton olan patates üretimi, 2022 yılında 334.435 tona çıkarak %97 oranında bir artış göstermiştir (TUİK, 2023). Ancak son beş yıllık dönemde ekim alanlarında dalgalanmalar yaşanmıştır. Bu azalışların başlıca nedenleri arasında patates siğili hastalığı (*Synchytrium endobioticum*) yayılımı, yağış düzensizlikleri, fiyat istikrarsızlıkları ve artan girdi maliyetleri sayılabilir.

3. PATATES ÜRETİMİNDE KARŞILAŞILAN SORUNLAR

Patates üretimi, yüksek getiri potansiyeline sahip olmasına rağmen, çeşitli zorluklarla karşı karşıyadır. Bu zorluklar, tarımsal verimliliği düşürmekte, üretim maliyetlerini artırmakta ve çiftçilerin ekonomik durumunu olumsuz etkilemektedir. İşte Türkiye'de patates üretiminde sıklıkla karşılaşılan başlıca sorunlar:

3.1. Depolama Sorunları

Patatesin hasat sonrası depolanması sırasında birçok problem yaşanabilmektedir. Depolama sorunları, özellikle uzun süreli saklama gereken durumlarda büyük kayıplara yol açmakta olup depo koşullarının uygun olmaması, ürünlerin %10-20 oranında kaybına yol açmaktadır.

3.2. Pazarlama ve Fiyat Dalgalanmaları

Patates fiyatlarının dalgalı bir seyir izlemesi, çiftçilerin üretim planlamasında belirsizlik yaratmaktadır. Üretimdeki fazlalık, fiyatların düşmesine neden olurken, üretim azlığı fiyatları yükseltmekte ve fiyat dalgalanmaları üreticilerin gelirlerinde istikrarsızlığa yol açmaktadır. Tüccar ve aracılar, fiyatları manipüle ederek üreticinin düşük gelir elde etmesine sebep olabilmekte ve çiftçilerin doğrudan pazar erişimi sınırlamaktadır.

3.3. Girdi Maliyetleri

Üretim için gerekli olan girdilerdeki maliyet artışı, çiftçilerin kâr oranlarını düşürmektedir. Gübre fiyatlarındaki sürekli artış, çiftçilerin yeterli miktarda gübre kullanmasını engellemekte ve zararlılarla mücadelede kullanılan pestisitler, küçük ölçekli üreticiler için ekonomik yük oluşturmaktadır.

3.4. Tohumluk Patates:

Kaliteli tohumluk patateslerin fiyatı yüksektir. Bu durum, bazı üreticilerin düşük kaliteli tohum kullanmasına neden olmaktadır.

3.5. Enerji ve Su Maliyetleri:

Sulama sistemleri için elektrik ve su maliyetleri yüksek olduğu için çiftçiler sulama yaparken kısıtlama yoluna gidebilmektedir.

3.6. Tarımsal Bilgi ve Teknoloji Eksikliği

Birçok üretici, modern tarım teknikleri ve teknoloji kullanımında yetersiz kalmakla birlikte çiftçilerin çoğu, hastalık yönetimi, gübreleme ve sulama gibi temel konularda yeterli bilgiye sahip değildir. Modern tarım ekipmanlarının yüksek maliyeti nedeniyle küçük ölçekli üreticiler bu ekipmanlara erişememektedir.

3.7. İklim Değişikliği ve Kuraklık

Küresel iklim değişikliği, tarım sektörünü doğrudan etkilemektedir. Kuraklık, sulama imkanlarını sınırlamakta ve verimi düşürmektedir. Türkiye'nin birçok bölgesinde yer altı su seviyelerinde ciddi azalma görülmektedir.

3.8. Hastalıklar ve Zararlılar

Patates üretiminde en büyük sorunlardan biri hastalıklar ve zararlılardır. Patates yumrularının yüksek su içeriği (%70-80), birçok patojenin gelişimi için elverişli bir ortam oluşturmaktadır. Bu durum, özellikle yumuşak çürüklük ve kuru çürüklük gibi hastalıkların yayılmasına katkıda bulunur. Örneğin, *Fusarium* kuru çürüklüğü üzerine yapılan bir çalışmada, yüksek su içeriğine sahip taze hasat edilmiş patates yumrularının, hasat ve depolama sırasında daha savunmasız olduğu belirtilmiştir (Pavlou ve ark., 2021). Ayrıca, patatesin vejetatif olarak yumrularla çoğaltılması, onu generatif yollarla çoğaltılan kültür bitkilerine kıyasla bitki patojenlerine karşı daha hassas hâle getirmektedir. Vejetatif çoğaltma, patatesin genetik çeşitliliğini azaltır ve bu durum, tüm bitkilerin belirli bir hastalığa karşı aynı derecede savunmasız olmasına neden olabilir. Bu, özellikle geç yanıklık gibi yaygın hastalıkların hızla yayılmasına ve büyük ürün kayıplarına yol açabilmektedir (Savary ve ark., 2006).

4. PATATES ÜRETİMİNDE ZARAR YAPAN VE EKONOMİK ÖNEME SAHİP HASTALIK, ZARARLI VE YABANCI OTLAR

Tarımsal üretimde ekonomik kayba neden olan tüm hastalık ve zararlı grupları patates açısından yüksek öneme sahiptirler (Tablo 1). Patateste zarar yapan patojenler, virüsler, zararlılar ve yabancı otlardan kaynaklanan gerçek kayıplara ilişkin tahminler dünya genelinde sırasıyla %14, %7, %11 ve %8'dir. Patates üretiminde bitki koruma uygulamalarının yapılmaması durumunda elde edilecek ürünün neredeyse %75'i hastalık, zararlı ve yabancı otlar tarafından kaybedileceği belirtilmiştir. Bununla beraber mevcut ürün kayıpları Kuzeybatı Avrupa'da %24 civarındayken bu kayıplar Orta Afrika'da %50'lere kadar çıkmaktadır (Oerke, 2006). Bu durum tarımsal mücadele faaliyetlerinin önemini ve ayrıca yapılan uygulama yoğunluklarında ve/veya yapılan uygulamalarda elde edilen sonuçlarda farklılıklar olduğunu göstermektedir. Küresel ölçekte patateste ekonomik öneme sahip en önemli etmenler arasında *Phytophthora infestans, Alternaria* spp., *Ralstonia solanacearum, Pectobacterium* spp., *Dickeya* türleri, potato leafroll luteovirus, potato potyvirus Y, patates kist nematodları, patates böceği, patates güvesi sayılabilir (Chakrabarti vd., 2022).

Tablo 1. Önemli bazı ürünlerde küresel ölçekte hastalık, zararlı ve yabancı otlardan kaynaklanan ürün kayıpları (%)

Ürün	Zararlılar		Patojenler		Virüsler		Yabancı otlar		Toplam	
	P*	G	P	G	P	G	P	G	P	G
Buğday	8,7	7,9	15,6	10,2	2,5	2,4	23,0	7,7	49,8	28,2
Çeltik	24,7	15,1	13,5	10,8	1,7	1,4	37,1	10,2	77,0	37,4
Mısır	25,9	9,6	9,4	8,5	2,9	2,7	40,3	10,5	68,5	31,2
Patates	15,3	10,9	21,2	14,5	8,1	6,6	30,2	8,3	74,9	40,3
Soya fasülyesi	10,7	8,8	11,0	8,9	1,4	1,2	37,0	7,5	60,0	26,3
Pamuk	36,8	12,3	8,5	7,2	0,8	0,7	35,9	8,6	82,0	28,8

* P: Potansiyel kayıp, G: Gerçek kayıp

Türkiye'de tarımsal üretimde zarar yapan ve mücadele yapılması gerekliliği öngörülen hastalık, zararlı ve yabancı ot sayısı 2024 yılı itibariyle toplam 668'dir. Patateste ise altı tanesi ana hastalık ve zararlı olmak üzere 50'nin üzerinde patates üretiminde zarar yapan hastalık, zararlı ve yabancı ot türü bulunmaktadır (Tablo 2).

Tablo 2. Türkiye'de patates üretiminde zarar yapan ve ekonomik öneme sahip hastalık, zararlı ve yabancı ot türleri

Ana Zararlı ve Hastalıklar
Zararlılar
Patates böceği (*Leptinotarsa decemlineata* Say)
Patates güvesi (*Phthorimaea operculella* (Zeller))
Patates kist nematodları (*Globodera rostochiensis* Wollenweber, *G. pallida* Stone)
Kök ur nematodları (*Meloidogyne spp*. Goeldi)
Hastalıklar
Patates mildiyösü (*Phytophthora infestans* (Mont.) de Bary)
Patates siğil hastalığı (*Synchytrium endobioticum* (Schilb.) Percival)
Diğer Zararlı, Hastalık ve Yabancı Otlar
Zararlılar
Bozkurt (*Agrotis segetum* Schff., *A.ipsilon* Hufn.)
Telkurdu (*Agriotes spp*.)
Manas (Kadı lokması) (*Polyphylla turkmenoglui* Petr., *P.fullo* L.)
Yaprakbitleri, Patates yaprakbiti (*Aulacorthum solani*)
Patates yaprakbiti (*Macrosiphum euphorbiae*)
Patates yaprakbiti (*Aphis nasturtii*)
Şeftali yaprakbiti (*Myzus persicae*)
Pamuk yaprakbiti (*Aphis gossypii*)
Yaprak pireleri (*Empoasca fabae* Harris, *Empoasca decipiens* Paoli, *Asymmetrasca decedens* Paoli) *Hyalesthes obsoletus* Signoret
Patates çürüklük nematodu (*Ditylenchus destructor* Thorne)
Soğan-sak nematodu (*Ditylenchus dipsaci* Kühn)
Hastalıklar
Fungal Hastalıklar
Erken yaprak yanıklığı *(Alternaria solani* Sorauer *)*
Tozlu uyuz (*Spongospora subterranea* (Wallr.) Lagerh. f.sp. *subterranea* Toml.)
Solgunluk (*Fusarium* spp, *Verticillium* spp., *Colletotrichum coccodes* (Wallr.) Hughes)
Kuru çürüklük (*Fusarium* spp.)
Gümüşi leke (*Helminthosporium solani* Dur and Mont.)
Kökboğazı nekrozu ve siyah siğil (*Rhizoctonia solani* Kühn)
Bakteriyel Hastalıklar
Patateste bakteriyel yumuşak çürüklük ve karabacak (*Pectobacterium carotovorum* (Jones) Waldee emend. Portier ve ark., *Pectobacterium atrosepticum* (van Hall) Gardan ve ark., *Pectobacterium wasabiae* (Goto and Matsumoto) Gardan ve ark., *Pectobacterium brasiliense* Portier ve ark., *Pectobacterium parmentieri* Khayi ve ark., *Dickeya solani* van der Wolf ve ark.)

Patateste adi uyuz (*Streptomyces scabies* (Thaxter) Lambert and Loria, *Streptomyces turgidiscabies* Miyajima ve ark., *Streptomyces reticuliscabiei* Bouchek-Mechiche ve ark.)
Patateste bakteriyel solgunluk ve kahverengi çürüklük (*Ralstonia solanacearum*(Smith) Yabuuchi ve ark.)
Patates halka çürüklüğü (*Clavibacter sepedonicus* (Spieckermann & Kotthoff) Li ve ark.)
Patateste stolbur hastalığı (*Candidatus Phytoplasma solani*)

Tablo 2. Türkiye'de patates üretiminde zarar yapan ve ekonomik öneme sahip hastalık, zararlı ve yabancı ot türleri (Devam)

Virüs ve Viroid Hastalıkları
Patates yaprak kıvrılma virüsü (*Potato leafroll virus*, PLRV)
Patates Y virüsü (*Potato virus Y*, PVY)
Patates X virüsü (*Potato virus X*, PVX)
Patates A virüsü (*Potato virus A*, PVA)
Patates M virüsü *(Potato virus* M, PVM)
Patates S virüsü *(Potato virus* S, PVS)
Patates iğ yumru viroidi (*Potato spindle tuber viroid*, PSTVd)
Yabancı Otlar
Sirken (*Chenopodium album* L. (Chenopodiaceae))
Yabani Hardal (*Sinapis arvensis* L. (Brassicaceae))
Boynuzlu yoğurt otu (*Galium tricornutum* Dandy (Rubiaceae))
Tarla sarmaşığı (*Convolvulus arvensis* L. (Convolvulaceae))
Semizotu (*Portulaca oleracea* L. (Portulacaceae))
Tarla atkuyruğu (*Equisetum arvense* L (Equisetaceae.))
Kırmızı köklü tilki kuyruğu (*Amaranthus retroflexus* L. (Amaranthaceae))
Tilki kuyruğu (*Alopecurus myosuroides* Huds. (Poaceae))
Darıcan (*Echinochloa crus-galli* (L.) P.B. (Poaceae)
Köpek dişi ayrığı (*Cynodon dactylon* (L.) Pers. (Poaceae))
Küsküt (*Cuscuta campestris* L. (Convolvulaceae))

4.1. Bakteriyel hastalıklar

Doğada yüzbinlerce farklı bakteri türü bulunmasına rağmen bunlardan çok az bir kısmı patates için patojen durumundadır. Bakteriyel hastalıklar, özellikle tropikal ve subtropikal bölgelerde ve dünyanın bazı ılık ılıman bölgelerinde patates üretiminin en önemli biyotik kısıtlamalarından biri durumundadır (Charkowski ve ark., 2020). Patateste zarar yapan hastalık etmenleri arasında bakteriyel etmenler mücadelesi en zor olanları arasındadır. Bu durumun nedenleri arasında ilki bakterilerin uygun koşullar devam ettiği sürece hızla çoğalma potansiyeline sahip olması ve bunun sonucu olarak nispeten kısa bir süre içinde hastalık baskısının oluşmasıdır. İkincisi, bakteriyel etmenlerin bulaşıcılık seviyelerinin yüksek olması ve böylece hızlıca yayılma potansiyeline sahip olmalarıdır. Üçüncüsü, bazı bakteriyel etmenlerin hastalık gelişimlerinin erken aşamalarında latent halde olabilmeleri ve bunun sonucu olarak enfeksiyonun gözden kaçabilmesidir. Dördüncüsü ise bakteriyel hastalıkların mücadelesinin son derece zor olmasıdır. Bu durumun sonucu olarak bakteriyel hastalıkların görüldüğü alanlarda mücadelelerinde ciddi zorluklar yaşanmakta, karantina ve diğer önlemlerle yayılmalarını sınırlamak için önemli çaba sarf edilmektedir (Wale ve ark., 2008). Genel olarak, bakteriyel etmenlerin mücadelesinde kimyasal mücadele yok denecek ölçüde kısıtlı olup pestisitlerin kullanımı tohumluk yumrularının dezenfekte etmek için kullanımları ile sınırlıdır. Bazı çeşitler tolerans ve çeşitli düzeylerde dayanıklılık gösterse de, bakteriyel hastalıklara karşı dayanıklılık genellikle mevcut değildir (van der Wolf ve De Boer, 2007).

Patates üretiminde önemli ürün kayıplarına neden olan bakteriyel hastalık etmenleri arasında en önemlileri; karabacak ve yumuşak çürüklük hastalığı (*Dickeya* spp. ve *Pectobacterium* spp.), bakteriyel halka çürüklüğü hastalığı (*Clavibacter michiganensis* subsp. *sepedonicus*), kahverengi çürüklük hastalığı (*Ralstonia solanacearum*), uyuz hastalığı (*Streptomyces* spp.), yer almaktadır. Dünya genelinde riskli olan *Clavibacter michiganensis* subsp. *sepedonicus*,

Ralstonia solanacearum ve *Streptomyces scabies* ise karantina listesinde yer almaktadır (Van der Wolf ve De Boer, 2007, Doolotkeldieva ve ark., 2016, Baştaş, 2023).

4.2 Fungal hastalıklar

Patateste zarar yapan fungal organizmaların çeşitliliği son derece geniştir (Wale ve ark., 2008). Patateste zararlı 33 farklı fungal etmen bulunmakta olup bunlardan sekiz tanesi hava yoluyla bulaşırken 25 tür toprak kökenlidir. Bu etmenlerden *Puccinia piettieriana, Phoma andigena, Thecaphora solani* ve *Septoria lycopersici* var. *malagutii* A1, *Synchytrium endobioticum* ise A2 karantina listelerinde yer alan organizmalardır (EPPO, 2004). Karantina listesinde A1'de yer alan etmenler patatesin ana vatanı Güney Amerika ile sınırlıyken özellikle toprak kökenli olan fungal etmenlerin birçoğu dünyada patates üretimi yapılan alanlara yayılmış durumdadırlar (Termorshuizen, 2007). Fungal hastalık etmenlerinden bazıları yaprakta bazıları ise yumruda zarar yaparken birçoğu hem yaprak hem de yumruda zarar oluşturmaktadır (Rich, 2013).

Dünya çapında başlıca patates hastalıkları arasında mildiyö (*Phytophthora infestans*), erken yaprak yanıklığı (*Alternaria solani*), patates siğil hastalığı (*Synchytrium endobioticum*) ve tozlu uyuz (*Spongospora subterranea*) yer almaktadır. *Phytophthora infestans* patates üretimindeki en önemli biyotik kısıtlamaların başında gelmektedir. Yapraklarda açık ila koyu kahverengi lekeler, saplarda kahverengi lekeler ve yumrularda kırmızımsı kahverengi renkli hafif çöküntüler şeklinde görülebilmektedir. Hastalığın gelişmesi için yüksek nem ve ılıman sıcaklıklar gerekli olup uygun koşullar altında hastalık birkaç gün içinde bir tarlayı tamamen enfekte edebilmektedir. Patates yetiştirilen çoğu ülkede görülen erken yaprak yanıklığı etmeni yapraklarda tipik olarak eş merkezli halkalar şeklinde koyu kahverengi veya siyah lekeler oluşturmaktadır. Uygun koşullar altında özellikle hassas çeşitlerde önemli verim kayıplarına neden olan etmene karşı fungusit direnç gelişimi tespit edilmiş olması mücadelesini de zorlaştırmaktadır. Kökler hariç patatesin tüm meristematik dokularında gelişebilen ve yumruda karnabahar benzeri tipik belirteler oluşturan patates siğil hastalığı önemli bir karantina etmeni olmasına rağmen tüm dünyada patates yetiştirilen önemi alanların çoğuna yayılmış durumdadır. Konukçusu olmadan toprakta 40 yıla kadar canlılığını koruyabilen etmen patates üretiminde ciddi sorunların başında gelmektedir. Tozlu uyuz etmeni *Spongospora subterranea* dünya genelinde hem tohumluk hem de yemeklik patates üretiminde yumruda meydana getirdiği zarar sonucunda önemli ölçüde kalite ve verim düşüşlerine neden olmaktadır. Etmen aynı zamanda potato mop-top virus (PMTV)'nün vektörü durumundadır. Özellikle serin ve nemli koşullarda gelişen ve mücadelesi zor olan hastalık bulaşık yumrularla ve toprak hareketiyle yayılmaktadır (Adolf ve ark., 2020; Rich, 2013; Termorshuizen, 2007; Wale ve ark., 2008).

4.3 Virüs, Viroid ve Fitoplasmalar

Virüslerin tohumla taşınabilmeleri ve neden oldukları verim kayıplarının son derece yüksek olması nedeniyle patateste zarar yapan önemli etmenler arasındadır (Ross, 1986). Mücadele yöntemlerine yanıt vermemeleri ekonomik önemlerini daha da arttırmaktadır (Kolychikhina ve ark., 2021). Patateste zarar yapma potansiyeline sahip 50'den fazla virüs bulunmakla beraber *Potato leaf roll virus* (PLRV), *Potato spindle tuber viroid* (PSTVd), *Potato virus A* (PVA), *Potato virus X* (PVX), *Potato virus Y* (PVY), *Potato yellow vein virus* (PYVV), *Potato mop-top virus* (PMTV), *Tobacco rattle virus* (TRV) ve Tomato spotted wilt virus (TSWV) patates üretimi açısından büyük önem araz etmektedir. Diğer türlerin yayılımları ve önemleri son derece sınırlıdır (Wale ve ark., 2008). Birçok virüs hastalığının taşınmasında ve yayılmasında

vektörler önemli pay sahibidirler. Patateste viral etmenlerin zararı sonucunda bitkinin büyüme süreçlerinde bodurlaşma ve cücelik, yapraklarda mozaik lekeler, yaprak buruşması, damar nekrozu, büzülme, kloroz, yumrularda nekrotik halkalar, iç damar ölümü, çizgi şeklinde belirtiler meydana gelirken verim ve ürün kalitesinde de önemli düşüşler meydana gelmektedir (Kreuze ve ark., 2020, Valkonen, 2007).

4.4. Nematodlar

Birçok farklı ekosistemde canlılıklarını sürdüren ve hayvanlar aleminde tür sayısı açısından üçüncü, yoğunluk açısından ise birinci sırada gelen nematodlar içerisinde bitki paraziti nematodlar küçük bir kısmı oluşturmalarına karşın tarımsal üretimde önemli ölçüde kayıplara neden olmaktadırlar. Bitki paraziti nematodlar, patates yetiştirilen birçok alanda patates verimini ve kalitesini kısıtlayan önemli faktörlerden biri durumundadır (Lima ve ark., 2018; Niere ve Karuri, 2018). Patateste zarar yapan en önemli türler patates kist nematodları (*Globodera rostochiensis, G. pallida*) ile kök-ur nematodları (*Meloidogyne* spp.)'dır. Soğan sak nematodu (*Ditylenchus dipsaci*) ve patates çürüklük nematodu (*Ditylenchus destructor*) zararı tohumluk kalitesindeki artışa paralel olarak son yıllarda azalmıştır. Patateste verim üzerine mücadele yapılmaması durumunda %100'lere varan düzeyde zararla karşılaşılabilen bitki paraziti nematodlar aynı zamanda patateste kalite açısından da zarar oluşturmaktadırlar. Doğrudan yaptıkları zararın yanı sıra toprak kökenli etmenlere giriş kapısı oluşturmaları nedeniyle sekonder zarara da neden olmaktadırlar (Ravichandra, 2014). Meydana getirdikleri zarar genellikle popülasyon büyüklüğü ile ilişkili olmakla beraber popülasyon hızlı şekilde arttığı için tespit edildiği alanlarda kesinlikle mücadele yapılması gerekmektedir.

4.5. Zararlılar

Patates zararlıları çeşitlilik arz etmekle birlikte, zararlıların çoğu böceklerden oluşurken, diğer eklem bacaklı grupları da patateste zarar oluşturmaktadırlar. Patates zararlıları sıklıkla hareketlidirler ve büyük mesafelere ulaşabilme veya taşınabilme kabiliyetine sahiptirler. Uygun çevresel koşulların mevcut olduğu yerlerde hızla çoğalma yetenekleri de göz önüne alındığında meydana getirdikleri zarar mücadele yapılmaması durumunda ciddi seviyelere ulaşabilmektedir. Diğer patates patojen gruplarına kıyasla büyüklükleri nedeniyle, zararlılar nispeten kolay tanımlanırlar ve popülasyon yoğunluklarının izlenmesi genellikle mücadele programlarının bir parçasıdır. Birçok böcek zararlısı toprak üstü gövde veya toprak altı gövde dokusunda zarar yaparken yumruda zarar yapan tür sayısı göreceli olarak daha azdır. Patates böceği (*Leptinotarsa decemlineata*) bitki üst aksamında zarar yapan en bilinen ve zarar potansiyel, en yüksek olan zararlıların başında gelirken patates güvesi (*Phthorimaea operculella*) ve tel kurdu (*Agriotes* spp.) yumruda zarar yapan en önemli zararlılar arasında yer almaktadır. Başta yaprak bitleri olmak üzere bazı zararlılar aynı zamanda virüs vektörü durumundadırlar. Bu durumda, virüs vektörü zararlıların sayısı virüs taşıyıp taşımadıklarından daha az önemlidir. Patateste zarar yapan böceklerin tür ve biyolojilerinin çeşitlilik mücadelenin planlanmasını da zorlaştırmaktadır. Birçok böcek yaşam döngüsünde çeşitli aşamalardan geçer ve patatesler her zaman tüm aşamalar tarafından zarara uğramaz. Bu nedenle yaşam döngüsünün anlaşılması, kontrol önlemlerinin etkili olmasını sağlamak için çok önemlidir (Kroschel ve ark., 2020; Radcliffe ve Lagnaoui, 2007; Wale ve ark., 2008).

5. TÜRKİYEDE PATATES YETİŞTİRİCİLİĞİNDE KULLANILAN RUHSATLI PESTİSİTLER

Türkiye'de Kasım 2024 itibariyle patateste sorun olan hastalık, zararlı ve yabancı otlara yönelik olarak 94 farklı aktif ruhsatlı olup bunlardan bir tanesi biyolojik olmak üzere 46 tanesi fungusit olarak ruhsatlı iken 21 tanesi herbisit, iki tanesi desikant+herbisit, bir tanesi desikant, 15 tanesi insektisit, bir tanesi biyolojik olmak üzere beş tanesi nematisit, dört tanesi bitki gelişim düzenleyicisi olarak ruhsatlıdır. Herbisitler 38 farklı yabancı ot için ruhsatlıyken, insektisitler beş, fungusitler üç ve nematisitler ise iki farklı etmen için ruhsatlıdırlar. Bitki koruma ürünleri açısından değerlendirdiğimizde ise patateste ruhsatlı olan toplam148 bitki koruma ürününden 73 tanesi fungusit, 42 tanesi insektisit, 28 tanesi herbisit ve beş tanesi nematisit olarak ruhsatlıdır (Tablo 3) (Anonim, 2024).

Türkiye'de son 15 yılda zararlı olan hastalık, zararlı ve yabancı otlarla mücadelede kullanılan toplam bitki koruma ürünü miktarları ve bunun ürün tiplerine göre ayrılmış hali Tablo 4'de verilmiştir. Kullanılan toplam bitki koruma ürünü miktarı 2008 yılında toplam 38.836 ton iken 2023 yılında kullanılan toplam BKÜ miktarı %27,3'lük artışla 57.776 ton olarak gerçekleşmiştir. Yıllara göre değişimine baktığımızda kullanılan toplam BKÜ miktarının 2015 yılına kadar 40 bin bandının altında kaldığını ama 2016 yılı itibariyle sürekli 50 bin tonun üzerinde kullanıldığını ve en yüksek kullanım miktarına 2018 yılında 60.020 ton ile ulaşıldığı görülmektedir. Kullanılan BKÜ tipleri açısından değerlendirildiğinde ise 15 yıl açısından da en fazla kullanılan BKÜ grubu fungusitler olmuştur. Kullanılan toplam BKÜ miktarını 15 yıl için değerlendirdiğimizde %39,9'unu fungusitler oluşturmaktadır. Fungusitler sırasıyla herbisitler ve insektisitler izlerken son 15 yıl içerisinde beş yıl hariç herbisitler insektisitlerden daha fazla kullanılmıştır.

Son yıllarda ise herbisit kullanımıyla insektisit kullanımı arasındaki farkın arttığı ve herbisitlerin insektisitlere oranla yaklaşık %20 daha fazla kullanılmaya başlandığı görülmektedir. Rodentisit ve mollussisit kullanım miktarı ise yıllara göre değişmekle beraber düzenli bir artış veya azalış söz konusu değildir. Akarisitler açısından baktığımızda ise 2023 yılında 2008 yılına oranla akarisit kullanımı %321 artmış olmakla beraber son yıllarda önemli bir artış görülmemektedir.

Tablo 4. Türkiye'de Bitki Koruma Ürünleri Kullanım Miktarları (2008-2023)

Yıllar	Toplam[1]	İnsektisit[1]	Fungisit[1]	Herbisit[1]	Akarisit[1]	Rodentisit ve Mollussisit[1]	Diğerleri[1,2]
2008	38.836	9.251	16.707	6.177	737	351	5.613

BGD		1 g/tb Gibberellic Acid	100 lt suya 2 tablet Tohumluk olarak kullanılacak patatesler,dikiminden önce hazırlanan solüsyona dikimden önce daldırılarak muamele edilir ve dikilir. Böylece çimlenme hızlanır ve düzenli çıkış olur. Tüketim amaçlı bağ yaprağı hasadı yapılacak bağ alanlarında kullanılmaz.	
BGD		20 g/l Gibberellic acid	100lt su 30-60ml+20ml yayıcı-yapıştırıcı	
BGD		20 g/l Gibberellic acid	100 lt suya 25-50 ml	
BGD		843,2 g/l Portakal Yağı	100 ml/ 1 ton patates	

6. SONUÇ

Tarımsal faaliyetlerin başlangıcından bu yana insanlar ürünlerinde kayıplara neden olan hastalık, zararlı ve yabancı otlarla mücadele halindedir. Bu kapsamda 1900'lü yılların başından 1960'lara kadar kimyasal mücadelenin kullanım oranı her geçen gün artarak devam etmiştir.

Bu yılların devamında zararlı yönetimi, ekonomik zarar eşiği, entegre kontrol gibi kavramlar hayatımıza girmiş ve özellikle "Sessiz Bahar" isimli kitabın yayınlanmasından sonra başlayarak günümüze kadar artarak devam eden pestisitlerin olumsuz yönlerine yönelik bir farkındalık artışı olmuştur. Özellikle son yıllarda yapılan mevzuatsal değişiklikler sonucunda yoğun olarak kullanılan birçok pestisitin kullanımı gerek Avrupa'da gerekse de ülkemizde yasaklanmıştır. Hatta Avrupa Birliği, ilerleyen süreçte pestisit kullanımını tamamen kaldıracağını Green Deal kapsamında beyan etmiş durumdadır. Oluşan tüm bu olumsuz duruma rağmen hali hazırda tüm dünyada en çok başvurulan, üreticilerin en hızlı ve yüksek oranda sonuç aldıkları mücadele yönteminin kimyasal mücadele olduğu gerçeği değiştirmemektedir. Mevcut bitki koruma uygulamaları sonucunda hasatlık, zararlı ve yabancı otlardan kaynaklanan kayıplar küresel ölçekte %30-40 azaltılmakla beraber bu etkinin büyük bir kısmı kimyasal mücadele sayesinde oluşmaktadır.

Patates neredeyse tüm dünyada yetiştirilen, verim ve besleyicilik özellikleri son derece yüksek olan en önemli besin kaynaklarından biri durumundadır. Gerek vejetatif olarak yumruları ile çoğaltılması gerekse de patatesten elde edilen ürün olan yumruların toprak altında yer alması nedeniyle patates hastalık, zararlı ve yabancı otlardan en fazla kayıpların yaşandığı bitkilerin başında gelmektedir. Her ne kadar elimizde bitki bazında pestisit kullanımı ile ilgili veriler bulunmasa da ruhsatlı olan ürün sayıları göz önüne alındığında patatesin en fazla bitki koruma ürünü kullanılan bitkilerin başında geldiğini ve fungisit, herbisit ve insektisitlerin en çok kullanılan bitki koruma ürünleri olduğunu söyleyebiliriz.

ABSTRACT

Stored product pests, which occur during the storage of agricultural products, are one of the most important agricultural pests because they seriously affect the quantity and quality of the product as a result of the damage they cause to the product. Storage pests, which can potentially be found in all warehouses, cause 10-30% damage to the world's annual cereal production. Although chemical pesticides are most commonly used to control storage pests, both the direct consumption of stored products and increasing concerns about pesticide use in recent years have led to the development of more environmentally friendly approaches. Therefore, interest in biological control methods based on natural components such as essential oils of plant origin has increased in recent years. In this study, the scientific literature on the use of essential oils from the genera *Mentha* and *Lavandula* against the main storage pests *Sitophilus*, *Tribolium* and *Rhyzopertha* species was systematically reviewed using Scopus databases and a bibliometric analysis of the results obtained was carried out using Biblioshiny in R Studio. Various metrics such as research trends, influential authors, journals, keyword patterns and country contributions were evaluated. A general evaluation of the results obtained shows that the studies have a history of 24 years and consist of 100 articles in 72 different sources. Nevertheless, an annual growth rate of 2.93% and a citation/publication ratio of 28.53 indicate that this topic is increasingly on the research agenda. Publications are particularly concentrated in countries such as Morocco, Italy and India, with an average of 5.32 co-authors and an international co-authorship rate of 33%, indicating that research in this area is largely collaborative. It is hoped that the findings will help researchers identify existing scientific gaps and identify opportunities for collaboration between scientists working in the field. In addition,

it is aimed to provide information that can contribute to the development of natural pesticide use for policy makers and the agricultural sector.

Keywords: storage product pests, mentha, lavandula, essential oil, bibliometric analysis

BAZI DEPO ZARARLILARINA KARŞI MENTHA VE LAVANDULA UÇUCU YAĞLARININ KULLANIMINA YÖNELİK BİLİMSEL YAYINLARIN BİBLİYOMETRİK ANALİZİ

ÖZET

Tarım ürünlerinin depolanması sırasında karşılaşılan depo zararlıları, ürün üzerinde yaptıkları zarar sonucunda ürün miktarı ve kalitesini ciddi şekilde etkilemeleri nedeniyle önemli tarımsal zararlıların başında gelmektedirler. Potansiyel olarak tüm depolarda bulunabilen depo zararlıları yıllık küresel tahıl üretimine %10-30 oranında zarar vermektedirler. Depo zararlılarına karşı çoğunlukla kimyasal pestisitler kullanılmakla beraber hem depolanmış ürünlerin doğrudan tüketilmesi hem de son yıllarda pestisit kullanımına ilişkin endişelerin artması, daha çevre dostu yaklaşımların geliştirilmesine yol açmıştır. Bu nedenle, bitkisel kaynaklı uçucu yağlar gibi doğal bileşenlere dayanan mücadele yöntemlerine olan ilgi son yıllarda artmıştır. Çalışma kapsamında başlıca depo zararlıları olan *Sitophilus, Tribolium* ve *Rhyzopertha* türlerine karşı *Mentha* ve *Lavandula* cinslerinden elde edilen uçucu yağların kullanımına dair bilimsel literatürü Scopus veri tabanları üzerinden sistematik bir şekilde incelenmiş ve elde edilen sonuçların bibliyometrik analizi R Studio'da Biblioshiny ile gerçekleştirilmiştir. Araştırma eğilimleri, etkili yazarlar, dergiler, anahtar kelime örüntüleri ve ülkesel katkılar gibi çeşitli metrikler bu kapsamda değerlendirilmiştir. Elde edilen sonuçlar genel olarak değerlendirildiğinde çalışmaların 24 yıllık bir geçmişi olduğu ve 72 farklı kaynakta yer alan 100 makaleden oluştuğu görülmektedir. Bununla beraber %2.93'lük yıllık büyüme oranı ve 28.53 atıf/yayın düzeyi, bu konunun araştırma gündeminde giderek daha fazla yer bulduğunu göstermektedir. Yayınlar özellikle Fas, İtalya ve Hindistan gibi ülkelerde yoğunlaşırken ortalama 5.32 ortak yazar ve %33 uluslararası ortak yazarlık oranı, bu alanda yürütülen çalışmaların büyük ölçüde iş birliğine dayalı olduğunu göstermektedir. Elde edilen bulguların, araştırmacılara mevcut bilimsel boşlukları görme ve bu alanda çalışan bilim insanları arasında iş birliği fırsatlarını belirleme açısından yol gösterici olacağı düşünülmektedir. Ayrıca, politika yapıcılar ve tarım sektörü için doğal pestisit kullanımının gelişimine katkı sağlayabilecek bilgiler sunulması hedeflenmektedir.

Anahtar kelimeler: depo zararlıları, mentha, lavandula, uçucu yağ, bibliyometrik analiz

1. GİRİŞ

Depolanmış tarım ürünlerinin korunması hem gıda güvenliği hem de ekonomik sürdürülebilirlik açısından küresel ölçekte büyük önem taşımaktadır. Ancak, depolama sürecinde özellikle böcek zararlılarından kaynaklanan kayıplar, ciddi ekonomik zararlara yol açmakta; ürün kalitesini düşürmekte ve dolaylı olarak tüketici sağlığını tehdit etmektedir (Stathas ve ark., 2023). En yaygın depo zararlıları arasında yer alan *Sitophilus oryzae* (pirinç biti), *Tribolium confusum* (kırma biti) ve *Rhyzopertha dominica* (ekin kambur biti) gibi türler, dünya genelinde tahıl depolarında yaygın olarak tespit edilmekte ve ciddi ekonomik zararlara yol açmaktadır (Wakil ve ark., 2023). Bu zararlılarla mücadelede uzun yıllardır yaygın olarak kullanılan sentetik pestisitler, başlangıçta etkili çözümler sunmuş olsa da zamanla çevresel kalıntı birikimi, pestisit direncinin gelişmesi, hedef dışı organizmaların zarar görmesi ve insan sağlığı üzerindeki toksik etkiler gibi çeşitli olumsuzlukları da beraberinde getirmiş ve bu durum kimyasal yöntemlerin sürdürülebilirliğini tartışmalı hale getirmiştir. Bu nedenle, daha güvenli, çevre dostu ve sürdürülebilir alternatif mücadele yöntemlerine olan ihtiyaç artmıştır (Basavakiran ve ark., 2025). Özellikle bitkisel kaynaklı uçucu yağlar, doğal biyopestisitler kapsamında sürdürülebilir tarım uygulamalarında umut vadeden alternatifler olarak öne çıkmaktadır (Pavela ve Benelli, 2016). Uçucu yağlar, bitkilerin ikincil metabolitleriyle oluşturdukları karmaşık kimyasal kompozisyonlar olup antimikrobiyal, antifungal, antifeedant, repellent ve toksik etki profilleri sergilemektedir (Singh ve ark., 2012; Said-Al Ahl ve ark., 2017). Bu etkiler özellikle *Lamiaceae* familyası üyelerinde; menthol, pulegone, carvone, linalool ve limonene gibi monoterpen bileşenlerde yoğunlaşarak, depo zararlıları üzerinde yüksek insektisidal potansiyele dönüşmektedir (Singh ve Pandey, 2018). *Mentha* (*M. piperita*, *M. pulegium*, *M. spicata*) ve *Lavandula* (*L. angustifolia*, *L. stoechas*) türlerinin sahip olduğu menthol, pulegone, carvone ve linalool gibi yüksek orandaki monoterpenoid bileşikler, bu yağların depo zararlıları üzerinde belirgin bir insektisidal potansiyele sahip olmasını sağlamaktadır. Bu bileşikler fumigant, temas toksisitesi ve yutma yoluyla böceklerin ölümüne, beslenme davranışlarının bozulmasına, yumurtlamanın engellenmesine, larva gelişiminin azalmasına ve repellent etkiye sebep olabilmektedir (Akşit, 2025; Alkan ve ark., 2024, Karabörklü ve Ayvaz, 2023; Nerio ve ark., 2010; Yazdani ve ark., 2013).

Son yıllarda bitkisel uçucu yağlara yönelik ilgi, yalnızca biyolojik etkinlik düzeyinde değil; aynı zamanda bunların kimyasal bileşimleri, etki mekanizmaları ve uygulama tekniklerine ilişkin çok boyutlu bilimsel çalışmalara evrilmiştir (Yu, 2025; Karabörklü ve Ayvaz, 2023). Bu bağlamda, *Sitophilus*, *Tribolium* ve *Rhyzopertha* türlerine karşı *Mentha* ve *Lavandula* cinslerinden elde edilen uçucu yağların kullanımına dair yapılan akademik çalışmaların artış gösterdiği gözlemlenmektedir. Söz konusu çalışmaların değerlendirilmesi hem bilimsel eğilimleri hem de gelecekteki araştırma alanlarını belirleme açısından önem arz etmektedir.

Bilimsel üretimin yönünü, etki düzeyini ve iş birliklerini analiz etmek amacıyla kullanılan bibliyometrik analiz, bu tür literatür birikimlerinin değerlendirilmesinde etkin bir araçtır. Bibliyometrik yöntemler, bir araştırma alanının zaman içerisindeki gelişimini, yayın sayıları, yazar ağları, anahtar kelime dağılımları, coğrafi katkılar gibi birçok değişken üzerinden ortaya koyabilmektedir (Aria ve Cuccurullo, 2017). Özellikle SCOPUS gibi geniş kapsama sahip veri tabanlarının kullanılması, analizlerin güvenilirliğini artırmaktadır.

Bu çalışmada, SCOPUS veri tabanında yer alan ve *Mentha* ile *Lavandula* türlerinden elde edilen uçucu yağların *Sitophilus oryzae*, *Tribolium confusum* ve *Rhyzopertha dominica* gibi temel depo zararlılarına karşı kullanımını konu edinen bilimsel yayınlar, bibliyometrik yöntemlerle analiz edilmiştir. Analizlerde R programına entegre edilen “bibliometrix” paketi kullanılarak

yıllara göre yayın sayıları, atıf düzeyleri, en üretken yazarlar, kurumlar ve ülkeler, tematik kümeler ve iş birlikleri değerlendirilmiştir.

2. MATERYAL VE METOT

Çalışma kapsamında SCOPUS veri tabanında yer alan dergilerde yayınlamış çalışmaların başlık, özet ve veya anahtar kelimelerinde ((“Sitophilus oryzae” OR "Tribolium confusum" OR "Rhyzopertha dominica ") AND (“Mentha longifolia” OR “Lavandula angustifolia” OR “Mentha piperita”) AND ("essential oil" OR "EOs")) girişine uygun olan çalışmalar 05.05.2025 tarihi itibariyle araştırılmıştır. Bu arama sonucunda 100 farklı dokümana ulaşılmıştır. Elde edilen bu sonuçlar daha sonra R programına aktarılmış ve verilere bibliyometrik analiz uygulanmıştır. Analizler için Aria ve Cuccurullo (2017) tarafından geliştirilen “bibiliometrix” isimli paket R programı kullanılmıştır.

3. BULGULAR

Çalışma kapsamında SCOPUS veri tabanından elde edilen çalışmaların analizi sonucunda elde edilen tanımlayıcı analiz sonucuna ait temel bilgiler Tablo 1’de verilmiştir. Bibliyometrik analiz kapsamında incelenen çalışmalara bakıldığında başlıca depo zararlıları olan *Sitophilus*, *Tribolium* ve *Rhyzopertha* türlerine karşı *Mentha* ve *Lavandula* cinslerinden elde edilen uçucu yağların kullanımına dair bilimsel literatürün 2001–2025 yılları arasındaki zaman dilimini kapsadığı ve konuya ilişkin bilimsel ilginin sürdürülebilir şekilde devam ettiğini göstermektedir. Analiz edilen toplam 100 makaleyi içeren belge, 72 farklı akademik dergiden oluşan kaynaktan elde edilmiştir. Bu çeşitlilik, konunun disiplinler arası nitelik taşıdığını ve entegre bir araştırma alanı haline geldiğini ortaya koymaktadır. Yıllık ortalama yayın artış oranının %2.93 olarak hesaplanması, araştırma konusunun özellikle son yıllarda ivme kazandığını ve çevre dostu biyopestisit çözümlerine olan akademik ilginin arttığını göstermektedir. Belgelerin ortalama yaşının 7.33 yıl olması ise bu alandaki yayınların güncelliğini koruduğunu ve hâlen aktif olarak yeni çalışmalarla desteklendiğini ortaya koymaktadır. Bu genel görünüm, *Mentha* ve *Lavandula* bitkisel uçucu yağlarının *Sitophilus*, *Tribolium*, *Rhyzopertha* türlerinin mücadelesinde kullanımı üzerine yapılan araştırmaların hem güncel hem de giderek artan bir ilgiyle sürdüğünü göstermektedir. Bibliyometrik analiz kapsamında değerlendirilen 100 akademik çalışmada toplam 441 farklı yazar görev almış olup bu durum konuya olan uluslararası akademik ilgiyi ve disiplinler arası katılım düzeyini yansıtmaktadır. Analiz edilen belgeler arasında yalnızca bir çalışma tek yazarlı olarak yayımlanmış olması araştırma alanında iş birliğine dayalı üretimin baskın olduğunu ve yürütülen araştırmaların genellikle ekip çalışmasına dayandığını göstermektedir.

1. Tablo 1. Tanımlayıcı analiz: Koleksiyona ilişkin temel bilgiler

Veriler Hakkında Ana Bilgiler	
Zaman aralığı	2001:2025
Kaynaklar (Dergi, Kitap vb.)	72
Belge Sayısı	100
Yıllık Büyüme Oranı (%)	2,93
Belgelerin Ortalama Yaşı	7,33
Belge Başına Ortalama Atıf	28,53
Yazarlar	
Yazar	441
Tek Yazarlı Belgelere Ait Yazar	1
Yazar İşbirlikleri	
Tek Yazarlı Belge	1
Belge Başına Ortak Yazar	5,32
Uluslararası Ortak Yazarlıklar (%)	33
Belge Türleri	
Makale	100

Yıllara göre yayımlanan makalelerin dağılımı, araştırma konusunun zaman içerisinde nasıl bir gelişim gösterdiğine dair önemli ipuçları sunmaktadır. Şekil 1 incelendiğinde konuyla ilgili ilk makalenin 2001 yılında yayınlandığı, üretimin 2001–2003 yılları arasında her yıl yalnızca birer yayınla sınırlı kaldığı ve 2004–2006 döneminde ise tamamen durma noktasına geldiği görülmektedir. Ancak 2007 yılından itibaren yayın sayılarında yeniden artış gözlenmiş ve bu artış özellikle 2011 sonrası daha istikrarlı bir hâl almıştır. 2012 yılında ulaşılan 7 yayınlık üretim, konunun literatürde yeniden önem kazanmaya başladığını göstermektedir. Özellikle 2018 ve 2019 yıllarında sırasıyla 8 ve 9 yayınla zirveye ulaşılması, çalışmaya esas uçucu yağların depo zararlılarına karşı kullanımına yönelik araştırmalara olan ilginin belirgin şekilde arttığını ortaya koymaktadır. Bu durum, doğal pestisitlere olan yönelimin ve sürdürülebilir tarım uygulamalarına duyulan gereksinimin bilimsel çalışmalara da yansıdığı şeklinde de yorumlanabilir.

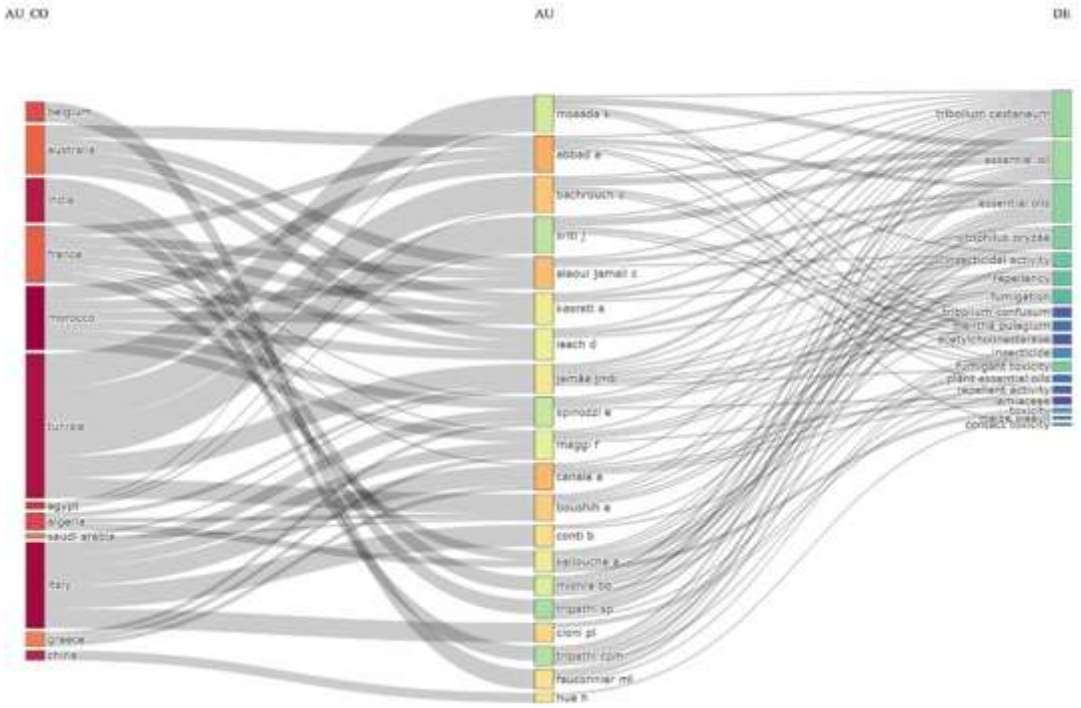
Yıllara göre yayımlanan makalelerin ortalama toplam atıf sayıları ve yıllık ortalama atıf düzeyleri, araştırma konusunun literatürdeki etkisini ve görünürlüğünü değerlendirme açısından önemli bir göstergedir. 2007 yılında yayımlanan tek bir makale, aldığı 264 atıf ile dönemsel olarak en yüksek etkiyi yaratmıştır (Şekil 1). Bu çalışmanın, alan açısından sıklıkla referans gösterilen ve muhtemelen metodolojik ya da uygulama açısından özgünlük taşıyan bir yayın olduğu değerlendirilebilir. 2001 ve 2002 yıllarında yayımlanan çalışmalar da sırasıyla 114 ve 87 toplam atıf ile yüksek etki düzeyine sahiptir. Bu durum, özellikle erken dönem literatürünün araştırma alanına yön veren temel çalışmaları içerdiğini göstermektedir. Bu yıllara ait makalelerin yıllık ortalama atıf sayılarının da sırasıyla 4.56 ve 3.62 olduğu dikkate alındığında, bu etkilerin sürdürülebilir olduğu görülmektedir. Buna karşın daha sonraki yıllarda yayımlanan bazı çalışmaların ortalama toplam atıf sayılarında bir düşüş gözlenmektedir. Örneğin 2008 yılına ait 3 çalışmanın ortalama toplam atıf sayısı 50.67, yıllık ortalama atıf düzeyi ise 2.82 ile sınırlı kalmıştır. Bu bulgu, yeni yayınların literatürde etki yaratması için

belirli bir zamana ihtiyaç duyduğunu ya da daha yeni çalışmaların henüz yeterince görünürlük kazanmadığını düşündürmektedir.

Şekil 1. *Mentha* ve *Lavandula* bitkisel uçucu yağlarının *Sitophilus, Tribolium, Rhyzopertha* türleri üzerine etkisi konusunda yapılan çalışmaların ve makale başına ortalama atıf sayılarının yıllara göre değişimi

Yüksek katkı sağlayan ülkelerin, üretken yazarlar ve odaklanılan araştırma temaları ile olan ilişkisini gösteren ve Şekil 2'de verilen Sankey diyagramı, literatürdeki coğrafi-tematik kümelenmeyi açık biçimde gözler önüne sermektedir. Çalışmalarda yer alan ve en sık kullanılan yazar anahtar kelimeleri (DE) arasında *essential oil, Tribolium castaneum, Sitophilus oryzae,* fumigation, repellency, insecticidal activity gibi terimler ön plana çıkmaktadır. Bu anahtar kelimeler, bitkisel kökenli uçucu yağların özellikle bu iki önemli depo zararlısı üzerinde böcek öldürücü, fumigant ve repellent etkilerinin araştırıldığını göstermektedir. Diğer yandan, acetylcholinesterase ve chemical composition gibi biyokimyasal ve içerik temelli terimlerin de bulunması, çalışmaların sadece biyolojik etkiyle sınırlı kalmayıp, mekanizma düzeyinde analizler içerdiğini de ortaya koymaktadır. Ülke dağılımı incelendiğinde ise Fas, Tunus, Mısır, Hindistan, İran, Çin ve Türkiye gibi ülkelerin öne çıktığı görülmektedir. Fas kökenli araştırmacılar arasında Bachrouch O., Msaada K. ve Sriti J. öne çıkarken; bu yazarların çalışmaları çoğunlukla *Tribolium castaneum, Sitophilus oryzae,* essential oil, repellency gibi anahtar kavramlar etrafında şekillenmiştir. Bu da Fas merkezli araştırma gruplarının özellikle depo zararlıları ve uçucu yağ etkileşimlerine yönelik deneysel çalışmalara ağırlık verdiğini göstermektedir. Tunus'ta ise Abbad A., Alaoui Jamali C. ve Jemâa JMB gibi yazarların, fumigation, toxicity, chemical composition gibi anahtar terimlerle güçlü bağlantıları bulunmaktadır. Bu durum, Tunus'ta yürütülen çalışmaların yalnızca biyolojik aktiviteyle değil, aynı zamanda uçucu yağların kimyasal içeriği ve etki mekanizmalarıyla da ilgilendiğini göstermektedir. Benzer şekilde, Hindistan kökenli araştırmacılar olan Mishra BB., Tripathi SP. ve Tripathi CPM., özellikle repellent activity, contact toxicity, maize weevil ve plant essential oils anahtar kelimeleriyle güçlü biçimde ilişkilidir. Bu da Hindistan'daki çalışmalarda hem bitki bazlı pestisitlerin etkinliğinin hem de farklı zararlı türlerinin hedef alındığını göstermektedir.

Türkiye kökenli araştırmacıların sayıca diğer üretken ülkelere kıyasla daha sınırlı sayıda olmasına rağmen, çalışmalardaki tematik çeşitlilikleri ve katkı sundukları kavramsal alanlar dikkate değerdir. Türkiye menşeli yazarlar, özellikle essential oils, *Sitophilus oryzae*, fumigation, repellency, insecticidal activity, acetylcholinesterase gibi anahtar kavramlar etrafında yoğunlaşmıştır. Bu, Türkiye'deki çalışmaların hem pratik zararlı mücadelesi hem de biyokimyasal etki mekanizmaları düzeyinde yürütüldüğünü göstermektedir.

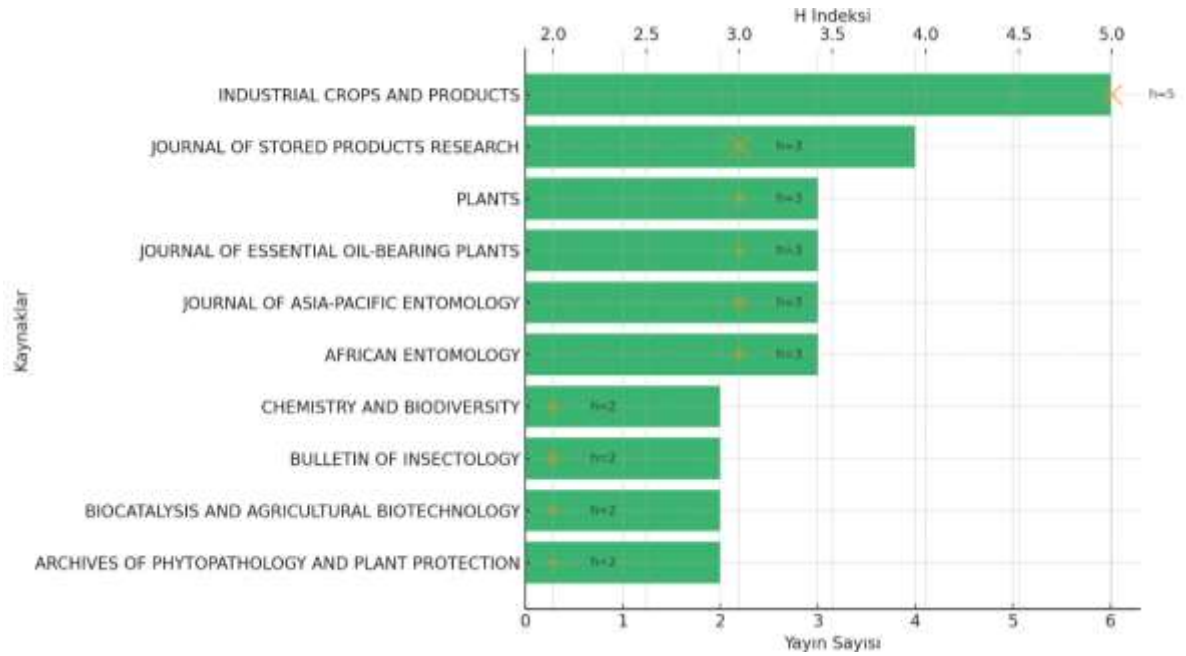


Şekil 2. *Mentha* ve *Lavandula* bitkisel uçucu yağlarının *Sitophilus, Tribolium* ve *Rhyzopertha* türleri üzerine etkisini konu alan çalışmalarda; katkı sağlayan ülkeler (AU_CO), araştırmacılar (AU) ve yazar anahtar kelimeleri (DE) arasındaki ilişkileri gösteren Sankey diyagramı

Yapılan bibliyometrik analiz, *Mentha* ve *Lavandula* türlerinden elde edilen uçucu yağların *Sitophilus, Tribolium* ve *Rhyzopertha* gibi depo zararlıları üzerindeki etkilerini inceleyen literatürde hem yayın hacmi hem de akademik etki açısından öne çıkan dergileri ortaya koymuştur (Şekil 3). Çalışmaların yayınlandıkları dergilere bakıldığında çalışmaya esas konulardaki makalelerin SCOPUS veri tabanında taranan 72 farklı dergide yayınladığı görülmektedir. Yayın sayısı bakımından ilk sırada yer alan Industrial Crops and Products dergisi, toplam 6 yayın ile en üretken kaynak konumundadır. Bu dergiyi sırasıyla Journal of Stored Products Research (4 yayın), African Entomology (3 yayın), Journal of Asia-Pacific Entomology (3 yayın) ve Journal of Essential Oil-Bearing Plants (3 yayın) takip etmektedir. Bu dergiler, bitki koruma, doğal pestisitler ve entomoloji gibi konulara odaklanan çalışmalara ev sahipliği yapmaktadır.

Etki düzeyleri incelendiğinde, Industrial Crops and Products dergisi aynı zamanda en yüksek H indeksi (h = 5) değerlerine sahiptir; bu da sadece yayın sayısı açısından değil, aynı zamanda yayınlarının aldığı atıf sayısı bakımından da güçlü bir etkiye sahip olduğunu göstermektedir. Journal of Stored Products Research ise her ne kadar h-indeksi 3 olarak gözükse de, toplam 426 atıf ile en fazla atıf alan dergi olmuştur. Bu bulgu, söz konusu dergide yayımlanan çalışmaların uzun süreli ve geniş çaplı bir etki yarattığını göstermektedir. Diğer üç dergi olan African Entomology, Journal of Asia-Pacific Entomology ve Journal of Essential Oil-Bearing Plants,

her biri 3'er yayınla katkı sağlamış olup, benzer şekilde h-indeksi 3 olarak kaydedilmiştir. Bu dergilerin görece daha dengeli ama etkili bir yayın profili sergilediği söylenebilir. Sonuç olarak, bu iki analiz birlikte değerlendirildiğinde özellikle *Industrial Crops and Products* ve *Journal of Stored Products Research*, araştırmaların görünürlüğünü artırmak açısından önemli yayın organları olarak değerlendirilebilir.

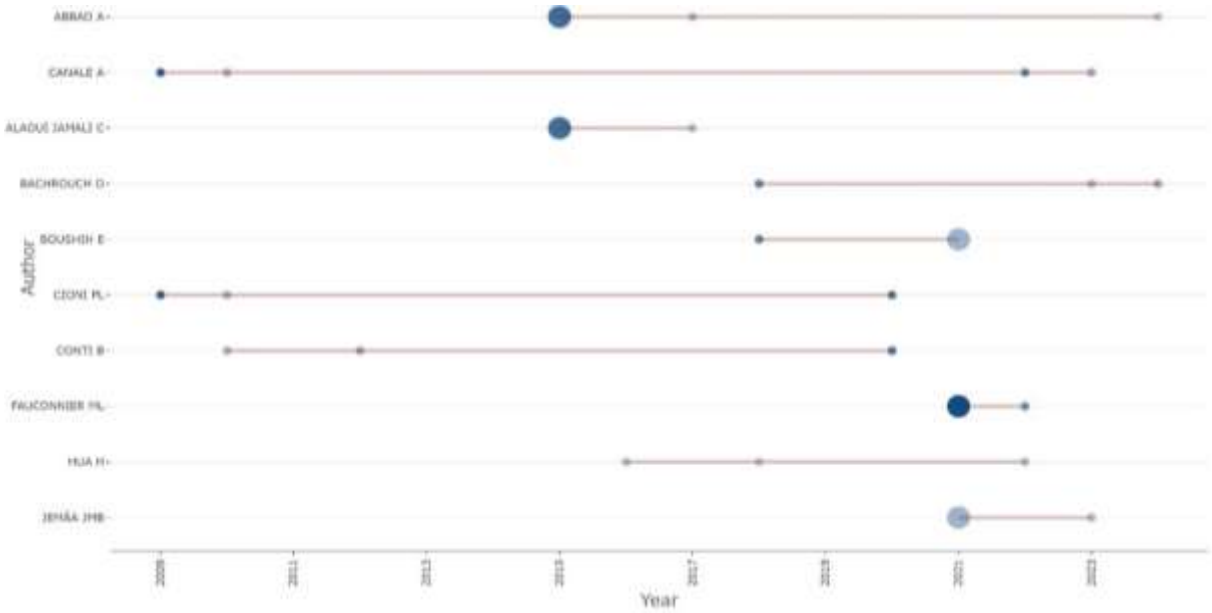


Şekil 3. *Mentha* ve *Lavandula* bitkisel uçucu yağlarının *Sitophilus, Tribolium, Rhyzopertha* türleri üzerine etkisi konusunda yapılan çalışmaların yayınlandığı ilk on dergi ve H-indeksi

Bibliyometrik analiz sonuçlarını yazarlar açısından değerlendirdiğimizde ise Abbad A. ve Canale A.'nin dörder yayınla en üretken yazarlar olduğu görülmektedir. Her biri üç yayın ile alana katkıda bulunmuş 19 yazar bulunmakla beraber yayınlara katkıları açısından değerlendirildiğinde Alaoui Jamali C., Bachrouch O., Boushih E., Cioni P.L., Conti B., Fauconnier M.L., Hua H. ve Jemâa J.M.B. isimlerinin ön plana çıktığı görülmektedir. Verileri yazarların yayınlara zamana yayılmış katkıları açısından değerlendirdiğimizde ise Canale A., Cioni P.L. ve Conti B. gibi yazarların araştırma alanına erken dönemde katkı sağlamaya başladığı ve çalışmalarının yıllar içinde periyodik olarak devam ettiği görülmektedir (Şekil 4). Bu durum, söz konusu araştırmacıların konuyla uzun vadeli bir akademik ilgiyi sürdürdüklerini göstermektedir. Buna karşın Abbad A., Fauconnier M.L. ve Jemâa J.M.B. gibi yazarlar özellikle 2018 sonrası dönemde yoğun yayın faaliyeti yürütmüş; kısa sürede yüksek etkiye sahip yayınlar üretmişlerdir. Bu durum, son yıllarda artan bilimsel ilginin ve projelere dayalı araştırma dinamiklerinin bir sonucu olarak değerlendirilebilir. Yazarlar arasında Cioni P.L. ve Jemâa J.M.B. gibi isimler ise farklı yıllarda tekrar eden katkılarla sürekliliği temsil etmektedir. Özellikle 2020 ve sonrası, yeni araştırmacıların da katılımıyla yayın yoğunluğunun arttığı bir dönem olmuştur.

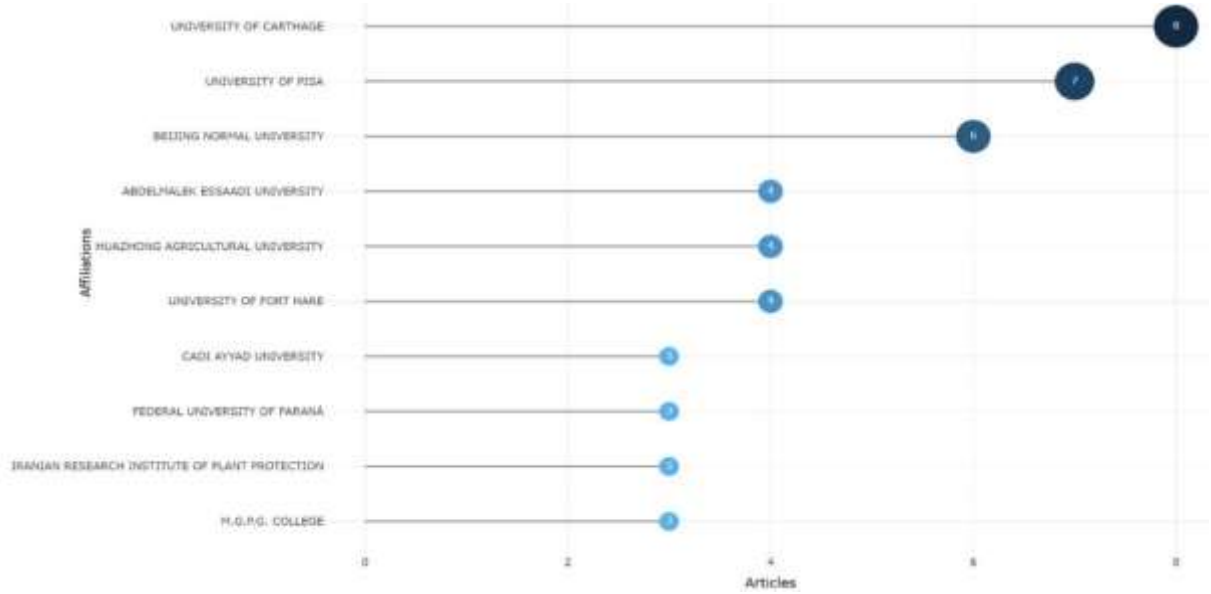
Çalışmalara en fazla katkı sağlayan kurum sekiz yayınla University of Carthage (Tunus) olmuş ve bunu sırasıyla University of Pisa (İtalya) ve Beijing Normal University (Çin) yedi ve altı yayınla takip etmiştir (Şekil 5). Bu üç üniversite, uçucu yağlar ve zararlı böcekler üzerine yapılan araştırmaların merkezinde yer almaktadır. Dördüncü sırada dörder yayınla Abdelmalek Essaadi University (Fas), Huazhong Agricultural University (Çin) ve University of Fort Hare

(Güney Afrika) bulunmaktadır. Ayrıca Fas (Cadi Ayyad University), İran (Iranian Research Institute of Plant Protection), Brezilya (Federal University of Paraná) ve Hindistan (M.G.P.G. College) gibi ülkelerden kurumlar da üçer yayınla önemli katkılar sağlamıştır. Yıllar açısından değerlendirdiğimizde ise University of Fort Hare, erken dönemde literatüre katkı sağlayan ilk kurumlardan biri olmuş ve bu katkısını uzun süre sabit bir seviyede sürdürmüştür. Zaman içinde en dikkat çekici çıkışı yapan kurum ise University of Carthage (Tunus) olmuştur. Bu kurum, 2016 sonrası hızlı bir yayın artışı göstermiş ve 2024 itibariyle toplam 8 yayına ulaşarak en üretken kurum haline gelmiştir.



Şekil 4. *Mentha* ve *Lavandula* bitkisel uçucu yağlarının *Sitophilus, Tribolium, Rhyzopertha* türleri üzerine etkisi konusunda çalışan yazarların yıllara göre yayın katkılarını gösteren üretkenlik grafiği

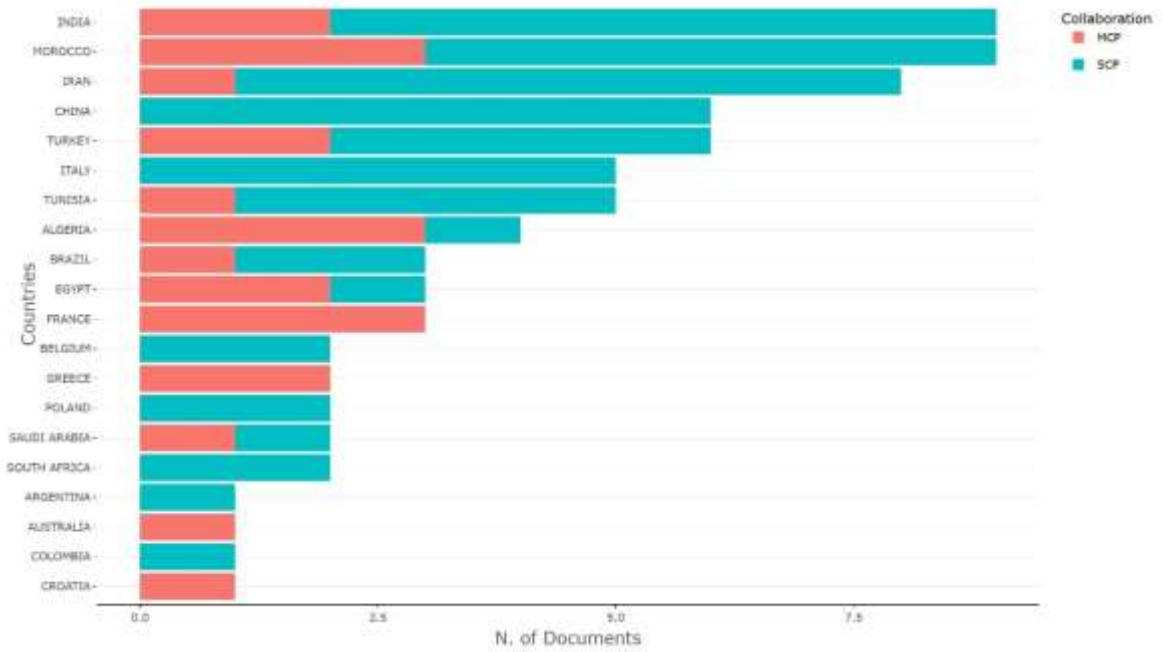
Benzer şekilde, University of Pisa (İtalya) da 2011 sonrası aktif olarak katkı sağlamış ve 2023 yılına kadar yayın sayısını 7'ye yükseltmiştir. Beijing Normal University (Çin), özellikle 2011 sonrası etkinliğini artırmış ve 2020'li yıllarda sabit bir yayın üretkenliği yakalamıştır. Huazhong Agricultural University (Çin) ile Abdelmalek Essaadi University (Fas) gibi kurumlar ise son yıllarda katkılarını artırarak dikkat çekmiştir. Bu kurumların 2023–2025 yıllarında hızlı bir ivmeyle yayın üretmeye başladıkları gözlemlenmektedir. Çalışmaların kurumsal ve zamansal dağılımı, konunun yalnızca bir bölgeye özgü olmadığını; Afrika, Asya ve Avrupa'daki kurumların da bu literatürde aktif rol aldığını ortaya koymaktadır. Özellikle Tunus, İtalya ve Çin'den gelen yayın yoğunluğu, ilgili bölgelerde konuya gösterilen bilimsel ilgiyi yansıtmaktadır.



Şekil 5. *Mentha* ve *Lavandula* bitkisel uçucu yağlarının *Sitophilus, Tribolium, Rhyzopertha* türleri üzerine etkisi konusunda yapılan çalışmalara katkı sağlayan kurumlar

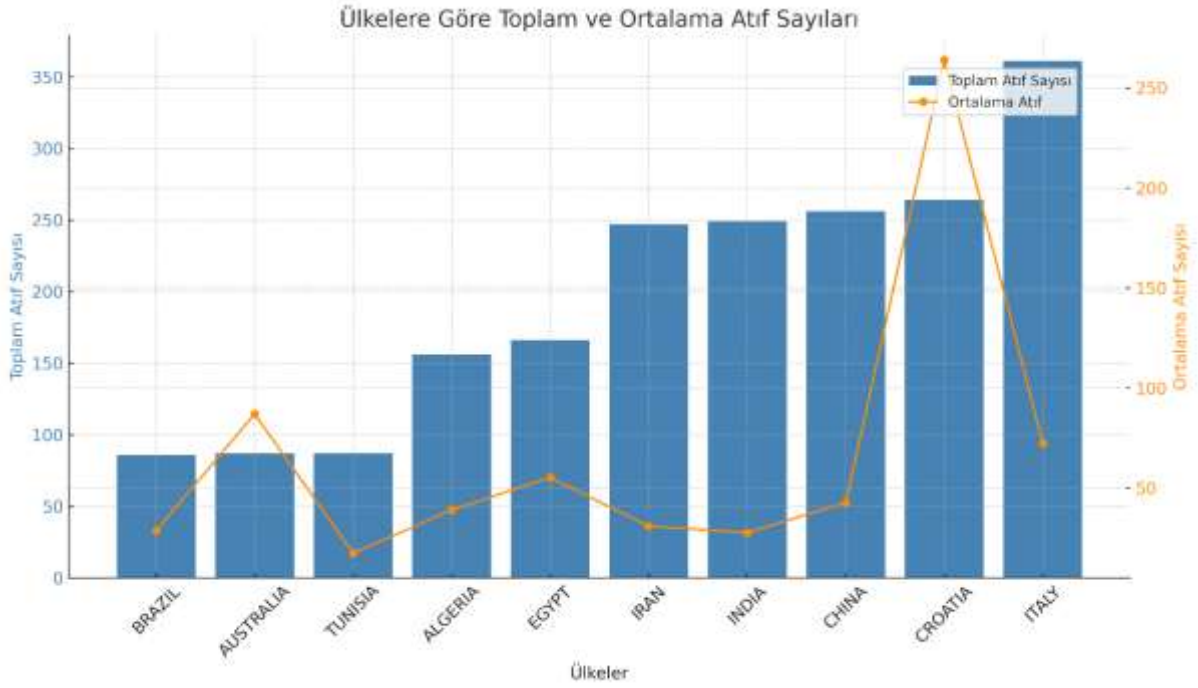
Bibliyometrik analiz kapsamında değerlendirilen çalışmalarda, sorumlu yazarların ülkesel dağılımı incelendiğinde, literatüre en fazla katkı sağlayan ülkelerin Hindistan ve Fas olduğu görülmektedir. Her iki ülke, analiz edilen yayınlar arasında 9'ar çalışmayla en üst sırada yer almıştır. Bu ülkeleri, 8 yayınla İran, 6'şar yayınla Çin ve Türkiye takip etmektedir. Bu bulgular, araştırma konusunun özellikle Güney Asya, Kuzey Afrika ve Orta Doğu ülkelerinde yoğun ilgi gördüğünü göstermektedir.

Ülkelerin yalnızca yayın sayılarıyla değil, aynı zamanda uluslararası iş birliği düzeyleriyle de analiz edilmesi anlamlıdır. Tek ülke içinde yapılan yayınlar (Single Country Publications – SCP) ile çok uluslu iş birliklerine dayalı yayınlar (Multiple Country Publications – MCP) karşılaştırıldığında; sırasıyla %77.8 ve %87.5 SCP oranı ile Hindistan ve İran yayınlarının büyük çoğunluğunu ulusal düzeyde üretildiği görülmektedir (Şekil 6). Bu durum, bu ülkelerde araştırmaların daha çok yerel araştırma altyapısı ve ulusal finansmanlar ile yürütüldüğünü düşündürmektedir. Buna karşılık, Fas ve Türkiye, MCP oranları bakımından dikkat çekmektedir. Fas'tan ve Türkiye'den çıkan yayınların %33.3'ü çok uluslu iş birliklerine dayanmaktadır. Bu oranlar, söz konusu ülkelerin uluslararası akademik ağlara daha açık olduğunu ve çok uluslu araştırma projelerinde aktif rol oynadığını ortaya koymaktadır. Özellikle Cezayir, yalnızca 4 yayına sahip olmasına rağmen bu yayınların %75'inin MCP kapsamında gerçekleşmiş olmasıyla öne çıkmaktadır. Bu durum sınırlı yayın sayısına rağmen güçlü uluslararası entegrasyonu işaret etmektedir. Sonuç olarak, sorumlu yazarın ülkelerine göre yapılan bu değerlendirme, araştırma alanının coğrafi çeşitliliğini ve uluslararasılaşma düzeyini ortaya koymakta; aynı zamanda iş birliğine dayalı bilimsel üretimin önemini vurgulamaktadır. Elde edilen bulgular, *Mentha* ve *Lavandula* gibi uçucu yağ kaynaklı bitkisel biyopestisitlerin araştırılmasında farklı bölgesel yaklaşımların ve iş birliği stratejilerinin etkili olduğunu göstermektedir.



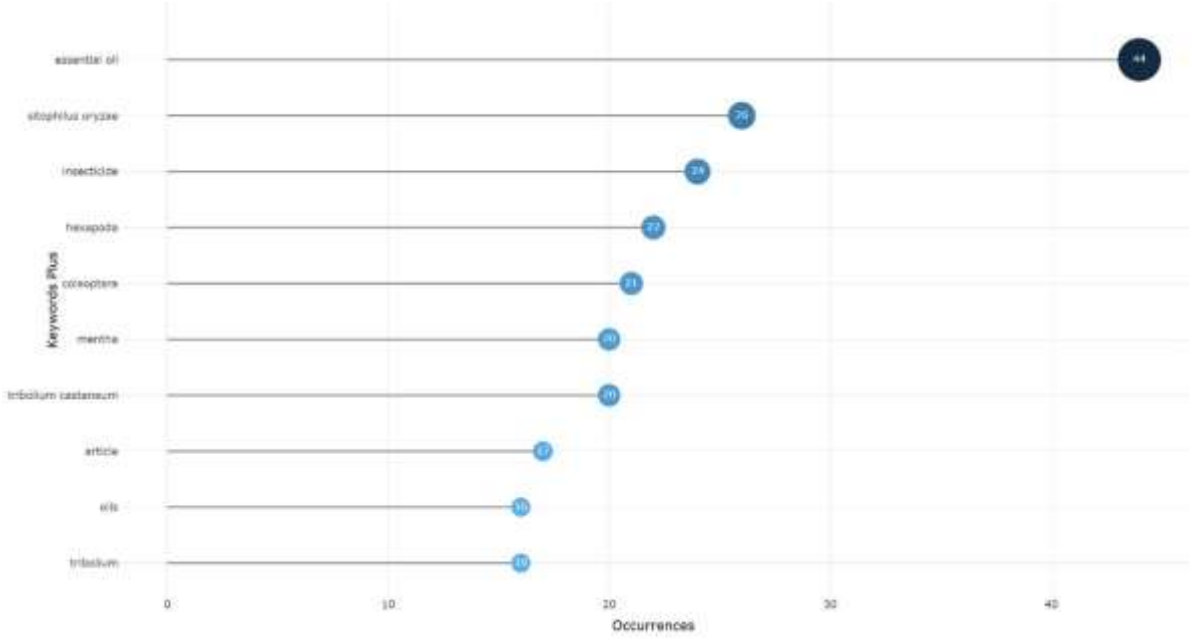
Şekil 6. *Mentha* ve *Lavandula* bitkisel uçucu yağlarının *Sitophilus, Tribolium, Rhyzopertha* türleri üzerine etkisi konusunda yapılan çalışmalara katkı sağlayan sorumlu yazarların ülkelere göre dağılımı

Yapılan bibliyometrik analiz kapsamında, araştırma alanında en yüksek atıf sayısına ulaşan ülkeler incelendiğinde İtalya beş farklı makalesine aldığı 361 atıfla en çok atıf alan ülke olarak öne çıkmaktadır (Şekil 7). Onu sırasıyla Hindistan, İran, Çin ve Hırvatistan sırasıyla 249, 247, 256 ve 264 atıf ile takip etmektedir. Atıf analizinde yalnızca toplam atıf sayısı değil, yayın başına ortalama atıf sayısı da önemli bir göstergedir. Bu açıdan bakıldığında, Hırvatistan, yalnızca bir yayından elde ettiği 264 ortalama atıfla öne çıkmaktadır. İtalya beş makale açısından ortalama 72.2 atıf ile literatürde oldukça görünür ve sık atıf alan çalışmalar üretmiştir. Buna karşın dokuzar makaleyle en üretimin gerçekleştiği Fas ve Hindistan sırasıyla ortalama 4.7 ve 27.7 atıf almış olup buna göre göreceli olarak bu çalışmaların yaygın etkilerinin düşük kaldığını söyleyebiliriz. Kuzey Afrika ülkelerinden Cezayir ve Mısır ortalama 39 ve 55.3 atıfla hem üretkenlik hem de etki açısından güçlü katkılar sağlamıştır. Tunus ve Brezilya ise sırasıyla 17.4 ve 28.7 atıfla daha mütevazı düzeyde katkı sağlamakla birlikte bölgesel çeşitliliğin sürdüğünü göstermektedir. Genel olarak bu veriler, alanın Avrupa (İtalya, Hırvatistan), Asya (Hindistan, İran, Çin) ve Afrika (Mısır, Cezayir, Tunus) kökenli çok uluslu ve etkili bir literatür ağı tarafından desteklendiğini ortaya koymaktadır. Sadece yayın sayısının değil, yayınların aldığı atıfların da dikkate alınması, ülkelerin bilimsel görünürlüğünü ve katkı kalitesini daha doğru değerlendirmeyi sağlamaktadır.



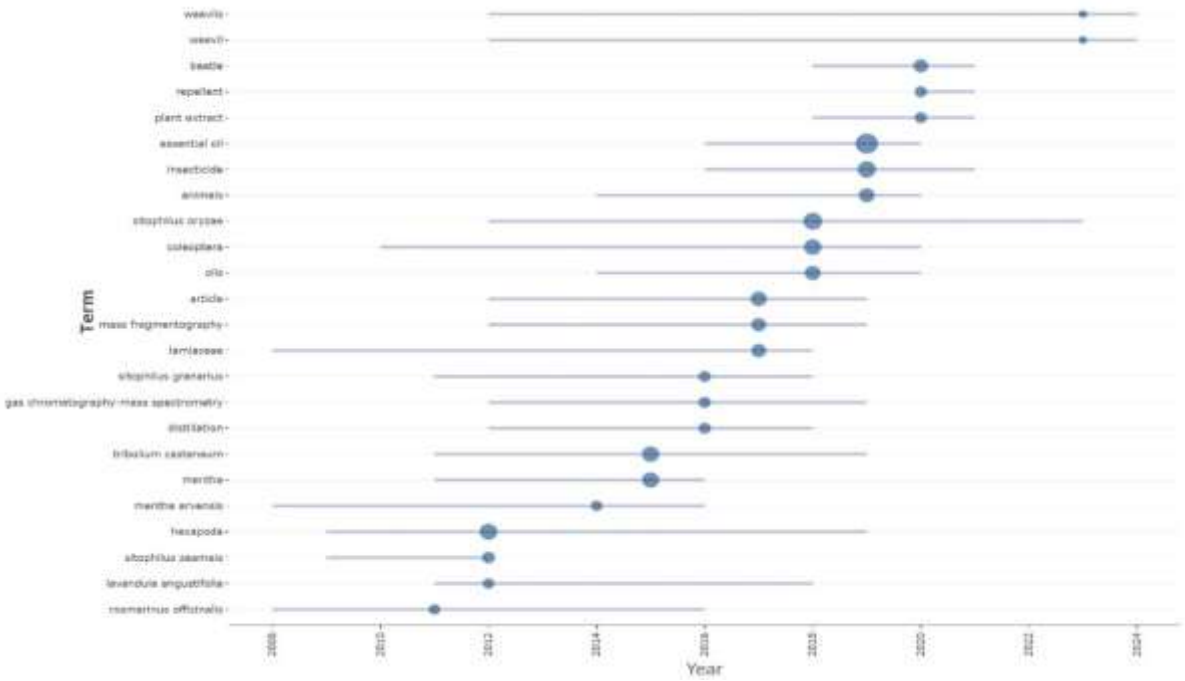
Şekil 7. *Mentha* ve *Lavandula* bitkisel uçucu yağlarının *Sitophilus*, *Tribolium*, *Rhyzopertha* türleri üzerine etkisi konusunda yapılan çalışmalara yapılan atıf sayılarının ülkelere göre dağılımı

Bibliyometrik analiz kapsamında incelenen literatürde en sık karşılaşılan terimlerin dağılımı, Keywords Plus verileriyle ortaya konmuştur (Şekil 8). Toplamda 44 çalışmada yer alan "essential oil" ifadesi açık ara farkla en sık kullanılan anahtar kelime durumundadır. Onu takip eden terimler arasında "*Sitophilus oryzae*" (26) ve "insecticide" (24) yer almakta; bu da uçucu yağların kullanım alanının doğrudan depo zararlısı türleri ve insektisit özellikleriyle ilişkili olduğunu ortaya koymaktadır. Ayrıca "hexapoda" (22) ve "coleoptera" (21) gibi taksonomik düzeyde sınıflandırmaları ifade eden terimler, çalışmalarda organizma odaklı bir yaklaşımın benimsendiğini göstermektedir. Alt sıralarda yer alan ancak yine de dikkate değer sıklıkta kullanılan "article" (17), "oils" (16) ve "tribolium" (16) gibi terimler, literatürün içeriksel çeşitliliğini desteklemektedir.



Şekil 8. *Mentha* ve *Lavandula* bitkisel uçucu yağlarının *Sitophilus, Tribolium, Rhyzopertha* türleri üzerine etkisi konusunda yapılan çalışmalarda en sık karşılaşılan terimlerin dağılımı

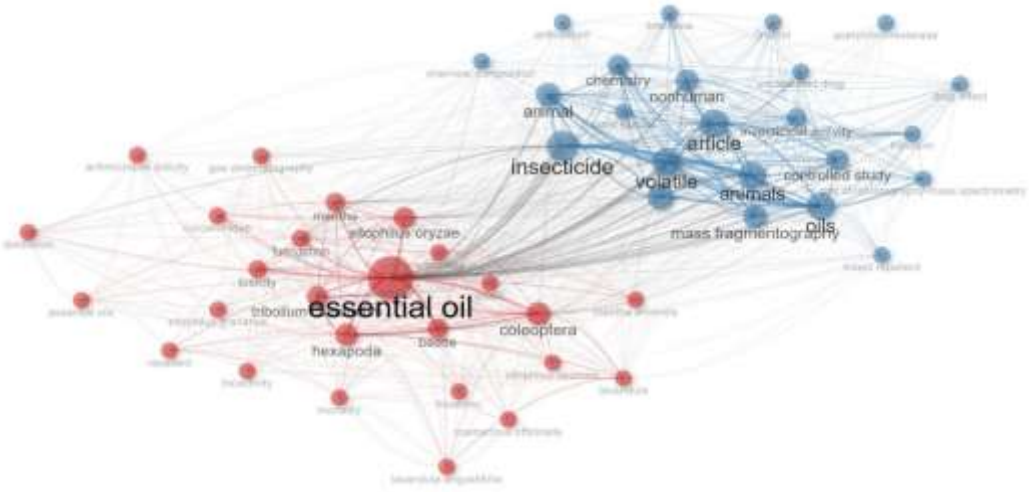
Araştırmalarda kullanılan başlıca anahtar terimlerin literatürdeki ilk belirme yılları ve sonraki süre boyunca kullanım sıklıkları Şekil 9'da görülmektedir. Her bir terim için çizilen yatay çizgi, terimin kullanıldığı zaman aralığını; dairelerin büyüklüğü ise belirli yıllarda terimin ne kadar yoğun kullanıldığını temsil etmektedir.



Şekil 9. *Mentha* ve *Lavandula* bitkisel uçucu yağlarının *Sitophilus, Tribolium, Rhyzopertha* türleri üzerine etkisi konusunda yapılan çalışmalarda kullanılan Keywords Plus verilerine göre en sık rastlanan terimlerin sıklık grafiği

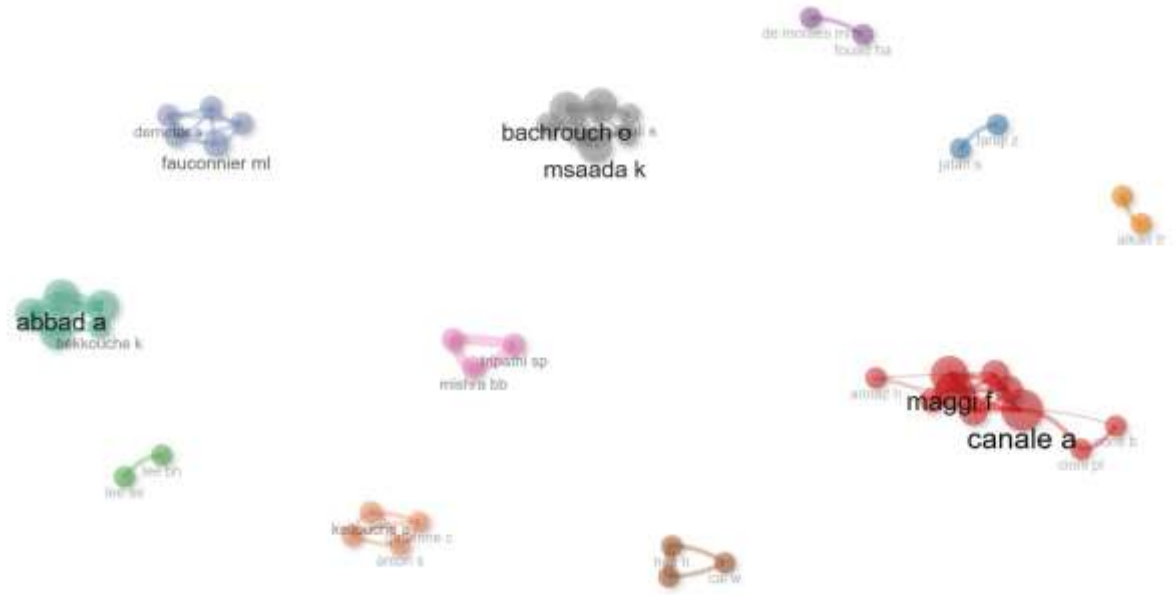
2012–2017 dönemi, *Mentha, Tribolium castaneum, Sitophilus zeamais* gibi hedef organizmalar ile *Rosmarinus officinalis, Lavandula angustifolia* ve *Mentha arvensis* gibi bitki türlerinin yoğun şekilde çalışıldığı bir dönem olarak öne çıkmaktadır. Özellikle "essential oil", "repellent", "plant extract" ve "insecticide" gibi anahtar kavramlar, bu dönemde daha yoğun biçimde literatüre yansımıştır. Zamana yayılan anahtar kelimeler arasında "gas chromatography–mass spectrometry", "distillation" ve "mass fragmentography" gibi teknik terimlerin varlığı, literatürde kullanılan metodolojilerin gelişmiş analitik yaklaşımlara dayandığını göstermektedir. Ayrıca "*Sitophilus oryzae*", "*Sitophilus granarius*" ve "*Tribolium castaneum*" gibi tür isimlerinin sürekliliği, bu organizmaların farklı çalışmalarda yaygın olarak hedef alındığını ortaya koymaktadır.

Yapılan çalışmalarda en sık birlikte kullanılan anahtar kelimeler arasında kurulan co-occurrence ağı, literatürde kullanılan temel kavramlar arasındaki ilişki yapısını ve araştırma alanının kavramsal haritasını ortaya koymaktadır. Analiz sonuçları, çalışma konusunun iki ana tematik küme etrafında şekillendiğini göstermektedir (Şekil 10). İlk olarak, biyolojik odaklı kümelenme, "essential oil", "*Sitophilus oryzae*", "*Tribolium castaneum*", "*Mentha*", "*Lavandula*", "repellent", "toxicity" ve "bioassay" gibi anahtar kelimeler etrafında toplanmıştır. Bu grup, uçucu yağların depo zararlıları üzerindeki biyoinsektisit ve repellent etkilerinin araştırıldığı çalışmaları temsil etmektedir. Özellikle zararlı türlerinin adı geçen bu kümelenme, entomolojik açıdan hedef odaklı ve pratik uygulamalara dönük çalışmaların ağırlığını göstermektedir. İkinci olarak, kimyasal ve analitik temelli kümelenme, "insecticide", "volatile", "mass fragmentography", "gas chromatography-mass spectrometry", "chemical composition" ve "limonene" gibi terimlerle temsil edilmektedir. Bu küme, uçucu yağların kimyasal bileşenlerinin belirlenmesi ve insektisit etki mekanizmalarının açıklanması amacıyla yapılan laboratuvar temelli araştırmaları yansıtmaktadır. Her iki küme arasında "essential oil", "insecticide" ve "animals" gibi terimlerin köprü rolü oynadığı görülmüştür. Bu anahtar kelimeler, disiplinler arası araştırmaların merkezi bileşenleri olup hem biyolojik hem de kimyasal içerikli çalışmaların ortak kavramsal çerçevesini oluşturmuştur. Sonuç olarak, analiz edilen literatürdeki anahtar terimler arasındaki birlikte geçme yapısı, araştırma alanının çok disiplinli doğasını yansıtmaktadır. Uçucu yağların bitki koruma, entomoloji, farmakoloji ve analitik kimya perspektifleriyle eş zamanlı olarak çalışıldığı anlaşılmaktadır.



Şekil 10. *Mentha* ve *Lavandula* bitkisel uçucu yağlarının *Sitophilus, Tribolium, Rhyzopertha* türleri üzerine etkisi konusunda yapılan çalışmalarda en sık birlikte kullanılan anahtar kelimeler arasında kurulan co-occurrence ağı

Yazarlar arası iş birliği ağı, araştırma alanında faaliyet gösteren bilim insanlarının oluşturduğu bilimsel toplulukları, merkezî figürleri ve bölgesel kümelenmeleri göstermektedir (Şekil 11). Grafik üzerinde her bir düğüm bir yazarı, bağlantılar ise ortak yazarlı yayınları temsil etmektedir. Küme renkleri ise belirli iş birliği gruplarını göstermektedir. Analize göre, Canale A., Maggi F., Conti B. ve Cioni P.L.'den oluşan kırmızı renkli küme, ağın en büyük ve en yoğun kümelenmiş iş birliği grubunu temsil etmektedir. Bu yazarlar, genellikle İtalya merkezli çalışmalarda bir araya gelmiş, çok sayıda ortak yayın üretmiş ve güçlü bir ağ yapısı kurmuştur. Diğer dikkat çekici bir diğer küme, Bachrouch O., Msaada K. ve Jemâa J.M.B. gibi yazarları içeren Tunus ve Kuzey Afrika odaklı gruptur. Siyah renkle temsil edilen bu yazarlar, kendi içinde sıkı bağlantılara sahiptir ve alanda bölgesel liderlik rolü oynamaktadır. Benzer şekilde, Abbad A. ve Bekkouche K.'nin öne çıktığı yeşil kümelenme, Cezayir merkezli çalışmaları yansıtmakta; Fauconnier M.L. – Demeter S. ikilisi ise daha çok Belçika/Fransa eksenindeki Avrupa merkezli araştırma iş birliklerini temsil etmektedir. Diğer yandan, Tripathi S.P. – Mishra B.B., Hua H. – Cai W. ve Jafari S. – Faraji Z. gibi ikili grupların daha küçük ölçekli ve bağımsız iş birliği ilişkileri kurduğu görülmektedir. Bu yapılar, daha az uluslararası ağ etkisine sahip olmakla birlikte, odaklanmış tematik araştırmaların örnekleri olabilir. Genel olarak ağın modüler yapısı, alanın bölgesel ve disiplinler arası kümelere ayrıldığını, ancak uluslararası çapta merkezi birleştirici figürlerin sınırlı kaldığını göstermektedir. Bu durum, araştırma alanında daha fazla disiplinler arası ve uluslararası ortaklıkların teşvik edilmesi gerektiğini ortaya koymaktadır.



Şekil 11. *Mentha* ve *Lavandula* bitkisel uçucu yağlarının *Sitophilus, Tribolium, Rhyzopertha* türleri üzerine etkisi konusunda yapılan çalışmalarda yer alan yazarların ortak yayınlarına dayalı iş birliği ağı haritası

6. SONUÇ

Bu çalışma, *Mentha* ve *Lavandula* türlerinden elde edilen uçucu yağların, önemli depo zararlıları olan *Sitophilus oryzae, Tribolium confusum* ve *Rhyzopertha dominica*'ya karşı kullanımına ilişkin bilimsel yayınları bibliyometrik yöntemlerle incelemiştir. SCOPUS veri tabanından elde edilen 100 akademik çalışmanın analizine dayanan bulgular, konunun 2001 yılından itibaren düzenli biçimde bilimsel literatürde yer bulduğunu ve 2011 sonrası dönemde

artan bir ivmeyle ele alındığını göstermektedir. Özellikle 2018 ve 2019 yıllarında ulaşılan yayın zirveleri, çevre dostu biyopestisitlere olan akademik ilginin güçlendiğini ortaya koymaktadır.

Yayınların yıllık büyüme oranı %2.93 olup, belgelerin ortalama yaşı 7.33 yıl olarak hesaplanmıştır. Belgelerin her biri ortalama 28.53 atıf almış; bu da alanın bilimsel etki bakımından dikkate değer bir görünürlüğe sahip olduğunu göstermektedir. Literatürde yer alan 441 yazar arasında sadece birinin tek yazarlı makale yayımlamış olması, araştırma konusunun iş birliği temelli yürütüldüğünü ortaya koymaktadır. Uluslararası ortak yazarlık oranı %33 düzeyindedir.

Ülke bazlı analizlerde, Fas ve Hindistan'ın 9'ar yayın ile en üretken ülkeler olduğu belirlenmiştir. Bu ülkeleri İran (8), Çin ve Türkiye (6'şar yayın) takip etmektedir. Uluslararası iş birliği oranları açısından Cezayir (%75 MCP) ve Fas ile Türkiye (%33.3 MCP) gibi ülkeler dikkat çekmektedir. En fazla atıf alan ülke İtalya (361 atıf) olurken, Hırvatistan tek bir yayından 264 atıf alarak ortalama bazda en yüksek değeri elde etmiştir. Kuzey Afrika (Fas, Tunus, Mısır, Cezayir) ve Asya (Hindistan, İran, Çin) ülkelerinin katkısı, çalışmanın coğrafi çeşitliliğini ve bölgesel önemini yansıtmaktadır.

Anahtar kelime analizleri, literatürde "essential oil", "Sitophilus oryzae", "insecticide" ve "repellency" gibi kavramların öne çıktığını göstermiştir. Co-occurrence ağı ve çok boyutlu ölçekleme (MDS) analizleri sonucunda, tematik olarak iki ana küme tanımlanmıştır: (i) uçucu yağların biyolojik etkilerine odaklanan çalışmalar ve (ii) bu yağların kimyasal bileşimlerinin analiziyle ilgili araştırmalar. Terimlerin zaman içindeki kullanım sıklığı, 2012–2017 döneminin kavramsal yoğunluk açısından kritik bir dönem olduğunu ortaya koymuştur.

Yazar ve kurum analizleri, Canale A., Abbad A. gibi isimlerin ve University of Carthage (Tunus), University of Pisa (İtalya), Beijing Normal University (Çin) gibi kurumların literatürde merkezi roller üstlendiğini göstermektedir. İş birliği ağı yapısı, bölgesel kümelenmelerin baskın olduğunu ancak uluslararası iş birliklerinin henüz sınırlı kaldığını göstermektedir.

Sonuç olarak, bibliyometrik veriler bu araştırma alanının disiplinler arası yapısını, artan bilimsel ilgisini ve çok yönlü uluslararası katılım potansiyelini ortaya koymaktadır. Uçucu yağlara dayalı biyopestisit araştırmaları, hem ekolojik hem de toksikolojik yönleriyle zengin bir bilimsel üretim alanı sunmakta ve sürdürülebilir tarım uygulamaları bağlamında önemini her geçen gün artırmaktadır.

ABSTRACT

In this study, the effects of different salt concentrations on the growth of plants were investigated under *in vitro* conditions. In the experiment, four different media (MYA, MYB, MYC, and MYD) were used, and increasing concentrations of salt (0, 100, 200, and 300 mM) were applied to these media. Stem length (mm), root length (mm), stem wet (g) and dry weight (g), and root wet (g) and dry weights were measured as plant growth parameters. According to the results obtained, a significant decrease in plant growth was observed as the salt concentration increased. The highest growth values were determined in the control group MYA medium and were measured as stem length 43.87 mm, root length 87.07 mm, stem wet weight 0.040 g, stem dry weight 0.004 g, root wet weight 0.0036 g and root dry weight 0.0012 g. The lowest values were recorded in MYD medium with the highest salt concentration. Statistical analysis showed that the differences between the media were statistically significant for most of the traits. These results indicate that increasing salt stress negatively affected the *in vitro* growth of parsley.

Keywords: Salinity, Parsley, *In vitro*

MAYDANOZ BİTKİSİNİN TUZ STRESİNE KARŞI *İN VİTRO* TEPKİLERİNİN ARAŞTIRILMASI

ÖZET

Bu çalışmada, *in vitro* koşullarda farklı tuz konsantrasyonlarının maydanoz bitkisinin gelişimi üzerindeki etkileri araştırılmıştır. Denemede dört farklı ortam (MYA, MYB, MYC ve MYD) kullanılmış ve bu ortamlara artan tuz (0, 100, 200 ve 300 mM) konsantrasyonları uygulanmıştır. Bitkisel gelişim parametreleri olarak gövde uzunluğu (mm), kök uzunluğu (mm), gövde yaş (g) ve kuru ağırlığı (g) ile kök yaş (g) ve kuru ağırlıkları ölçülmüştür. Elde edilen bulgulara göre, tuz konsantrasyonu arttıkça bitki gelişiminde anlamlı bir azalma gözlenmiştir. En yüksek gelişim değerleri kontrol grubu olan MYA ortamında belirlenmiş olup, gövde uzunluğu 43.87 mm, kök uzunluğu 87.07 mm, gövde yaş ağırlığı 0.040 g, gövde kuru ağırlığı 0.004 g, kök yaş ağırlığı 0.0036 g ve kök kuru ağırlığı 0.0012 g olarak ölçülmüştür. En düşük değerler ise en yüksek tuz konsantrasyonuna sahip MYD ortamında kaydedilmiştir. İstatistiksel analizler sonucunda ortamlar arasındaki farkların çoğu özelliğe göre istatistiksel olarak önemli olduğu belirlenmiştir. Bu sonuçlar, artan tuz stresinin maydanozun *in vitro* gelişimini olumsuz yönde etkilediğini göstermektedir.

Anahtar Kelimeler: Tuzluluk, Maydanoz, *In vitro*

GİRİŞ

Toprak besin eksiklikleri kuraklık ve tuzluluk gibi abiyotik streslerin zararlı etkilerini artırarak genel bitki sağlığı ve ürün verimliliği için önemli zorluklar yaratır (Bisht, 2025). Küresel ısınma ve iklim değişikliği, biyolojik çeşitlilik ve tarımsal üretim açısından dünya genelinde ciddi tehditler oluşturmaktadır. Tuzluluk, yüksek sıcaklık ve kuraklık gibi olumsuz çevresel stresler aracılığıyla tarımsal verimliliği önemli ölçüde azaltmaktadır (Boorboori ve ark., 2011; Moore ve ark., 2017; Pan ve ark., 2017; Pourraeisi ve ark., 2022; Boorboori ve Li, 2025). Genel olarak abiyotik stresler, tarımsal verimliliğin artırılmasında karşılaşılan en büyük engellerden biridir (Boorboori ve Zhang, 2023; Munns ve Gilliham, 2015). Bu stresler arasında tuz stresi, küresel ölçekte tarımsal üretim ve verim üzerinde en ciddi etkiye sahip olan başlıca çevresel sınırlamadır. (Zhu 2016; Malik ve Lal 2018; Van Zelm ve ark., 2020, Zhang ve Testerink 2020). Tuzluluk stresindeki artış, doğal etkenlerin (örneğin okyanusun zamanla geri çekilmesi veya minerallerin aşınması) yanı sıra özellikle tarımsal faaliyetler gibi insan kaynaklı faaliyetlerle tetiklenmektedir (Boorboori, 2023; Corwin, 2021). 2050 yılına kadar gezegende yaklaşık 10 milyar insan olacağı tahmin edilmektedir; bu da gıda gereksinimlerinde %50'lik bir artışa işaret etmektedir. Dünya nüfus artışı ve iklim değişikliğinin oluşturduğu tehdit, popüler çiftçilik yaklaşımlarını geçersiz kılıyor gibi görünmektedir (van Dijk ve ark., 2021; Zulfiqar ve Ashraf 2021; Abdelhameed ve ark., 2025). Günümüzde tuzlanma, dünyadaki ekilebilir arazilerin neredeyse üçte birini etkiliyor ve yetersiz sulama teknikleri, uygunsuz pestisit kullanımı ve endüstriyel kirliliğin durumu dünya çapında daha da kötüleştireceği tahmin edilmektedir (Abdelhameed ve ark., 2025). Dünyada tuzluluk stresinden en fazla etkilenen bölgeler kurak ve yarı kurak alanlardır (Sajyan ve ark., 2018; Siddiqui ve ark., 2019). Bu bölgeler, kara yüzeyinin üçte birini kaplamakta olup küresel tarımsal üretime önemli ölçüde katkı sağlayabilecek potansiyele sahiptir (Yurtseven ve ark., 2005; Muhammed ve Gomaa, 2012; Boorboori ve Zhang, 2022; Boorboori ve Li, 2025). Toprak tuzluluğu, özellikle korunaklı yetiştiricilik sistemlerinde sebze gelişimini ve hasadını tehdit eden, modern tarımın sürdürülebilirliğini sekteye uğratan küresel çapta önemli bir sorundur (Roeber ve ark., 2021). Günümüzde, sulanan tarım arazilerinin üçte birinden fazlası tuzlanma nedeniyle bozulmakta; bu durum, kontrolsüz iklim olayları, yetersiz drenaj ve yanlış sulama uygulamaları gibi çeşitli etkenlerle daha da kötüleşmektedir ve bu da gıda güvenliği açısından ciddi bir tehdit oluşturmaktadır (Roeber ve ark., 2021). Tuz stresi, sebze gelişimini yavaşlatmakta; hatta bitkilerde ölüm, kalite kaybı ve verim düşüşü gibi olumsuz sonuçlara yol açabilmektedir (Yang ve Guo, 2018). Bu nedenle, bitkilerin yüksek tuz konsantrasyonlarına karşı gösterdiği tepkileri anlamak büyük önem taşımaktadır (Peng ve ark., 2025).

Petroselinum crispum maydanoz, yaprak, kök ve tohumlarının ot ve baharat olarak, gıda işlemede ve ilaç endüstrisinde yaygın kullanımıyla Apiaceae (*Umbelliferae*) ailesine ait en önemli sebzeler arasındadır (Kadoglidou ve ark., 2025). Maydanoz hayati bir mutfak ve tıbbi bitki olup, önemli besinsel ve terapötik faydalar sağlar. Akdeniz bölgesinden gelen bu harika bitki, apigenin ve apiin gibi birçok fenolik bileşik ve flavonoidin yanı sıra, esas olarak miristisin ve apiolden oluşan uçucu yağlar ve kumarinlerin bir sandığıdır (Roy ve ark., 2025). Maydanoz antioksidan, antidiyabetik, anti-inflamatuar ve anti-apoptotik özelliklere sahiptir ve çeşitli fitokimyasallar (flavonoidler, kumarinler, karotenoidler, apiol, miristisin, ftalidler, seskiterpenler, monoterpenler ve askorbik asit) içerir. Esansiyel yağlar açısından zengindir ve bu nedenle hastalıkları ve alerjileri bastırmada önemli bir rol oynayabilir. Antioksidan özellikleriyle maydanoz, MTX (Metotreksat) kaynaklı beyin ve bağırsak hasarını iyileştirebilir. Bu nedenle maydanoz, insan diyetlerinde yaygın olarak bir takviye olarak kullanılır ve sağlıklı beslenmeye önemli bir katkıda bulunur (Sener ve ark., 2003; Mahmood ve ark., 2014; Maodaa ve ark., 2016; Ertaş ve ark., 202; Dursun, 2023; Yılmaz ve ark., 2024).

Bitki doku kültürü, artan besin değeriyle tarımsal üretime yönelik artan küresel talebi karşılamak için geliştirilen yenilikçi bir biyoteknolojik yaklaşımdır. Bu aseptik, *in vitro* teknik, bitki hücrelerinin, dokularının veya tüm bitkilerin kontrollü çevre ve besin koşulları altında yetiştirilmesine olanak tanır ve genetik olarak özdeş klonların üretilmesini kolaylaştırır. Bu yöntem, nesli tükenmekte olan bitki türlerinin korunması, ürün veriminin ve kalitesinin artırılması ve hastalıksız bitkilerin yıl boyunca üretilmesinin sağlanması için vazgeçilmezdir (Sidik ve ark., 2024).

Bu çalışmada, *in vitro* koşullarda farklı konsantrasyonlarda (0, 100, 200, 300 mM) NaCl içeren besin ortamlarının maydanoz bitkisi gelişimine etkilerinin belirlenmesi amaçlanmıştır.

MATERYAL VE METOT

Çalışma, Çukurova Üniversitesi, Ziraat Fakültesi Bahçe Bitkileri Bölümü Prof. Dr. Saadet BÜYÜKALACA doku kültürü laboratuvarında gerçekleştirilmiştir. Araştırmada D giant italiana maydanoz tohumları kullanılmıştır. Denemede tuzluluk stresi için MS (Murashige ve Skoog, 1962) besin ortamına değişik dozlarda (0, 100, 200, 300 mM) NaCl eklenerek ortamlar hazırlanmıştır (Çizelge 1). Maydanoz tohumları steril kabin içerisinde 20 dakika %20'lik sodyum hipoklorit çözeltisinde bekletilerek steril hale getirilmiştir. Kullanılan besin ortamları adlandırması ve ortam içerikleri Çizelge 1'de sunulmuştur. Steril kabin içerisinde besin ortamları petrilere dökülüp soğuyup katılaşmaya bırakılmıştır. Katılaşan ortamlara ekimi yapılmış ve 25 ± 2°C sıcaklık 3.000 lüx' ışık altında 16 saat aydınlık 8 saat karanlık periyotta büyütme odasına alınmıştır.

Çizelge 1. Ortamların adlandırılması

Dozlar	NaCl (mM)
MYA	0
MYB	100
MYC	200
MYD	300

Çalışmada kapsamında; gövde yaş ağırlığı (g), gövde kuru ağırlığı (g), kök yaş ağırlığı (g), kök kuru ağırlığı (g), gövde uzunluğu (mm) ve kök uzunluğu (mm) belirlenmiştir. Çalışmada incelenen parametrelerden elde edilen verilere SAS temeli üzerine kurulu JMP 8.1 istatistik paket programında tesadüf parselleri deneme desenine göre analiz edilmiştir.

BULGULAR VE TARTIŞMA

Çizelge 2'de değişik NaCl dozlarının maydanoz tohumlarındaki gövde yaş ağırlığı (g), gövde kuru ağırlığı (g), kök yaş ağırlığı, kök kuru ağırlıkları (g) gövde kök uzunlukları (mm) belirlenmiştir. Ortamlar arasındaki farklar, istatistiksel olarak önemli bulunmuştur.

Çizelge'e göre gövde yaş ağırlığı, en fazla MYA (0.040 g) ortamında saptanmıştır. Gövde kuru ağırlığı en yüksek MYA (0.004 g) ortamında görülürken bu ortamı MYB (0.003 g) izlemiştir. Kök yaş ağırlığı en fazla MYA (0.0036 g) en az MYD (0.0013 g) ortamında belirlenmiştir. Kök kuru ağırlığı en yüksek MYA (0.0012 g) ortamında elde edilmiştir.

Gövde uzunluğu, en fazla kontrol ortamı olan MYA (43.87 mm) kök uzunluğu MYA (87.07 mm) ortamında sağlanmıştır.

Woodward ve Bennett (2005), Eucalyptus camaldulensis üzerinde gerçekleştirdikleri bir çalışmada, büyüme ortamına NaCl ve absisik asit ekleyerek bitkinin 100 mM'ye kadar olan tuz konsantrasyonlarına uyum sağlayabildiğini tespit etmişlerdir. Bekheet ve ark. (2006) tarafından gerçekleştirilen bir çalışmada, soğan dokularının tuz stresine verdiği yanıtlar incelenmiş ve tuz oranının 4000 ppm'e kadar yükselmesiyle birlikte kuru ağırlık ve kuru madde miktarında artış gözlemlendiği, bu seviyeden sonra ise azalmaların meydana geldiği belirtilmiştir. Kurum ve ark. (2013), farklı kabak çeşitlerinde çeşitli tuzluluk seviyelerinin (0 "kontrol", 2, 4, 8 ve 12 dS m^{-1}) fide gelişimi üzerindeki etkilerini incelemiştir. Çalışmada kök ve sürgünlerin taze ve kuru ağırlıkları değerlendirilmiştir. Araştırma sonucunda, çözeltinin elektriksel iletkenliği arttıkça kök taze ve kuru ağırlıkları ile sürgün taze ve kuru ağırlıklarında azalma eğilimi gözlemlenmiştir. Karakoç ve Kale (2015), marul bitkisine NaCl ve $CaSO_4$ içeren sulama sularını 0, 2, 4 ve 6 dS/m düzeylerinde uyguladıkları çalışmada, tuzluluk arttıkça bitkinin yaş ve kuru ağırlıklarında azalma görüldüğünü bildirmişlerdir.Rezaei Nasab ve ark. (2016), lavanta bitkisi üzerinde tuzluluğun etkilerini araştırdıkları çalışmalarında, artan tuz konsantrasyonlarının kök ve sürgün kuru ağırlığı, kök ve sürgün uzunluğu, dal sayısı ve yaprak yüzeyi gibi morfolojik özelliklerde belirgin azalmaya neden olduğunu bildirmişlerdir. Mahawar ve ark. (2018), tuz stresi altında yetiştirilen roka bitkilerinin yaş ağırlıklarının 0.613 ± 0.0186 g ile 0.167 ± 0.0176 g arasında, kuru ağırlıklarının ise 0.2 ± 0.0115 g ile 0.0833 ± 0.0033 g arasında olduğunu bildirmiştir. Szekely-Varga ve ark. (2020), gerçekleştirdikleri çalışmada, iki farklı lavanta çeşidine uygulanan NaCl'nin, konsantrasyona bağlı olarak kök gelişimini engellediğini rapor etmişlerdir. Altuner ve ark. (2022), in vitro koşullarda tuz stresinin bazı arpa çeşitleri üzerindeki etkilerini incelemiştir. Çalışma sonucunda, artan tuz konsantrasyonlarına bağlı olarak kuru kök ağırlığında azalma meydana geldiği belirlenmiştir. Saraçoğlu ve Akat (2022), süs lahanasında üç farklı tuzluluk seviyesinin bazı kalite parametreleri üzerindeki etkilerini araştırmışlardır. Araştırma sonucunda, en düşük tuzluluk seviyesinde bitki çapı, bitki boyu ve görsel skorun en yüksek değerlere ulaştığı rapor edilmiştir.

Mevcut çalışmanın sonuçları literatürle kıyaslandığında benzer sonuçlar elde edildiği dikkat çekmektedir.

Çizelge 2. Farklı NaCl konsantrasyonlarının maydanoz bitkisinin gövde yaş kuru, kök yaş kuru ve gövde kök uzunluklarının belirlenmesi

Ortamlar	Gövde Yaş Ağırlığı (g)	Gövde Kuru Ağırlığı (g)	Kök Yaş Ağırlığı (g)	Kök Kuru Ağırlığı (g)	Gövde Uzunluğu (mm)	Kök Uzunluğu (mm)

SONUÇ

Abiyotik stres faktörlerinden tuzluluk önemli bir sorun olarak gerek ülkemizde gerekse dünya için önemli bir sorun olarak göze çarpmaktadır. Yetiştiriclik sırasında tuzluluğu yüksek olan topraklarda öenmli derecede verim kaybına neden olmaktadır. Bu çalışmada *in vitro* koşullarda

farklı NaCl stresi koşullarında maydanoz bitkisinin gelişimi belirlenmiştir. Çalışma sonucunda herhangi bir tuz ilavesi yapılmayan ortamlarda bitki gelişimin yüksek olduğu bununla birlikte tuz konsantrasyonunun artması sonucu bitki gelişiminin yavaşladığı görülmüştür.

ABSTRACT

This study was conducted to determine the morphological responses of *Brassica oleracea* var. *italica* (broccoli) to different salt (NaCl) concentrations under *in vitro* conditions. In this study, four different culture media (BRKA, BRKB, BRKC and BRKD) were established by adding increasing concentrations of NaCl (0, 100, 200 and 300 mM) to Murashige and Skoog (MS) basal nutrient media. Morphological parameters such as stem length (mm), root length (mm), stem wet (g) and dry weight (g), and root wet (g) and dry weight (g) were measured to evaluate the effects of salt treatments on plant growth. The data obtained showed that statistically significant decreases occurred in all growth parameters parallel to the increase in salt level. The highest values were determined in BRKA medium representing the control group and were recorded as stem length 70.52 mm, root length 81.28 mm, stem wet weight 0.2061 g, stem dry weight 0.0771 g, root wet weight 0.0187 g and root dry weight 0.0047 g. In BRKD medium with the highest salt level, these values were 48.72 mm, 55.17 mm, 0.1662 g, 0.0428 g, 0.0111 g and 0.0025 g, respectively. The results revealed that broccoli plants were sensitive to salt stress under *in vitro* conditions and increasing NaCl concentrations had suppressive effects on plant morphology.

IN VİTRO KOŞULLARDA ARTAN TUZ KONSANTRASYONLARININ BROKKOLİ BİTKİSİNİN MORFOLOJİK GELİŞİMİ ÜZERİNE ETKİLERİ

ÖZET

Bu çalışma, *Brassica oleracea* var. *italica* (brokoli) bitkisinin *in vitro* koşullarda farklı tuz (NaCl) konsantrasyonlarına verdiği morfolojik yanıtları belirlemek amacıyla yürütülmüştür. Araştırma kapsamında Murashige ve Skoog (MS) bazal besin ortamına artan NaCl (0, 100, 200 ve 300 mM) konsantrasyonları eklenerek dört farklı kültür ortamı (BRKA, BRKB, BRKC ve BRKD) oluşturulmuştur. Tuz uygulamalarının bitki gelişimi üzerindeki etkilerini değerlendirmek amacıyla gövde uzunluğu (mm), kök uzunluğu (mm), gövde yaş (g) ve kuru ağırlığı (g) ile kök yaş (g) ve kuru ağırlığı (g) gibi morfolojik parametreler ölçülmüştür. Elde edilen veriler, tuz düzeyindeki artışa paralel olarak tüm gelişim parametrelerinde istatistiksel olarak anlamlı azalmalar meydana geldiğini göstermiştir. En yüksek değerler kontrol grubunu temsil eden BRKA ortamında belirlenmiş olup, gövde uzunluğu 70.52 mm, kök uzunluğu 81.28 mm, gövde yaş ağırlığı 0.2061 g, gövde kuru ağırlığı 0.0771 g, kök yaş ağırlığı 0.0187 g ve kök kuru ağırlığı 0.0047 g olarak kaydedilmiştir. En yüksek tuz düzeyine sahip BRKD ortamında ise bu değerler sırasıyla 48.72 mm, 55.17 mm, 0.1662 g, 0.0428 g, 0.0111 g ve 0.0025 g olarak ölçülmüştür. Sonuçlar, brokoli bitkisinin *in vitro* koşullarda uygulanan tuz stresine karşı duyarlılık gösterdiğini ve artan NaCl konsantrasyonlarının bitki morfolojisi üzerinde baskılayıcı etkiler oluşturduğunu ortaya koymuştur.

Anahtar Kelimeler: Tuzluluk, Brokoli, *In vitro, Brassica oleracea* var. italica

GİRİŞ

Toprak tuzluluğu, dünyanın kara yüzeyinin yaklaşık %7'sini temsil eden 1100 Mha toprağı etkileyen küresel bir tehdittir (FAO, 2023). Çok faktörlü bir olgu olarak toprak tuzlanması, doğal jeokimyasal süreçler ve ikincil antropojenik faaliyetler yoluyla meydana gelmektedir (Singh, 2022). Toprak tuzluluğu, ürün verimliliğini olumsuz etkileyen en önemli küresel sorunlardan biridir. Tuzluluk, su stresi, sodyum (Na^+) ve klorür (Cl^-) gibi iyonların aşırı alımına bağlı sitotoksisite ve besin dengesizliği yoluyla bitki büyümesini ve gelişimini bozar . Ek olarak, tuzluluğa genellikle reaktif oksijen türlerinin (ROS) oluşumu nedeniyle oksidatif stres eşlik eder (Tsugane ve ark., 1999 ; Hernandez ve ark., 2001; Isayenkov, 2012; Isayenkov ve Maathuis 2019). Küresel ısınma ve iklim değişikliği, dünya çapında biyolojik çeşitlilik ve tarımsal üretim için ciddi tehditlerdir ve tuzluluk, yüksek sıcaklık ve kuraklık gibi istenmeyen çevresel stresler yoluyla tarımsal üretkenliği önemli ölçüde etkilemektedir (Boorboori ve ark., 2011; Moore ve ark., 2017; Pan ve ark., 2017 ; Pourraeisi ve ark., 2022; Boorboori ve Li 2025). Genel olarak, abiyotik stresler tarımda verimliliği artırmanın önündeki en önemli sınırlamalardır (Boorboori ve Zhang 2023; Munns ve Gilliham 2015) ve tuz stresi, dünyadaki tüm abiyotik stresler arasında tarımsal verim ve üretkenlik üzerinde en önemli etkiye sahip olan en kritik çevresel sınırlamadır. (Zhu 2016; Malik ve Lal 2018; Van Zelm ve ark., 2020, Zhang ve Testerink 2020). Tuzluluk stresindeki artış, doğal süreçler (okyanusun kademeli olarak geri çekilmesi veya minerallerin aşınması gibi) ve özellikle tarımsal faaliyetler olmak üzere farklı insan faaliyetlerinin etkisiyle yönlendirilir (Boorboori 2023; Corwin, 2021). Tuzluluk stresinden en çok etkilenen dünya bölgelerinin başında kurak ve yarı kurak alanlar gelmektedir (Sajyan ve ark., 2018; Siddiqui ve ark., 2019) ve bu alanlar kara kütlesinin üçte birini oluşturduğundan, küresel mahsul üretimine önemli bir katkı sağlayabilir (Yurtseven ve ark., 2005; Muhammed ve Gomaa 2012; Boorboori ve Zhang 2022; Boorboori ve Li 2025). Toprak tuzlanması, özellikle korumalı yetiştirme sistemlerinde sebze büyümesini ve hasadını tehdit eden ve çağdaş tarımın sürdürülebilir ilerlemesini engelleyen küresel bir sorundur (Roeber ve ark., 2021). Sulanan arazilerin üçte birinden fazlası tuzlanma nedeniyle bozulmaktadır. Eşi benzeri görülmemiş aşırı iklim, uygunsuz drenaj ve sulama sistemleri ve diğer bazı faktörlerle birlikte, ekili arazi tuzlanması sorunu daha da artmış ve gıda güvenliğini ciddi şekilde tehdit etmektedir (Roeber ve ark., 2021). Tuz stresi sebze büyümesini engeller ve hatta ölüme, kalite bozulmasına ve verim düşüşüne neden olur (Yang ve Guo 2018). Bu nedenle, bitkilerin yüksek tuzluluğa nasıl tepki verdiğini araştırmak kritik öneme sahiptir (Peng ve ark., 2025). Brokkoli (*Brassica oleracea* var. *italica*), daha iyi üretim ve niteliksel performans gösterdiği ılıman sıcaklıklara sahip bölgelerde olmak üzere dünyanın her yerinde yetiştirilen bir sebzedir. (Cecílio Filho ve ark., 2012; Torres ve ark., 2021). Brokkoli, dünya çapında sebze olarak yenen Brassicaceae ailesine ait iki yılda bir bitkidir . Bitkinin yenilebilir kısımları sap ve büyük çiçekli baştır. Brokkoli, C vitamini ve K vitamini açısından zengin bir kaynaktır. Ayrıca önemli miktarda B1 , B3, B5, B6 ve E vitamini içerir. Brokolide ayrıca folat , krom, magnezyum, fosfor, çinko, kalsiyum, demir, selenyum, proteinler ve omega-3 yağ asitleri bulunur. Brokoli ayrıca polifenoller, yani kaempferol , kuersetin glukozitleri, isorhamnetin , glukozinolatlar ve bunların türevleri gibi çok sayıda fitokimyasal içerir. Bunlar, antioksidan ve antikanser özelliklerinden ve diğer sağlık yararlarından sorumludur. Brokkoli, yüksek besin ve lif içeriği nedeniyle en sevilen yiyeceklerden biri haline gelmektedir. Çok sayıda epidemiyolojik çalışma, brokolinin bağışıklık modülasyonu, detoksifikasyon, göz sağlığı, kemik sağlığı ve antimikrobiyal ve antioksidan özellikler gibi diyet ve terapötik faydalarını doğrulamıştır (Nagraj ve ark., 2020). Bitki doku kültürü sistemleri, laboratuvarda kontrollü aseptik koşullar altında tüm bitkilerin, organların, dokuların veya hücrelerin yetiştirilmesine olanak tanımaktadır. Doku kültürü sistemi, bitki veya eksplant büyümesi için gerekli tüm besinleri,

enerjiyi ve suyu bazal ortam aracılığıyla sağlar. Ayrıca, kontrollü inkübasyon koşulları büyümeyi desteklemek için optimize edilmiş ışık ve sıcaklık ayarları sağlar (Phillips ve Garda 2019). Bu çalışmada, *in vitro* koşullarda farklı konsantrasyonlarda (0, 100, 200, 300 mM) NaCl içeren besin ortamlarının brokkoli bitkisi gelişimine etkilerinin belirlenmesi amaçlanmıştır.

MATERYAL VE METOT

Çalışma, Çukurova Üniversitesi, Ziraat Fakültesi Bahçe Bitkileri Bölümü Prof. Dr. Saadet BÜYÜKALACA doku kültürü laboratuvarında gerçekleştirilmiştir. Araştırmada Atlantis brokkoli tohumları kullanılmıştır. Denemede tuzluluk stresi için MS (Murashige ve Skoog, 1962) besin ortamına değişik dozlarda (0, 100, 200, 300 mM) NaCl eklenerek ortamlar hazırlanmıştır (Çizelge 1). Brokkoli tohumları steril kabin içerisinde 20 dakika %20'lik sodyum hipoklorit çözeltisinde bekletilerek steril hale getirilmiştir. Kullanılan besin ortamları adlandırması ve ortam içerikleri Çizelge 1'de sunulmuştur. Steril kabin içerisinde besin ortamları petrilere dökülüp soğuyup katılaşmaya bırakılmıştır. Katılaşan ortamlara ekimi yapılmış ve 25 ± 2°C sıcaklık 3.000 lüx' ışık altında 16 saat aydınlık 8 saat karanlık periyotta büyütme odasına alınmıştır.

Çizelge 1. Ortamların adlandırılması

Dozlar	NaCl (mM)
BRKA	0
BRKB	100
BRKC	200
BRKD	300

Çalışmada kapsamında; gövde yaş ağırlığı (g), gövde kuru ağırlığı (g), kök yaş ağırlığı (g), kök kuru ağırlığı (g), gövde uzunluğu (mm) ve kök uzunluğu (mm) belirlenmiştir. Çalışmada incelenen parametrelerden elde edilen verilere SAS temeli üzerine kurulu JMP 8.1 istatistik paket programında tesadüf parselleri deneme desenine göre analiz edilmiştir.

BULGULAR VE TARTIŞMA

Araştırma süresince, değişik tuzluluk konsantrasyonlarında brokkoli tohumlarının gövde yaş ağırlığı (g), gövde kuru ağırlığı (g), kök yaş ağırlığı, kök kuru ağırlıkları (g) gövde kök uzunlukları (mm) Çizelge 2'de sunulmuştur. Ortamlar arasındaki farklar, istatistiksel olarak önemli bulunmuştur.

Gövde yaş ağırlıkları bakımından, en yüksek ağırlık 0.2061 g ile BRKA ortamında gerçeleşirken bu ortamı sırasıyla 0.1781 BRKB ve 0.1725 g BRKC ortamları izlemiştir. Gövde kuru ağırlığı en yüksek BRKA (0.0771 g) ortamında belirlenirken en düşük değer konsantrasyonların artması ile birlikte BRKD (0.0428 g) ortamında görülmüştür. Kök yaş ağırlığı en fazla BRKA 0.0187 g ortamında elde edilmiştir. Kök kuru ağırlığı bakımından en yüksek BRKA (0.0047 g) en düşük BRKD (0.0025 g) ortamında sağlanmıştır.

Gövde uzunluğu, en fazla kontrol ortamı olan BRKA (70.52 mm) ortamında bulunmuştur. En düşük uzunluk ise BRKD (48.72 mm) ortamında saptanmıştır. Kök uzunluğu bakımından en yüksek kök uzunluğuna diğer incelenen parametrelerdeki gibi BRKA (81.28 g) ortamında tespit

edilmiştir. Ortamlar arasındaki en düşük kök uzunluğu ise BRKD (55.17 mm) ortamında elde edilmiştir.

Kurum ve ark. (2013), farklı kabak çeşitlerinde değişik tuzluluk düzeylerinin (0, "kontrol", 2, 4, 8 ve 12 dS m-1) fide büyümesi üzerine etkilerini belirlemiştir. Araştırmada kök taze ve kuru ağırlıkları, sürgün taze ve kuru ağırlıkları incelenmiştir. Sonuç olarak çözeltinin elektriksel iletkenliği arttığında kök taze ağırlığı, kök kuru ağırlığı, sürgün taze ağırlığı ve sürgün kuru ağırlıklarının azalma eğiliminde olduğu görülmüştür. Avcı ve ark. (2020), pamuk çeşitlerinde in vitro koşullarda tuz uygulamalarında, artan tuz konsantrasyonunun bitkinin yaş kök ağırlığında azalmaya neden olduğunu bildirmiştir. Altuner ve ark. (2022) *in vitro* tuz stresinin bazı arpa çeşitlerindeki etkilerini belirlemiştir. Deneme sonunda, tuz konsantrasyonlarının artması sonucu kuru kök ağırlığının azldığı tespit edilmiştir. Baktemur (2023), *in vitro* koşullarda değişik dozlarda (0, 50, 100, 150, 200, 250 mM) NaCl'nin kabak bitkisi üzerine etkilerini incelemiştir. Denemede, tuz miktarının arması kabak bitkisinin gelişimini yavaşlattığını bildirmiştir.

Çizelge 2. Farklı NaCl konsantrasyonlarının brokkoli bitkisinin gövde yaş kuru, kök yaş kuru ve gövde kök uzunluklarının belirlenmesi

Ortamlar	Gövde Yaş Ağırlığı (g)	Gövde Kuru Ağırlığı (g)	Kök Yaş Ağırlığı (g)	Kök Kuru Ağırlığı (g)	Gövde Uzunluğu (mm)	Kök Uzunluğu (mm)
BRKA	0.2061a	0.0771a	0.0187a	0,0047a	70.52a	81.28a

BRKC	0.1725bc	0.0547bc	0.01347bc	0.0031b	53.31bc	65.14c
BRKD	0.1662c	0.0428c	0.0111c	0.0025c	48.72c	55.17d

SONUÇ

İn vitro koşullarda farklı NaCl stresi koşullarında brokkoli bitkisinin gelişimi üzerindeki etkileri incelenmiştir. Gövde yaş ağırlığı en yüksek BRKA (0.206 g) ortamında belirlenmiştir. Gövde kuru ağırlığı en yüksek en yüksek BRKA (0.0771 g) ortamında gerçekleşmiştir. Kök yaş ağırlığı en yüksek BRKA (0.0187 g), kök kuru ağırlığı en yüksek BRKA (0.0047 g) ortamında saptanmıştır. Gövde ve kök uzunlukları ise incelenen diğer özelliklerdeki gibi BRKA (Kontrol) ortamında en fazla elde edilmiştir. Çalışma sonucunda tuzluluk dozlarının artması bitki gelişimini yavaşlattığı dikkat çekmiştir.

PRECISION LIVESTOCK FARMING: POTENTIAL AND RISKS OF USING DIGITAL TECHNOLOGY IN ANIMAL HUSBANDRY

Gökçe ÖZDEMİR
Sivas Cumhuriyet Üniversitesi Veteriner Fakültesi Zootekni Anabilim Dalı, 58140, Sivas, TÜRKİYE, gokceozdemir@cumhuriyet.edu.tr, ORCID NO: 0000-0003-1977-130X

ABSTRACT

In recent years, there has been a growing trend toward technologies designed to support farmers in livestock management by continuously, automatically, and in real-time monitoring and following animal productivity, environmental impacts, and parameters related to animal health and welfare. Scientists have increasingly focused on technology-driven approaches that establish a close connection between the environment, technology, and people, while also addressing the needs for sustainability and resilience in agriculture and livestock production. Terms such as Industry 4.0, Agriculture 4.0, and Livestock 4.0—or alternatively, precision livestock farming, precision agriculture, and smart farming—have become increasingly widespread. Numerous studies have been conducted on technologies aimed at supporting livestock management through the continuous and automated monitoring of productivity, environmental factors, and animal health and welfare. This study aims to comparatively examine, from multiple dimensions, the implementation status and potential of digital technologies emerging under the concept of Precision Livestock Farming (Livestock 4.0), as well as their impacts, strengths, weaknesses, opportunities and risks regarding animal health and welfare.

Keywords: Precision Livestock Farming, Animal health and welfare, Effect, Benefit, Risk

HASSAS HAYVANCILIK: HAYVANCILIKTA DİJİTAL TEKNOLOJİ KULLANIM POTANSİYELİ VE RİSKLERİ

ÖZET

Hayvan verimliliğini, çevresel etkileri, hayvan sağlığı ve refahı parametrelerini düzenli, gerçek zamanlı ve otomatik bir şekilde izleyip takip ederek, çiftçileri süürü yönetiminde desteklemek üzere tasarlanan teknolojilere bir yönelim oluşmaktadır. Son yıllarda bilim insanları, teknoloji odaklı yaklaşımlara odaklanmakla birlikte, sürdürülebilirlik ve dayanıklılık ihtiyaçlarına odaklanan çevre, teknoloji ve insanlar arasında yakın bir bağlantı kuracak, tarım ve hayvancılık alanlarıyla da ilgilenmektedirler. Endüstri 4.0, Tarım 4.0 ve Hayvancılık 4.0 veya hassas hayvancılık, hassas tarım, akıllı tarım gibi terimler giderek daha yaygınlaşmaktadır. Hayvan verimliliğini, çevresel etkileri, hayvan sağlığı ve refahı parametrelerini düzenli, gerçek zamanlı ve otomatik bir şekilde izleyip takip ederek çiftçileri sürü yönetiminde desteklemek üzere tasarlanan teknolojilere üzerine birçok araştırma düzenlenmektedir. Bu çalışmada, Hassas Hayvancılık (Hayvancılık 4.0) kavramı altında gelişen dijital teknolojilerinin hayvancılıkta uygulanma durumu ve potansiyelinin incelemesi yanında bu uygulamaların hayvan sağlığı ve refahı üzerine etkileri, güçlü, zayıf yönleri ile fırsat ve riskleriyle farklı boyutlarda karşılaştırılmalı olarak ele alınması amaçlandı.

Anahtar Kelimeler: Hassas Hayvancılık, Hayvan sağlığı ve refahı, Etki, Yarar, Risk

GİRİŞ

Hayvansal kaynaklı ürünlere yönelik küresel talebin giderek artması, çiftçileri faaliyetlerini genişletmeye ve büyütmeye zorlamaktadır (Morrone et al., 2022). Hayvancılık sektöründe hayvan başına maksimum üretkenliğin hedeflendiği, üretim alanlarının kontrol edildiği yoğun ve uzmanlaşmış sistemlere doğru hızlı bir ilerleme yaşanmaktadır (Berckmans, 2017; Yaman ve ark., 2021). Hayvansal kökenli gıdaya talebin 2050 yılına kadar küresel düzeyde %70 artması beklenmektedir. Bu talep artışının çevreyi çok fazla etki etmeden karşılanması gerekmektedir (Berckmans, 2017; Schillings et al., 2021; Yaman ve ark., 2021). Hayvancılık devrimi diyebileceğimiz bu süreç yavaş başlayıp, hızlı bir büyüme ve ilerleme göstermiştir (Berckmans, 2017; Yaman ve ark., 2021). Artan çiftlik ölçeği ve hayvan sayısı gibi sebepler, çiftçilerin geçmişte kullandığı uygulamaların veya yöntemlerin yeni düzen içerisinde sürü yönetimini sağlamada yetersiz olmalarına zemin hazırlamaktadır (Schillings et al., 2021; Gezici ve ark., 2023). Büyük hayvan topluluklarından oluşan çiftliklerde hayvan sağlığının sürekli izlenmesi daha önemli bir konu haline gelecektir (Berckmans, 2017). Yetiştiricilerin, yönetmeleri gereken büyük sürüler içerisindeki hayvanları bireysel olarak izleyecek araç ve gereçlere sahip olmaları gerektiği gerçeğini kabul edilmektedir (Berckmans, 2017). Hayvan verimliliğini, çevresel etkileri, hayvan sağlığı ve refahı parametrelerini düzenli, gerçek zamanlı ve otomatik bir şekilde izleyip takip ederek, çiftçileri sürü yönetiminde desteklemek üzere tasarlanan teknolojilere bir yönelim oluşmaktadır (Schillings et al., 2021; Morrone et al., 2022). Bu konular, ulusal ve uluslararası hukuk tarafından yoğun bir şekilde üzerinde çalışılan hassas konulardır. Bu konuların kontrol edilmesine yönelik yöntemlerin hızlı, etkili ve verimli olması gerekliliğini doğurmaktadır (Schillings et al., 2021; Morrone et al., 2022).

Son yıllarda bilim insanları, teknoloji odaklı bu yaklaşımlara odaklanmakla birlikte, insanlar sürdürülebilirlik ve dayanıklılık ihtiyaçlarına odaklanan çevre, teknoloji ve insanlar arasında yakın bir bağlantı kuracak, tarım ve hayvancılık ile ilgilenmektedirler (Vázquez-López et al., 2021; Kraft et al., 2022). Endüstri 4.0, Tarım 4.0 ve Hayvancılık 4.0 veya hassas hayvancılık (PLF, Precision Livestock Farming), hassas tarım, dijital tarım, akıllı tarım gibi terimler giderek daha yaygınlaşmaktadır. Bugüne kadar çeşitli ülkeler ve büyük dünya kuruluşları bu terimleri sürdürülebilir ve kullanıcı dostu çiftlik yönetiminin geliştirilmesinde temel taşları olarak kullanmaktadır (Schillings et al., 2021; Vázquez-López et al., 2021; Morrone et al., 2022).

Bu çalışmada, Hassas Hayvancılık (Hayvancılık 4.0) gibi gelişen dijital teknolojilerinin hayvancılıkta uygulanma durumu ve potansiyelinin incelemesi yanında bu uygulamaların hayvan sağlığı ve refahı üzerine etkileri, yararları ve riskleri gibi konular farklı boyutlarda karşılaştırılmalı olarak ele alınması amaçlandı.

Teknoloji Kullanmanın Potansiyeli ile Hayvan Sağlığı ve Refahı Üzerine Yararları

Hayvan yetiştiriciliğinde bulaşıcı hastalıklar ve topallık gibi önemli sağlık sorunları son derece yaygındır. Çiftliklerdeki ekonomik kayıpların en aza indirilmesi bağlamında bu tür durumların erken tespiti için teknolojinin kullanılması büyük avantaj sağlamaktadır. Hayvan yetiştiricilerinin hayvanlarının refahını izlemelerine yardımcı olacak bu "akıllı teknolojilerin" büyük potansiyeline sahip olduğu bildirilmektedir. Birçok ülke sürdürülebilir tarıma yönelik stratejilerin bir parçası olarak bu teknolojilerin gelişimine yatırım yapmaktadır (Schillings et al., 2021; Morrone et al. 2022; Kraft et al., 2022). Hassas hayvancılık, nesnelerin interneti (IoT), büyük veri, elektrikli araçlar (EV), 3D baskı, bulut bilişim, yapay zeka (AI) ve siber-fiziksel sistemler gibi teknolojik yenilikleri içeren bir girişimdir (Morrone et al. 2022). Sensörler, kameralar veya mikrofonlar gibi teknolojileri kullanan çeşitli sistemler, hayvanlar üzerinde tespit edilen verileri veya anormallikleri, çiftçilere çeşitli cihazlar (örneğin telefonlar,

bilgisayarlar veya tabletler) aracılığıyla doğrudan iletebilmekte ve çiftçilerin erken müdahale etmesine olanak sağlamaktadır (Schillings et al., 2021; Morrone et al. 2022; Kraft et al., 2022).

Hayvancılık söz konusu olduğunda çevre ve sosyo-ekonomiyi sürdürülebilirliğin boyutlarında ele alınması gerekmektedir, ayrıca hayvan sağlığı ve refahı da sürdürülebilirliğin önemli unsurlarıdır. Tüm bu teknolojilerin hayvan sağlığı ve refahı üzerine faydaları; hayvan sağlığının iyileştirilmesi, antibiyotik kullanımının azaltılması ve bazen sistemlerde hastalık salgınlarının önleyecek erken müdahale gibi yönetim kararlarının desteklenmesi şeklinde sıralanmaktadır. Ek olarak, hayvanları bireysel olarak izlenmesi, örneğin, vücuda giyilebilir cihazların kullanımı, hayvanların özel ihtiyaçlarının daha iyi anlaşılmasına yardımcı olarak kullanılabilmektedir (Schillings et al., 2021; Kraft et al., 2022).

İnsan-hayvan ilişkisi hem hayvan refahını hem de üretkenliği etkileyebilecek önemli bir faktördür. Bakıcıların hayvanlarına karşı tutumları veya davranışları, hayvanların insanlardan korkmasına, stres yaşamasına verimlerinin ve verimliliği de etkilenmesine sebep olabilmektedir (Hemsworth, 2003; Waiblinger ve ark., 2006). Hassas hayvancılık teknolojileri, insan-hayvan etkileşimlerini içeren belirli görevleri kolaylaştırmak ve/veya değiştirmek ve yetiştiricilerin hayvanlarını bireysel gözlemlenmesi için harcadığı zamanı azaltmak için kullanılmaktadır (Berckmans, 2017; Schillings et al., 2021).

Hassas hayvancılıkta kullanılan teknolojiler ile hayvanların davranışları doğrudan hayvan üzerinde bulunan biyosensörler aracılığıyla sürekli olarak ölçülmektedir. Bu tekniğin bazı avantajları vardır: hayvana fiziksel bir temas olma olasılığı, enfeksiyon veya hastalık bulaşma riski, ölçüm yapılırken hayvanın tepkisini etkileme riski yoktur, ayrıca tek bir veya mikrofon kamera kullanılarak maliyetler azaltılabilir (Berckmans, 2017).

Çiftlik yönetimini iyileştirmek için bu teknolojiler ile elde edilen verilerin gerçek zamanlı entegrasyonunun, çiftçilikte veriye dayalı karar alınmasına sağlamaktadır (Cabrera et al., 2020). Yeni teknolojilerden üretilen tüm bu veriler, doğru işlendiğinde yönetimin karar verme sürecine yardımcı olarak çiftliğe özgü modellerin geliştirilmesi için bir fırsat sunmaktadır (Cabrera et al., 2020). Sadece büyük ölçekli işletmelerde değil, küçük ölçekli çiftliklerde bile dijitalleşme, işi basitleştirme, esnekliği artırma ve yüksek profesyonel düzeyde uzmanlaşmış bilgi ve karar desteği sağlama konusunda büyük bir potansiyele sahip olduğu bildirilmektedir (Kraft et al., 2022; Gezici ve ark., 2023).

Uygulamada Karşılaşılan Riskler ve Zorluklar

Endüstriyel üretimde hassasiyeti artırmak için teknoloji ve otomasyondan yararlanmanın genel prensibi hassas hayvancılık uygulamaları kolayca aktarılabilir olmasına rağmen, ilgili prosedürlerini oluştururken çok dikkatli ve titiz çalışılması gereken bazı sorunların olduğu da göz ardı edilmemesi gerekmektedir (Goller et al., 2021; Morrone et al., 2022). Dijital teknolojinin çiftçiler ürerim süreçleri olumlu etkilerinin yanında barındırdığı potansiyel riskleri sıralamakta fayda bulunmaktadır. Bazı insanlar ve çiftçiler, hassas hayvancılık teknolojileri kullanımının çiftliklerin işleyişini temel olarak değiştirmesinden dolayı bazı etik kaygılar dile getirmektedirler. Ayrıca, tarımsal kar marjları genellikle düşük olduğundan, bu tür teknolojilerin maliyeti, tarım operasyonlarının karlılığını azaltabileceği ve kırsal bölgelerde internet bağlantısının eksikliği, bu tür sistemlere erişimi zorlaştırabileceği gibi kaygılar dillendirilmektedir (Morrone et al. 2022; Gezici ve ark., 2023). Bu teknolojiler grup düzeyinde alınan yönetim kararları ile hayvan refahı tespit edilmesinde faydalı olabilirken, farklı beslenme veya tedavi gereksinimleri olan bireylerin refahı için zararlı olabileceğinden verilerin yorumlanması dikkatli yapılması gerekliliği önemli bir endişe yaratmaktadır (Schillings et al., 2021). Diğer endişe ise, özellikle insanlara alışma fırsatlarının zaten sınırlı olduğu, fazla sayıda

hayvanın bulunduğu yetiştirme sistemlerinde insan-hayvan ilişkisinin hayvan refahı üzerindeki potansiyel bir etkisini bir sorun yaratabilmesi üzerinedir (Schillings et al., 2021).

Dijital teknolojilerin kullanımı, tüm paydaşlar için güvenilir teknolojiye ilişkin etik mevzuatlara, yönergelere ihtiyaç bulunmakta olup, bu yönergelerin sektöre özgü uygulaması aciliyeti de bulunmaktadır (Kraft et al., 2022; Gezici ve ark., 2023).

Dijitalleştirilmiş çiftliklerin yönetimi için çiftçilerin geleneksel tarım bilgilerini ve teknolojik okuryazarlığı içeren detaylı bir anlayışa sahip olmaları gerekmektedir. Genç çiftçilerin bu anlayışı nasıl geliştirdikleri henüz belirsizdir ve bu nedenle mesleki ve akademik okulların geleneksel tarımın yanı sıra dijital tarımı da kapsaması önemlidir (Goller et al., 2021).

Hayvancılıkta dijital destekli veya otonom üretimi sistem ve teknolojilerin kullanımı, yalnızca çiftliklerde değil, aynı zamanda onları çevreleyen tüm ilgili meslek mensuplarının, alanda işletme ve kurumlarda da gelişmiş doğrultusunda gerekli bilgi ve becerilere sahip olması gerekmektedir (Goller et al., 2021; Kraft et al., 2022; Morrone et al., 2022).

Hayvancılık yönetim teknolojileri kullanımı; geçiş maliyeti, hem donanım hem de yazılım maliyeti, teknolojinin etkili bir şekilde uygulanabilmesini sağlamak için ek enerji, internet bant genişliği veya ek ekipman maliyeti, eğitim ve uygulama süreci ve maliyeti ile çiftçilerin hatalarından kaynaklı kayıpları da içerebilmektedir. Çiftçiler, sürekli olarak maliyetleri potansiyel faydalara göre değerlendirecek, tüm bu yatırım ve çabaların geri dönüşü mantıklı olmadığı sürece, bu teknolojiyi benimsemeleri zor olacaktır (Neethirajan & Kemp, 2021; Gezici ve ark., 2023).

Fırsatlar, Öneriler ve Sonuç

Teknolojinin sürekli olarak gelişmesi insanların daha ucuz ve etkili cihazlara sahip olmalarına olanak sağlamaktadır. Bu nedenle, çiftlikler ve hayvancılık endüstrisi de teknolojiyi benimsemeye başlayarak önümüzdeki yıllarda bu sorunları aşabilecektir. Özellikle, internetin yaygınlaşmasıyla birlikte günlük yaşamımızda teknolojik ekipmanların kullanımı büyük ölçüde artmaktadır. Bu teknolojilerin çiftliklerde de yaygınlaşması kaçınılmaz olduğu ön görülmektedir (Morrone et al. 2022). Taşınabilir sensörler, hayvanların GPS konumlandırması ve çeşitli yazılım uygulamaları, hayvancılık ekonomisinin her alanında da dijital ilerlemelerin kullanımına olanak sağlayacağı bildirilmektedir (Kraft et al., 2022).

Çiftçileri bu dijitalleşme sürecini başarıyla yürütmesi onlara uluslararası pazarlarda rekabet avantajı sağlayacağı, uluslararası etik ve hayvan refah standartlarına uyumu kolaylaştıracağı ve tarım ve hayvancılık teknolojilerine yönelik yeni iş fikirleri ve girişimcilik fırsatları ortaya çıkaracağı da öngörülmektedir (Berckmans, 2017; Morrone et al. 2022; Kraft et al., 2022)

Sonuç olarak; Hassas Hayvancılık (PLF) tabanlı dijital teknolojiler, hayvanların davranışlarını ve sağlık durumlarını daha yakından izlemeyi mümkün kılarak hayvan refahının iyileştirilmesine katkı sağlamaktadır. Araştırmalarda, hayvan sağlığı ve refahına yönelik bu dijital uygulamaların yararları ve fırsatları kadar, zorluk ve riskleri de ortaya koymakta ve artıları ile eksileri aşağı yukarı dengeli olduğu bildirilmektedir. Ancak artan küresel nüfus ve hayvansal gıda talebi, yakın gelecekte hayvancılık sektörünü dijital teknolojilerin daha hızlı ve yaygın bir şekilde entegrasyonuna zorlayacağı; bu da Hassas Hayvancılık / Hayvancılık 4.0'a geçiş sürecini hızlandıracağı ön görülmektedir. Günümüzde Hayvancılık 5.0 kavramı ortaya çıkmış olup, hayvancılıkta Yapay Zeka teknolojilerinin kullanılacağı son evre olan İleri Hayvancılığın kavşağında olunduğu da vurgulanması gerekmektedir.

ABSTRACT

Transformer architecture, which fundamentally differs from traditional deep learning models such as RNNs and CNNs by leveraging self-attention mechanisms rather than recurrence or convolution. This design allows for better parallelization and long-range dependency modeling, making Transformers particularly effective in sequence-to-sequence tasks such as machine translation. In this study, a bilingual English-German dataset was selected to systematically evaluate the impact of the learning rate on Transformer performance. A series of training runs were performed using learning rates ranging from 1e-2 to 1e-7 to systematically evaluate the impact of learning rate, a critical hyperparameter for optimization stability and convergence. The results reveal several noteworthy trends regarding the effect of learning rate on model performance. A relatively high learning rate (1e-3) facilitated rapid initial convergence; however, it also introduced significant instability, likely due to excessive parameter updates that caused the optimizer to overshoot optimal minima in the loss surface. Conversely, an extremely low learning rate (1e-6) yielded negligible improvements in performance, as evidenced by the slow and nearly parallel decline in training and validation losses. Although the 1e-2 learning rate yielded relatively competitive accuracy and faster computation compared to 1e-3, its persistently elevated loss values indicated unstable convergence behavior; conversely, extremely low learning rates, such as 1e-7, resulted in substantially reduced accuracy and extended computation times, illustrating the delicate balance required in learning rate selection. This behavior is indicative of underfitting, stemming from insufficient updates to the model's parameters. However, the most balanced and stable performance was observed at a learning rate of 1e-4, which achieved smooth convergence, strong alignment between training and validation metrics and consistent loss reduction throughout training. This outcome highlights the importance of selecting an appropriate learning rate, as it significantly influences both optimization stability and model generalization. Furthermore, these findings empirically support theoretical principles regarding learning rate selection in deep learning, demonstrating that intermediate values—particularly 1e-4 in this configuration—can effectively balance convergence speed and solution quality. Therefore, this study contributes to the growing body of research emphasizing the necessity of systematic hyperparameter tuning in neural network training, especially for Transformer-based models applied to sequence-to-sequence tasks.

Keywords: Transformer Architecture, Machine Learning Models, Deep Learning, Neural Machine Translation, Learning Rate

Introdcution

Deep learning is a critical research area with broad applications. It is extensively used in various disciplines today, including natural language processing(Islek, Katirci, and Celik 2024), social sciences(Çelik and Çınar 2021)(Celik and Cinar 2021), medicine(Tuncer et al. 2024), materials science(KATIRCI and TEKİN 2022) and particularly neural machine translation (Ott et al. 2018)(Karaca and Aydın 2023).

Deep learning research encompasses a diverse array of neural network architectures, notably recurrent neural networks (RNNs), including Long Short-Term Memory (LSTM) and Gated Recurrent Unit (GRU) models. Numerous studies have conducted comparative analyses of RNN (Çelik, Katırcı, and İşlek 2024), LSTM (Gupta et al. 2021) and GRU GRU (Islek, Katirci, and Celik 2024) architectures to evaluate their respective strengths and limitations in various sequence modeling tasks (Cai et al. 2019). Although these techniques achieved moderate success in processing sequential data, they exhibited significant limitations, particularly in terms of limited parallelization capabilities and inefficiencies in modeling long-range dependencies.To overcome these constraints, the Transformer architecture(Vaswani et al. 2017) was introduced in 2017, which was based on the self-attention mechanism. This groundbreaking architecture eliminated the sequential processing constraints of RNNs, enabling the direct modeling of dependencies between any two tokens in a sequence. Work with the Transformer significantly improved translation quality, primarily due to its enhanced parallel computing capabilities and its effectiveness in capturing long-range dependencies.

The performance of deep learning models is influenced by various components, including architectural choices, data characteristics and optimization strategies. Among these, the learning rate stands out as a critical hyperparameter, particularly during the backpropagation process, where it determines the magnitude of weight updates. It significantly affects convergence speed and the overall effectiveness of neural networks (Wu and Liu 2023). An optimal learning rate facilitates faster convergence and helps avoid local minima, whereas a poorly chosen rate can cause slow training or divergence. Hence, many studies have focused on learning rate schedules, such as step decay, exponential decay and adaptive methods like Adam (Liu et al. 2020) or RMSprop (Hermann et al. 2015), to improve training efficiency and stability across various tasks. In the field of deep learning, the careful selection of the learning rate is a critical factor that influences model optimization and performance. Despite significant progress in adaptive learning strategies and comprehensive hyperparameter tuning methodologies, there is a notable lack of focused, systematic, analytical studies assessing the impact of fixed learning rates on complex architectures, such as Transformer models. To address this critical gap, the present study provides a thorough analysis of a wide range of fixed learning rates, specifically from 1e-2 to 1e-7. The study thoroughly assesses the impact of these rates on training dynamics (as evidenced by loss convergence), generalization performance (as measured by accuracy) and computational efficiency (as reflected in total training time) in the context of neural machine translation tasks. The findings not only provide robust scientific evidence for the principles that govern learning rate selection, but also highlight the importance of rigorous hyperparameter tuning for Transformer architectures. This research aims to provide practitioners with actionable insights to facilitate more effective model configuration and optimize deployment strategies in real-world sequence-to-sequence applications.

Related Work

In the original Transformer study (*Vaswani et al., 2017*), the authors employed the Adam optimizer alongside a custom learning rate schedule that included a linear warmup phase followed by inverse square root decay, highlighting the sensitivity of the architecture to learning

rate dynamics(Vaswani et al. 2017). More recent implementations, such as by *Yan and Shao (2024)*, adopt fixed initial learning rates (e.g., 1e-3 with AdamW), further emphasizing the ongoing interest in understanding the effects of learning rate settings on Transformer performance (Yan and Shao 2024) (Liu et al. 2020). Jurkiewicz et al. present top-performing systems for propaganda technique classification and span identification using semi-supervised learning. Their work highlights the novel use of RoBERTa-CRF for span identification and introduces Span CLS layers for classification, conducted with transformer-based language models and learning rates of 5e-4 and 2e-5 (Jurkiewicz et al. 2020). Huang et al. address optimization challenges in Transformers caused by unstable gradients that typically require learning rate warm-up. They propose a novel weight initialization method that stabilizes training, eliminating the need for warm-up even in very deep Transformer models (Huang et al. 2020). Liang et al. propose a training method that adjusts learning rates per parameter based on sensitivity to reduce redundancy in large Transformer models, improving parameter utilization and generalization across tasks. They select learning rates in the range of 2e-4, 3e-4, 8e-4, 1e-3, 5e-4, 7e-4 and 2e-3 (Liang et al. 2022). Karpov et al. improve retrosynthetic reaction prediction using Transformer models with various learning rate schedules and snapshot learning, a technique that averages weights at learning rate minima to effectively prevent overfitting and boost accuracy (Karpov, Godin, and Tetko 2019). Xiong et al. show that learning rate warm-up is crucial for Post-LN Transformers due to unstable gradients near the output. However, Pre-LN Transformers have stable gradients at initialization, allowing training without warm-up, reducing time and hyperparameter tuning (Xiong et al. 2020). Wortsman et al. address training instabilities in large Transformers by reproducing them at smaller scales, showing that issues such as logit growth and divergence can arise with high learning rates even in small models and that mitigation techniques like warm-up and weight decay remain effective across different model sizes (Wortsman et al. 2024). Shazeer and Stern propose reducing memory usage in adaptive optimizers by approximating per-parameter second moments through per-row and per-column sums. They also introduce update clipping and gradually increasing decay rates to prevent excessively large updates, achieving Transformer training performance comparable to Adam while using significantly less memory (Shazeer and Stern 2018). Li and Ke analyzed how varying dropout rates across layers and residual connections impact overfitting, training efficiency and generalization in language models, highlighting a key trade-off between residual depth and dropout for optimal performance. In their study using the Transformer architecture, the learning rate was initially set to 1e-3, with decay allowed down to a minimum of 1e-4 over 50,000 iterations(Li and Ke 2024). Lialin et al. introduce ReLoRA, a parameter-efficient training method that uses low-rank updates for large Transformer models, achieving comparable performance to standard training while reducing memory usage and accelerating training. They experimented with learning rates of 1e-3, 5e-4 and 4e-4(Lialin et al. 2024). Rothermel et al. show that the reported success of frozen pretrained Transformers in transfer tasks is due to insufficient learning rate tuning. By testing rates from 1e-2 to 1e-6, they find that fully fine-tuned models outperform or match training from scratch, highlighting the importance of proper learning rate selection in transfer learning. In contrast, in this study analyzes learning rates from 1e-3 to 1e-6 on Transformer language models, focusing on optimization stability and convergence. We find that high rates cause instability, low rates lead to underfitting and 1e-4 achieves the best balance for smooth convergence and generalization. Thus, while both works stress learning rate tuning, Rothermel et al. focus on transfer tasks and freezing, whereas ours focuses on training dynamics in language modeling (Rothermel et al. 2021). Wortsman et al. train small decoder-only Transformer models using an auto-regressive loss in a GPT-2-like setup, implemented with Flax and trained on the C4 dataset. They experiment with learning rate schedules—such as warm-up and cosine decay—

and apply regularization techniques including weight decay and z-loss. Their primary focus is on understanding training instabilities that emerge at high learning rates by analyzing the behavior of loss under various configurations. While both their work and mine involve loss analysis, my study diverges by analyzing the relationship between learning rate and model performance metrics (e.g., BLEU score and final loss) under stable training conditions. Additionally, focused on the interactions between learning rate and architectural hyperparameters such as embedding size and the number of attention heads, rather than the emergence of instability(Wortsman et al. 2024).

While existing literature has extensively analyzed dynamic learning rate schedules and advanced optimization techniques a systematic empirical analyz into the isolated effects of a comprehensive range of *fixed* learning rates on Transformer models across multiple key performance indicators remains less explored. In particular prior studies have highlighted optimal initial rates specific rates for niche tasks or parameter-specific adjustments. Challenges like unstable gradients have led to proposed solutions such as novel initializations or a focus on architectural specifics. Moreover, studies on training instabilities or the impact of learning rate in transfer learning with frozen layers often focus on specific contexts. In contrast, the present study offers a holistic analysis by systematically evaluating fixed learning rates across a broad spectrum (1e-2 to 1e-7) within Transformer models for neural machine translation. We meticulously assess their concurrent impact on training dynamics (including loss convergence and stability, notably addressing behaviors like the high non-converging loss at 1e-2), generalization performance (accuracy) and computational efficiency (total training time). This comprehensive approach provides an in-depth understanding of how fixed learning rate choices directly influence the multifaceted aspects of Transformer model training and deployment under standard conditions, thereby filling a critical gap in the existing literature.

Methodology

This section describes the setup and the specific hyperparameters configured for the Transformer model used in this study. Selecting these parameters is crucial for ensuring that results from different learning rate analysis is reproducible and comparable. Table 1 summarizes the core configuration, including architectural specifications and training parameters. As detailed in Table 1, the Transformer model architecture was standardized with an embedding dimension of 128, a feed-forward unit size of 128, 4 attention heads and 3 layers. A dropout rate of 0.1 was applied to mitigate overfitting. The Adam optimizer was utilized for training, with Gelu selected as the activation function and a batch size of 32 was consistently maintained. Positional encoding was set to 10000. Crucially, this study systematically investigates the impact of various fixed learning rates, specifically 1e-2, 1e-3, 1e-4, 1e-5, 1e-6 and 1e-7, allowing for a focused analysis of their individual effects on model performance and convergence.

Table 1. Model Hyperparameters and Values

Hiperparametreler	Complexity Model
Embedding Dimension	128
Feed Forward Units	128
Number of Heads	4
Number of Layers	3
Dropout Rate	0.1
Learning Rate	1e-2, 1e-3, 1e-4, 1e-5, 1e-6, 1e-7
Batch Size	32
Positional Encoding	10000
Optimizer	Adam
Activation Function	Gelu

This study used a dataset of 20,000 different Turkish-English sentence pairs as the base corpus for training a neural machine translation (NMT) model. Preparing this dataset was essential for providing consistent input to the Transformer architecture. Before being entered into the model, all input and target sequences underwent a standardized preprocessing step that included limiting all sequences to a maximum length of 28 tokens. This precise ensured consistent input dimensions, enabling efficient batch processing and stable training dynamics under all conditions. The resulting vocabulary size was 7,361 tokens for the English target language and 19,892 tokens for the German source vocabulary, reflecting the unique lexical scope of the processed corpus in each language.

The performance of the model was comprehensively evaluated using three critical metric sets: first training loss and validation loss, second training accuracy and validation accuracy and third total training time. Training and validation loss provided crucial insights into the model's learning dynamics and convergence behavior during the optimization process, directly indicating the effectiveness of the model in minimizing prediction errors. Subsequently, training and validation accuracy served to rigorously assess the model's overall learning progress and its critical generalization capabilities on previously unseen data. Finally, total training time was meticulously recorded to quantify the computational efficiency associated with each analyzed fixed learning rate across the experimental configurations. This integrated evaluation framework facilitated a thorough analysis of how varying fixed learning rates directly influenced the model's performance, its operational efficiency and its convergence characteristics.

In this study, a high-performance computing (HPC) system was employed to address the substantial computational demands of the research. The HPC system operates on Rocky Linux 8.5, which is derived from Red Hat 8.5 and is powered by AMD EPYC 7543 processors. It consists of eight compute nodes, each equipped with 64 cores and 1024 GB of memory, thereby facilitating efficient parallel processing. To enhance data transfer rates, the system is integrated with HDR InfiniBand technology, which provides a connectivity bandwidth of 200 Gbps. This robust infrastructure enables the execution of complex computations and the handling of large datasets essential for the study.

Results And Discussion

A systematic evaluation of learning rate impact on Transformer model training, with all other hyperparameters held constant (as detailed in Table 1), revealed distinct convergence patterns across four tested values (1e-3, 1e-4, 1e-5 and 1e-6) over 100 epochs, as depicted in Figure 1.

The provided graph illustrates the training and validation loss curves across 100 epochs for a deep learning model, evaluating the impact of different learning rates: 1e-3, 1e-4, 1e-5 and 1e-6. With a learning rate of 1e-3, the training and validation loss curves initially decline steeply, reflecting rapid learning. However, improvement soon stabilizes and both losses peak at comparatively high levels. Notably, the validation loss consistently exceeds the training loss throughout the epochs, suggesting suboptimal generalization. This behavior may indicate overfitting or instability in the optimization process. It could be caused by the learning rate being too high, which prevents the model from converging to a more optimal solution in the parameter space. In contrast, the learning rate of 1e-4 demonstrates a more favorable trend, exhibiting a rapid initial reduction in both training and validation losses, followed by a steady and consistent decline, with the validation loss closely tracking the training loss. This suggests stable learning and good generalization. The learning rate of 1e-5 also shows a consistent reduction in both losses, although at a slower speed than 1e-4. This indicates a cautious yet effective learning process. Finally, the 1e-6 learning rate results in a very slow and gradual decrease in both training and validation losses, with the curves remaining relatively high throughout the training epochs. This behavior is characteristic of underfitting, where the learning rate is too low to effectively update the model parameters and achieve optimal performanc. In general, the graph strongly suggests that learning rates of 1e-4 and 1e-5 provide the most effective balance for this model, achieving stable convergence and robust generalization.

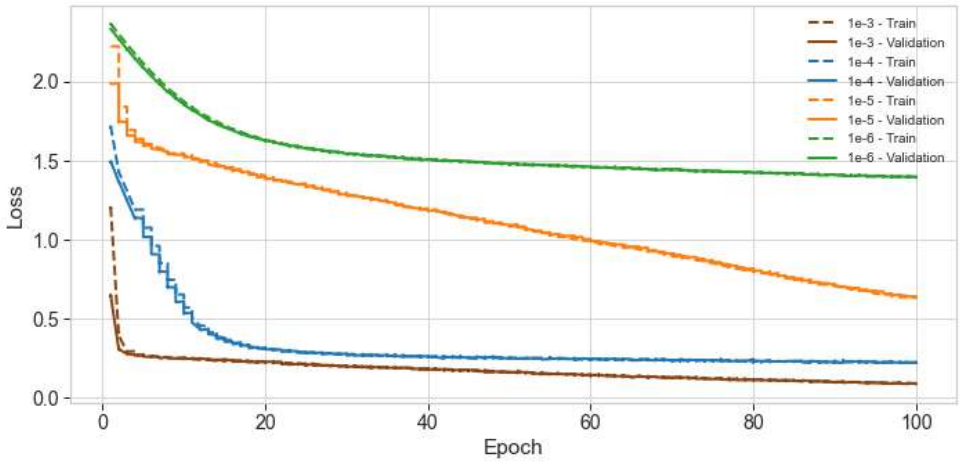

Figure 1: Training and validation loss curves for learning rate values of 1e-3, 1e-4, 1e-5 and 1e-6.

Figure 2 presents a comparative analysis of the training and validation loss trajectories across a range of learning rates. The inclusion of the extreme values 1e-2 and 1e-7 allows for a more comprehensive evaluation of convergence dynamics. At a learning rate of 1e-2, both the training and validation loss values are observed to remain persistently elevated throughout the entire training process. This clearly indicates a failure of the model to converge effectively.

This lack of convergence is primarily attributable to excessively large gradient updates, which impede the optimization algorithm from locating and settling into a stable minimum. Consequently, this specific learning rate configuration significantly hinders the model from achieving its potential performance. Conversely, at a learning rate of 1e-7, the loss curves exhibit minimal decline over epochs, suggesting a significantly slow learning process that limits the model's capacity to effectively minimize the objective function. These observations emphasize the critical role of learning rate selection in ensuring both stable convergence and optimal generalization, as inappropriate values can lead to underfitting or divergence.

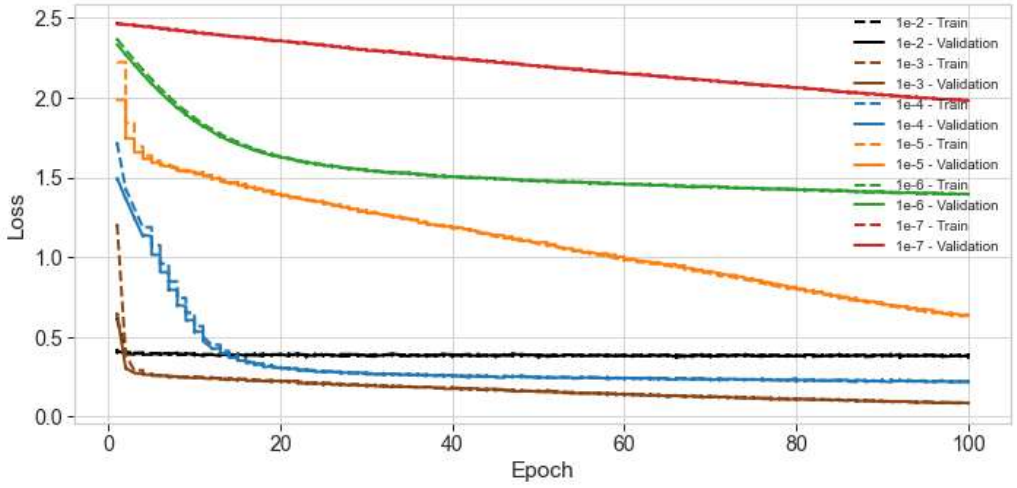

Figure 2: Training and validation loss curves for learning rate values of 1e-2, 1e-3, 1e-4, 1e-5, 1e-6 and 1e-7

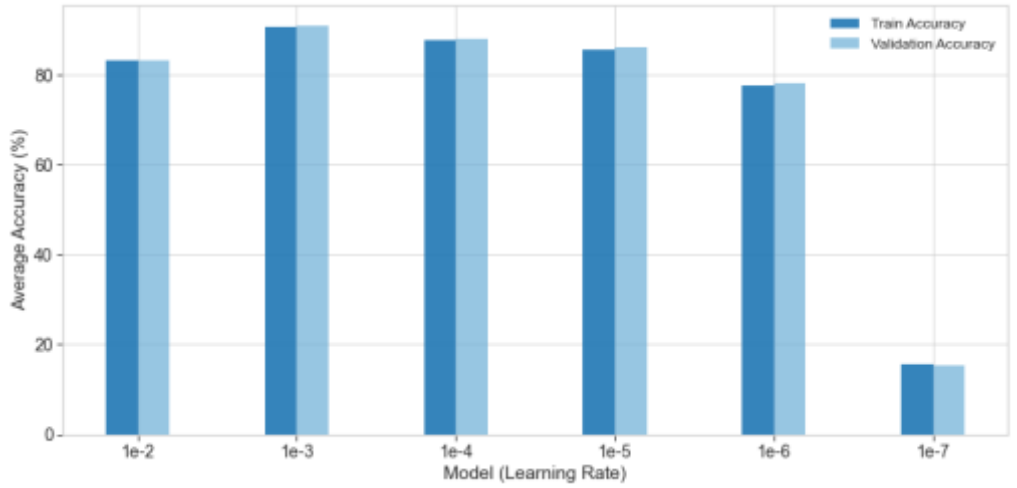

Figure 3: Impact of Learning Rates on Average Model Accuracy

Understanding the optimal configuration of hyperparameters is crucial for maximizing the performance and generalization capabilities of machine learning models. Figure 3 illustrates the relationship between various learning rates and the corresponding average training and validation accuracies of a model. As depicted, the model exhibits peak performance at a learning rate of 1e-3, achieving approximately 93% for both training and validation accuracy. Deviations from this optimal rate generally lead to a decline in accuracy. Specifically, as the

learning rate decreases beyond 1e-3 (e.g., from 1e-4 down to 1e-7), a progressive decline in accuracy is observed. This decline becomes sharp at learning rates of 1e-6 and particularly 1e-7, suggesting that the model struggles to converge effectively or learn meaningful patterns due to excessively small step sizes. Conversely, at a learning rate of 1e-2, the model still performs relatively well, although slightly below the 1e-3 optimum. Similarly, 1e-4 and 1e-5 also demonstrate strong performance, with only marginal decreases compared to the peak. This analysis underscores the critical importance of selecting an appropriate learning rate for optimal model performance and generalization capability, as an incorrectly chosen rate can severely hinder learning efficiency and final accuracy.

In addition to achieving optimal accuracy, the computational efficiency of machine learning models is critical to their practical deployment and scalability, especially when working with large datasets or real-time applications. Figure 4 illustrates the total computation time (in seconds) required by the model when operating with different learning rates. As shown in Figure 4, the model's execution time varies across the analyzed learning rates, indicating a relationship that is not simply linear. The most efficient execution, indicating the lowest total time, is achieved at a learning rate of 1e-5, where the model completes its operations in approximately 305 seconds. Conversely, the longest computation times are observed at the extreme ends of the tested range specifically, at a learning rate of 1e-7, the model takes approximately 355 seconds, representing the highest recorded time. Other learning rates, such as 1e-2, 1e-3, 1e-4 and 1e-6, fall within this range, indicating varying degrees of computational efficiency. This analysis suggests that selecting an optimal learning rate is not only crucial for model accuracy (as seen in Figure 3) but also plays a significant role in determining the computational cost and overall efficiency of the model's training or inference process.

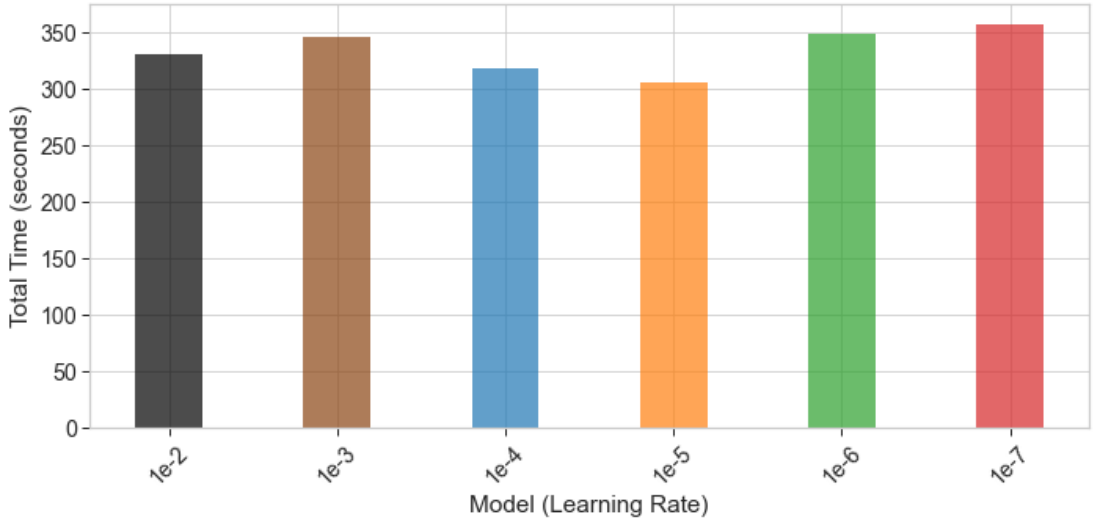

Figure 4: Total Time Taken by Model at Various Learning Rates

Conclusion

The findings of this study highlight the significant impact of the learning rate on the performance of a machine learning model in terms of accuracy, computational cost and convergence stability. Although the highest accuracy was achieved with a learning rate of 1e-3, this configuration did not provide optimal computational efficiency, which was observed

with a learning rate of 1e-5 instead. This discrepancy reveals a fundamental trade-off between achieving peak accuracy and maintaining computational efficiency, emphasizing that optimizing one aspect may compromise the other. Although learning rate of 1e-2 produced relatively competitive accuracy and faster computation than 1e-3; however, its consistently elevated loss values indicate unstable convergence behavior. Conversely, extremely low learning rates, such as 1e-7, resulted in substantially reduced accuracy and extended computation times, further illustrating the delicate balance required in learning rate selection. Therefore, selecting an appropriate learning rate is crucial not only for achieving optimal model performance but also for ensuring efficient and stable training dynamics. This study has shown that an optimum learning rate of 1e-4 strikes a balance between accuracy, training stability and computational efficiency.

ABSTRACT

The terahertz (THz) frequency range, which spans from 0.1 to 10 THz, serves as a bridge between microwave and infrared radiation. This range holds transformative potential for applications in imaging, spectroscopy, sensing, and high-speed communication. However, the successful development of efficient THz technologies relies on advanced materials that can generate, modulate, and detect these waves. Cadmium sulfide (CdS), a II-VI compound semiconductor, has emerged as a promising candidate for THz applications due to its unique optoelectronic and structural properties. In this study, we examine the dielectric properties of CdS on a glass substrate using the powerful analytical technique known as THz time-domain spectroscopy (THz-TDS). We investigate how immersion time affects various properties, including the refractive index, permittivity, absorption coefficient, and loss tangent of CdS on glass. The results indicate that increasing the immersion time reduces both the absorption coefficient and the loss tangent of CdS on glass, while having no effect on the refractive index or permittivity. Moreover, advancements in material fabrication highlight CdS's potential to address critical gaps in THz technology. This study explores the fundamental properties of CdS in the THz frequency range and evaluates its potential for fully utilizing the terahertz spectrum. These properties enable CdS to perform exceptionally well in THz photoconductive switches.

Keywords: Terahertz, Cadmium sulfide, Dielectric properties, THz time-domain spectroscopy.

Introduction

The terahertz (THz) frequency range, typically defined between 0.1 and 10 THz, occupies a unique position in the electromagnetic spectrum situated between the microwave and infrared regions (Mollah et al., 2020). This intermediate spectral window has garnered increasing interest in recent years due to its distinctive interactions with matter and its broad applicability in various scientific and technological domains(Baxter & Guglietta, 2011). THz waves are non-ionizing, thereby posing minimal risk to biological tissues, and possess the capability to penetrate a variety of non-metallic and non-polar materials such as plastics, fabrics, and ceramics (Kundu & Pathak, 2024). These properties make the THz region particularly advantageous for non-destructive imaging, high-resolution spectroscopy, security screening, and next-generation wireless communication systems (Nsengiyumva et al., 2023). Beyond its functional uses, the THz domain holds significant promise for probing material properties at the microscopic and mesoscopic levels. Among the most powerful techniques available in this regime is terahertz time-domain spectroscopy (THz-TDS), which enables precise measurement of a material's complex dielectric response over a wide frequency range (Shekari et al., 2025). Unlike conventional optical techniques, THz-TDS directly provides both amplitude and phase information of transmitted or reflected THz pulses, allowing for accurate extraction of parameters such as refractive index, absorption coefficient, and permittivity. As such, it serves as a robust, non-invasive tool for the investigation of dielectric behavior in various functional materials. In this context, cadmium sulfide (CdS) emerges as a technologically relevant material warranting further investigation. CdS is a direct bandgap semiconductor belonging to the II–VI group, widely utilized in optoelectronic devices including solar cells, photodetectors, and thin-film transistors (Ismail et al., 2023). Its optical and electrical properties have been extensively studied in the visible and near-infrared regions; however, a comprehensive understanding of its dielectric response in the THz domain remains limited. Given the increasing interest in integrating THz technologies with existing semiconductor platforms, characterizing the THz dielectric behavior of CdS is both timely and essential. In this study, we aim to explore the dielectric properties of CdS thin films deposited on glass substrates using THz-TDS. The results provide insight into the frequency-dependent permittivity and absorption characteristics of CdS in the terahertz regime, contributing to the foundational knowledge necessary for future THz-integrated optoelectronic applications.

Materials and Methods

In this study, CdS thin films were fabricated using the Chemical Bath Deposition (CBD) technique, a widely used low-cost and low-temperature method that enables the controlled growth of semiconductor films on various substrates (De Guire et al., 2013). In this technique, glass substrates are immersed in a chemically reactive aqueous solution where the film forms through controlled precipitation and surface adsorption processes. To prepare the precursor solution, cadmium acetate and thiourea were dissolved in deionized water under continuous magnetic stirring. The concentrations of the precursors were adjusted to approximately 0.56 wt.% for cadmium acetate and 0.77 wt.% for thiourea. Subsequently, 20 mL of ammonium hydroxide was added dropwise to the solution in order to adjust the pH level and to form a clear, homogeneous complex solution. The mixture was then heated to 80 °C using a hot plate integrated with a magnetic stirrer to facilitate uniform mixing and controlled reaction kinetics. Prior to deposition, standard microscope glass slides were cleaned thoroughly using sequential ultrasonic baths of acetone, ethanol, and deionized water to ensure removal of surface contaminants. The cleaned substrates were then vertically immersed into the reaction solution, leaning slightly against the beaker wall to allow even exposure. The deposition process was

carried out for 15, 30, 45 and 60 minutes under constant temperature and stirring conditions (Figure 1). After the deposition, the substrates were removed from the chemical bath, rinsed gently yet thoroughly with deionized water to eliminate any loosely attached particles, and dried in ambient air. This procedure resulted in the formation of uniform, adherent CdS thin films on the glass substrates. The dielectric properties of the fabricated CdS films were characterized using THz-TDS, a powerful non-contact technique capable of probing both the amplitude and phase of ultrafast THz pulses transmitted through the sample. Measurements were performed using a TeraFlash Pro spectrometer, which operates based on the generation and detection of sub-picosecond terahertz pulses via a photoconductive antenna system. In this method, a broadband THz pulse is directed onto the sample, and the transmitted waveform is measured in the time domain. The recorded temporal signal is then subjected to Fourier transformation to obtain the frequency-dependent spectral response of the material. This technique enables direct extraction of both the real and imaginary parts of the complex refractive index, from which the absorption coefficient and dielectric permittivity are calculated. All measurements were conducted in a dry air environment to eliminate the influence of atmospheric water vapor absorption in the THz range. Reference measurements were taken using a bare glass substrate to ensure accurate extraction of the thin film's intrinsic response.

Figure 1. Cadmium sulfide (CdS) thin film samples grown for different durations.

Findings and Discussion

Figure 2 illustrates the frequency-dependent refractive index of CdS thin films deposited for varying immersion durations (15, 30, 45, and 60 minutes), as measured by THz-TDS.

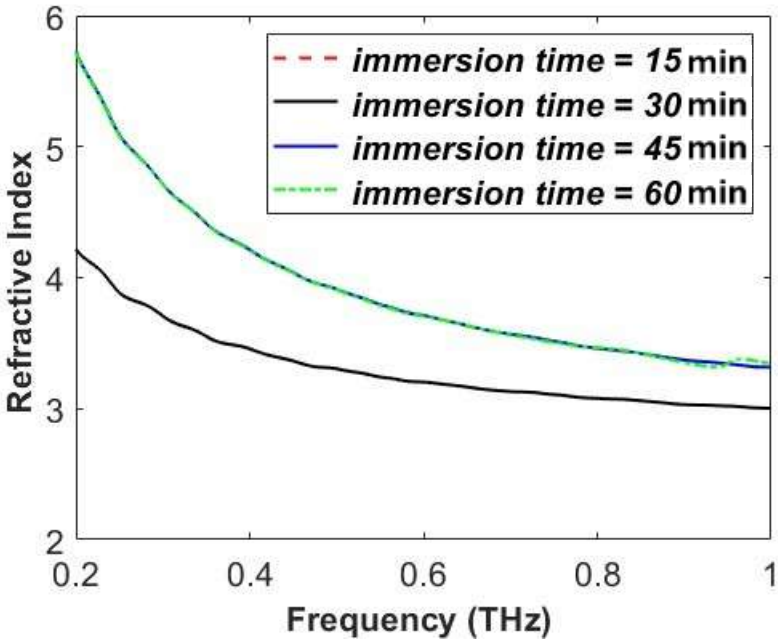

Figure 2. Refractive index spectra of CdS thin films for different immersion times (15, 30, 45, and 60 minutes).

As seen in Figure 2, all samples except the 30-minute immersion film exhibit similar refractive index profiles, starting from approximately 5.8 at 0.2 THz and gradually decreasing to about 3.2 at 1 THz, which is characteristic of typical dielectric dispersion behavior in the terahertz regime. The gradual decline in refractive index with increasing frequency is attributed to the frequency-dependent polarization response of the material, where dipolar and lattice vibrations contribute significantly in the lower THz range but diminish at higher frequencies. The sample with 30 minutes of immersion, however, consistently shows a lower refractive index across the entire frequency range compared to the other samples. This deviation suggests a noticeable difference in microstructural or morphological properties, potentially related to film density, grain boundaries, or void formation during growth. Since the refractive index is sensitive to material packing density and internal interfaces, a lower value indicates either reduced film compactness or increased porosity, which may arise from suboptimal nucleation and growth conditions at that specific deposition duration. In contrast, the near-complete overlap of the curves for 15, 45, and 60-minute immersions indicates that these films share a similar microstructural and optical behavior. This convergence implies that beyond 45 minutes, the growth process reaches a steady-state regime where film properties stabilize, and additional immersion time contributes minimally to further morphological refinement. The 15-minute sample's similarity with longer immersions suggests that even short deposition periods can yield films with mature microstructure under the current chemical bath conditions.

Figure 3 presents the absorption coefficient spectra of CdS thin films grown with varying immersion durations, measured in the THz frequency range using THz-TDS.

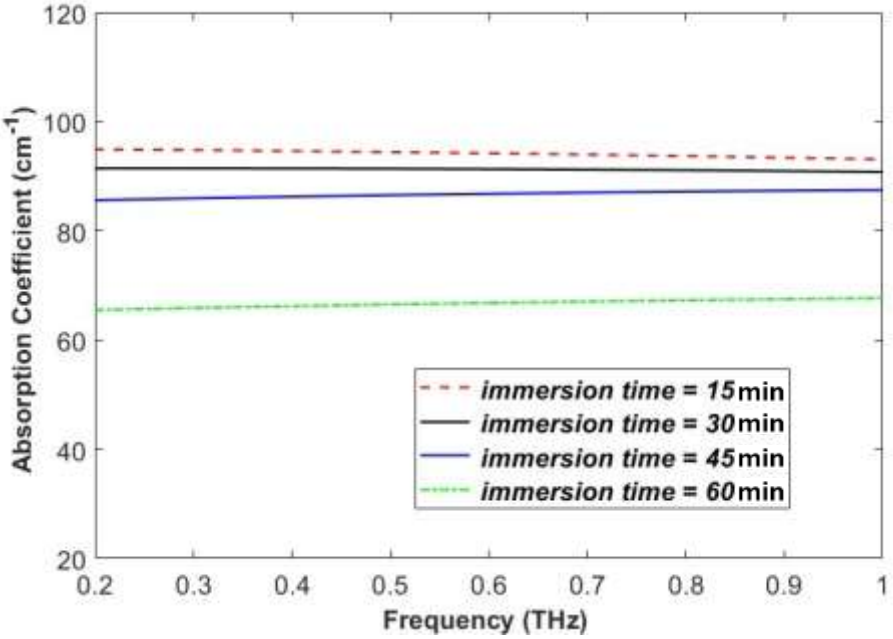

Figure 3. Absorption coefficient of CdS thin films as a function of frequency for different immersion times (15, 30, 45, and 60 minutes).

As shown in the figure, the absorption coefficient decreases with increasing immersion time. The 15-minute sample exhibits the highest absorption (~90 cm^{-1}), while the 60-minute sample shows the lowest (~65 cm^{-1}) across the entire frequency range. This trend suggests a progressive improvement in film uniformity, microstructural order, and reduction in defect-induced scattering with longer deposition durations. The significant drop in absorption for the longest immersion time indicates that extended growth leads to more compact and defect-free films, which absorb less THz radiation. In addition, all samples display a slight increase in absorption with frequency, reflecting a modest frequency-dependent behavior that is typical of many semiconducting materials in the THz domain. However, the slope of this increase is relatively low, suggesting that the CdS films maintain optical stability over the 0.2–1 THz range, a favorable property for THz applications. These results are also consistent with the refractive index trends discussed in Figure 1. Notably, the 30-minute sample, which exhibited the lowest refractive index, shows relatively high absorption, indicating potential microstructural inhomogeneity or incomplete crystallization. In contrast, the 60-minute film, with its low absorption and stable refractive index, demonstrates the best overall optical quality, suggesting a well-formed microstructure with minimal internal scattering centers.

Figure 4 presents the loss tangent ($\tan\delta$) spectra of CdS thin films deposited with different immersion durations (15, 30, 45, and 60 minutes), as a function of frequency in the 0.2–1 THz range.

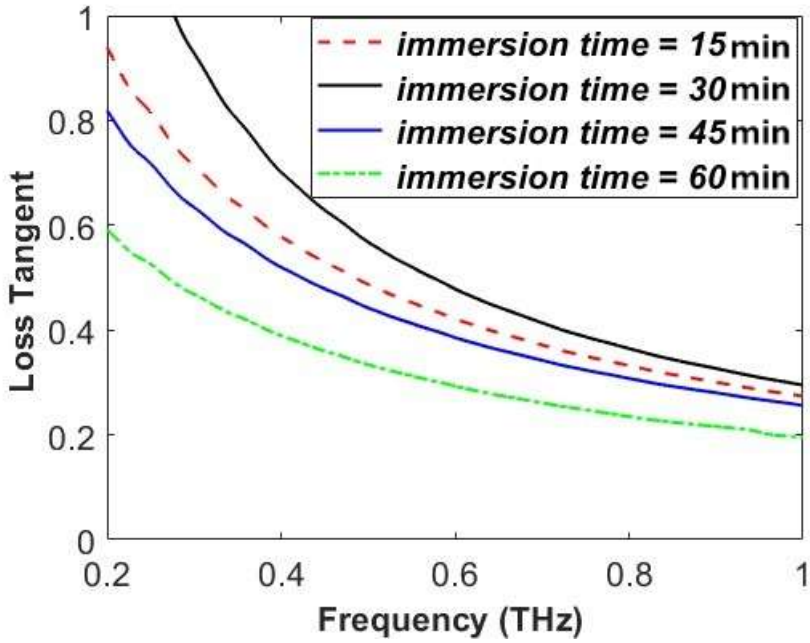

Figure 4. Loss tangent of CdS thin films on glass substrates for varying immersion times.

As shown in Figure 4, the loss tangent decreases significantly with increasing frequency for all samples. This trend indicates that dielectric losses in the CdS films diminish at higher THz frequencies, which is consistent with the expected behavior of many semiconductors due to reduced dipolar relaxation and phonon scattering effects at elevated frequencies. The effect of immersion time is clearly observed in the magnitude of the loss tangent. The 15-minute and 30-minute samples show the highest loss values across the frequency range, while the 45-minute and especially the 60-minute samples demonstrate considerably lower dielectric losses. This suggests that longer deposition times result in improved film microstructure, likely due to enhanced crystallinity, reduced defect density, and minimized grain boundary scattering. The 60-minute film, which exhibits the lowest loss tangent across the spectrum, stands out as the sample with the highest optical quality, reinforcing previous observations from the refractive index and absorption coefficient analyses. Additionally, the steep decline in loss tangent at lower frequencies and the gradual flattening at higher frequencies further emphasize the frequency-dependent nature of dielectric damping in CdS films. This behavior is beneficial for THz applications that operate in the upper portion of the spectrum, as the films maintain lower intrinsic energy dissipation. In summary, longer immersion times improve the dielectric performance of CdS thin films by simultaneously reducing absorption and dielectric loss.

Figure 5 shows the real dielectric permittivity spectra of CdS thin films grown with different immersion times, measured in the 0.2–1 THz frequency range.

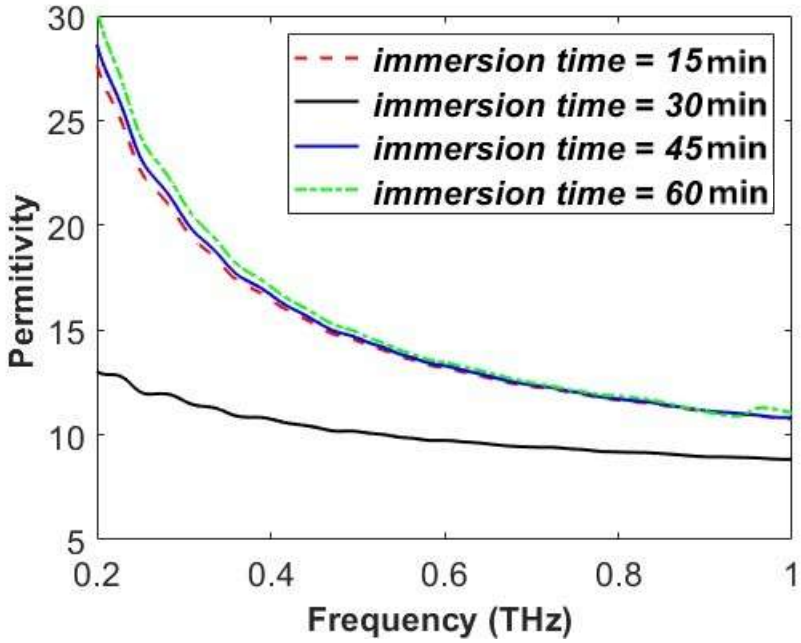

Figure 5. Frequency-dependent dielectric permittivity (ε') of CdS thin films for different immersion durations.

As shown in the graph, the permittivity of all CdS samples decreases sharply with increasing frequency. Starting from approximately 30 at around 0.2 THz, the values drop to ~11 near 1 THz. This indicates that CdS exhibits strong dielectric dispersion in the THz range. The decline is primarily attributed to the reduced contribution of polarizability at higher frequencies, as low-energy dipolar and lattice vibrational modes become less effective. The sample grown with a 30-minute immersion time displays noticeably lower permittivity values across the entire frequency spectrum. This suggests the presence of microstructural irregularities or a lower material density. The reduced polarizability in this sample implies that the growth conditions may not have supported the formation of a fully developed film. In contrast, the 15-, 45-, and 60-minute films exhibit closely overlapping curves, indicating similar microstructural and dielectric behavior. The convergence of these curves suggests that immersion beyond 45 minutes yields no significant improvement in permittivity. Moreover, the fact that even the 15-minute sample achieves sufficient polarizability highlights the effectiveness of the CBD method in rapidly initiating nucleation and early-stage growth. In conclusion, the permittivity of CdS films decreases strongly with frequency, a factor that must be carefully considered in THz optoelectronic applications.

Conclusion and Recommendations

This study demonstrates that the dielectric behavior of CdS thin films in the THz frequency range is strongly influenced by the immersion duration during chemical bath deposition. Extended immersion times lead to notably reduced absorption coefficients and loss tangents, indicating improved film quality and minimized dielectric losses. Across all samples, the optical parameters absorption, refractive index, permittivity, and loss tangent show a consistent decreasing trend with increasing frequency. These results reflect the characteristic dielectric dispersion of CdS in the THz regime. While significant differences are observed between samples at low frequencies, their optical responses tend to converge at higher frequencies,

suggesting that microstructural differences become less influential as the frequency increases. Among all samples, the 60-minute immersion condition produced films with the lowest absorption and dielectric loss, indicating improved homogeneity and reduced defect density. Conversely, the 15-minute sample exhibited higher absorption and permittivity at lower frequencies, likely due to incomplete growth, surface roughness, or residual moisture effects. These findings underscore the critical role of immersion time in governing the dielectric properties of CdS films. The data suggest that structural features such as film density, uniformity, and surface quality which are closely tied to deposition duration significantly affect how CdS interacts with THz radiation.

ABSTRACT

The terahertz (THz) frequency band offers significant opportunities for various critical applications such as high-resolution imaging, non-destructive testing, security screening, and wireless communication systems. However, appropriate waveguide technologies for the efficient utilization of this spectrum remain limited. Developing waveguides that operate effectively in this frequency range necessitates the use of air-core, polymer-based fiber structures as an alternative to conventional metallic designs. In this context, air-core polymer waveguides with negative curvature provide an innovative solution to reduce transmission losses while enabling broadband operation. Thus, this study focuses on designing, fabricating, and characterizing anti-resonant negative curvature waveguides that enable low-loss transmission in the 0.2 THz frequency range. Within the scope of this work, suitable polymer materials compatible with stereolithography-based 3D printers (SLA) were selected, and waveguide geometries were optimized using COMSOL simulations. The fabricated prototypes were characterized in terms of their optical and dielectric properties using Terahertz Time-Domain Spectroscopy (THz-TDS). The proposed structures offer an ideal platform for single-mode, low-loss transmission in the THz band, with broad bandwidth and fundamental mode propagation capabilities. This research presents a significant contribution to the development of innovative THz solutions in the fields of defense, security, and communication, aiming to enhance national expertise and capacity in THz technologies.

Keywords: SLA Fabrication, THz-TDS Characterization, Negative Curvature Fiber, THz Waveguide

Introduction

In recent years, considerable advancements have been achieved in the generation and detection of electromagnetic waves in the terahertz (THz) frequency range, typically defined between 0.1 and 10 THz (Pawar et al., 2013). For a long time, this region was known as the "terahertz gap" due to the lack of reliable sources and sensitive detectors (Zhang et al., 2019). However, since the mid-1980s, rapid progress in optoelectronic and photonic device technologies has significantly increased scientific and industrial interest in this spectral domain. Positioned between the infrared and microwave bands of the electromagnetic spectrum, terahertz waves exhibit properties of both regions, which enables their integration into hybrid systems for signal manipulation and transmission. As a result, THz waves have become increasingly important in the development of advanced functional components, including waveguides, filters, lenses, and polarizers(Mollah et al., 2020). One of the key advantages of THz radiation is its ability to penetrate many non-metallic, non-polar, and low-loss dielectric materials. This feature opens up numerous possibilities for applications in imaging, sensing, and spectroscopy (Rahaman et al., 2021). The relatively short wavelengths of terahertz waves, compared to microwave radiation, offer higher spatial resolution, making them particularly suitable for high-precision systems used in biomedical diagnostics, security screening, and non-destructive testing. Additionally, since THz radiation is non-ionizing, it can safely interact with biological tissues without inducing structural damage. Moreover, the THz spectrum contains unique absorption features corresponding to the vibrational and rotational modes of a variety of molecules, making it highly effective for chemical and biological identification (Zhao et al., 2014). Beyond these applications, growing interest in terahertz technology has also been observed in areas such as radio astronomy and high-speed wireless communications. To ensure efficient THz wave propagation, the development of specialized waveguide systems is essential. Although metallic waveguides have been used historically, their performance is significantly compromised at terahertz frequencies due to high conductive losses (Blanco-Redondo & Hudson, 2024). As a result, researchers have turned to alternative guiding structures based on dielectric and polymeric materials, which provide lower intrinsic absorption and greater design flexibility. Optical fibers fabricated from polymers, in particular, are of interest due to their low-loss characteristics in the terahertz regime and compatibility with various fabrication techniques. In this context, innovative waveguide geometries have emerged, including hollow-core and microstructured fiber designs (Wei et al., 2017). These configurations aim to reduce propagation losses by confining the electromagnetic field within low-loss regions, such as air-filled cores, rather than lossy solid materials. Hollow-core waveguides offer a significant advantage by enabling the confinement of THz radiation primarily within an air-filled central region, thereby mitigating the absorption losses typically associated with dielectric or polymeric core materials. To achieve this, the waveguide's internal structure must be carefully engineered to maintain mode confinement while preventing signal leakage (Wei et al., 2017). Among the various guiding mechanisms, photonic bandgap structures utilize periodic arrangements around the core to restrict wave propagation to specific frequency bands. While effective within narrow spectral windows, their limited bandwidth often restricts their utility in broadband applications. In contrast, antiresonant hollow-core waveguides have demonstrated superior performance over broader frequency ranges. These waveguides rely on the antiresonance effect of the surrounding cladding layers to reflect light back into the hollow core, thus minimizing leakage and material absorption (Ni et al., 2021). A particularly promising subclass of these structures involves negative-curvature geometries, where the inner surfaces of the cladding bend inward toward the core. This specific curvature reduces the interaction between the guided mode and the lossy material boundaries, thereby enhancing single-mode guidance and suppressing higher-order

modes. As a result, these waveguides are capable of delivering low-loss, high-fidelity transmission in the terahertz band, which is essential for high-capacity data links and sensitive spectroscopic measurements. The realization of such complex fiber architectures has been greatly facilitated by the emergence of advanced additive manufacturing techniques. Among these, stereolithography (SLA) has gained particular attention due to its ability to produce high-resolution, intricate structures using UV-curable photopolymers (Biswas et al., 2024). SLA enables the fabrication of smooth-surfaced, geometrically precise components that are critical for reducing scattering and ensuring optimal optical performance. Its layer-by-layer approach also allows for rapid prototyping and iterative design refinement, which is essential in experimental THz waveguide development. The availability of low-loss resin formulations further supports the use of SLA in constructing functional THz transmission components. To achieve optimal performance, the geometric design of antiresonant negative-curvature waveguides must be carefully tailored. These waveguides offer not only broadband and low-loss transmission but also stable single-mode propagation, which is critical for maintaining signal integrity. In conventional multimode systems, energy is distributed across multiple modes, leading to modal dispersion and reduced efficiency. By contrast, the inherent structure of negative-curvature fibers suppresses the excitation of higher-order modes and favors the propagation of the fundamental mode, resulting in enhanced energy confinement and transmission stability(Mu et al., 2024). Given their favorable characteristics, antiresonant negative-curvature waveguides are emerging as a key enabling technology for terahertz applications. Their potential extends beyond laboratory-scale demonstrations to practical use in biomedical imaging, remote sensing, spectroscopy, and next-generation communication systems. Furthermore, their ability to support high-speed, broadband data transmission while maintaining low attenuation makes them particularly well suited for integration into compact and efficient THz platforms (Yu, 2021). In the context of security and defense, these waveguides offer enhanced detection capabilities through high-resolution imaging and precise spectral recognition, enabling the identification of concealed threats and hazardous materials. In summary, the development of antiresonant negative-curvature waveguides addresses many of the key challenges associated with terahertz signal transmission. By combining broadband operation, low-loss performance, and modal selectivity, these advanced fiber structures offer a compelling solution for expanding the capabilities of THz technologies. Their implementation promises not only to enhance the performance of current systems but also to unlock new opportunities across scientific, industrial, and defense-related domains.

Materials and Methods

In this study, negative curvature hollow-core fiber structures were initially designed and analyzed using the COMSOL Multiphysics simulation environment. The geometric parameters of the fiber structures were defined based on functional considerations to support low-loss terahertz wave guidance. The first fiber configuration consists of two concentric rings with the following dimensional specifications: an outer ring diameter of 30 mm, outer wall thickness of 2 mm, an inner ring diameter of 6 mm, and an inner wall thickness of 0.5 mm. The central air core, which enables low-index guidance, was designed with a diameter of 14 mm. A second configuration was also developed, incorporating four inner rings to evaluate the effect of structural complexity on modal confinement and propagation characteristics. Following the completion of numerical simulations, the optimized structures were fabricated using a Formlabs 3L SLA 3D printer. Two commercial photopolymer resins “High Clear V4 and Rigid 10K” were used in the fabrication process to compare the optical quality and mechanical stability of the

final components. All waveguide samples were produced with a fixed height of 5 cm. After fabrication, the experimental characterization of the THz transmission properties was carried out using a TeraFlash Pro terahertz THz-TDS system. The measurement setup enabled the extraction of frequency-dependent refractive index profiles, which were used to assess the waveguiding performance and material dispersion characteristics of the fabricated fiber structures.

Findings and Discussion

COMSOL Multiphysics simulations effectively demonstrated the fundamental mode guidance characteristics and electric field distribution within the designed negative-curvature hollow-core fiber (NCHCF) structures. The simulation results revealed strong confinement of the electric field within the central hollow core, while the field intensity near the surrounding cladding walls remained minimal. This distribution confirms that antiresonant conditions are satisfied and that electromagnetic energy is efficiently confined within the core region. In the initial design, which features two concentric tubes, the mode tends to spread more in the horizontal direction, resulting in asymmetric field distribution and directional propagation. In contrast, the second design, incorporating four internal tubes, exhibits a symmetric field profile centered in the hollow core, enabling more stable and low-loss transmission. This symmetric confinement leads to improved mode stability and uniform propagation, making the four-tube configuration superior in terms of modal balance and optical guidance performance.

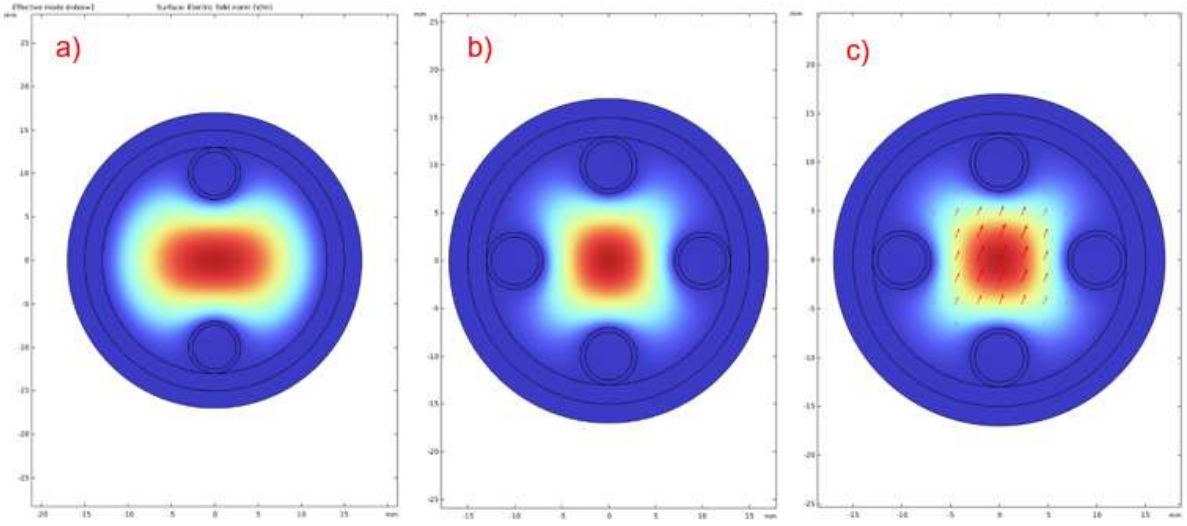

Figure 1. Electric field distributions of the fundamental mode obtained from COMSOL Multiphysics simulations for negative-curvature hollow-core waveguides. (a) Two-tube structure exhibiting horizontal mode spreading with asymmetrical confinement. (b) Four-tube structure showing symmetric mode confinement within the central air core. (c) Vector plot overlay of the electric field for the four-tube design, confirming stable and centralized mode propagation.

Based on these COMSOL findings, the experimental characterization phase focused on the four-tube fiber geometry. THz-TDS was employed to investigate the frequency-dependent optical behavior of the fabricated structures. Initially, a free-space (air) reference signal was recorded. Subsequently, the 3D-printed antiresonant negative-curvature waveguides produced

using Rigid 10K and Clear V4 resins were positioned between two parabolic-mirror antennas, and transmission measurements were repeated. The time-domain signals were subjected to Fourier transform to extract both amplitude and phase information in the frequency domain. Using these data, the complex transmission function was obtained, and frequency-dependent refractive index profiles were calculated for both resin types.

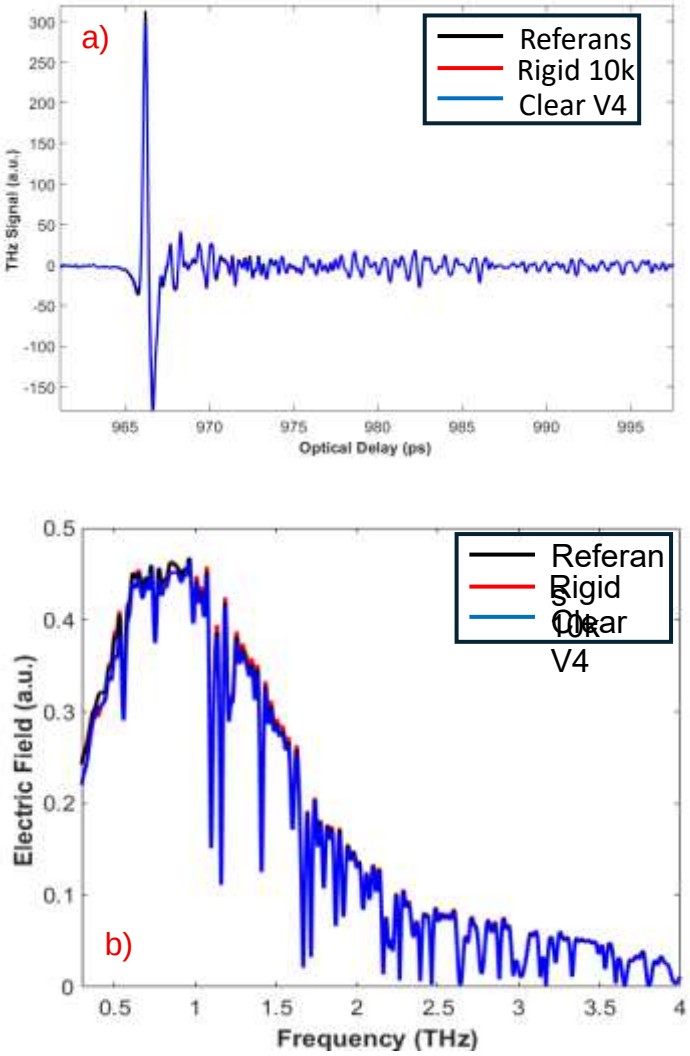

Figure 2. THz-TDS measurement results for antiresonant negative-curvature waveguides fabricated with Rigid 10K and Clear V4 resins. (a) Time-domain THz signal comparison showing the reference (air) signal and signals transmitted through the waveguides. (b) Corresponding frequency-domain spectra obtained via Fourier transformation, indicating the amplitude response over the 0.1–4 THz range.

The extracted refractive index profiles indicate that both fiber structures operate within a low-index environment close to $n \approx 1$ across the terahertz spectrum. This result clearly demonstrates that the antiresonant negative-curvature geometry effectively supports broadband, low-loss THz light propagation. Notably, the waveguide fabricated with Rigid 10K exhibited higher refractive index values and a more consistent spectral response across the frequency range, while Clear V4 showed slightly lower index values. These differences may be attributed to variations in material composition and the dispersive behavior of the polymer matrix in the THz

regime. Both time-domain attenuation and frequency-domain amplitude spectra support the conclusion that both resins are suitable for THz wave transmission, with Rigid 10K offering improved stability and spectral uniformity.

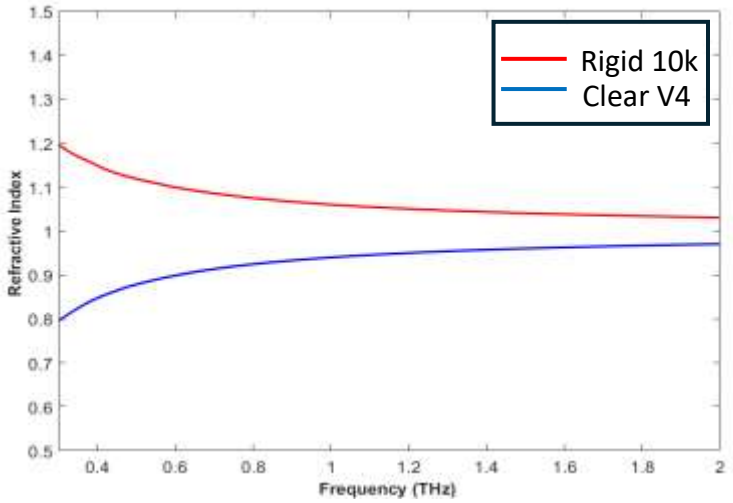

Figure 3. Frequency-dependent refractive index profiles of the 3D-printed antiresonant negative-curvature waveguides fabricated using Rigid 10K and Clear V4 resins.

In summary, the combined numerical and experimental results confirm that the four-tube negative-curvature antiresonant waveguide design provides an optimal platform for low-loss and single-mode terahertz transmission. Owing to its ability to minimize material interaction and maintain stable modal confinement, this structure holds significant promise for high-resolution, broadband, and low-attenuation THz applications.

Conclusion and Recommendations

In this study, antiresonant waveguides with negative curvature were designed, simulated, and experimentally evaluated for efficient THz wave transmission. Numerical analyses performed in the COMSOL Multiphysics environment revealed that the proposed structures are capable of supporting fundamental mode propagation while maintaining strong field confinement within the central hollow core. Among the different geometries investigated, the four-tube configuration demonstrated superior performance by providing a symmetric mode distribution and minimizing interaction with the lossy cladding material. Based on these simulation results, the four-tube structure was selected for experimental validation. Samples were fabricated using SLA with two distinct photopolymer resins: Rigid 10K and Clear V4. Subsequent terahertz tTHz-TDS measurements confirmed that both materials support low-loss THz wave transmission within the designed waveguide structure. The refractive index values obtained from the frequency-domain analysis remained close to unity, which is consistent with the expected behavior of air-core antiresonant fibers. The combined results of simulation and experimentation clearly demonstrate that the four-tube antiresonant negative-curvature waveguide design offers a promising platform for broadband, single-mode terahertz transmission. Its geometrical advantages, coupled with the versatility of SLA-based fabrication, make it a strong candidate for future applications in THz imaging, sensing, and communication systems

ABSTRACT

Low power resistojet thrusters are a type of electrothermal propulsion systems which are capable of producing a thrust up to 100 mN at power less than 50 W, specific impulse up to 100 s, feed pressure up to 10 bar, and operating temperature up to 800K using most compressed or liquified-gases as propellant. Currently, concerning the growing interest in smaller satellites, low-power systems are of great interest as they can offer many advantages compared to other potential systems of the same category. However, the performance of such a system is highly dependent on the input power to the system and investigation of this dependency is of great concern. Therefore, a parametric study has been conducted to investigate the effect of input power on the thruster performance. This study evaluates the performance of a resistojet thruster using Computational Fluid Dynamics (CFD) simulations across varying input electrical powers (0-10-20-30 W) and propellant gas butane (C_4H_{10}). The simulations assess key performance parameters such as thrust, specific impulse (I_{sp}), and mass flow rate under different operational conditions. The results demonstrate the influence of propellant thermophysical properties and input power on thruster efficiency. The findings provide insights into optimal power settings for resistojet thrusters in space propulsion applications, supporting future design and mission-specific performance optimization.The results of the present study showed that increasing the power from 0 to 30 W, accelerates the exhaust velocity from 641.62to 661.92 m/s while mass flow diminishes from 145.04 mg/s to 140.86 mg/s. Thrust proved to be independent of input power while the specific impulse, which is supposed to increase directly with square root of flow temperature, improved from 68.251 to 70.442 s.

Keywords: Resistojet, Electric Propulsion, CFD, Control Thruster, Small Satellite, Outer Space.

Introduction

In recent years, the increasing demand for small and cost-effective space missions has led to significant interest in compact, low-power propulsion systems. Among various options, resistojet thrusters—electrothermal propulsion devices—have gained attention due to their ability to provide efficient and reliable performance within the constraints of small spacecraft, where power limitations and mass efficiency are critical. These thrusters are capable of producing thrusts up to 100 mN at power levels below 50 W, with a specific impulse (I_{sp}) up to 100 s, making them suitable for a wide range of small satellite applications [1].

Resistojets operate by heating a propellant using electrical power to produce a high-temperature gas, which is then expelled through a nozzle to generate thrust. The performance of these systems is closely linked to the thermophysical properties of the chosen propellant and the amount of input power provided to the system. As such, a comprehensive understanding of how different operational parameters—particularly input power and propellant type—affect the thruster's performance is essential for optimizing design and operational efficiency in space missions [2][3].

Recent studies have explored various factors affecting the performance of resistojet thrusters, including the impact of input power, propellant selection, and nozzle design. For example, Krejci and Lozano [4] investigated the performance of electrothermal thrusters using hydrogen and xenon as propellants, revealing that hydrogen provides better specific impulse due to its lower molecular weight. Similarly, Miele et al. [5] examined the influence of different propellants on the efficiency of low-power resistojet thrusters, emphasizing the role of thermal properties in optimizing system performance.

The relationship between power input and system performance is complex. Increasing input power typically results in higher exhaust velocities and improved specific impulse, but the effect on mass flow and thrust requires careful consideration. By analyzing the performance of different input powers under a range of operating conditions, this work aims to contribute to the optimization of resistojet thrusters for future space propulsion applications, providing a basis for informed power management in spacecraft design [6].

Materials and Method

The present study employs CFD simulations to investigate the performance of a low power resistojet thruster using butane (C_4H_{10}) as a propellant. All computations were carried out in ANSYS Fluent 2023 R2 under steady, compressible flow assumptions. The computational domain, shown in Figure 1, consists of a 10 mm diameter inlet section, a 50 mm long heated channel, a 0.5 mm throat, and a 7 mm diameter divergent nozzle with a 30° expansion angle.

The simulations were performed using the Reynolds-Averaged Navier-Stokes (RANS) equations with the k-ω SST turbulence model, which is well-suited for capturing near-wall viscous effects and flow separation in small-scale nozzles. The energy equation was enabled to account for heat transfer, and the ideal gas law was applied for butane (C_4H_{10}) to model compressibility effects.

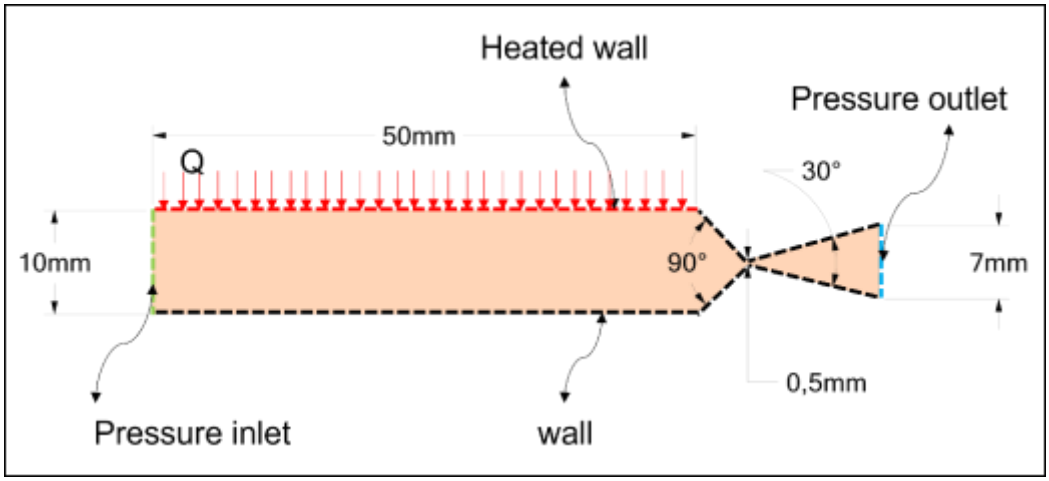

Figure 1. Calculation Domain

Boundary conditions implemented in the computational model are summarized in Table 1 and Figure 1. A constant pressure inlet condition of 2.5 bar was specified at the thruster inlet, representing the propellant supply. The heated wall, corresponding to the heating chamber, received uniform heat flux input of 0, 10, 20, and 30 W to investigate the influence of input power variations. A no-slip boundary condition was applied to all solid walls. At the nozzle exit, a fixed low-pressure outlet boundary of 50 Pa was assigned, representing conditions typical of outer space vacuum environments.

Table 1. Boundary Conditions

Boundary	Conditions
Pressure inlet	2.5 bar
Heated wall	0-10-20-30 W
Wall	No-slip condition
Pressure outlet	50 pa

A 2D axisymmetric mesh was created in ANSYS Meshing comprising 26 004 cells and 26 508 nodes. A structured grid with 30 prism layers was applied along all walls, with a first-layer thickness of 1.4×10^{-7} m and a growth rate of 1.20. Mesh structure is presented in Figure 2 and mesh properties presented in table 2.

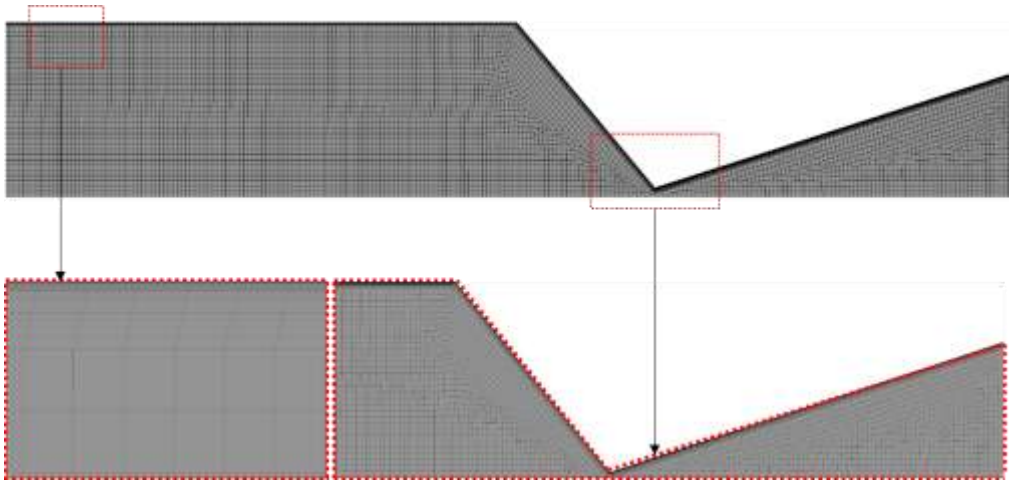

Figure 2. Mesh Structure

Table 2. Mesh Properties

Property	**Value**
Node Number	26 508
Cell Number	26 004
First Layer Height	$1{,}4\times10^{-7}$ m
Layer number	30
Growth Rate	1,20

Results and Discussion

Figure 3 presents the total pressure contours within the resistojet thruster for different input powers (0, 10, 20, and 30 W). As illustrated, the pressure distribution remains nearly constant across the investigated power levels, primarily governed by the fixed inlet pressure boundary condition. This demonstrates that within the range studied, the influence of input power on pressure is minimal. However, the pressure drop at the nozzle throat remains prominent across all cases, underscoring that the main role of varying input power is related to thermal energy addition rather than altering the pressure conditions within the thruster significantly.

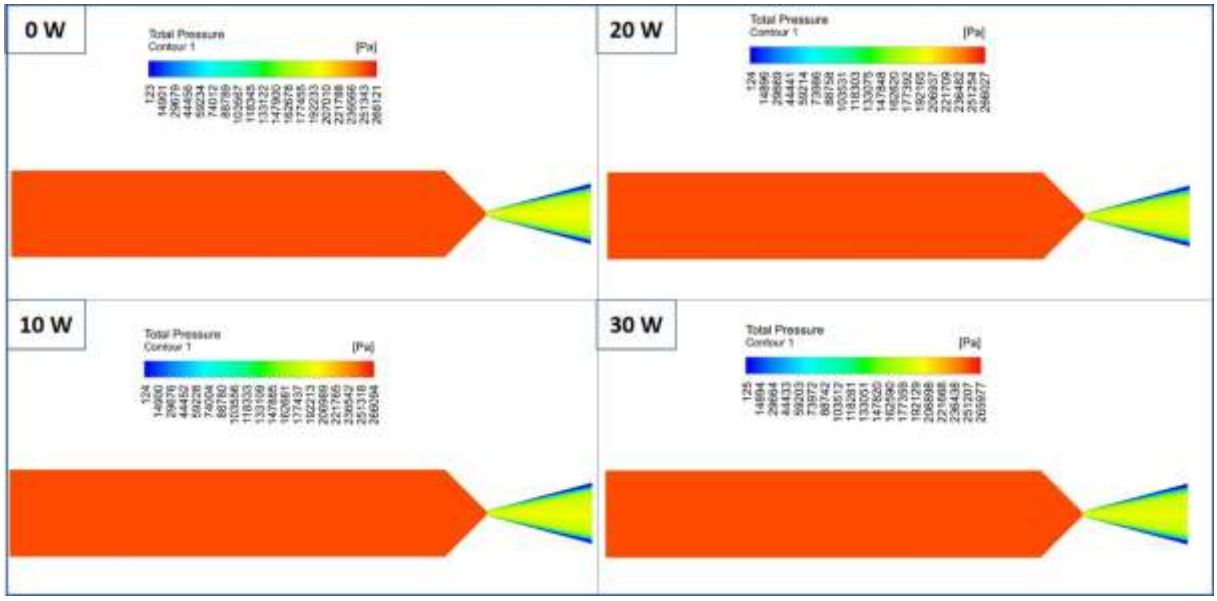

Figure 3. Input Power vs Total Pressure

Figure 4 shows total temperature contours within the resistojet thruster for different input power conditions (0, 10, 20, and 30 W). At 0 W, the thruster demonstrates uniform but relatively low temperatures throughout the domain, reflecting the absence of additional heating. With increasing input power (10 W and above), a clear thermal gradient emerges, indicating efficient heat transfer from the heated wall to the propellant gas. Particularly at 30 W, the maximum temperature reaches approximately 380 K, significantly enhancing the internal energy of the propellant.

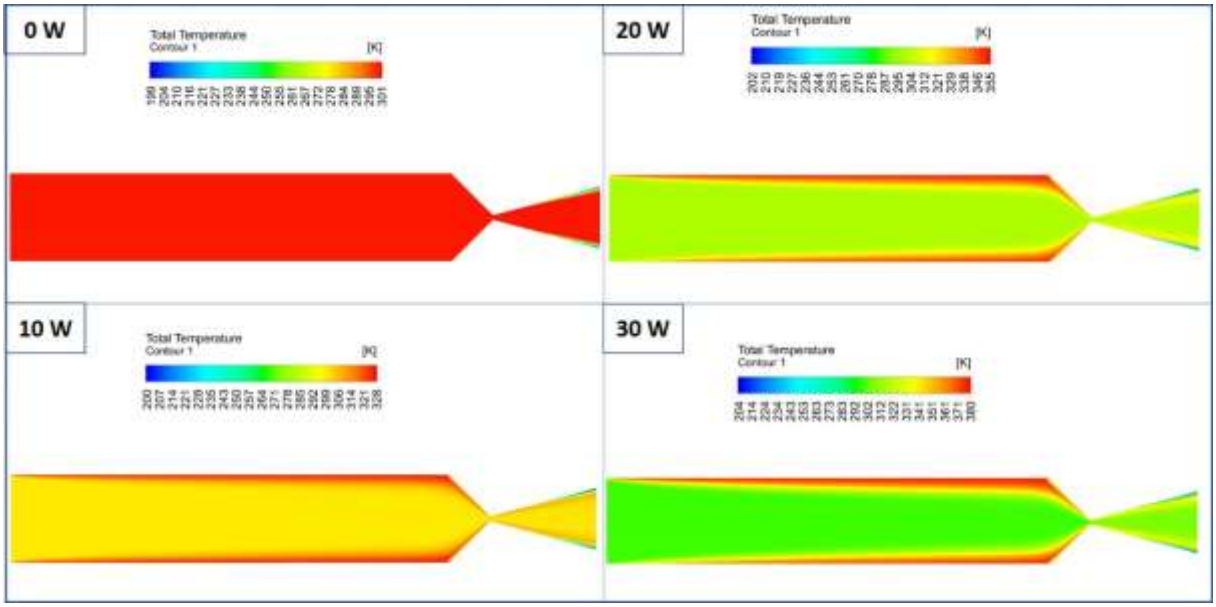

Figure 4. Input Power vs Total Temperature

Figure 5 presents the velocity contours within the resistojet thruster for input powers of 0, 10, 20, and 30 W. The results clearly illustrate the impact of power input on exhaust velocity. With no power (0 W), the exit velocity remains relatively low, approximately 673 m/s. Increasing the input power gradually enhances the thermal energy imparted to the propellant, thereby accelerating the flow through the nozzle. At the highest input power (30 W), the maximum velocity reaches approximately 700 m/s, confirming the direct influence of heating on the kinetic energy of the propellant gas.

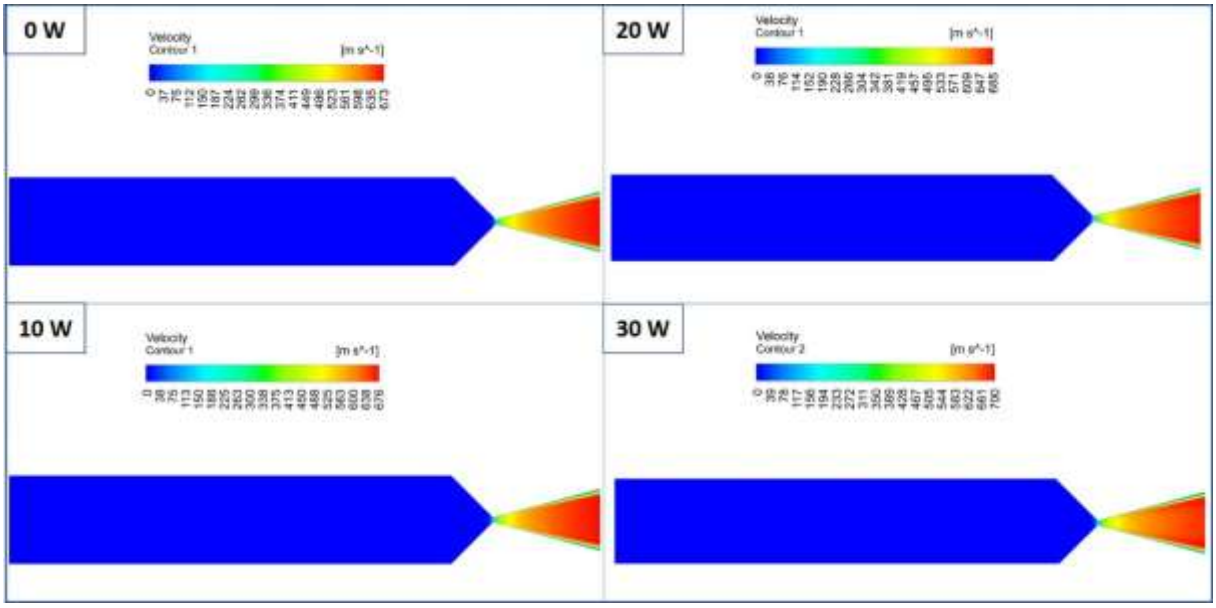

Figure 5. Input Power vs Velocity

Conclusions and Recommendations

Figures 6 and 7 clearly illustrate the relationship between input power and the primary performance parameters of the resistojet thruster. Figure 6 demonstrates that the specific impulse significantly increases as the input power rises from 0 W to 30 W. This improvement occurs due to enhanced heating of the propellant gas, resulting in increased thermal and kinetic energies within the nozzle and consequently higher exhaust velocities. The specific impulse increased from 68.251 s at 0 W to about 70.442 s at 30 W, indicating that the efficiency of the propulsion system substantially benefits from additional thermal energy input.

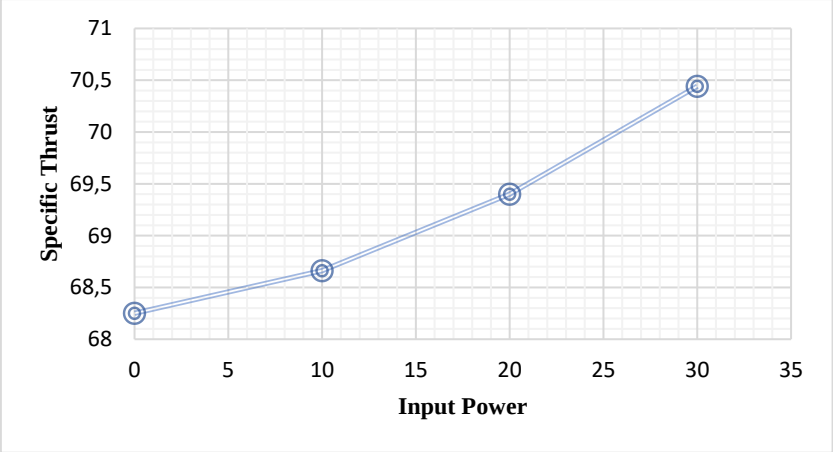

Figure 6. Input Power vs Specific Thrust

On the other hand, Figure 7 illustrates that the thrust produced by the resistojet remains relatively stable across the examined power levels. The minor variations observed—from 0.09711 N at 0 W to 0.09734 N at 30 W—indicate that, within this range of input power, the thrust is relatively independent of heating power, primarily governed by inlet pressure and mass flow rate rather than the thermal input alone.

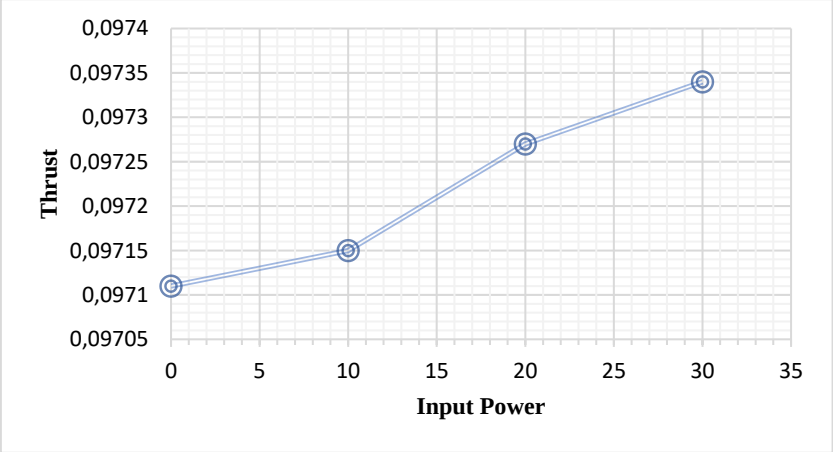

Figure 7. Input Power vs Thrust

In conclusion, while increased input power significantly improves the specific impulse and hence the propulsion system's efficiency, it has a minimal impact on thrust. These insights underline the importance of optimal power management, where power input should be carefully balanced to maximize efficiency gains without unnecessary resource consumption, particularly in small satellite propulsion applications where power availability is critically limited.

ABSTRACT

The Terahertz (THz) frequency range becomes increasingly important for next-generation systems. Thus, the selection and properties of materials in this frequency band are crucial for improving system efficiency. In this regard, ceramics have recently gained significant attention for THz applications, due to their unique properties. In this context, we investigate the dielectric properties of zirconium oxide (ZrO_2) and nickel (Ni)-added aluminium oxide (Al_2O_3)-based ceramics in the THz range. The fabricated ceramics are characterized using THz time-domain spectroscopy (THz-TDS), a powerful analytical technique that employs THz radiation. We analyse the impact of ZrO_2 and ZrO_2+Ni additives on the dielectric properties of Al_2O_3-based ceramics. Key parameters examined include refractive index, permittivity, absorption coefficient, and loss tangent. Our findings reveal that Al_2O_3-based ceramics with ZrO_2 + Ni additives exhibit a higher dielectric constant and refractive index than the pure Al_2O_3 and ceramics containing only ZrO_2 additives. Furthermore, these ceramics' loss tangent is lower than those with only ZrO_2 additives. However, the combination of ZrO_2 and Ni additives increases the permittivity of Al_2O_3-based ceramics. These results facilitate the selection of suitable composites and enhance the dielectric properties of Al_2O_3-based ceramics, paving the way for high-performance THz applications, especially for next-generation 6G communication systems.

Keywords: Terahertz, Aluminium Oxide-based Ceramics, Zirconium Oxide, Nickel, Dielectric Properties.

Introduction

Terahertz radiation is the frequency range between infrared and microwave in the electromagnetic spectrum, ranging from 0.1 to 10 THz (Hakobyan et al., 2022). Recent advances in photonics and microelectronics have led to significant progress in THz functional devices (Purlu et al., 2025). THz photonics has attracted a lot of attention, especially for its low scattering, high spectral bandwidth, low photon energy, and free space propagation (Hakobyan et al., 2022). The applications of terahertz technologies include radar, high-speed wireless communications, non-destructive testing, spectroscopy, materials characterization, and space technologies (Calvo-de la Rosa et al., 2020; Pałka et al., 2023; Purlu et al., 2025). The dielectric ceramics with high permittivity and low losses are promising materials for the THz frequency band (Hakobyan et al., 2022).

Advanced ceramics are a class of engineered materials that are ideal for demanding technological applications because of their unique mechanical, thermal, and chemical stability. Ceramics are materials characterized by excellent wear resistance, high hardness, corrosion resistance, and high melting points, making them suitable for a wide range of applications from engineering to medicine (Ayode Otitoju et al., 2020). The dielectric properties of ceramic materials in the terahertz (THz) frequency range make them attractive for high-frequency device applications. The characteristic properties of Al_2O_3 ceramics in the THz frequency band, such as low dielectric constant and low dielectric loss factor, make it a potential candidate material for various dielectric-based technological applications such as dielectric resonator structures, integrated circuit applications, and interconnection antenna systems (Hakobyan et al., 2022; Purlu et al., 2025).

The microstructural properties of ceramic materials, such as grain size, composition, and porosity, directly affect their dielectric properties. The performance of the material in the THz range can also be improved by modifying these properties (Cao et al., 2023). MacDougall et al. investigated the optical properties in the terahertz frequency range of monoclinic zirconia samples with different powder sizes (MacDougall et al., 2024). Purlu et al. examined the effect of samarium oxide and zirconia addition to Al_2O_3 ceramics on the microstructure and dielectric properties in the THz frequency range. As a result of the study, it was observed that the dielectric constant and refractive index of the samples containing ZrO2, Sm_2O_3, and ZrO_2-Sm_2O_3 additives improved according to pure Al_2O_3 (Purlu et al., 2025). At the same time, the THz frequency can be used to detect the internal structural defects of ceramic samples in a non-destructive method. This enables it to play an important role in the quality control and characterization of ceramic components. Hokabyan et al. performed terahertz characterization of pure Al_2O_3 and Al_2O_3-ZrO_2 ceramics produced with different powder sizes and porosity ratios. The porosity ratios of the samples were determined by a THz time-domain spectroscopy (THz-TDS) system. In addition, a relationship between porosity ratio, grain size, and dielectric properties was attempted to be determined (Hakobyan et al., 2022). Palka et al. visualized the defects in the internal structure of hexagonal Al_2O_3 ballistic test samples by a THz-TDS method (Pałka et al., 2024).

In the present study, the densification, microstructure, and dielectric properties (refractive index, permittivity, absorption coefficient, and loss tangent) of the Al_2O_3-based ZrO_2 and ZrO_2-Ni additives were investigated in the terahertz range. The Ni-added samples were produced via the heterogeneous precipitation method. The fabricated ceramics are analyzed using THz time-domain spectroscopy (THz-TDS), an advanced analytical method that utilizes THz radiation.

Materials and Methods

The raw materials used in this work were α-Al_2O_3 powder (Alfa Aesar, 99.5% purity, 0.25–0.45 μm), ZrO_2 powder (3 mol% Y_2O_3 stabilized, Inframat Advanced Materials, <0.5μm), nickel nitrate hexahydrate ($Ni(NO_3)_2 \cdot 6H_2O$, 98% purity, Alfa Aesar), ammonium bicarbonate (NH_4HCO_3, precipitant, Sigma Aldrich, 99% purity), polyacrylic acid (dispersant, MSE Tech Co. Ltd, Turkey), polypropylene carbonate (PPC, binder, QPAC 40, Empower Materials, USA).

The Al_2O_3 ceramics were added with ZrO_2 and Ni at 5 vol.% and 1 vol.%, respectively. The heterogeneous precipitation technique was utilised to produce nano-Ni particles on the Al_2O_3 ceramic. The heterogeneous precipitation method is an effective technique used to obtain nano-sized metal particles with homogeneous distribution in the ceramic matrix (Yıldız et al., 2021).

Initially, the solution of $Ni(NO_3)_2$-$6H_2O$ in distilled water was prepared in the required quantities to obtain a 1 vol.% Ni content in the Al_2O_3-ZrO_2-Ni composite. Subsequently, this solution was ball milled with Al_2O_3 powder, ZrO_2 powder, and polyacrylic acid as a dispersant. Meanwhile, an aqueous solution of precipitant NH_4HCO_3 was prepared and added dropwise to the milled mixture under vigorous stirring. Through this process, the Al_2O_3 and ZrO_2 powder mixture was coated with the amorphous $NiCO_3 \cdot 2Ni(OH)_2 \cdot 2H_2O$ phase formed as a result of the reaction. The precipitant added mixture was dried and then crushed in an agate mortar. The prepared powder mixture was calcined at 500°C in a pressureless air environment for 2 hours, and nano nickel oxide (NiO) was obtained in the form of particles from the amorphous phase $NiCO_3.2Ni(OH)_2.2H_2O$. The calcined powder was subjected to heat treatment at 700°C in a 10% H_2 + 90% Ar atmosphere for 4 hours, and the reduction of nickel oxide to Ni metal was ensured. As a result of this process, Al_2O_3-ZrO_2-Ni composite powder was obtained. The composite powder was mixed with the binder solution (PPC + acetone) and dried. The dried powder was crushed and sieved via a 90 μm sieve. The granulated powders were first pressed in a uniaxial press (under 40 MPa pressure), followed by a cold isostatic press (under 200 MPa pressure). The sintering process was carried out at 1550°C under a 10% H_2+90% Ar atmosphere for 2 hours. Sintering was carried out step by step to remove PPC from the structure. In Figure 1, the production process of the Ni-containing samples is illustrated schematically.

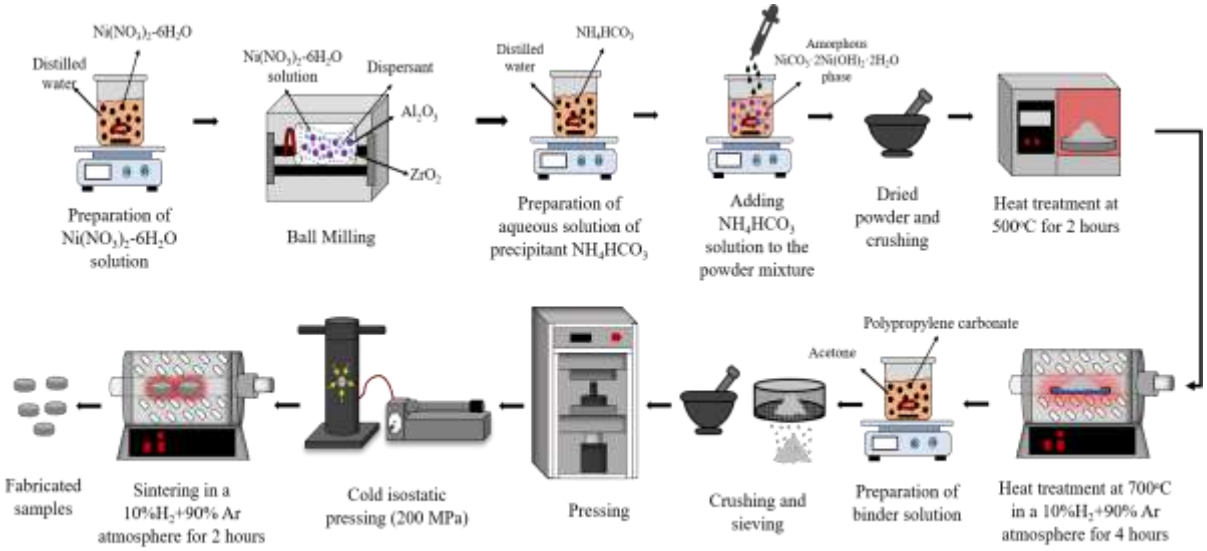

Figure 1. Fabrication process of nickel-containing samples

In the fabrication of the non-Ni ceramics, the required amount of ceramic powders was ball milled in distilled water with polyacrylic acid and dried. Then the powder was crushed in an agate mortar, and the dispersant was removed from the samples by heat treatment at 500°C (2 hours in air). The prepared binder solution was added to the powder, and the acetone in the mixture was evaporated, and the powder was dried. The pressing and sintering stages were performed under the same conditions as the nickel-containing samples. Finally, the samples were sanded with a lapping machine and polished with a 1 μm diamond solution.

The Archimedes method was used to analyse the densification of the produced samples. The samples were analysed by scanning electron microscopy (SEM) for grain size, grain morphology, and distribution of additive phases investigations. The crystalline phases and structures of the compositions were analysed by the X-ray diffraction (XRD) method. The dielectric properties (refractive index, permittivity, absorption coefficient, and loss tangent) of the samples in the terahertz band were characterised by THz time-domain spectroscopy (THz-TDS). Terahertz characterisations were performed in the frequency range 0.3-1.5 THz.

Findings and Discussion

Table 1 shows the relative density results of the produced samples. It is seen that the sintering of pure Al_2O_3 is positively affected, and its densification increases with the addition of additives. Especially, with the addition of 5vol.% ZrO_2, the density value has reached 98.5%. In the case of Al_2O_3-ZrO_2-Ni composites, although the density is also increased compared to pure Al_2O_3, the densification is lower compared to the composition containing only ZrO_2. This phenomenon can be attributed to the low wettability of alumina and zirconia by liquid nickel (118° for ZrO_2, 128° for Al_2O_3). Low wettability leads to weakening of the interface, and the densification is negatively affected (Yıldız & Tür, 2019).

Table 1. Relative density values of the fabricated samples

Composition	Relative Density (%)
Pure Al_2O_3	95.7
Al_2O_3-ZrO_2	98.5
Al_2O_3-ZrO_2-Ni	97.7

The XRD graphs of the sintered samples are given in Figure 2. In the graph, the symbols "♦" and "♦" indicate the peaks of Ni and ZrO_2, respectively. When the peaks were analyzed, the presence of Al_2O_3 and tetragonal ZrO_2 peaks were determined in the composites. Moreover, Ni peaks are clearly visible in the Ni-containing composition. Also, the formation of undesirable secondary phases (monoclinic zirconia and nickel aluminate spinel ($NiAl_2O_4$)) was not observed in XRD analysis.

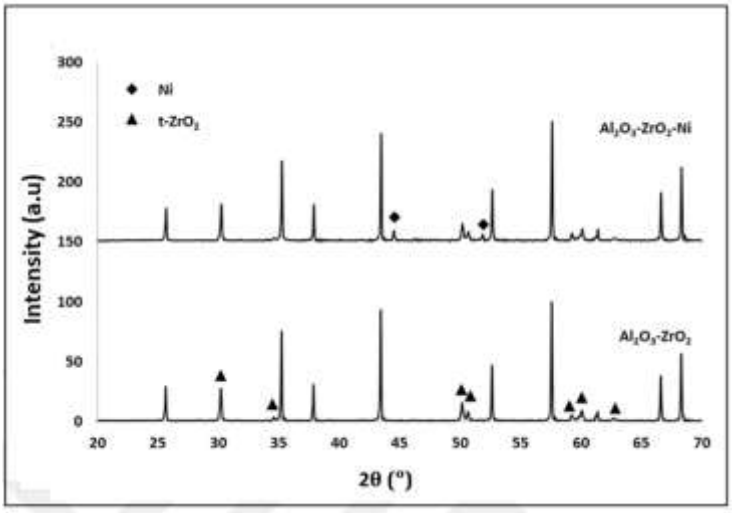

Figure 2. XRD graphs of sintered samples

The SEM images of the Al_2O_3-based samples produced are presented in Figure 3. The gray regions in the images are Al_2O_3, and the white regions are ZrO_2 and Ni. The SEM images reveal that the additives are distributed almost homogeneously in the microstructure. It is also observed that ZrO_2 and Ni particles are mostly located at grain boundaries and triple junctions. This prevented excessive grain growth due to the high temperature during sintering.

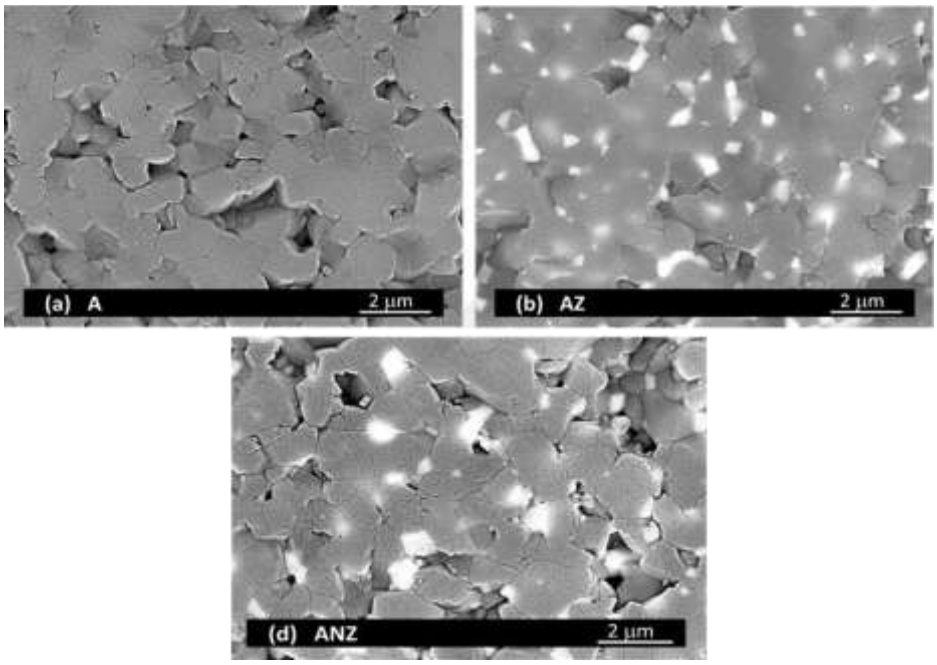

Figure 3. The SEM images of the (a) Pure Al_2O_3, (b) Al_2O_3-ZrO_2 and (c) Al_2O_3-ZrO_2-Ni

Figure 4 shows the variation of refractive index with frequency. The refractive index curves for all three ceramic compositions remain essentially flat across the 0.3–1.5 THz band, indicating minimal dispersion in this frequency range. The addition of ZrO_2 to Al_2O_3 shifts the refractive index upward relative to pure Al_2O_3, while the further inclusion of Ni produces the highest

refractive index, reflecting an increased dielectric constant. This combination of elevated, frequency-stable refractive index in the Al_2O_3+ZrO_2+Ni sample makes it particularly attractive for THz applications that demand high permittivity without added dispersion.

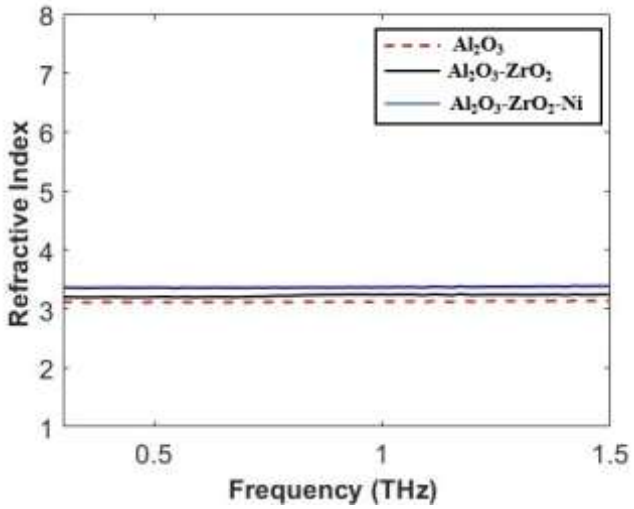

Figure 4. The variation of refractive index with frequency in the produced ceramics

The variation of the absorption coefficient in the terahertz frequency range is given in Figure 5. The absorption coefficient for all three compositions exhibits a slight upward trend across the measured 0.3–1.5 THz range, reflecting frequency-dependent absorption behavior. The Al_2O_3+ZrO_2 sample shows the highest absorption values, likely due to increased scattering and defect states introduced by the ZrO_2 additive. Incorporation of Ni into the Al_2O_3+ZrO_2 matrix reduces the absorption compared to the ZrO_2-only sample, balancing absorption losses with the observed permittivity enhancement.

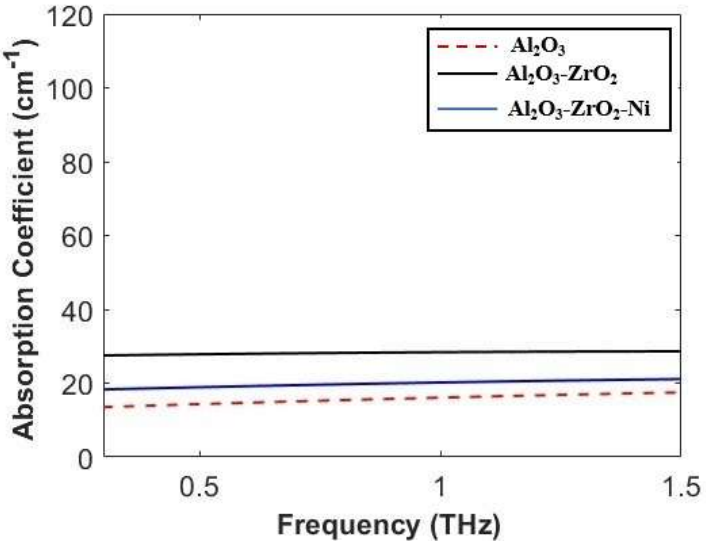

Figure 5. The variation of the absorption coefficient in the terahertz frequency range

The trend of the loss tangent with frequency is presented in Figure 6. The loss tangent for all samples decreases markedly with increasing frequency, indicating reduced dielectric losses at higher THz frequencies. The Al_2O_3+ZrO_2 composition exhibits the highest loss tangent across the band, while the addition of Ni to the ZrO_2-doped matrix lowers the loss tangent closer to that of pure Al_2O_3. This frequency-dependent loss reduction in the Al_2O_3+ZrO_2+Ni sample underscores its potential for low-loss THz applications, especially above 1 THz.

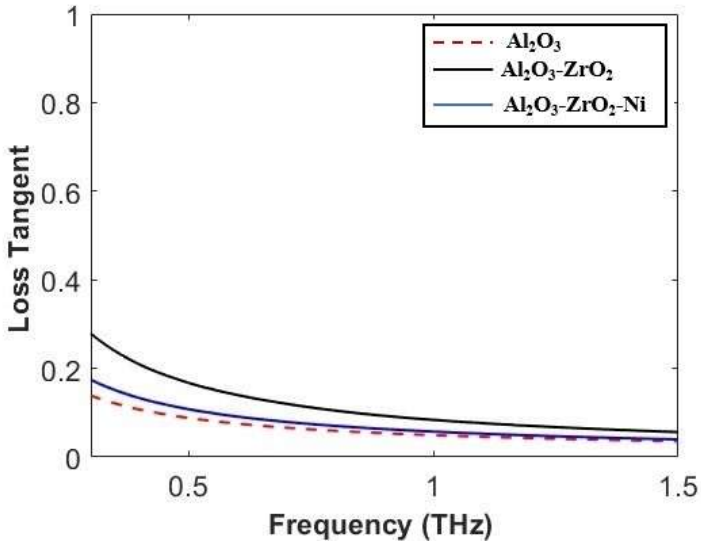

Figure 6. The variation of the loss tangent with the frequency

The graph in Figure 7 presents the variation of the permittivity depending on the frequency. The permittivity of all three ceramic compositions exhibits a slight upward trend over the 0.3–1.5 THz range, reflecting increased polarization at higher frequencies. The Al_2O_3+ZrO_2 sample shows higher permittivity than pure Al_2O_3, while the Al_2O_3+ZrO_2+Ni composition achieves the highest values, confirming the synergistic effect of both additives on dielectric polarization. This combination of elevated and frequency-stable permittivity underscores its suitability for THz devices requiring enhanced dielectric response without significant dispersion.

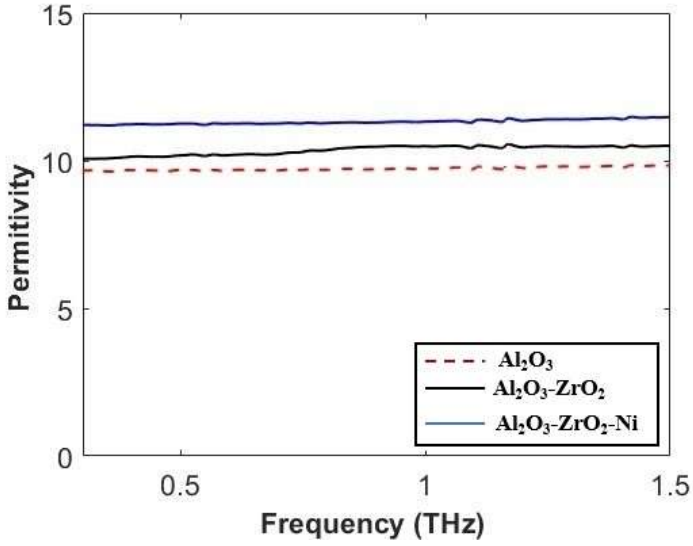

Figure 7. The variation of the permittivity depending on the frequency.

Conclusion and Recommendations

In this paper, the Al_2O_3-based ceramics containing 5vol.%ZrO_2 and 1vol.%Ni were produced by the heterogeneous precipitation method. The densification behaviour, microstructure, and dielectric properties in the range of 0.3-1.5 THz were investigated. The THz band properties of the samples were characterized by a THz time-domain spectroscopy (THz-TDS) system.

- In the study, the Ni precipitation process was successfully carried out, and it was observed that ZrO_2 and nano-sized Ni particles were homogeneously dispersed in the Al_2O_3 matrix. Besides, the ZrO_2 and Ni particles are located at the grain boundaries and triple junctions in the microstructure, so there is no excessive grain growth. At the same time, it was observed that the densification increased with ZrO_2 and Ni additives in the sintered samples.
- When the dielectric properties of the samples in the terahertz band were examined, it was observed that the refractive index and permittivity were stable in the range of 0.3-1.5 THz in all compositions. It is seen that the loss tangent exhibits a marked decrease in this range. It was observed that the Al_2O_3-ZrO_2-Ni composites have higher dielectric constant and refractive index compared to the pure Al_2O_3 and the Al_2O_3-ZrO_2 composites. Consequently, it was determined that the additives improved the dielectric properties of Al_2O_3-based ceramics. It is inferred that these compositions have potential in THz applications.

ABSTRACT

One of the critical parameters of Free-Space Optical (FSO) communication links is the Signal to Noise Ratio (SNR). Higher SNR means the signal power is much stronger than the noise power, this makes the system more resilient to turbulence-induced distortions and insures more reliable propagation of the laser beams. In this regard, the SNR of Hermite Cosine-hyperbolic Gaussian vortex beams (HChvGB) in turbulent FSO communication links is examined. HChvGB have been recently introduced and known for their unique properties. Thus, in this study, the topological charge, beam order and decentred parameter impact on the SNR behavior of HChvGB is analyzed. For beams with lower decentred parameter, as the beam order increases the SNR increases then at the order of 4 SNR starts to decrease. Besides that, for links longer that 2 km, beams with lower decentred parameter and having a topological charge of 2 have the advantage of increasing the SNR level. As a result, the provided results will play a significant role in the design and performance improvement of the FSO communication links, laser detection and ranging (LIDAR) systems and directed infrared counter measure systems (DICM).

Keywords: Hermite Cosine-hyperbolic Vortex Gaussian beams, Free-space optical communication links, turbulent atmosphere, SNR

Introduction

In recent years, requirement for the high date rates, high-level security, ultra-low latency, and low power consumption pave the way for development of FSO communication systems(Al-Gailani et al., 2021). However, atmospheric turbulence poses challenge for FSO systems, which generate refractive index fluctuations in the propagation path. These fluctuations lead to beam wander, scintillation, phase front distortion, and overall signal degradation, which is adversely affecting the system's SNR(Wang et al., 2021). To address these issues, various optical beams, such as Hermite-Gaussian (HG), Laguerre-Gaussian (LG), Bessel Gaussian and Airy Gaussian have explored by the researchers and their propagation characteristics under the atmospheric turbulence are studied (Du et al., 2023; Jin et al., 2021; Wuming et al., 2021; Zhang et al., 2022). Among these, HChvGB have emerged as a promising candidate due to their unique combination of spatial symmetry, phase singularities, and the ability to customize beam structure through tunable parameters such as topological charge, beam order, and decentred parameters. In a literature survey, the propagation properties of HChvGB in atmospheric turbulence are investigated based on the extended Huygens–Fresnel diffraction integral. The influence of the turbulence strength on the intensity distribution under the change of beam parameters conditions is illustrated (Hricha et al., 2021). Besides that, influence of the beam parameters on the beam propagation factor (M^2-factor) of the HChvGB is investigated by using the second-order intensity moments (Ahlane et al., 2024). Despite the given studies, to the best of our knowledge, comprehensive studies evaluating their SNR performance under turbulent atmospheric conditions has never studied before. Therefore, this study aims to analyze the influence of key beam parameters namely topological charge (m), Hermite polynomial order (p, q), and decentred parameter (b) on the SNR behavior of HChvGB in FSO communication links using a random phase screen turbulence model.

Materials and Methods

The HChvGB in the rectangular coordinate system and z axis refers to propagation plane, electric field intensity of beam in the source plane (z = 0) can be expressed by equation (1) (Hricha et al., 2021);

$$(x_0, y_0, z = 0) = H_p\left(\sqrt{2}\frac{x_0}{w_0}\right) H_q\left(\sqrt{2}\frac{y_0}{w_0}\right) \cosh\left(b\frac{y_0}{w_0}\right) e^{-\left(\frac{{x_0}^2+{y_0}^2}{{w_0}^2}\right)} \left({x_0}^2 + i{y_0}^2\right)^m \quad (1)$$

where (x_0, y_0) are the transverse Cartesian coordinates at initial plane, w_0 is the waist radius of gaussian part, p, q are the Hermite polynomial orders, cosh denotes the hyperbolic-cosine function, b is decentred parameter related to the cosh part, m is topological charge.

Random phase screen model was used to investigate SNR for different parameters of the HChvGB beam propagating in the atmospheric turbulence conditions. This model requires dividing the propagation distance (L) into N_s intervals $\Delta L = \frac{L}{N_s}$ separated by thin phase screen planes. Accordingly, the received electric field intensity after free space propagation can be computed using (2)(Bayraktar et al., 2024);

$$u_r(r, mL) = F^{-1}\left[F\left[u_s(r, (m-1)\Delta L) exp\left(j\phi(r)\right)\right] H(f)\right] \quad (2)$$

Here F, F^{-1}, correspond to Fourier transform and its inverse, $H(f)$ Fourier transform of transfer function, $r = (r_x, r_y)$receiver plane coordinates, $f = (f_x, f_y)$ are spatial frequencies, ΔL equal to partial propagation distance, $\phi(r)$ denotes the phase power spectral density for each individual in the random phase screen model. In this study the Von-Karman power spectral

density is used to generate random phase screen model which is shown in (3)(Akcan et al., 2024);

$$\phi_{\emptyset}(f) = \frac{0.0036LC_n^2k^2L_0^{11/3}}{(L_0^2|f|^2+1)^{11/6}} exp[-1.1265I_0^2|f|^2] \quad (3)$$

Here, C_n^2 is the refractive index structure constant, l_0, L_0 are the inner and outer scale of turbulence. The aperture averaged scintillation is calculated using the received field as given (4)(Dalgac et al., 2025);

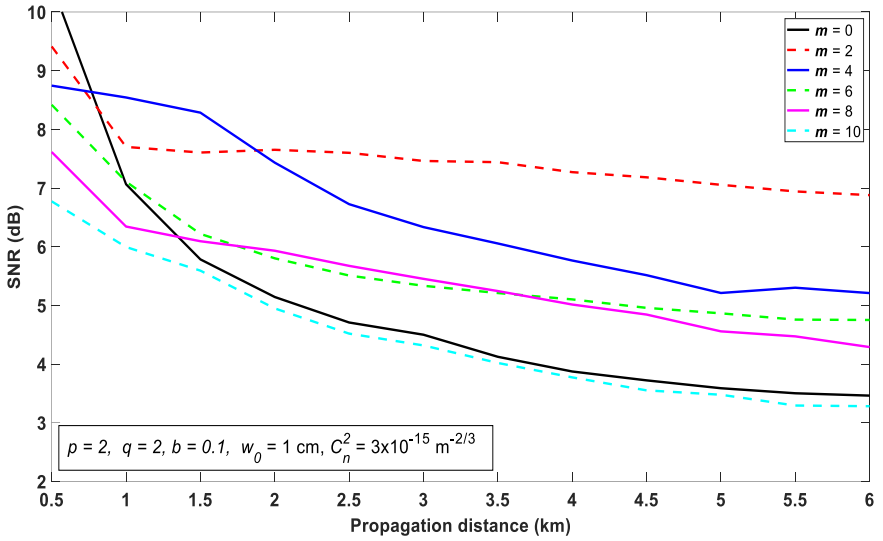
$$m_A{}^2 = \frac{\frac{1}{N}\left[\int_0^{r_x}\int_0^{r_y}\sum_{i=1}^{N} u_r(r,L)u_r{}^*(r,L)dr_x dr_y\right]^2 - \left[\frac{1}{N}\int_0^{r_x}\int_0^{r_y}\sum_{i=1}^{N} u_r(r,L)u_r{}^*(r,L)dr_x dr_y\right]^2}{\left[\frac{1}{N}\int_0^{r_x}\int_0^{r_y}\sum_{i=1}^{N} u_r(r,L)u_r{}^*(r,L)dr_x dr_y\right]^2} \quad (4)$$

where N indicates the number of realizations taken as 500 in the simulations. After obtaining the aperture averaged scintillation index, due to the dominancy of scintillation index against other noise types, SNR is calculated as it is defined in (5) (Eyyuboğlu & and Bayraktar, 2015);

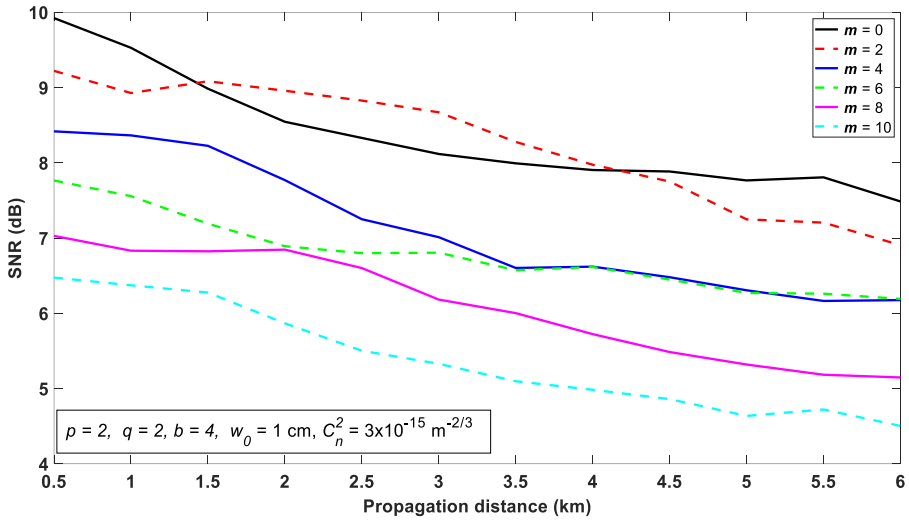
$$\text{SNR} \sim \frac{1}{m_A^2} \quad (5)$$

Findings and Discussion

In this study, the SNR of HChvGB in turbulent FSO communication links is examined. The communication link operates at 1550 nm and communicates through a 6 km atmospheric channel with a refractive index structure constant of $C_n^2 = 3 * 10^{-15}\text{m}^{-2/3}$. The number of screens inserted between source and receiver plane is 50 and their grid size is 256*256. The topological charge effect on the SNR of HChvGB when *b=0.1* and *b=4* were investigated and obtained results were illustrated as given Figure 1(a) and Figure 1(b), respectively. It can be said that, as the topological charge increases, SNR tend to decreases for shorter communication links up to 1-2 km regardless of the decentred parameter. Also, increasing of decentred parameter leads to decrease of SNR. For links longer than 2 km, beams with lower decentred parameter and having a topological charge of 2 have the advantage of increasing the SNR level.



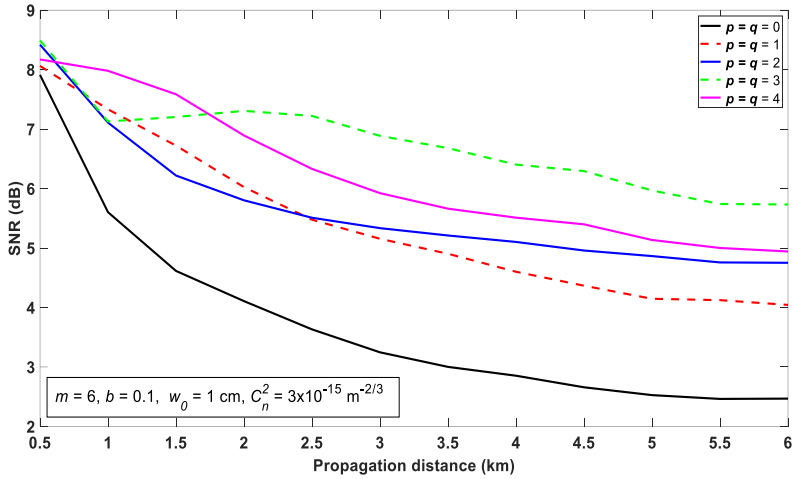
(a)



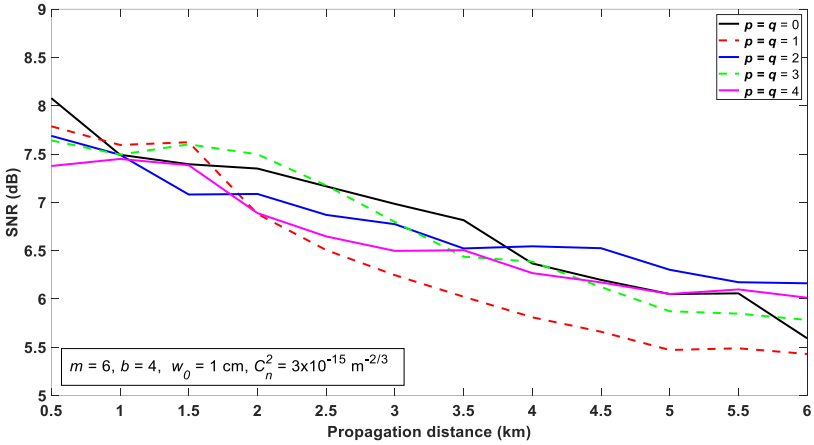
(b)

Figure 1. The effect of the topological charge on the SNR of the HChvGB. (a) $b = 0.1$, (b) $b = 4$.

In addition to topological charge, the impact of Hermite polynomials order on the SNR of HChvGB was also analyzed in Figure 2. As given Figure 2 (a) and Figure 2(b), Hermite polynomial order vary from 0 to 4 in the case of *b=0.1 and b=4*, respectively. Figure 2 (a) demonstrate that, for beams with lower decentred parameter, as the beam order increases the SNR increases then at the order of 4 SNR starts to decrease. In contrast, Figure 2 (b) represent that for higher decentred parameter, SNR generally lower and exhibits a flatter profile across the beam orders.



(a)



(b)

Figure 2. The effect of the Hermite polynomials orders on the SNR of the HChvGB. (a) $b = 0.1$, (b) $b = 4$.

Conclusion and Recommendations

In this study, the behavior of the SNR for HChvGB propagating through FSO communication links was investigated by the help of random phase screen model. The effects of topological charge, Hermite polynomial order, and decentred parameter on SNR performance were systematically analyzed. The results reveal that increasing the topological charge generally reduces the SNR, especially for shorter propagation distances. However, for longer distances, beams with a low decentred parameter and a topological charge of 2 demonstrate superior SNR performance. Additionally, the influence of Hermite beam order is non-monotonic: as the order increases, SNR initially rises, reaches a peak at order 4, and then declines. A higher decentred parameter consistently leads to reduced SNR. The results provide guidance for designing robust FSO systems, as well as other optical platforms such as LIDAR and DIRCM, where controlling beam shape and vortex structure is critical.

ABSTRACT

Laryngoscope is a medical device used by healthcare professionals to examine a patient's larynx. The tongue and epiglottis are lifted using the extension of the laryngoscope and are used in emergency rooms or ambulances to help open the airways of patients. Traditional laryngoscopes require healthcare professionals to adjust the patient's neck, lift the tongue with the laryngoscope, and bend the practitioner to view the level of the mouth. This procedure is challenging and requires experience. If the laryngoscope is applied incorrectly, irritation and complications may occur in the applied area and may also adversely affect the interventions made on the patient's respiratory tract. For this reason, within the scope of this working, a laryngoscope with a camera was developed in order to prevent such negativities and facilitate laryngoscope application. Mechanical parts were designed using computer-aided drawing programs, paying attention to ergonomics and usage in laryngoscope applications. In order to prototype and check the suitability of the designs, their production was carried out using jointed manufacturing methods. Then, the mechanical parts of the final product were produced using DLP printers. In the video laryngoscope device, electronic systems and software of our design were used. The laryngoscope device produced with the designed electronic systems can perform imaging and wireless image transfer simultaneously. In addition, the device can be used for several hours without any cable requirement with its battery. As a result of the studies, the design and production of a laryngoscope with an ergonomic grip, which can be used remotely, and which can be viewed from a distance, has been designed and produced. With this design, an important step has been taken in increasing the ease of use of the laryngoscope, reducing the need for experience, and preventing complications that may occur in patients.

Keywords: Laryngoscope, Biomedical Engineering, Respiratory Systems,

Introduction

With the advancement of technology, the use of imaging devices in the field of medicine has become increasingly widespread. Especially in medical devices such as surgical instruments and endoscopy systems, imaging technologies play a crucial role in medical diagnosis and surgical procedures. Another imaging device used in the medical field is the video laryngoscope. Since its invention, the laryngoscope has played an important role in the diagnosis of throat diseases, surgeries, and medical education. While traditional laryngoscopes do not contain any electronic components, video laryngoscopes enable real-time visualization of the procedure through the use of a camera and display, allowing the process to be completed more quickly.

Today, the laryngoscope is a medical device frequently needed, particularly in intubation procedures. However, when performed by inexperienced medical personnel, intubation can present significant challenges and may lead to undesirable outcomes. The use of a video laryngoscope can facilitate the intubation process and help minimize the likelihood of potential complications. Figure 1 shows different types of laryngoscope devices. Video laryngoscopes with various designs are available from different manufacturers. These designs have their own advantages and disadvantages relative to one another.

Figure 1. Different Laryngoscope devices

Today, medical devices incorporating imaging technologies are widely used in surgical instruments and endoscopic systems (Matek, Kolek, Klementova, Michalek, & Vymazal, 2021). The integration of imaging technologies in medical devices allows for faster and more accurate diagnosis and treatment. One such device that utilizes imaging technology is the laryngoscope used in intubation procedures. Currently, models of laryngoscopes with integrated imaging capabilities are available. These advanced models enable intubation procedures to be performed more quickly and accurately (Tabari, Soltani, Zirak, Alipour, & Khazaeni, 2013; Liu et al., 2019). Studies have shown that the success rate of intubation using a video laryngoscope exceeds 95%, whereas with traditional laryngoscopes, the success rate may fall below 50% depending on the conditions (Özkan, 2011).

In addition to patient interventions, video laryngoscope devices can also be utilized in the training of medical personnel. A study examining the impact of video laryngoscopes in training demonstrated that training with such devices improved success rates and reduced intubation

times (Malito, Mathias, Junior, Correa, & RamalhoBardauil, 2021). The use of imaging in the laryngoscopy method is highly important for ensuring the success of intubation procedures.

Numerous studies on video laryngoscopes exist in the literature. Some of these studies proposed cost-effective and rapid solutions by using micro-cameras connected to tablets or smartphones via USB cables (Kim et al., 2020; MD, MD, & MD, 2018). However, these devices are not suitable for medical applications due to issues such as lack of product certification, sterilization difficulties, and concerns regarding patient data privacy. Other studies have proposed fully developed video laryngoscope devices. For instance, in 2009, the company CMAC designed a video laryngoscope consisting of a camera and an external monitor mounted on a stand, allowing for visual support during intubation (Cavus et al., 2009). The study reporting the initial use of this device highlighted that even in cases where intubation was extremely challenging with a traditional laryngoscope, video laryngoscopy enabled successful intubation on the first attempt.

The laryngoscope models developed by King Vision feature a built-in screen located on the handle, directly connected to the laryngoscope (Murphy et al., 2014). Powered by an internal battery, this device is compact and cable-free, making it more portable. A study on this model reported that intubation was successfully performed in patients who posed difficulties for traditional laryngoscopy and that the duration of the procedure was reduced. In addition to video laryngoscopes, wireless laryngoscopes capable of transmitting images without cables are also found in the literature (Huang, Yang, & Feng, 2017; Lai & Wu, 2019; Guerra-Hernández, Vidaña-Martínez, & Camacho-Juárez, 2020). These devices are particularly helpful when intubation is performed by less experienced personnel or during training sessions. Some wireless laryngoscopes include built-in screens, while others are designed to transmit images to external devices such as smartphones or tablets.

A video laryngoscope model developed and manufactured in Turkey also exists. The device, named Scoper, was developed by Gazi University and features a micro-USB camera connected to a tablet display. However, due to its cabled and stand-mounted structure, it is not suitable for use in every environment. Additionally, it lacks wireless capability and can only display images on the tablet screen.

In this study, a laryngoscope prototype is aimed to be developed, which will include an integrated camera and display, making it portable and suitable for use in any setting. With the inclusion of wireless image transmission, it is intended to reduce the duration required for training and the intubation procedure itself. This study is expected to contribute to the literature in terms of local innovation by proposing a wireless and modular video laryngoscope, while also aiming to provide economic benefits through a cost-effective design.

Materials and Methods

This section outlines the design and implementation of the video laryngoscope system. The first subsection details the imaging system, the second addresses the wireless transmission mechanism, and the final subsection presents power consumption calculations and battery specifications.

Imaging System

The imaging system includes a digital camera (OV2640), a microcontroller (ESP32-S3), and a 320×240 resolution TFT screen. To ensure usability and smooth display, the selected components target a frame rate (FPS) of at least 15. The OV2640 camera, with a parallel

interface and support for 20 MHz clock speed, enables high FPS rates and transmits both compressed (JPEG) and uncompressed data efficiently.

The image captured by the camera is transferred to the ESP32-S3, where it is decompressed before being displayed on the screen. Preliminary tests indicate that decoding a 320×240 JPEG image takes approximately 20 ms, while screen transfer over SPI takes about 30 ms, totaling 50 ms per frame—sufficient for the 15 FPS target.

A GUI is implemented using the open-source LVGL graphics library, chosen for its modern interface support and compatibility with resource-constrained microcontrollers. Menu designs are rendered in English due to font limitations.

To improve image quality when needed, an IPS panel TFT may replace the initial display, offering better color accuracy during intubation procedures.

Wireless Transmission

In addition to local display, the device wirelessly transmits captured images to a remote server using Wi-Fi and the User Datagram Protocol (UDP). UDP's low-latency, lightweight structure makes it well-suited for this real-time application.

The ESP32-S3 establishes a connection to a fixed-IP server and continuously streams 320×240 JPEG images, typically sized between 4–5 kB. A web service on the server handles multiple client connections (via web, desktop, or mobile apps) and authorizes them using HTTP-based authentication.

Battery and Charging System

The device is powered by an integrated lithium-ion battery (2S configuration, 1200 mAh). In contrast to removable batteries, this setup allows the device to operate while charging. The target operational duration is at least 2 hours.

Assuming an average power draw of 500 mA at 5 V, the estimated power consumption is 2.5 Wh. Accounting for battery health (80% usable capacity), the system is expected to run for over 3 hours. AA-sized 14500 Li-ion batteries are selected to minimize space usage within the device.

Mechanical Structure

Mechanical housing was designed and produced to support and protect the electronic components of the video laryngoscope. This section summarizes the design, validation, and prototyping process.

Mechanical Design

Following the development of electronics, a protective and ergonomic mechanical enclosure was created using SolidWorks. The housing serves both to shield internal components from moisture and to enable comfortable handling. Special attention was paid to ergonomics, designing the grip to fit the human hand with contours and, if necessary, texture surfaces for secure handling.

Given that the laryngoscope is inserted through the mouth into delicate tissue areas, design accuracy is critical. Any design flaw could cause patient discomfort or harm. The electronics were positioned to remain in the grip section, simplifying disinfection and minimizing exposure to contaminants. The overall geometry was optimized to remain lightweight and compact for ease of use and storage.

To accommodate different patient sizes and age groups, the blade portion (the insertable tip) was designed to be detachable and replaceable, while the grip and electronics remain consistent across use cases. The connection mechanism was designed to be simple and secure.

Since considerable force may be required during intubation, the mechanical structure was engineered to withstand stress without fracture. Wall thickness and geometry were carefully calculated to prevent stress concentrations and ensure structural integrity.

Design Validation

Finite Element Analysis (FEA) was conducted to validate the mechanical design. The 3D model was meshed using Hypermesh and analyzed in ANSYS under static load conditions. The grip section was fixed, and a maximum expected force was applied to the blade end. Results from the analysis guided design refinements to improve durability and ergonomic performance without the need for repeated physical prototyping.

Prototyping and Fabrication

After validation, a prototype was fabricated using additive manufacturing for rapid prototyping. The design was exported as an STL file and prepared for printing in Halot Box software. Printing was performed using digital light processing (DLP) with photopolymer resin. Table 1 lists the parameters used in the printing process.

Table 1. 3D Printing Parameters

Parameter	**Value**
Layer thickness	0.1 mm
Support density	30%
Exposure time	3 s
First layer exposure	40 s
Delay between exposures	10 s

After printing, the mechanical and electronic components—including the camera, battery, and other modules—were assembled. Any issues encountered during assembly were addressed through iterative redesign and reprinting.

The final prototype was evaluated for mechanical integrity, ergonomic fit, and compatibility with electronics. It was also tested for ease of disinfection and liquid ingress resistance. Mechanical strength was verified through load testing by fixing the laryngoscope blade to a rigid surface and applying force to the handle. A successful prototype was defined as one meeting all ergonomic, hygienic, mechanical, and functional requirements under simulated usage conditions.

Findings and Discussion

Electronics Results

The prototype video laryngoscope device, developed as part of this study, relies on multiple electronic components to fulfill its intended functionality. To enable proper interconnection

among these components, several printed circuit boards (PCBs) were designed. The 3D views of the designed PCBs are shown in **Figure 2.**

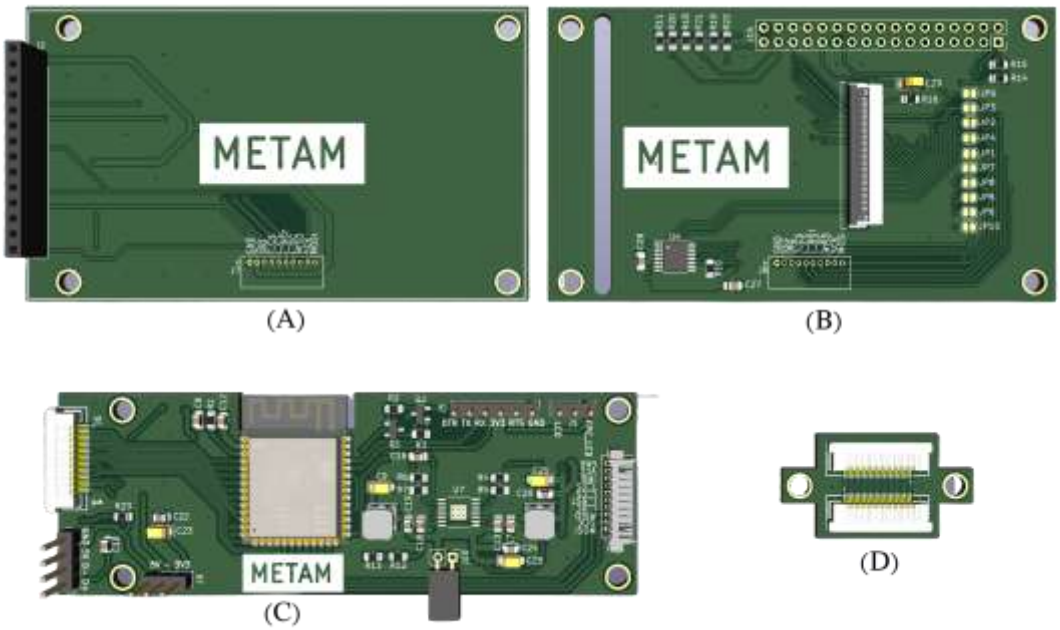

Figure 2. Views of the Electronic Components Designed

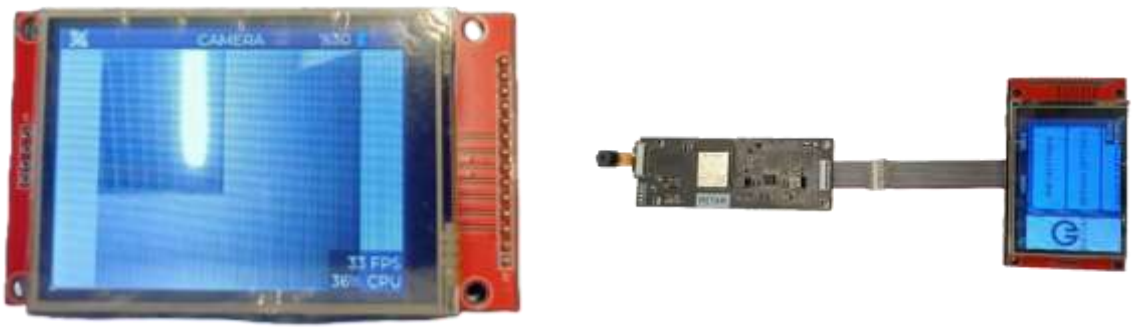
As seen in the figure, four separate PCBs were developed for the prototype. **Figure 8A** presents the primary LCD interface board used in the device. **Figure 8B** shows a backup LCD interface, which was not ultimately used as the main LCD interface met performance expectations. **Figure 8C** illustrates the main controller board that integrates the microcontroller, screen and camera connections, voltage regulator, and programming interface. This board supports both USB and Camera Serial Interface (CSI) connections for the camera. For ease of assembly, a USB camera was used in the current prototype. **Figure 8D** shows an extension board designed to enable longer connections for CSI-based cameras, but it was not used in the final setup. The assembled electronic system is presented in **Figure 3**.



(A) (B)

Figure 3. Assembled Electronic Circuits of the Video Laryngoscope Device

In **Figure 3A**, the device's interface and display are shown. The interface was developed using the Light and Versatile Embedded Graphics Library (LVGL), enabling control over Wi-Fi connectivity, remote server configuration, and screen brightness. The 2.8-inch SPI-based display achieves approximately 8 FPS during page transitions, 33 FPS on static pages, and 15 FPS on the camera display page. **Figure 3B** shows the full assembly with all connections in place. The image depicts a setup with a CSI camera, while the screen is connected to the main board via a flexible cable and connector—designed to facilitate integration with the mechanical structure.

The prototype successfully displays real-time camera footage on the built-in screen and simultaneously transmits the image to a remote server via Wi-Fi. This allows external users to access the camera stream live on their devices. In this prototype stage, the server implementation is simplified and does not include features such as user authentication or device switching. A basic mobile-compatible web interface was designed to display the live camera feed, as shown in **Figure 4**.

(A) (B)

Figure 4. View of the Designed Web Interface; (A) Mobile View, **(B)** Desktop View

As shown, the interface includes a dedicated button to focus solely on the camera stream when needed, improving usability on both mobile and desktop devices. The camera captures images in 320×240 pixel resolution in JPEG format. This format was chosen for its reduced data size, allowing faster image acquisition. For on-device display, the image is decompressed and

rendered in raw format, with minimal impact on refresh rate due to efficient decoding in small blocks.

However, wireless transmission introduces challenges due to the 1492-byte Maximum Transmission Unit (MTU) limitation in standard Wi-Fi protocols. To avoid data loss, the JPEG image is segmented, numbered, and transmitted via User Datagram Protocol (UDP) to the remote server. The server reassembles the packets based on sequence numbers, decodes the JPEG using image processing libraries, and scales it to 640×480 resolution for display in the browser.

Mechanical Design and Structural Analysis

The laryngoscope body was designed using SolidWorks, a computer-aided design (CAD) software. The resulting geometry is shown in **Figure 5**. As seen in the figure, the handle section was designed with contours to support the fingers, improving ergonomics and preventing slippage during use. Sufficient internal space was reserved within the body to house all electronic components compactly, contributing to a lightweight and compact final device.

The distal part of the laryngoscope, which enters the patient's mouth, was angled to facilitate the lifting of the epiglottis. Additionally, a cavity was created at the tip of the device to mount the camera. A dedicated channel was also designed, running from the internal electronics compartment to the distal tip, to allow proper cable routing and camera integration.

Figure 5. Laryngoscope Body Design

The detailed placement of the electronic components within the laryngoscope body is presented in **Figure 6**. As illustrated, a dedicated camera channel was included, extending from the internal electronics compartment to the distal end. Battery slots were positioned at the bottom of the handle to power the system, with the control board placed above this section. Power and control buttons, including screen adjustment potentiometers, were positioned at the bottom of the body for easy accessibility during operation.

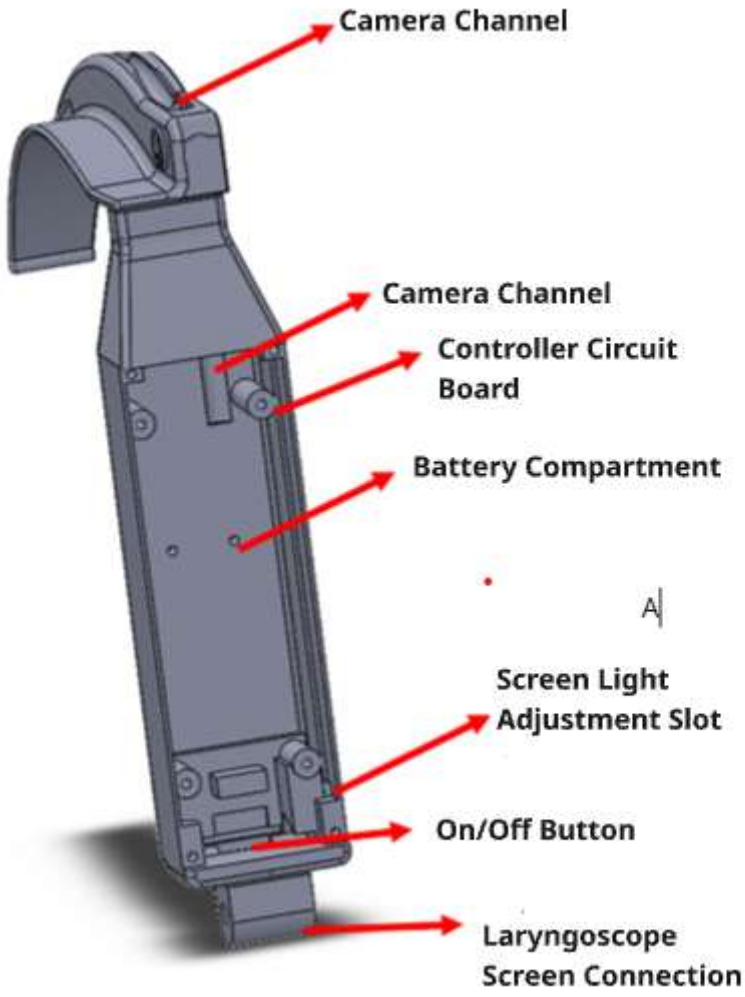


Figure 6. Placement of Electronic Components Within the Laryngoscope Body

The display module, used to present the captured image, was housed in a separate enclosure as shown in **Figure 7**. This housing includes a mounting area for the screen and a channel for routing flat cables externally. Additionally, mechanical protrusions at the base of the enclosure allow it to be connected to the main laryngoscope body.

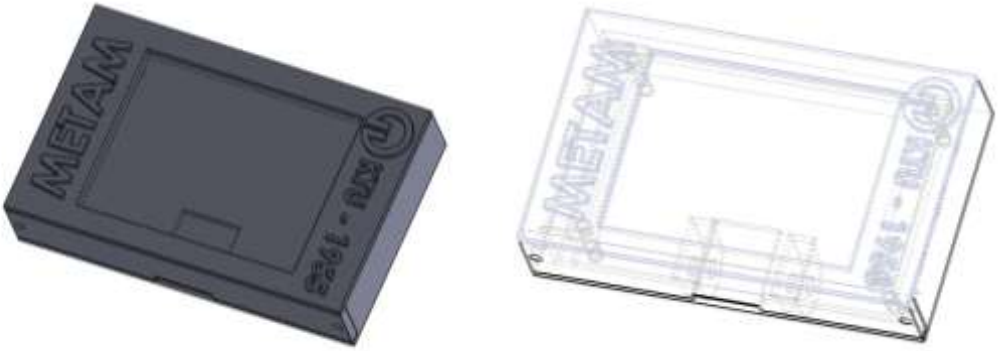

Figure 7. Enclosure for the Laryngoscope Display Module

In the final assembly stage, the laryngoscope and screen housing were integrated, as shown in **Figure 8**. The connection between the screen and the body is articulated, allowing the user to tilt the display according to their viewing angle. This design enables clear visualization regardless of the patient's or clinician's position.

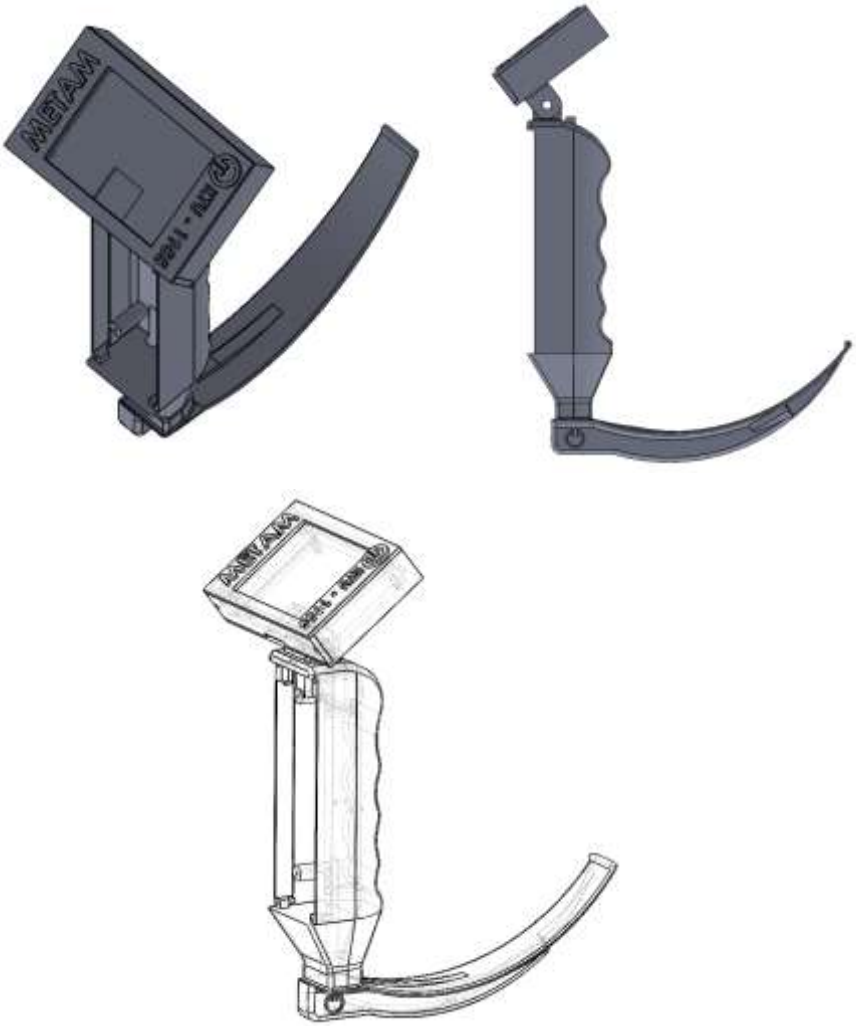

Figure 8. Final Assembly of Laryngoscope Components

To evaluate structural robustness and optimize the design, finite element analysis (FEA) was conducted. The results are presented in **Figure 9**. During simulation, the handle was fixed, and force was applied to the tip of the blade. High stress concentrations were initially observed at the junction of the blade and the main body. Through optimization, these concentrations were significantly reduced. As seen in **Figure 9**, the final design demonstrates low levels of stress, indicating a structurally sound model suitable for practical use.

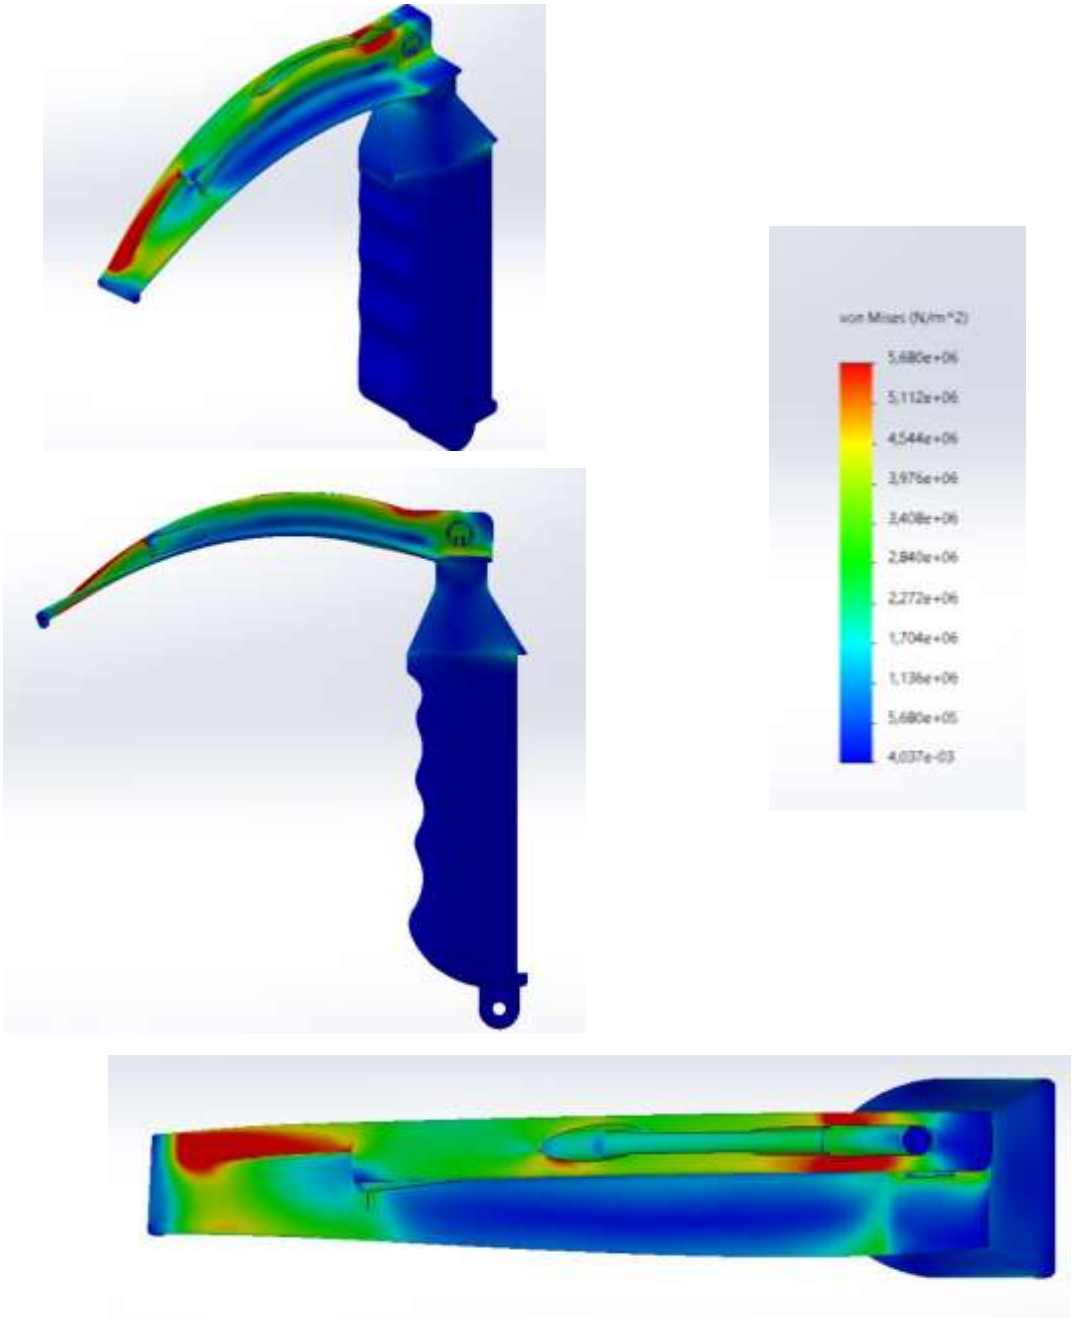

Figure 9. Finite Element Analysis of the Laryngoscope Design

Following the completion of mechanical and electronic fabrication, the components were assembled to form the final video laryngoscope device. Functional tests were conducted on the

assembled prototype, including image quality evaluation, extended runtime testing, and wireless video transmission performance.

Based on the results, the device was observed to operate wirelessly for durations exceeding one hour without interruption. These tests confirm the successful integration of all components and the prototype's capability to perform under realistic conditions. The assembled and tested prototype is shown in **Figure 10**.

Figure 10. Assembled Video Laryngoscope Device During Testing

Conclusions and Recommendations

This study presents the design and development of a portable, wireless, and modular video laryngoscope prototype—an innovative medical device intended for use in endotracheal intubation, a critical application of fiber optic and imaging technologies in modern medicine.

A comprehensive review of existing video laryngoscope models in the literature was conducted, highlighting their respective advantages and limitations. Building upon these insights and addressing gaps in the current state of the art, a new prototype was developed to provide wireless image transmission, modular design flexibility, and enhanced portability. The proposed device aims to improve the speed, accuracy, and safety of intubation procedures.

Furthermore, the inclusion of wireless connectivity supports its use in educational settings, enabling real-time demonstration and reducing the time required for medical personnel training. The prototype developed in this study offers significant advantages for both clinical and instructional use, standing out as a practical and cost-effective innovation.

The widespread adoption of such devices could increase the efficiency of diagnosis and treatment processes, enhance patient safety, and improve clinical success rates. From an

economic standpoint, the device also presents a cost-effective solution that could contribute positively to national healthcare systems.

Future work will focus on conducting clinical trials and long-term usage assessments to further validate the device's effectiveness, durability, and reliability in real-world healthcare environments.

ABSTRACT

In this study, hybrid thermoplastic composite materials reinforced with hemp and basalt/carbon fabrics were developed for the production of sustainable and environmentally friendly automotive interior trim panels. Within the scope of the project, several trials were conducted using various thermoplastic polymers (polyethylene, PET, and PVC) to identify a suitable matrix polymer compatible with the natural fiber hemp fabric. Preliminary evaluations on samples hot-pressed via the film stacking method revealed that PVC exhibited the best interfacial compatibility with hemp fiber among the tested polymers. Accordingly, further composite production was focused on PVC as the matrix, and experimental studies were conducted at different temperatures and layering configurations.

However, due to the surface characteristics of natural fibers, insufficient bonding between the polymer and the fiber was observed, particularly caused by inadequate wetting between the layers. To address this issue, a chemical surface treatment—silanization—was applied to the fibers.

Based on literature reviews and preliminary experiments, a silane type with high chemical bonding affinity to PVC (VTMS) was identified. A silane solution was prepared and applied to the hemp fabrics. As a result, composite plates containing silane-treated hemp fibers were successfully produced. To further enhance mechanical performance, basalt fibers and basalt mesh layers were incorporated into the structure.

Experimental studies aimed at determining the mechanical and thermal performance of the fabricated composite plates are ongoing. If the results proceed as anticipated, a novel and advanced biocomposite structure will be introduced to the literature.

Keywords: Biocomposite, Hemp Fiber, Thermoplastic Composite, Silane Treatment, Automotive Interior Panel

Introduction

In the automotive industry today, environmental sustainability, energy efficiency, and material recyclability have become fundamental criteria in material selection. In this context, natural fiber-reinforced polymer composites have garnered increasing attention, particularly for non-structural automotive components such as interior trim panels, due to their renewable origins, low density, biodegradability, and environmental benefits (Çavdar, 2016).

Among natural fibers, hemp fiber stands out as an eco-friendly alternative to glass and carbon fibers owing to its high specific strength, modulus of elasticity, low density, and biodegradability (Mohanty et al., 2000; Bledzki & Gassan, 1999). The literature reports that hemp-reinforced composites can be processed compatibly with both thermoplastic and thermoset matrices, and through suitable processing parameters and fiber/matrix arrangements, their mechanical properties can compete with or even surpass those of glass fiber-reinforced composites (Drzal et al., 2004). However, the high moisture absorption and structural heterogeneity of hemp fibers have been identified as significant limiting factors adversely affecting the mechanical performance of composites (Brouwer, 2000).

To overcome these limitations, surface modification techniques such as alkaline treatment, silanization, and acetylation have been developed to improve fiber surface characteristics. These treatments enhance fiber-matrix interfacial adhesion, thereby increasing mechanical strength and simultaneously mitigating dimensional stability problems arising from the hygroscopic nature of natural fibers (Kokta et al., 1990a; Vilay et al., 2008; Gassan & Bledzki, 1997; Valadez-Gonzalez et al., 1999). For example, Dewidar et al. (2012) investigated the effects of different fiber contents and orientations on the mechanical properties of hemp fiber-reinforced PVC composites, demonstrating that a 6.2% fiber content resulted in optimal tensile strength improvement. Moreover, SEM analyses confirmed the positive contribution of fiber-matrix interfacial bonding to mechanical performance.

Interior trim panels in the automotive industry must meet multiple criteria including lightness, mechanical strength, dimensional stability, aesthetic quality, acoustic performance, and environmental sustainability (Al-Oqla & Omari, 2018; Zaini et al., 2022). Among thermoplastics, poly(vinyl chloride) (PVC) is preferred due to its low cost, chemical resistance, recyclability, and flame retardant properties (Şeker, 1999).

It has been reported that hemp fiber-reinforced PVC composites exhibit increased tensile strength and stiffness but decreased ductility. Additionally, dimensional stability issues caused by the hygroscopic nature of natural fibers can be alleviated by surface modifications (Mohanty et al., 2000).

Aesthetic expectations within vehicle interiors are met through surface texture, gloss, and color uniformity, while acoustic performance is enhanced by using multilayered and porous structures (Kim et al., 2018; Kumar et al., 2019). Furthermore, automotive materials must ensure environmental and health safety by exhibiting low volatile organic compound (VOC) emissions and flame retardant capabilities (Javadi et al., 2019).

The application of natural fiber-reinforced composites in the automotive sector has been adopted by major manufacturers such as BMW, Audi, Ford, Volvo, and Mercedes-Benz, resulting in significant vehicle weight reduction and consequently lowered fuel consumption and CO_2 emissions. These biocomposites play a critical role in meeting the European Union's 95 g CO_2/km emission limit implemented in 2020 (Avcı, 2021; Çavdar, 2016).

In conclusion, natural fiber-reinforced composites stand among the promising future material solutions in the automotive industry, balancing environmental sustainability with mechanical performance. When used in combination with recyclable thermoplastics like PVC, they provide advantages in lightweighting and durability for interior trim panels. Therefore, optimizing fiber content, appropriate fiber orientation, and effective surface modification techniques is essential to maximize performance and support sustainability goals.

Materials and Methods

This study focuses on the production and characterization of polyvinyl chloride (PVC) matrix composites reinforced with both natural and synthetic fibers. The primary objective is to enhance the structural integrity and mechanical performance of the composites by optimizing fiber-matrix interfacial interactions.

1. Materials

All materials used for composite production were cut into 20 cm × 20 cm square sheets.

Matrix Material: PVC film was employed as the polymer matrix, serving as the primary binding phase. Its thin film form was selected to ensure uniform fiber impregnation and efficient load transfer.
Natural Reinforcement Fiber: Hemp fiber fabrics were selected as reinforcement due to their lightweight nature, environmental sustainability, and inherent mechanical properties. Owing to their high hydroxyl (-OH) content and moisture absorption tendency, surface treatments were applied to mitigate water uptake.

Synthetic Reinforcement Fibers (for Hybrid Structures):

Carbon Fiber and Carbon Mesh: Used in hybrid samples to enhance mechanical strength and stiffness.

Basalt Fiber and Basalt Mesh: Incorporated as sustainable alternatives to carbon and glass fibers, offering superior thermal stability, chemical resistance, and mechanical properties. Silanization Agents: A blend of silicone oil, powdered resin (as a binding agent), and silane was used to improve fiber-matrix adhesion.

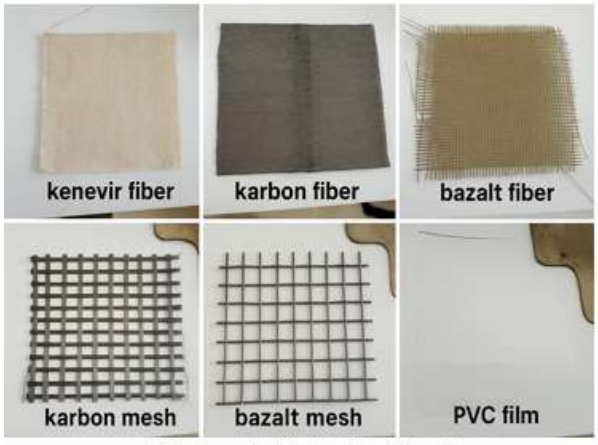

Figure 1. Fabrics Used

Figure 2. Silane Materials

2. Material Preparation and Surface Treatment

To reduce the moisture absorption tendency and improve the interfacial compatibility between hemp fibers and the PVC matrix, pre-treatments and silanization were applied to the hemp fabrics. Prior to silanization, hemp fabrics were preheated at 190 °C for 5 minutes to eliminate residual moisture.

Silanization Process: A detailed silanization protocol was followed to enhance surface wettability and fiber-matrix bonding. First, 60 g of silicone oil was combined with 6.66 g of powdered resin and stirred using a magnetic stirrer at 300 rpm and 30 °C until a homogeneous solution was achieved. Subsequently, 1.3 g of silane was precisely weighed and added to the mixture, which was stirred further to ensure full homogenization. The silane solution was then uniformly applied to the preheated hemp fabric using a brush, as illustrated in Figure 2.1. This treatment aimed to enable covalent bonding between the silane molecules and hydroxyl groups on the fiber surface, while supporting adhesion between the silicone/resin matrix and the modified fiber surface.

Figure 3. Silane Mixture

3. Composite Specimen Fabrication

Composite samples were produced via a hot-press molding process using optimized manufacturing parameters. Preliminary studies and systematic optimization trials identified the ideal conditions for ensuring homogeneous matrix infiltration and improved interfacial bonding. To prevent local dry spots, which were observed when hemp layers were increased, a strategy was adopted whereby two layers of PVC film were inserted between each hemp fiber layer.

This ensured complete and uniform resin impregnation, significantly improving structural cohesion and interfacial strength.

Optimized Process Parameters:

PVC Film Configuration: A configuration of 8 PVC films and 3 hemp layers was determined to provide the optimal balance of wetting, thickness, and mechanical integrity. Temperature: A pressing temperature range of 180 °C to 190 °C was found to be ideal for achieving structural consistency and visual quality without thermal degradation. Pressure Sequence: A combination of 5 tons of hot press (10 minutes) followed by 7–10 tons of cold pressing (5 minutes each) yielded excellent mechanical properties and robust interfacial bonding.

Sample Configurations: Five different sample groups were fabricated, each comprising 5 reinforcement layers separated by two layers of PVC film, totaling 12 PVC layers per sample:

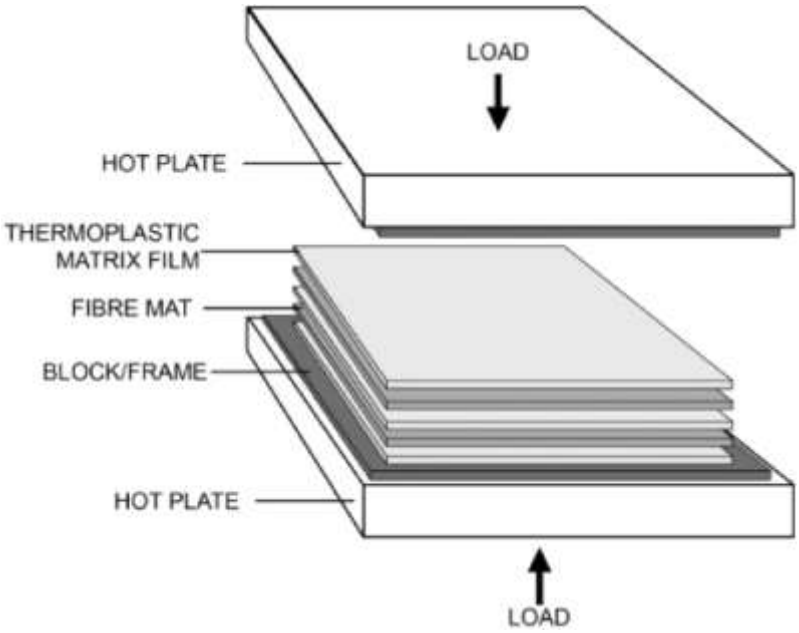

Figure 4. Film Stacking Huerta-Cardoso et al., 2022

Sample 1: Fully hemp-reinforced composite (5 hemp layers)

Sample 2: Hybrid composite with hemp and carbon fibers (3 hemp, 2 carbon)

Sample 3: Hybrid composite with hemp and carbon mesh (3 hemp, 2 carbon mesh)

Sample 4: Hybrid composite with hemp and basalt fibers (3 hemp, 2 basalt)

Sample 5: Hybrid composite with hemp and basalt mesh (3 hemp, 2 basalt mesh)

Pressing Procedure: Prepared sample stacks were first hot-pressed at 5 tons for 10 minutes. Subsequently, cold pressing was applied in two stages: 7 tons for 5 minutes followed by 10 tons for another 5 minutes.

Upon completion, the composite laminates were removed from the press and set aside for further processing.

Figure 5. Hot Press

Figure 6. Cold Press

4. Sample Cutting and Characterization Preparation

The proper sizing and shaping of composite laminates for testing is critical for data accuracy and repeatability.

Rough Cutting: Initial rough cutting of composite laminates was performed using a circular saw at the Forest Industry Engineering Education and Practice Workshop. A dry cutting technique was used to minimize fiber pull-out, fraying, and delamination. To stabilize the process, the composite laminates were clamped between two wooden plates during cutting, reducing direct impact from the saw blade (Campbell, 2004; Hull & Clyne, 1996).

Precision Cutting: Rough-cut composites were further refined using a wet abrasive cut-off machine to obtain test samples with appropriate dimensions and surface quality. Continuous coolant flow was used to minimize frictional heating and prevent thermal damage. This process ensured that specimens met the dimensional and surface quality requirements specified by international standards for optical microscopy, scanning electron microscopy (SEM), and density measurements (Metals Handbook, 1986).

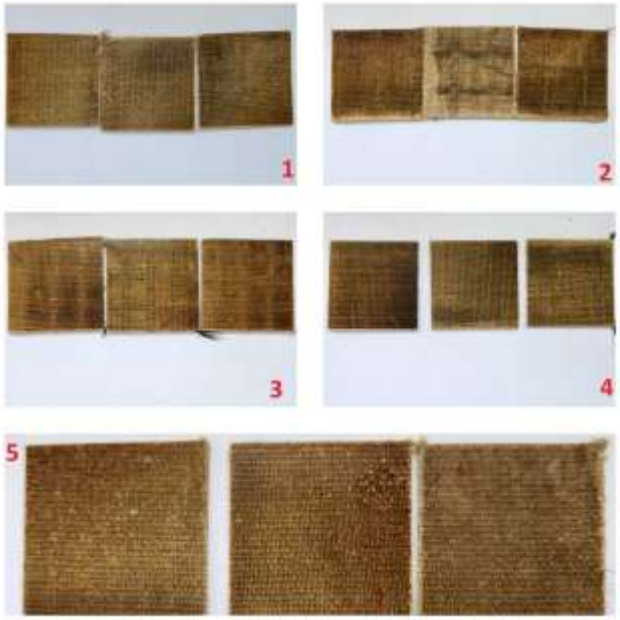

Figure 7. Precision Cut Samples

Findings and Discussion

Tensile Test

Tensile tests conducted in accordance with ASTM D638 revealed the influence of different fiber types and configurations on the mechanical properties of composite materials. The results clearly indicate that reinforcement type, fiber form, and fiber-matrix interaction play a critical role in determining both strength and deformation behavior.

The highest tensile strength, 88.00 MPa, was achieved with the basalt fiber-reinforced composite. This highlights basalt's high intrinsic strength and its ability to form an effective interfacial bond with the matrix. The hemp-basalt hybrid composite not only exhibited considerable strength but also demonstrated a prolonged elastic deformation range, indicating balanced mechanical performance. The synergy between the two fiber types enhanced both strength and energy absorption capacity.

The mechanical behavior of carbon-reinforced composites varied significantly depending on the form of the fiber. The sample containing carbon mesh showed substantial strength (64.73 MPa), but its low deformation tolerance led to brittle failure. In contrast, the carbon fabric-reinforced composite exhibited both lower tensile strength (34.23 MPa) and limited elongation, likely due to inadequate fiber-matrix bonding.

In the case of natural fiber composites, ductility emerged as a key characteristic. The sample reinforced solely with hemp fibers showed relatively low strength (39.23 MPa) but demonstrated an extended elongation region, indicative of high deformation capacity. This behavior was even more pronounced in the sample with increased hemp fiber content, which achieved moderate strength and high ductility.

These results underscore the contribution of natural fibers' flexibility to the overall toughness of the composite system.

In summary, while basalt fibers stood out for their strength contribution, hybrid hemp-basalt structures offered well-balanced and versatile mechanical performance. The effectiveness of carbon reinforcements was found to be highly dependent on fiber form and interfacial bonding, whereas natural fibers provided notable advantages in terms of ductility and deformation tolerance.

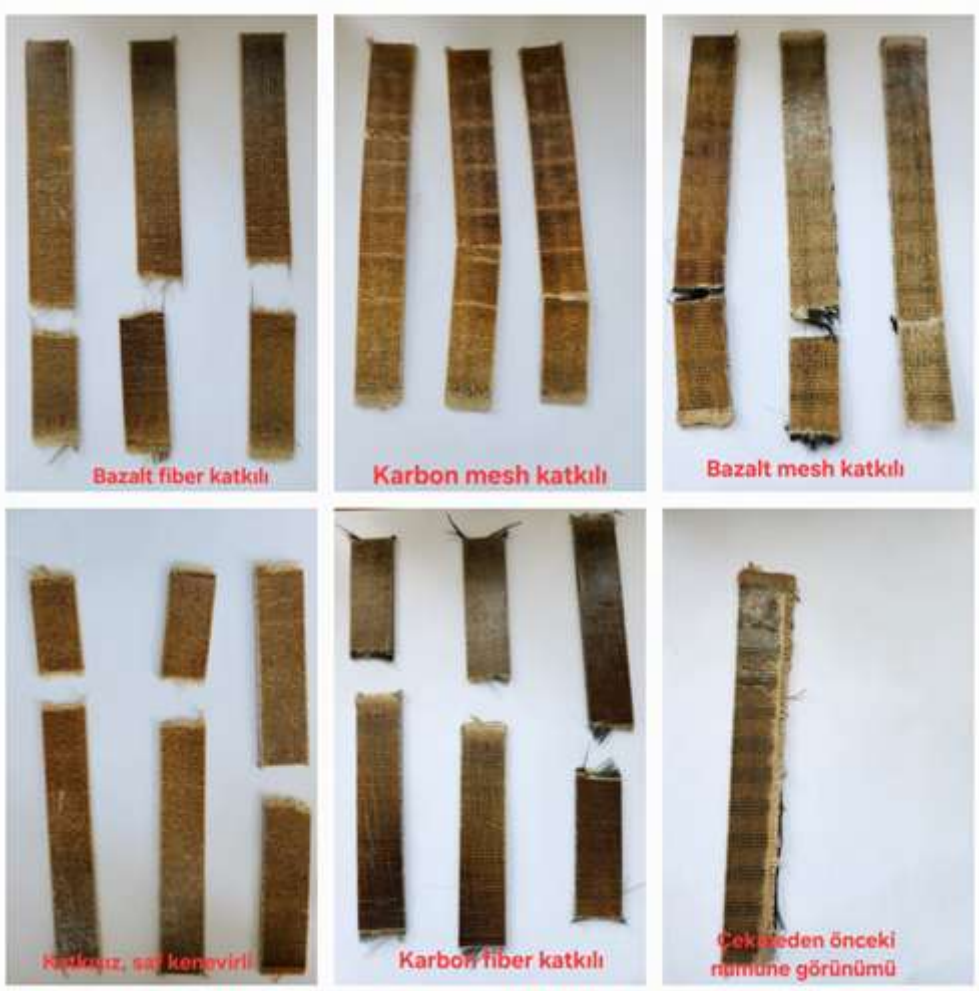

Figure 8. Condition of Samples After Tensile

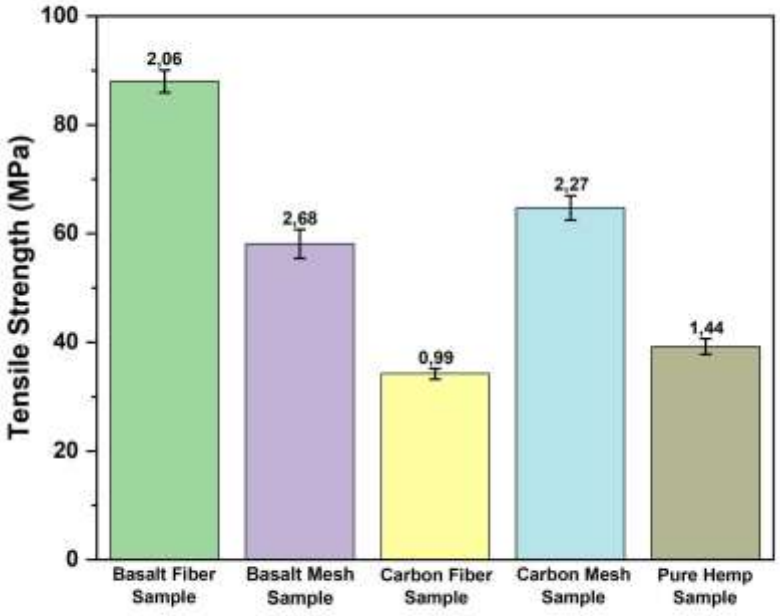

Table 1. Tensile Strength Average Ranking

Three Point Bend Test

The effects of different fiber reinforcement types (basalt, carbon, hemp) and forms (fabric, mesh) on the interlaminar shear strength of polymer composites were experimentally investigated. The findings indicate that both the chemical structure and geometry of the reinforcement material significantly influence shear strength.

The basalt fabric-reinforced composite exhibited the highest shear strength at 232.5 MPa. This can be attributed to the high intrinsic mechanical strength of basalt fibers and the homogeneous and extensive surface contact provided by the fabric form, which enhances load transfer efficiency. The fabric structure plays a critical role in achieving optimal fiber alignment, thereby minimizing delamination and interfacial damage. Basalt mesh, with a shear strength of 187.5 MPa, ranked second, confirming the inherent shear strength of basalt fibers, although it lagged slightly behind the fabric form due to its relatively reduced surface contact area.

In carbon-reinforced composites, the form of the reinforcement had a notable effect on shear strength. Carbon mesh (141.4 MPa) showed significantly higher shear strength than carbon fabric (103.072 MPa). Contrary to expectations, carbon fabric exhibited the lowest shear strength, which is associated with the brittle nature of carbon fibers, difficulties in matrix penetration, and insufficient interfacial cohesion. The more permeable structure of the mesh form facilitated better matrix infiltration between the fibers and improved distribution of shear forces.

The natural hemp-reinforced material demonstrated a moderate shear strength of 147.2 MPa. While this value was higher than both carbon fabric and mesh, it was still lower than that of basalt reinforcements. Although hemp fibers offer environmental sustainability advantages due

to their natural origin, limitations such as structural inhomogeneity and a tendency to absorb moisture can restrict their strength.

In conclusion, this study shows that the interlaminar shear strength of composite materials varies significantly depending on both the type and form of the fiber reinforcement. Reinforcements such as basalt fabric, which provide high strength and good integration with the matrix, are particularly critical for applications requiring high structural performance and durability. The findings highlight the vital role of reinforcement selection and form optimization in determining the final mechanical performance of composite materials.

Thermal Conductivity Results and Interpretation

This section evaluates the thermal conductivity (λ) values of five composite groups reinforced with different materials. Low thermal conductivity indicates good thermal insulation performance. For each group, the mean values and standard deviations from three separate measurements were analyzed.

Basalt Mesh Composite (Group 2): Exhibited the lowest thermal conductivity with an average of 0.0309 W/m·K, indicating the best thermal insulation performance.

The extremely low standard deviation (0.0001) confirms high consistency in the measurements and structural homogeneity of the sample.

Carbon Fiber Composite (Group 4): With an average thermal conductivity of 0.0479 W/m·K, it showed the second-best insulation performance after the basalt mesh composite. The standard deviation of 0.0001 supports the uniformity and consistency of the material structure.

Pure Hemp Composite (Group 5): Recorded an average thermal conductivity of 0.0524 W/m·K, with a standard deviation of 0.0002. The performance of pure hemp falls between that

of basalt fiber and carbon fiber composites, with good consistency observed across measurements.

Basalt Fiber Composite (Group 1): Had an average thermal conductivity of 0.0555 W/m·K. The low standard deviation (0.0002) indicates reliable measurements and consistent thermal performance across the sample.

Carbon Mesh Composite (Group 3): Displayed the highest average thermal conductivity at 0.0610 W/m·K, suggesting the lowest insulation performance among all groups. The significantly higher standard deviation (0.0013) points to structural heterogeneity or variability in the measurements.

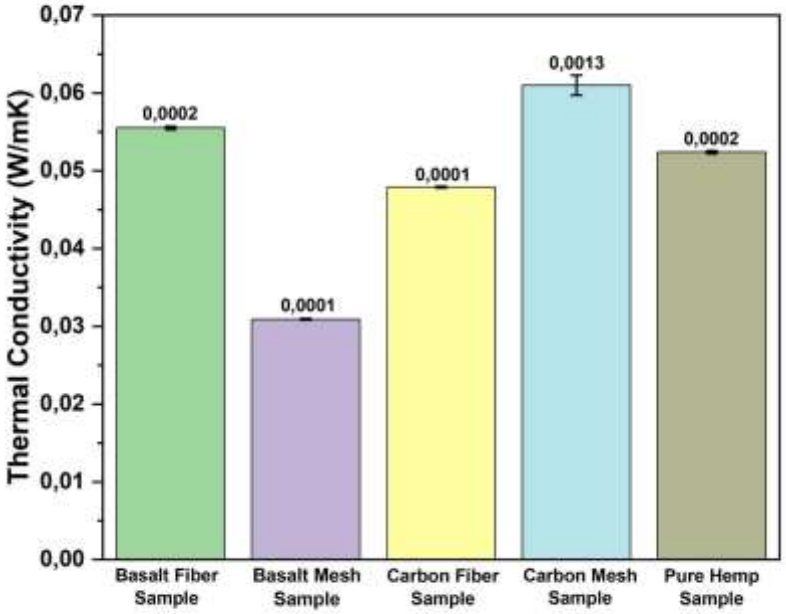

Table 3. Thermal Conductivitiy

Density Results and Interpretation

The density values (g/cm³) of the composite samples revealed the effects of different reinforcement materials on the overall composite structure. The average density and standard deviation for each sample group were determined.

Basalt Fiber Composite (Sample 2): With an average density of 1.3723 g/cm³, it was the second densest composite. The high density of basalt fibers (~2.7 g/cm³) and their uniform distribution significantly increased the overall density of the composite. The low standard deviation (0.0121 g/cm³) indicates a high degree of uniformity during the manufacturing process.

Carbon Fiber Composite (Sample 5): Exhibited a higher density (1.3159 g/cm³) compared to other carbon-reinforced samples. This can be attributed to the continuous and dense structure of the carbon fiber fabric, which may have integrated more effectively with the matrix, leaving fewer voids and contributing more mass to the composite.

Basalt Mesh Composite (Sample 3): Had an average density of 1.2831 g/cm³. This lower value, compared to continuous basalt fibers, may result from the mesh form contributing less to the overall density and potentially creating more voids within the matrix.

Pure Hemp Composite (Sample 6): Containing only hemp fibers and PVC film, this sample had a moderate average density of 1.2694 g/cm³. This reflects the relatively low densities of hemp fibers and PVC. The low standard deviation (0.0238 g/cm³) indicates good reproducibility in the manufacturing process.

Carbon Mesh Composite (Sample 4): Presented the lowest density value with an average of 1.2412 g/cm³. The result aligns with carbon's lower intrinsic density (~1.8 g/cm³) compared to basalt. The very low standard deviation (0.0077 g/cm³) suggests that this structure was also stably positioned during fabrication.

In general, continuous fiber forms of basalt and carbon increased the overall density of the composites, while mesh reinforcements resulted in lower density values.

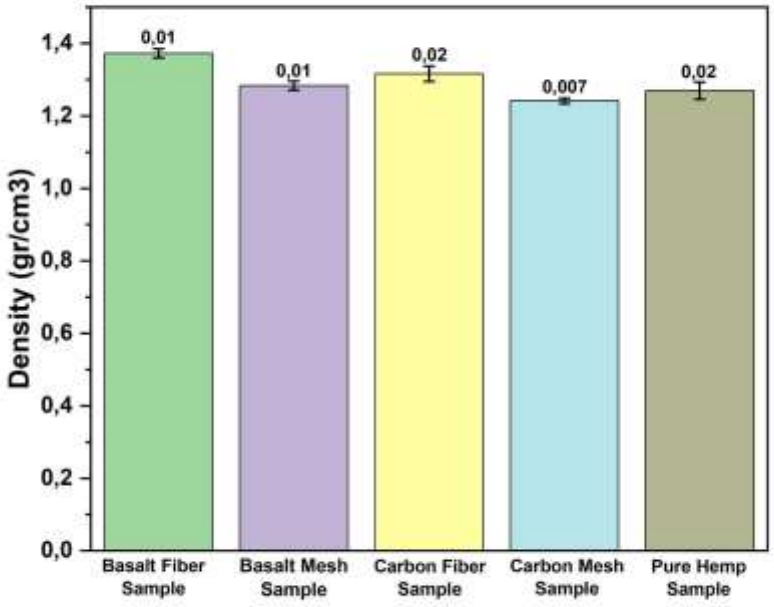

Table 4. Density

Optical Review

Optical microscopic examinations and microstructural analyses were conducted to evaluate the wettability behavior at the fiber–matrix interfaces and to identify structural defects in the samples. The findings revealed the critical influence of reinforcement materials and the manufacturing process on wettability and overall composite integrity.

Figure 9. Optical Examination Samples

Wettability of Hemp Fibers: Surface modification with a silane agent partially improved the wettability of hemp fibers within the matrix. The silane coating enhanced the chemical compatibility of the fiber surface, improving fiber–matrix adhesion and promoting better interaction with the resin. However, full impregnation of the fibers was not achieved, and some areas still exhibited insufficient bonding. Although partial wetting reduces the risk of fiber pull-out under mechanical loading, it limits the composite's full strength potential. (Microscopic images of the hemp/PVC composite indicate that silane treatment improved adhesion at the fiber–matrix interface to some extent, though ideal wetting conditions were not achieved. Unwetted regions on fiber bundles and surfaces, along with the resulting voids, are considered critical microstructural defects that restrict the composite's mechanical performance.)

Wettability of Basalt Fibers: In the basalt fiber regions, the matrix was observed to spread homogeneously across the fiber surfaces, effectively encapsulating them. This indicates that the dense and uniform structure of basalt fibers allows high interfacial compatibility with the PVC matrix. The sample demonstrated more stable and homogeneous wetting behavior for basalt fibers.

Wettability of Basalt Mesh: Microstructural images showed that the basalt mesh structure was completely coated with resin. However, it remains uncertain whether this coating resulted from pre-impregnation of the mesh with resin or from effective wetting by the PVC matrix. Further advanced analyses (e.g., SEM examination, spectroscopy) are needed to make a definitive assessment.

Wettability of Carbon Mesh: In the carbon mesh region, the fibers exhibited a more organized and dense distribution within the matrix and showed strong interaction with the resin. This behavior can be attributed to the high surface energy of carbon fibers, which promotes good mechanical interlocking with the PVC matrix. The fine fiber structure of the carbon mesh also facilitates more effective resin penetration and minimizes void formation.

Wettability of Carbon Fibers: Microstructural analysis revealed that the thick, continuous structure of carbon fibers hindered effective wetting by the PVC matrix. Microscopic images showed that the resin did not fully encapsulate the fiber surfaces and that sufficient interfacial

adhesion was lacking. The dense carbon fibers restrict resin penetration, increasing the risk of weak bonding and potential delamination.

Void and Porosity Formation: Voids and gaps observed in the composite structure were likely caused by air entrapment during manufacturing, inadequate resin flow, or cutting-induced defects. These microstructural flaws weaken fiber–matrix adhesion, lead to stress concentrations, and negatively affect the composite's mechanical properties (particularly impact resistance, fatigue life, and tensile strength). In particular, the insufficient wetting of thick carbon fibers and unimpregnated carbon mesh surfaces contributed to the formation of micropores.

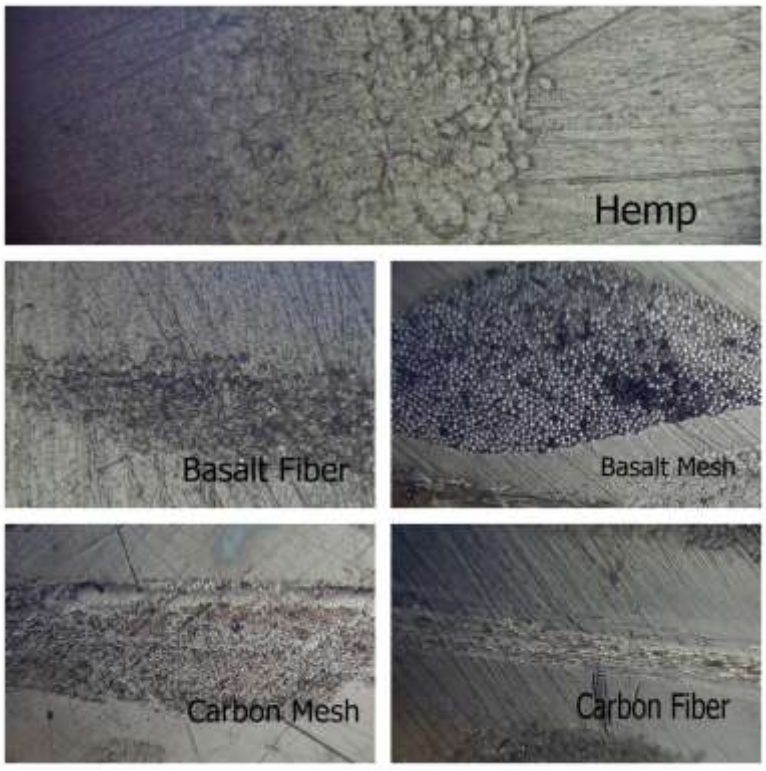

Figure 10. Optic Result

Overall, optical microscopy clearly indicated that basalt fibers provided the best wetting performance. Their continuous and uniform contact with the matrix reflects excellent interfacial compatibility. In contrast, carbon fiber fabric showed the lowest degree of wettability. Although the silane treatment significantly improved the wettability of natural fibers, complete wetting has not yet been achieved. These findings suggest that both hemp and carbon reinforcements were distributed effectively within the PVC matrix, and that acceptable interfacial integrity was achieved with proper surface treatments. However, eliminating process-related defects and ensuring complete wetting are critical for achieving optimal performance.

Conclusion and Recommendations

In this study, hybrid thermoplastic composites reinforced with natural (hemp) and synthetic (basalt and carbon) fibers were successfully fabricated using polyvinyl chloride (PVC) as the matrix material. The primary goal was to develop environmentally friendly, recyclable, and mechanically robust materials suitable for automotive interior trim applications. Surface modification of hemp fibers via silanization notably improved fiber–matrix compatibility, although complete wetting and interfacial bonding were not fully achieved. Among all

reinforcements, basalt fiber-reinforced composites demonstrated the highest tensile strength and superior wettability, indicating excellent compatibility with the PVC matrix. Hybrid configurations, especially those combining hemp and basalt fibers, offered balanced mechanical performance and improved energy absorption capabilities.

Thermal conductivity analyses revealed that composites containing basalt mesh exhibited the best thermal insulation properties, while carbon mesh composites showed higher thermal conductivity values, suggesting lower insulation efficiency.

Density measurements supported the conclusion that reinforcement type and form significantly influence the overall composite structure, with continuous fiber forms contributing to higher density values. Optical microscopy confirmed that basalt and silane-treated hemp fibers facilitated better resin penetration compared to untreated or thick carbon fiber fabrics.

In light of these findings, the following recommendations are proposed for future studies and industrial applications:

1. Enhanced Surface Treatment: The silanization process can be optimized further to achieve more uniform and complete fiber wetting. Additional surface modification techniques, such as plasma or enzymatic treatments, may be explored.
2. Hybrid Design Optimization: Fiber content, layering order, and mesh integration strategies should be fine-tuned to exploit the synergistic benefits of natural and synthetic reinforcements.
3. Advanced Characterization: Further analysis using scanning electron microscopy (SEM), dynamic mechanical analysis (DMA), and long-term aging tests can provide deeper insight into interfacial behavior and long-term performance.
4. Sustainability Assessment: Life cycle analysis (LCA) and recyclability studies should be conducted to quantify the environmental impact and potential advantages of these biocomposites over conventional materials.
5. Process Improvements: Improvements in resin infiltration and lamination techniques may help reduce void content and enhance mechanical integrity, particularly in thick or multilayered configurations.

In conclusion, hybrid thermoplastic composites developed in this study present a promising solution for sustainable and high-performance automotive applications. With further optimization, these materials have the potential to replace conventional synthetic composites and contribute to the industry's decarbonization and recyclability goals.

Thanks and Information Note

This study was conducted within the scope of research activities carried out at the Medical Device Design and Production Application and Research Center of Karadeniz Technical University. We would like to express our sincere gratitude to Associate Professor Mustafa Aslan, as well as to the staff of the aforementioned center and the laboratory personnel of the Department of Metallurgical and Materials Engineering, for their valuable academic contributions, laboratory infrastructure, and technical support throughout all stages of the study.

In addition, we extend our appreciation to all academic and technical stakeholders who contributed to the scientific quality of the project through their guidance, provision of materials, and support in experimental measurements during the course of the study.

The data presented in this paper are based on experimental findings obtained within the scope of an ongoing master's thesis. The related studies are still in progress, and the final results are planned to be published comprehensively upon completion.

We also gratefully acknowledge the support provided by the Karadeniz Technical University Individual Research Programs Coordination Unit under project number FBA-2025-16187.

ABSTRACT

This study presents a theoretical framework for neuroaccounting, an interdisciplinary approach that investigates the neural mechanisms underlying decision-making processes in the accounting domain, thereby challenging the assumptions of classical rationality. Rooted in cognitive neuroscience, neuroaccounting aims to elucidate the emotional and cognitive underpinnings of financial behavior at both individual and institutional levels. Specifically, the involvement of brain regions such as the prefrontal cortex, amygdala, and anterior cingulate cortex in accounting-related judgments provides a neuroscientific dimension to behavioral accounting and finance theories. This paper delineates the conceptual foundations and interdisciplinary scope of neuroaccounting, reviews the current literature, and evaluates the methodologies and experimental paradigms employed in the field. Additionally, the practical implications and ethical concerns associated with neuroaccounting are critically examined. The study concludes by discussing the potential contributions of neuroaccounting to accounting science and proposing avenues for future research.

Keywords: Neuroaccounting, Neuroscience, Financial Decision-Making, Behavioral Accounting, Neuroscientific Approaches in Finance

Giriş

Finansal karar alma süreçleri, geleneksel iktisat kuramlarında rasyonel birey varsayımı üzerinden açıklansa da son yıllarda yapılan çalışmalar bireylerin kararlarında duygusal, bilişsel ve nörolojik faktörlerin de etkili olduğunu ortaya koymuştur. Bu bağlamda, davranışsal iktisat ile nörobilim disiplinlerinin birleştiği yeni bir alan olan "nörofinans" (neurofinance), finansal kararların arka planındaki sinirsel süreçleri anlamaya yönelik katkılar sunmaktadır. Bu alan altında gelişen "nöromuhasebe" (neuroaccounting) ise, bireylerin muhasebe verilerini nasıl algıladığı, işlediği ve kararlarını nasıl oluşturduğu konularında biyo-nörolojik temelli bir analiz imkânı sağlamaktadır.
